- (ii) (a) Investment in debtors with incremental sales due to 2 months credit period. When all customers are extended 2 months credit period:
($₹75,00,000 \times 0.8$)/Debtors turnover ratio 6 = ₹10,00,000.
(b) When credit period is extended to new customers only: ($₹15,00,000 \times 0.8$)/Debtors turnover ratio 6 = ₹2,00,000.
- (iii) Additional investment in working capital required and its cost:

Particulars	All customers	New customers only
Incremental investment in debtors	₹6,00,000*	2,00,000
Increase in stock	2,00,000	2,00,000
Less increase in creditors	(1,00,000)	(1,00,000)
Increase in working capital	7,00,000	3,00,000
Cost of additional working capital @ 40%	2,80,000	1,20,000

(*₹10,00,000 – ₹4,00,000)

P.15.8 A company deals with consumer durables, having an annual turnover of ₹80 lakh, 75 per cent of which are credit sales effected through a large number of dealers while the balance sales are made through show rooms on cash basis. Normal credit allowed is 30 days.

LO 15.2,4 **LOD M**

The company proposes to expand its business substantially and there is good demand as well. However, the marketing manager finds that the dealers have difficulty in holding more stocks due to financial problems. He therefore proposes a change in the credit policy as follows:

(₹ in lakh)

Proposal	Credit period	Anticipated credit sales
A	60 days	70
B	90 days	75

The products yield an average contribution of 25 per cent on sales.

Fixed costs amount to ₹5 lakh per annum. The company expects a pre-tax return of 20 per cent on capital employed.

The finance manager after a review of the proposal has recommended increasing the provision for bad debts from the current 0.5 per cent to 1 per cent for proposal A and to 1.5 per cent for proposal B.

Evaluate the merits of the new proposals and recommend the best policy.

Solution

Evaluation of Proposed Credit Policies

Particulars	Present	Proposal A	Proposal B
Sales revenue	₹60,00,000	₹70,00,000	₹75,00,000
Less variable costs (0.75)	45,00,000	52,50,000	56,25,000
Less fixed cost	5,00,000	5,00,000	5,00,000
Less bad debts	30,000	70,000	1,12,500
Less cost of investment in debtors*	83,333	1,91,667	3,06,250
Profit	8,86,667	9,88,333	9,56,250

Recommendation Proposal A is recommended as it yields maximum profit.

Working Note

Cost of Investment in Debtors

Particulars	Present	Proposal A	Proposal B
(i) Total investment in debtors (Total VC + Total FC)	₹50,00,000	₹57,50,000	₹61,25,000
(ii) Debtors turnover ratio (360 days/Average collection period)	12 (360/30)	6 (360/60)	4 (360/90)
(iii) Average investment in debtors (i/ii)	4,16,667	9,58,333	15,31,250
(iv) Cost of average investment in debtors (iii) × 0.20	83,333	1,91,667	3,06,250

P.15.9 Exxon Ltd. has current sales of ₹6,00,000 per annum. To push up sales, Exxon is considering a more liberal credit policy as one of the strategies. The current average collection period of the company is 30 days. Proposed increases in collection period and their impact on sales and default rate (on total sales) are given below:

LO 15.24 LOB M

Credit Policy	Increase in collection period	Increase in sales	Default rate
I	15 days	₹25,000	0.5%
II	30 days	60,000	1.0%
III	40 days	70,000	2.0%

Exxon is selling its product at ₹10 each. Average cost per unit at the current level is ₹8 and variable cost per unit is ₹6. If Exxon requires a rate of return of 20 per cent on its investment, which credit policy do you recommend and why? Assume 360 days a year.

Solution

Evaluation of Proposed Credit Policies

Particulars	Present 30 days	Proposed (number of days)		
		I (45)	II (60)	III (70)
Sales (in units)	60,000	62,500	66,000	67,000
Sales revenue	₹6,00,000	₹6,25,000	₹6,60,000	₹6,70,000
Less variables costs @ ₹6 per unit	3,60,000	3,75,000	3,96,000	4,02,000
Less total fixed costs (60,000 units × ₹2)	—	3,125	6,600	13,400
Less bad debts	8,000	12,375	17,200	20,311
Less cost of investment in debtors*	1,12,000	1,14,500	1,20,200	1,14,289
Profit				

Recommendation Policy II (of increasing credit period by 30 days) is recommended as it yields maximum profit.

*Cost of Investment in Debtors

Particulars	Present	Proposed I	II	III
(i) Total investment in debtors (Total VC + Total FC)	₹4,80,000	₹4,95,000	₹5,16,000	₹5,22,000
(ii) Debtors turnover ratio 360/Average collection period	12	8	6	5.14
(iii) Average investment in debtors (i)/(ii)	40,000	61,875	86,000	1,01,556
(iv) Cost of investment in debtors (iii) × 0.20	8,000	12,375	17,200	20,311

P.15.10 The credit manager of XYZ Ltd. is reappraising the company's credit policy. The company sells its products on terms of net 30. Cost of goods sold is 85 per cent of sales and fixed costs are further 5 per cent of sales. XYZ classifies its customers on a scale of 1 to 4. During the past five years, the experience was as under:

LO 15.2,4 LOD M

Classification	Default as a percentage of sales	Average collection period-in days for non-defaulting accounts
1	0	45
2	2	42
3	10	40
4	20	80

The average rate of interest is 15 per cent. What conclusions do you draw about the company's credit policy? What other factors should be taken into account before changing the present policy? Discuss.

Solution

Statement showing evaluation of credit policy

Classification	Gross profit @ 15%	Fixed costs @ 5%	Bad debts	Interest cost ¹	Total costs (3 + 4 + 5)	Net profit (2 - 6)
1	2	3	4	5	6	7
1	₹15	₹5	Nil	₹1.66	₹6.66	₹8.34
2	15	5	₹2	1.55	8.55	6.45
3	15	5	10	1.48	16.48	(1.48)
4	15	5	20	2.96	27.96	(12.96)

Note: Assuming ₹100 as the amount of revenue generated from each type of customer.

Working Notes

(1) Computation of interest costs

Particulars	1 (45)	2 (42)	3 (40)	4 (80)
Investment in debtors (Total cost, TC)	90	90	90	90
Debtors turnover (DT) (365 ÷ average collection period)	8.11	8.69	9.125	4.5625
Average investment (TC ÷ DT)	11.096	10.36	9.86	19.73
Interest @ 15 per cent	1.66	1.55	1.48	2.96

The analysis indicates that there seems to be laxity on the part of credit collection department in that the average collection period is higher (40-80 days) than the period allowed (30 days) for all categories of customers. Given the low profit margin of the firm (say 10 per cent as 90 per cent virtually are incremental costs to sales revenue), the firm cannot afford such a policy. In fact, the firm is actually suffering loss on sales made to the two categories of customers (namely, classified as 3 and 4). Losses in these categories are primarily due to substantial amount of bad debts.

To promote sales, firm can afford liberal credit policy as the interest cost constitutes a small percentage of total costs. What is required is that the credit collection department of the firm should make more rigorous efforts to judge credit-worthiness of its customers; this, in turn, will reduce bad debts.

MINI CASES

15.C.1 (Credit Policy) Khoobsurat Industries Ltd is a major player in the soap and detergent business. It has a market share of 25 per cent which is almost twice as much as that of the next competitor. The current sales of Khoobsurat amount to ₹1,400 crore. Its bad debts are in the range of 1 per cent. The company has a P/V ratio of 45 per cent. The policy of Khoobsurat is to extend to all its customers a credit of 30 days. The existing fixed costs are ₹120 crore which are unaffected by changes in sales.

Khoobsurat Industries is facing severe competition both from multinational and regional players. The CEO of the company, Sushant Sachdeva, has asked Amit Gupta, the chief marketing manager, to submit proposals to meet the challenge from the competitors. Amit Gupta has, after a detailed survey and discussion, proposed three options for the consideration of the CEO:

Option 1: Increase the credit period to 60 days. In that case, the sales are likely to increase by 20 per cent. But bad debts would go up to 2 per cent and an additional investment of ₹20 crore will be required in working capital (without taking into account the effect of debtors).

Option 2: Offer a credit term, 2/10 net 30. In this case, sales are expected to increase by 10 per cent. Fifty per cent of the debtors are likely to avail of the discount. There would be no change in bad debts.

Option 3: Offer both extended credit to 60 days and cash discount of 2 per cent (2/10 net 30). An increase of 25 per cent in sales could be expected and cash discount could be availed of by 30 per cent of the customers. But bad debts will increase to 2 per cent and the additional investment in working capital of ₹20 crore will be required (without taking into account the effect of debtors).

The CEO of Khoobsurat Industries desires the CFO to carry out a financial evaluation of the above alternative proposals and suggest the course of action to be taken. The required rate of return of Khoobsurat is 20 per cent.

Solution

Financial Evaluation of Credit Proposal (₹ crore)

	Option 1	Option 2	Option 3
Incremental sales	(₹1,400 × .20) 280	(1,400 × 0.10) 140	(1,400 × 0.25) 350
Less incremental variable cost	(280 × 0.55) 154	(140 × 0.55) 77	(350 × 0.55) 192.5
Incremental contribution	(280 × 0.45) <u>126</u>	(140 × 0.45) <u>63</u>	(350 × 0.45) <u>157.5</u>
Less other relevant costs:			
Bad debts	19.6 ^a	1.4 ^c	21 ^d
Cost of investment in working capital (20 × 0.20)	4	—	4
Cost of investment in debtors	19.97 ^b	—	12.2 ^e
Cash discount	—	15.4	10.5
Add savings on account of reduction in debtors	—	4.1 ^f	—
Incremental profit	<u>82.43</u>	<u>50.3</u>	<u>109.8</u>

^a(₹1,680 crore × 0.02) – (₹1,400 crore × 0.01) = ₹19.6 crore

^b Proposed investment in debtors [(₹1,680 crore × 0.55) + ₹120 crore] ÷ 6

(Debtors turnover, 360 days ÷ 60 days = 6 days)

= ₹174 crore

Present investment in debtors [(₹1,400 crore × 0.55) + ₹120 crore] ÷ 12 (360 ÷ 30)

74.2 crore

Incremental investment in debtors

99.8

Cost of incremental investment in debtors (₹99.8 crore × 0.20)

19.97

^c (₹1,540 crore × 0.01) – (₹1,400 crore × 0.01) = 1.4 crore

^d (₹1,750 × 0.20) – (₹1,400 crore × 0.01) = 21 crore

^e Proposed investment in debtors [(₹1,750 crore × 0.55) × ₹120 crore]

+ 8 (360 days ÷ 45 days)

135.3

Present investment in debtors

74.2

Incremental investment in debtors

61.1

Cost of incremental investment in debtors (₹61.1 crore × 0.20)

12.2

THE

... ..

... ..

... ..

... ..

... ..

... ..

... ..

RESULTS

... ..

... ..

... ..

... ..

... ..

... ..

¹Debtors turnover = $360 \text{ days} / [(0.5 \times 10 \text{ days}) + (0.5 \times 30 \text{ days})] = 20 \text{ days} = 18$

Proposed investment in debtors $[(\text{₹}1,540 \text{ crore} \times 0.55) + \text{₹}120 \text{ crore}] + 18 = \text{₹}53.7 \text{ crore}$

Decrease in investment in debtors $(\text{₹}74.2 \text{ crore} - \text{₹}53.7 \text{ crore}) = \text{₹}20.5 \text{ crore}$

Savings on account of reduction in debtors $(\text{₹}20.5 \text{ crore} \times 0.2) = \text{₹}4.1 \text{ crore}$

Recommendation Option 3 which combines extended credit period and cash discount would result in the maximum incremental profit. The CEO may consider the proposed policy change due to its beneficial effect.

15.C.2 (Credit Period Policy) Addidas India Ltd is one of the leading global sports goods and apparel company, having a large presence in India. The region-wise break-up of Addidas' most recent sales are: (i) Western region—₹290 crore, Eastern region—₹105 crore, Northern region—₹285 crore and Southern region—₹265 crore. The market share of Addidas in this category are: West—30 per cent, East—5 per cent, North—25 per cent and South—26 per cent. Ashish Dhakde is the general manager incharge of the Western region. He was instrumental in generating the huge sales in the region which resulted in capturing an extra 6 per cent market share in the last one year only. Priyadarshi Sarkar, the CEO of Addidas India, is highly impressed with Ashish's performance and has promoted him as regional director of the Eastern region.

Ashish's immediate plan involves using the existing distribution channels, dealers and retailers to strengthen the Addidas brand in the Eastern region. He has identified that the Kolkatta area provides the largest share of revenue in the region amounting to ₹92 crore. In a brain-storming session with his managers, he came to the conclusion that strengthening the performance of at least three other centres as major revenue-earning areas is his topmost priority. The three identified areas are: (i) Bhubneshwar (existing sales, ₹6 crore) (ii) Jamshedpur (existing sale, ₹1.6 crore) and (iii) Guwahati (existing sale, ₹1.4 crore). After using ISM (Interpretation Structured Modelling), Ashish has identified the Bhubneshwar area as the first priority.

The most influential dealer for Bhubneshwar area is Soshit and Sons. During the first personal visit to the dealer, Dhakde met Soshit to discuss the possibilities of increasing the business in Bhubneshwar region. Soshit has assured Ashish of buying an extra 50 per cent over the current purchase of ₹5 crore if Addidas India relaxes its credit policies for him.

As per the current policy, Addidas India offers 27.5 per cent commission on MRP on cash purchases and 27 per cent commission on 30-day credit purchases. Soshit and Sons purchases on 30-day credit only as the cash purchase gives him only 0.5 per cent extra margin. The policy proposed by Soshit to Ashish is as follows:

- Cash purchase – 30 per cent commission on MRP
- 30-day credit purchase – 28 per cent commission on MRP
- 60-day credit purchase – 27 per cent commission on MRP

Soshit and Sons would be ready to buy (i) 50 per cent on cash basis (ii) 25 per cent on 30-day credit and (iii) 25 per cent on 60-day credit if Addidas India approves the policy proposed by Soshit.

Ashish is personally inclined to accept the proposal in principle. To figure out the benefits of the revised policy, he asks a financial consultant to carry out a financial analysis and prepare a report for the consideration of the CEO of Addidas India. The variable cost of Addidas India's products is 40 per cent of the MRP.

Solution

Financial Analysis of Proposed Credit Policy

Expected sales revenue $[\text{₹}5,00,00,000 + (0.50 \times \text{₹}5,00,00,000)]$	₹7,50,00,000
Less current sales	5,00,00,000
Incremental sales revenue	<u>2,50,00,000</u>

(Contd.)

(Contd.)

Incremental effective sales revenue to Addidas ($\text{₹}2,50,00,00 \times 0.73$ net of dealers margin)		1,82,50,000
Less incremental cost:		
Ø Variable costs ($\text{₹}2,50,00,000 \times 0.40$)	₹1,00,00,000	
Ø Cash discount ($\text{₹}7,50,00,000 \times 0.5 \times 0.03$)	11,25,000	
Ø Extra commission on 30-day credit ($\text{₹}7,50,00,000 \times 0.25 \times 0.01$)	1,87,500	
Ø Cost of incremental investments in debtors [®] ($\text{₹}2,08,333 \times 0.20$)	41,667	1,13,54,167
Incremental profit		68,95,833
® Proposed investment in debtors ($\text{₹}7,50,00,000 \times 0.50 \times 0.40$) + 8		₹18,75,000
Current investment in debtors ($\text{₹}5,00,00,000 \times 0.40$) + 12		16,66,667
Incremental investment in debtors		2,08,333
*Average collection period = [(30 days \times 0.50) + (60 days \times 0.50)] = 45 days		
Debtors turnover (360/45) = 8		

Recommendation The proposal seems to be financially sound as it has potentials of incremental profit.

15.C.3 (Receivables Management Policy) Auto-Comp Ltd manufactures auto components for some of the major car manufacturing companies in India. With several foreign car manufacturing firms set to establish their manufacturing facilities in India, Auto-Comp is looking ahead at a bright future. However, the company management feels that it first needs to consolidate its position among the domestic auto players before it can capture the business of the foreign auto manufacturers. As a first step in this direction, it appoints Arpita Sharma as its new financial controller with extensive experience in the auto sector, having worked with some of the leading auto firms in the country. Immediately after her appointment, Arpita immediately examines the working capital management policy of the company, particularly the receivables management. Upon examining the receivables management policy, Arpita comes across the following facts:

The current sales of Auto-Comp amount to ₹20,000 crore. Its bad debts are to the tune of 2 per cent. The company has a Contribution to Volume (C/V) ratio of 45 per cent. The existing fixed cost are ₹3,000 crore, which will remain unchanged in the coming period. The current cash discount of 1.5/10, net 50, is being currently availed by 50 per cent of its customers. The cost of capital for Auto-Comp is 20 per cent.

Arpita with her significant expertise in the auto sector, decides that she must talk to the customers directly to find out what they want. After a small survey, she comes up with the following three options for the consideration of the CEO of Auto-Comp.

Option 1: Increase the credit period to 60 days. This is expected to increase sales by 20 per cent and bad debts to 3 per cent. An incremental investment of ₹600 crore will be required in working capital (without taking into account the effect of debtors).

Option 2: Offer a cash discount, the terms of which are 2/10, net 30. This is expected to increase sales by 5 per cent. It is estimated that 50 per cent of the customers will avail of the cash discount. This will result in a decrease in bad debts to 1.5 per cent.

Option 3: Offer both extended credit of 60 days as well as cash discount, terms of which are 1.5/10, net 60. The estimated incremental sales would be 20 per cent. It is estimated that 40 per cent of the customers would avail of the cash discount. Due to more lenient credit terms, bad debts are expected to increase to 3 per cent. The incremental investment in working capital (without taking into account the effect of debtors) is ₹600 crore.

Required The CEO of Auto-Comp appoints a financial consultant to carry out an objective analysis and recommend which policy would be the most beneficial for the company. As a financial consultant, what advice would you give? Why?

Solution

Financial Analysis of Proposed Credit Policies to Determine The Optimal Credit Policy for Auto-Comp Ltd (₹ crore)

Options	Existing position	Option 1	Option 2	Option 3
Sales revenue	20,000	24,000	21,000	24,000
Variable costs	11,000	13,200	11,550	13,200
Fixed costs	3,000	3,000	3,000	3,000
Incremental revenues	6,000	7,800	6,450	7,800
Bad debts	400	720	315	720
Cash discounts	150	0	210	144
Financial cost of Incremental working capital excluding debtors	0	120	0	120
Financial cost of Investment in debtors	233.33	540	161.67	360
Profit	5,216.67	6,420	5,763.33	6,456

Recommendation Auto-Comp is advised to adopt the policy of extending credit of 60 days (option 3) and a cash discount at 1.5/10, net 60 as it yields the maximum profit.

Working Notes**Debtors turnover period:**

Existing $(0.5 \times 10 \text{ days}) + (0.5 \times 50 \text{ days}) = 30 \text{ days}$

Option 2: $(0.50 \times 10 \text{ days}) + (0.50 \times 30 \text{ days}) = 20 \text{ days}$

Option 3: $(0.40 \times 10 \text{ days}) + (0.60 \times 60 \text{ days}) = 40 \text{ days}$

Investment in debtors:

Existing: $0.20 \times [(0.55 \times ₹20,000 + ₹3,000) \div (360 \text{ days}/30 \text{ days})] = ₹233.33 \text{ crore}$

Option 1: $0.20 \times [(0.55 \times ₹24,000 + ₹3,000) \div (360 \text{ days}/60 \text{ days})] = ₹540 \text{ crore}$

Option 2: $0.20 \times [(0.55 \times ₹21,000 + ₹3,000) \div (360 \text{ days}/20 \text{ days})] = ₹161.67 \text{ crore}$

Option 3: $0.20 \times [(0.55 \times ₹24,000 + ₹3,000) \div (360 \text{ days}/40 \text{ days})] = ₹360 \text{ crore}$

Scan the QR Code given at the end of chapter to access comprehensive cases.

REVIEW QUESTIONS**LOD: Easy**

RQ.15.1 Indicate whether the following statements are true or false.

[LO 15.1,2,3,4]

- (i) Default costs are caused due to failure of customers to pay on time.
- (ii) Financial costs to support credit-sales are referred to as collection costs.
- (iii) Credit standards represent minimum requirements for extending credit to a customer.
- (iv) Financial costs of investment in debtors are determined with reference to selling price at which credit sales are made.
- (v) It is always in the interest of a business firm to pursue tight credit standards as they yield lower collection costs and bad debts.
- (vi) Business firms should not opt for relaxation of credit standards as they cause increase in collection costs, amount of bad debts and financial costs.
- (vii) The credit term '3/10 net 30' implies that the debtor would be entitled for cash discount of 3

per cent if payment is made within 10 days, 2 per cent if it is made within 20 days and 1 per cent if it is made in 30 days.

- (viii) The credit term '2/10 net 30' implies that the customer is entitled to 2 per cent cash discount only when he pays within 10 days after the beginning of credit period.
- (ix) Financial costs of investment in debtors are determined with reference to cash cost of sales.
- (x) The financial framework of analysis of various decision areas in receivable management should factor all measurable costs and benefits.

[Answers: (i) False (ii) False (iii) True (iv) False (v) False
(vi) False (vii) False (viii) True (ix) True (x) True]

RQ.15.2 What is meant by credit terms? What are the expected effects of (a) a decrease in the cash discount, and (b) a decrease in the credit period? [LO 15.3]

RQ.15.3 Explain the objectives of receivables management. [LO 15.1]

RQ.15.4 Hypothetical Ltd has currently an annual credit sales of ₹8,00,000. Its average age of accounts receivable is 60 days. It is contemplating a change in its credit policy that is expected to increase sales to ₹10,00,000, and increase the average age of accounts receivable to 72 days. [LO 15.2]

Its sale price is ₹25 per unit, the variable cost per unit is ₹12 and the average cost per unit is ₹8,00,000 sales volume is ₹17. Assuming a 360-days year, calculate the following:

- (i) What is the average accounts receivable with both the present and the proposed plans?
- (ii) What is the average cost per unit with the proposed plan?
- (iii) What are the marginal investments in accounts receivable resulting from the proposed change?
- (iv) What is the cost of marginal investment, if the assumed rate of return is 15 per cent?

LOD: Medium

RQ.15.5 What are credit standards? What key variables should be considered in evaluating possible changes in credit standards? [LO 15.2]

RQ.15.6 What are collection policies? How can they be evaluated? [LO 15.4]

RQ.15.7 XYZ Ltd has credit sales amounting to ₹32,00,000. The sale price per unit is ₹40, the variable cost is ₹25 per unit while the average cost per unit is ₹32. The average age of accounts receivable of the firm is 72 days. [LO 15.4]

The firm is considering to tighten the credit standards. It will result in a fall in sales to ₹28,00,000, and the average age of accounts receivable to 45 days.

Assume 20 per cent rate of return. Is the proposal under consideration feasible?

RQ.15.8 Hypothetical Ltd is examining the question of relaxing its credit policy. It sells at present 20,000 units at a price of ₹100 per unit, the variable cost per unit is ₹88 and average cost per unit at the current sales volume is ₹92. All the sales are on credit, the average collection period being 36 days.

A relaxed credit policy is expected to increase sales by 10 per cent and the average age of receivables to 60 days. Assuming 15 per cent return, should the firm relax its credit policy? [LO 15.4]

RQ.15.9 A firm has a current sales of ₹2,56,48,750. The firm has unutilized capacity. In order to boost its sales, it is considering the relaxation in its credit policy. The proposed terms of credit will be 60 days credit against the present policy of 45 days. As a result, the bad debts will increase from 1.5 per cent to 2 per cent of sales. The firm's sales are expected to increase by 10 per cent. The variable operating costs are 72 per cent of the sales. The firm's corporate tax rate is 35 per cent, and it requires an after-tax return of 15 per cent on its investment. Should the firm change its credit period? [LO 15.2.4]

Inventory Management

LEARNING OBJECTIVES

LO 16.1	Discuss the tradeoffs between costs and benefits associated with the level of inventory
LO 16.2	Describe the common techniques for managing inventory—ABC system, the basic economic order quantity (EOQ) model, the reorder point and the safety stock
LO 16.3	Discuss just-in time inventory/production

INTRODUCTION

The preceding two Chapters have discussed the basic strategies and considerations in managing two individual current assets, namely, cash and receivables. The third major current asset is inventory. The term inventory refers to the stockpile of the products a firm is offering for sale and the components that make up the product.¹ In other words, inventory is composed of assets that will be sold in future in the normal course of business operations. The assets which firms store as inventory in anticipation of need are **(i)** raw materials, **(ii)** work-in-process (semi-finished goods) and **(iii)** finished goods. The raw material inventory contains items that are purchased by the firm from others and are converted into finished goods through the manufacturing (production) process. They are an important input of the final product. The work-in-process inventory consists of items currently being used in the production process. They are normally semi-finished goods that are at various stages of production in a multi-stage production process. Finished goods represent final or completed products which are available for sale. The inventory of such goods consists of items that have been produced but are yet to be sold.

Inventory, as a current asset, differs from other current assets because only financial managers are not involved. Rather, all the functional areas, finance, marketing, production, and purchasing, are involved. *The views concerning the appropriate level of inventory would differ among the different functional areas.*² *The job of the financial manager is to reconcile the conflicting viewpoints of the various functional areas regarding the appropriate inventory levels in order to fulfil the overall objective of maximising the owner's wealth.* Thus, inventory management, like the management of other current assets, should be related to the overall objective of the firm. It is in this context that

the present chapter is devoted to the main elements of inventory management from the viewpoint of financial managers. The objectives of inventory management are explained in some detail. The chapter also focuses on inventory management techniques. Attention is given here to basic concepts relevant to the management and control of inventory. The aspects covered are: **(i)** determination of the type of control required, **(ii)** the basic economic order quantity, **(iii)** the reorder point and **(iv)** safety stocks. As a matter of fact, the inventory management techniques are a part of production management. But a familiarity with them is of great help to the financial managers in planning and budgeting inventory, hence, they are explained here. The just-in time inventory/production is also described. The chapter concludes with the main points.

LO 16.1 OBJECTIVES

The basic responsibility of the financial manager is to make sure the firm's cash flows are managed efficiently. Efficient management of inventory should ultimately result in the maximisation of the owner's wealth. It was indicated in Chapter 29 that in order to minimise cash requirements, inventory should be turned over as quickly as possible, avoiding stock-outs that might result in closing down the production line or lead to a loss of sales. It implies that while the management should try to pursue the financial objective of turning inventory as quickly as possible, it should at the same time ensure sufficient inventories to satisfy production and sales demands. In other words, the financial manager has to reconcile these two conflicting requirements. Stated differently, the objective of inventory management consists of two counter-balancing parts: **(i)** to minimise investments in inventory, and **(ii)** to meet a demand for the product by efficiently organising the production and sales operations. These two conflicting objectives of inventory management can also be expressed in terms of cost and benefit associated with inventory. That the firm should minimise investment in inventory implies that maintaining inventory involves costs, such that the smaller the inventory, the lower is the cost to the firm. But inventories also provide benefits to the extent that they facilitate the smooth functioning of the firm: the larger the inventory, the better it is from this viewpoint. Obviously, the financial managers should aim at a level of inventory which will reconcile these conflicting elements. That is to say, an optimum level of inventory should be determined on the basis of the trade-off between costs and benefits associated with the levels of inventory.

Costs of Holding Inventory

One operating objective of inventory management is to minimise cost. Excluding the cost of merchandise, the costs associated with inventory fall into two basic categories: **(i)** ordering or acquisition or set-up costs, and **(ii)** carrying costs. These costs are an important element of the optimum level of inventory decisions.

Ordering Costs This category of costs is associated with the acquisition or ordering of inventory. Firms have to place orders with suppliers to replenish inventory of raw materials. The expenses involved are referred to as **ordering costs**. Apart from placing orders outside, the various production departments have to acquire materials from the stores. Any expenditure involved here is also a part of the ordering cost. Included in the ordering costs are costs involved in **(i)** preparing a purchase order or requisition form and **(ii)** receiving, inspecting, and recording the goods received to ensure both quantity and quality. The cost of acquiring materials consists of clerical costs and costs of stationery. It is, therefore, called a *set-up cost*. These costs are generally fixed *per order placed*, irrespective of

Ordering cost is the fixed cost of placing and receiving an inventory order.

the amount of the order. The larger the orders placed, or the more frequent the acquisition of inventory made, the higher are such costs. From a different perspective, the larger the inventory, the fewer are the acquisitions and the smaller/lower are the order costs. The acquisition costs are inversely related to the size of inventory: they decline with the level of inventory. Thus, such costs can be minimised by placing fewer orders for a larger amount. But acquisition of a large quantity would increase the cost associated with the maintenance of inventory, that is, carrying costs.

Carrying Costs The second broad category of costs associated with inventory are the **carrying costs**. They are involved in maintaining or carrying inventory. The cost of holding inventory may be divided into two categories:

- **Carrying costs**
- are the variable
- costs per unit of
- holding an item
- in inventory for
- a specified time
- period.

1. Those that Arise Due to the Storing of Inventory The main components of this category of carrying costs are **(i)** storage cost, that is, tax, depreciation, insurance, maintenance of the building, utilities and janitorial services; **(ii)** insurance of inventory against fire and theft; **(iii)** deterioration in inventory because of pilferage, fire, technical obsolescence, style obsolescence and price decline; **(iv)** serving costs, such as, labour for handling inventory, clerical and accounting costs.

2. The Opportunity Cost of Funds This consists of expenses in raising funds (interest on capital) to finance the acquisition of inventory. If funds were not locked up in inventory, they would have earned a return. This is the opportunity cost of funds or the financial cost component of the cost.

The carrying costs and the inventory size are positively related and move in the same direction. If the level of inventory increases, the carrying costs also increase and *vice-versa*.

The sum of the order and carrying costs represents the **total cost** of inventory. This is compared with the benefits arising out of inventory to determine the optimum level of inventory.

- **Total cost**
- is the sum of the
- ordering costs and
- carrying costs of
- inventory.

Benefits of Holding Inventory

The second element in the optimum inventory decision deals with the benefits associated with holding inventory. The major benefits of holding inventory are the basic functions of inventory. In other words, inventories perform certain basic functions which are of crucial importance in the firm's production and marketing strategies.

The basic function of inventories is to act as a buffer to decouple or uncouple the various activities of a firm so that all do not have to be pursued at exactly the same rate³. The key activities are **(1)** purchasing, **(2)** production, and **(3)** selling. The term *uncoupling* means that these interrelated activities of a firm can be carried on independently. Without inventories, purchasing and production would be completely controlled by the sales schedules. If the sales of a firm increases, these two would also increase and *vice-versa*. In other words, purchase and production functions would depend upon the level of sales. It is, of course, true that in the long run, the purchasing and production activities are and, in fact, should be tied to the sales activity of a firm. But, in the short term they are rigidly related, the three key activities cannot be carried out efficiently. Inventories permit short-term relaxation so that each activity may be pursued efficiently. Stated differently, *inventories enable firms in the short run to produce at a rate greater than purchase of raw materials and vice-versa, or to sell at a rate greater than production and vice-versa*.

Since inventory enables uncoupling of the key activities of a firm, each of them can be operated at the most efficient rate. This has several beneficial effects on the firm's operations. In other words, three types of inventory, raw materials, work-in-process and finished goods, perform certain useful

The first part of the book is devoted to a general history of the world, from the beginning of time to the present day. It covers the various ages and the progress of human civilization, from the earliest times to the present day. The author discusses the different stages of human development, from the primitive state to the modern world, and the various influences that have shaped the course of history.

THE HISTORY OF THE

The second part of the book is devoted to a detailed history of the British Empire, from its rise to its decline. It covers the various stages of the empire's expansion, from the early years of settlement to the height of its power in the 19th century, and its eventual decline in the 20th century. The author discusses the various factors that led to the empire's success and its ultimate downfall, and the impact of the empire on the world.

THE HISTORY OF THE

The third part of the book is devoted to a detailed history of the United States, from its founding to the present day. It covers the various stages of the nation's development, from the early years of settlement to the present day, and the various influences that have shaped the course of American history. The author discusses the different stages of American development, from the primitive state to the modern world, and the various influences that have shaped the course of American history.

The fourth part of the book is devoted to a detailed history of the French Revolution, from its beginning to its end. It covers the various stages of the revolution, from the early years of the Estates-General to the final years of the Directory and the Napoleonic Wars. The author discusses the various factors that led to the revolution's outbreak and its ultimate outcome, and the impact of the revolution on the world.

The fifth part of the book is devoted to a detailed history of the Napoleonic Wars, from their beginning to their end. It covers the various stages of the wars, from the early years of the Revolutionary Wars to the final years of the Napoleonic Wars. The author discusses the various factors that led to the wars' outbreak and their ultimate outcome, and the impact of the wars on the world.

The sixth part of the book is devoted to a detailed history of the 19th century, from its beginning to its end. It covers the various stages of the century, from the early years of the Industrial Revolution to the final years of the century. The author discusses the various factors that led to the century's development and its ultimate outcome, and the impact of the century on the world.

The seventh part of the book is devoted to a detailed history of the 20th century, from its beginning to its end. It covers the various stages of the century, from the early years of the century to the final years of the century. The author discusses the various factors that led to the century's development and its ultimate outcome, and the impact of the century on the world.

The eighth part of the book is devoted to a detailed history of the future, from its beginning to its end. It covers the various stages of the future, from the early years of the future to the final years of the future. The author discusses the various factors that led to the future's development and its ultimate outcome, and the impact of the future on the world.

THE HISTORY OF THE

The ninth part of the book is devoted to a detailed history of the world, from its beginning to its end. It covers the various stages of the world's development, from the primitive state to the modern world, and the various influences that have shaped the course of world history. The author discusses the different stages of world development, from the primitive state to the modern world, and the various influences that have shaped the course of world history.

functions. Alternatively, rigid tying (coupling) of purchase and production to sales schedules is undesirable in the short run as it will deprive the firms of certain benefits. The effect of uncoupling (maintaining inventory) are as follows.

Benefits in Purchasing If the purchasing of raw materials and other goods is not tied to production/sales, that is, a firm can purchase independently to ensure the most efficient purchase, several advantages would become available. In the first place, a firm can purchase larger quantities than is warranted by usage in production or the sales level. This will enable it to avail of discounts that are available on bulk purchases. Moreover, it will lower the ordering cost as fewer acquisitions would be made. There will, thus, be a significant saving in the costs. Second, firms can purchase goods before anticipated or announced price increases. This will lead to a decline in the cost of production. Inventory, thus, serves as a hedge against price increases as well as shortages of raw materials. This is a highly desirable inventory strategy.

Benefits in Production Finished goods inventory serves to uncouple production and sale. This enables production at a rate different from that of sales. That is, production can be carried on at a rate higher or lower than the sales rate. This would be of special advantage to firms with seasonal sales pattern. In their case, the sales rate will be higher than the production rate during a part of the year (peak season) and lower during the off-season. The choice before the firm is either to produce at a level to meet the actual demand, that is, higher production during peak season and lower (or nil) production during off-season, or, produce continuously throughout the year and build up inventory which will be sold during the period of seasonal demand. The former involves discontinuity in the production schedule while the latter ensures level production. The level production is more economical as it allows the firm to reduce the cost of discontinuities in the production process. This is possible because excess production is kept as inventory to meet future demands. Thus, inventory helps a firm to coordinate its production scheduling so as to avoid disruptions and the accompanying expenses.⁴ In brief, since inventory permits *least cost* production scheduling, production can be carried on more efficiently.

Benefits in Work-in-Process The inventory of work-in-process performs two functions. In the first place, it is necessary because production processes are not instantaneous. The amount of such inventory depends upon technology and the efficiency of production. The larger the steps involved in the production process, the larger the work-in-process inventory and *vice-versa*. By shortening the production time, efficiency of the production process can be improved and the size of this type of inventory reduced. In a multi-stage production process, the work-in-process inventory serves a second purpose also. It uncouples the various stages of production so that all of them do not have to be performed at the same rate. The stages involving higher set-up costs may be most efficiently performed in batches with a work-in-process inventory accumulated during a production run.⁵

Benefits in Sales The maintenance of inventory also helps a firm to enhance its sales efforts. For one thing, if there are no inventories of finished goods, the level of sales will depend upon the level of current production. A firm will not be able to meet demand instantaneously. There will be a lag depending upon the production process. If the firm has inventory, actual sales will not have to depend on lengthy manufacturing processes. Thus, inventory serves to bridge the gap between current production and actual sales. A related aspect is that inventory serves as a competitive marketing tool to meet customer demands. A basic requirement in a firm's competitive position is its ability *vis-a-vis* its competitors to supply goods rapidly. If it is not able to do so, the customers

are likely to switch to suppliers who can supply goods at short notice. Inventory, thus, ensures a continued patronage of customers. Moreover, in the case of firms having a seasonal pattern of sales, there should be a substantial finished goods inventory prior to the peak sales season. Failure to do so may mean loss of sales during the peak season.

To summarise the preceding discussion relating to the objective of inventory management, the two main aspects pertain to the minimisation of investment in inventory, on the one hand, and the need to ensure that there is enough inventory to meet demand such that production and sales operations are smooth. They are often in conflict with each other. By holding less inventory, cost can be minimised, but there is a risk that the operations will be disturbed as the emerging demands cannot be met. On the other hand, by holding a large inventory, the chances of disruption of operations are reduced, but, the cost will increase. The appropriate level of inventory should be determined in terms of a trade-off between the benefits and costs associated with maintaining inventory.

LO 16.2 TECHNIQUES

In the preceding discussion the objectives of inventory management have been outlined. The financial managers should aim at an optimum level of inventory on the basis of the trade-off between cost and benefit to maximise the owner's wealth. Many sophisticated mathematical techniques are available to handle inventory management problems. But they are more appropriately a part of production management and lie outside the scope of this book. Nevertheless, they involve in-built financial costs. The financial managers should, therefore, be familiar with them. We have discussed below some simple production-oriented methods of inventory control to indicate a broad framework for managing inventories efficiently in conformity with the goal of wealth-maximisation. The major problem—areas that comprise the heart of inventory control⁵ are **(i)** the *classification problem* to determine the type of control required, **(ii)** the *order quantity problem*, **(iii)** the *order point problem*, and **(iv)** *safety stocks*.

Classification Problem: A B C System

The first step in the inventory control process is classification of different types of inventories to determine the type and degree of control required for each. The **A B C** system is a widely-used classification technique to identify various items of inventory for purposes of inventory control. This technique is based on the assumption that a firm should not exercise the same degree of control on all items of inventory. It should rather keep a more rigorous control on items that are **(i)** the most costly, and/or **(ii)** the slowest-turning, while items that are less expensive should be given less control effort.

On the basis of the cost involved, the various inventory items are, according to this system, categorised into three classes: **(i)** A **(ii)** B and **(iii)** C. The items included in group A involve the largest investment. Therefore, inventory control should be the most rigorous and intensive and the most sophisticated inventory control techniques should be applied to these items. The C group consists of items of inventory which involve relatively small investments although the number of items is fairly large. These items deserve minimum attention. The B group stands midway. It deserves less attention than A but more than C. It can be controlled by employing less sophisticated techniques.

The task of inventory management is to properly classify all the inventory items into one of these three groups/categories. The typical breakdown of inventory items is as shown in Table 16.1⁷.

- **A B C system**
- is an inventory
- management
- technique
- that divides
- inventory into
- three categories
- of descending
- importance based
- on the rupee
- investment in each.

TABLE 16.1 Inventory Breakdown between Number of Items and Inventory Value

Group	Number of items (per cent)	Inventory value (per cent)
A	15	70
B	30	20
C	55	10
Total	100	100

Some points stand out from Table 16.1. While group A is the least important in terms of the number of items, it is by far the most important in terms of the investments involved. With only 15 per cent of the number, it accounts for as much as 70 per cent of the total value of inventory. The firm should direct most of its inventory control efforts to the items included in this group. The items comprising B group account for 20 per cent of the investments in inventory. They deserve less attention than A, but more than C, which involves only 10 per cent of the total value although number-wise its share is as high as 55 per cent. The A B C analysis is illustrated in Example 16.1.

Example 16.1

A firm has 7 different items in its inventory. The average number of each of these items held, along with their units costs, is listed below. The firm wishes to introduce an A B C inventory system. Suggest a breakdown of the items into A, B, and C classifications.

Item number	Average number of units in inventory	Average cost per unit
1	20,000	₹60.80
2	10,000	102.40
3	32,000	11.00
4	28,000	10.28
5	60,000	3.40
6	30,000	3.00
7	20,000	1.3

Solution

The A B C analysis is presented in Table 16.2.

TABLE 16.2 ABC Analysis

Item (1)	Units (2)	Per cent of total (3)	Unit cost (4)	Total cost (5)	Per cent of total (6)
1	20,000	10	₹60.80	₹12,16,000	38.00
2	10,000	5	102.40	10,24,000	32.00
3	32,000	16	11.00	3,52,000	11.00
4	28,000	14	10.28	2,88,000	9.00
5	60,000	30	3.40	2,04,000	6.38
6	30,000	15	3.00	90,000	2.80
7	20,000	10	1.30	26,000	0.82
Total	2,00,000	100		32,00,000	100.00

The A B C system of classification should, however, be used with caution. For example, an item of inventory may be very inexpensive. Under the A B C system it would be classified into C category. But it may be very critical to the production process and may not be easily available. It deserves the special attention of management. But in terms of the A B C framework, it would be included in the category which requires the least attention. This is a limitation of the A B C analysis.

Order Quantity Problem: Economic Order Quantity (EOQ) Model

After various inventory items are classified on the basis of the A B C analysis, the management becomes aware of the type of control that would be appropriate for each of the three categories of the inventory items. The A group of items warrants the maximum attention and the most rigorous control. A key inventory problem particularly in respect of the Group A items relates to the determination of the size or quantity in which inventory will be acquired. In other words, while purchasing raw materials or finished goods, the questions to be addressed are⁸: *How much inventory should be bought in one lot under one order on each replenishment? Should the quantity to be purchased be large or small? Or, should the requirement of materials during a given period of time (say, six months or one year) be acquired in one lot or should it be acquired in instalments or in several small lots?* Such inventory problems are called order quantity problems.

The determination of the appropriate quantity to be purchased in each lot to replenish stock as a solution to the order quantity problem necessitates resolution of conflicting goals. Buying in large quantities implies a higher average inventory level which will assure (i) smooth production/sale operations, and (ii) lower ordering or set-up costs. But it will involve higher carrying costs. On the other hand, small orders would reduce the carrying cost of inventory by reducing the average inventory level but the ordering costs would increase as there is a likelihood of interruption in the operations due to stock-outs.

A firm should place neither too large nor too small orders. On the basis of a trade-off between benefits derived from the availability of inventory and the cost of carrying that level of inventory, the appropriate or optimum level of the order to be placed should be determined. The optimum level of inventory is popularly referred to as the **economic order quantity (EOQ)**. It is also known as the *economic lot size*. The economic order quantity may be defined as *that level of inventory order that minimises the total cost associated with inventory management*. As explained in the earlier section dealing with the objectives of inventory management, the costs associated with inventories are (i) ordering costs, and (ii) carrying costs. Stated with reference to cost perspectives, EOQ refers to *the level of inventory at which the total cost of inventory comprising acquisition/ ordering/set-up costs and carrying cost is minimal*.

For analysing the EOQ, as an inventory management technique, several sophisticated mathematical models are available.⁹ These are, however, outside the scope of this book. We illustrate here the analysis of EOQ on the basis of simple non-mathematical approach. Nevertheless, the main elements of the order quantity problem are covered by the analytical method followed here.

Assumptions The EOQ model, as the technique to determine the economic order quantity, illustrated by us, is based on three restrictive assumptions:

1. The firm knows with certainty the annual usage (consumption) of a particular item of inventory.
2. The rate at which the firm uses inventory is steady over time.
3. The orders placed to replenish inventory stocks are received at exactly that point in time when inventories reach zero.

In addition, it may also be assumed that ordering and carrying costs are constant over the range of possible inventory levels being considered.

- **Economic order quantity (EOQ) model**
- is the inventory management technique for determining optimum order quantity which is the one that minimises the total of its order and carrying costs;
- it balances fixed ordering costs against variable ordering costs.

Approaches The EOQ model can be illustrated by (i) the long analytical approach or trial and error approach, and (ii) the short cut or simple mathematical approach.

Trial and Error (Analytical) Approach Given the total requirements of inventory during a given period of time depending upon the inventory planning horizon, a firm has different alternatives to purchase its inventories. For instance, it can buy its entire requirements in one single lot at the beginning of the inventory planning period. Alternatively, the inventories may be procured in small lots periodically, say, weekly, monthly, quarterly, six-monthly and so on. If the purchases are made in one lot, the average inventory holdings would be relatively large whereas it would be relatively small when the acquisition of inventory is in small lots: the smaller the lot, the lower is the average inventory and *vice-versa*. High average inventory would involve high carrying costs. On the other hand, low inventory holdings are associated with high ordering cost. The trial and error or long analytical approach for the determination of EOQ uses different permutations and combinations of lots of inventory purchases so as to find out the least ordering and carrying cost combination. In other words, according to this approach, the carrying and acquisition costs for different sizes of orders to purchase inventories are computed and the order size with the lowest total cost (ordering plus carrying) of inventory is the economic order quantity. The mechanics of the computation of EOQ with the analytical approach is illustrated in Example 16.2.

Example 16.2

A firm's inventory planning period is one year. Its inventory requirement for this period is 1,600 units. Assume that its acquisition costs are ₹50 per order. The carrying costs are expected to be ₹1 per unit per year for an item.

The firm can procure inventories in various lots as follows: (i) 1,600 units, (ii) 800 units, (iii) 400 units, (iv) 200 units, and (v) 100 units. Which of these order quantities is the economic order quantity?

Solution

The calculations of the inventory costs for different order quantities are shown in Table 16.3.

TABLE 16.3 Inventory Cost for Different Order Quantities

1. Size of order (units)	1,600	800	400	200	100
2. Number of orders	1	2	4	8	16
3. Cost per order (₹)	50	50	50	50	50
4. Total ordering cost (2 × 3) (₹)	50	100	200	400	800
5. Carrying cost per unit (₹)	1	1	1	1	1
6. Average inventory (units)	800	400	200	100	50
7. Total carrying cost (5 × 6) (₹)	800	400	200	100	50
8. Total cost (4 + 7) (₹)	850	500	400	500	850

It can be seen from Table 16.3 that the carrying and ordering costs taken together are the lowest for the order size of 400 units. This, therefore, is the economic order quantity.

Working Notes

(i) Number of orders = Total inventory requirement/order size

(ii) Average inventory = Order size/2

The calculation of EOQ is further developed in Example 16.3.

Example 16.3

The following details are available in respect of a firm:

1. Inventory requirement per year, 6,000 units

2. Cost per unit (other than carrying and ordering costs), ₹5
3. Carrying costs per item for one year, ₹1
4. Cost of placing each order, ₹60
5. Alternative order sizes: (units) 6,000, 3,000, 2,000, 1,200, 1,000, 600 and 200.

Determine the economic order quantity.

Solution

The EOQ is determined in Table 16.4.

TABLE 16.4 Determination of Economic Order Quantity

1. Cost of items purchased each year (₹)	30,000	30,000	30,000	30,000	30,000	30,000	30,000
2. Order size (units)	6,000	3,000	2,000	1,200	1,000	600	200
3. Number of orders	1	2	3	5	6	10	30
4. Average inventory (units)	3,000	1,500	1,000	600	500	300	100
5. Total carrying costs (₹)	3,000	1,500	1,000	600	500	300	100
6. Total ordering costs (₹)	60	120	180	300	360	600	1,800
7. Total cost (carrying plus ordering cost) (₹)	3,060	1,620	1,180	900	860	900	1,900
8. Total cost (₹)	33,060	31,620	31,180	30,900	30,860	30,900	31,900

Clearly, the EOQ is 1,000 units.

Working Notes

- (i) Number of orders = Demand per year/order size
- (ii) Average inventory = Order size/2
- (iii) Total carrying cost = Average inventory × Carrying cost per unit
- (iv) Total ordering cost = Number of orders × Cost per order
- (v) Total cost = Cost of items purchased + Total carrying and ordering costs

Mathematical (Short cut) Approach The economic order quantity can, using a short-cut method, be calculated by the following equation:

$$EOQ = \sqrt{\frac{2AB}{C}} \quad (16.1)$$

where A = Annual usage of inventory (units),
 B = Buying cost per order, and
 C = Carrying cost per unit

Example 16.4

Using the facts in Example 16.2, find out the EOQ by applying the short-cut mathematical approach.

Solution

$$EOQ = \sqrt{\frac{2 \times 1,600 \times 50}{1}} = 400 \text{ units}$$

Limitations While using the EOQ model, it should be noted that it suffers from shortcomings which are mainly due to the restrictive nature of the assumptions on which it is based. The important limitations are explained below.

The assumption of a constant consumption/usage and the instantaneous replenishment of inventories are of doubtful validity. As discussed subsequently, deliveries from suppliers may be slower than expected for reasons beyond control. It is also possible that there may be an unusual

and unexpected demand for stocks. To meet such contingencies, firms have to keep additional inventories which are known as *safety* stocks.

Another weakness of the EOQ model is that the assumption of a *known annual demand* for inventories is open to question. There is likelihood of a discrepancy between the actual and the expected demand, leading to a wrong estimate of the economic order quantity.

In addition, there are some computational problems involved. For instance, Equation 16.1 may give the EOQ in fractions, say, 232.5 units. A more difficult situation may occur when the number of orders to be placed may turn out to be a fraction.

Order Point Problem

The EOQ technique determines the size of an order to acquire inventory so as to minimise the carrying as well as the ordering costs. In other words, the EOQ provides an answer to the question: how much inventory should be ordered in one lot? Another important question pertaining to efficient inventory management is: when should the order to procure inventory be placed? This aspect of inventory management is covered under the reorder point problem.

The reorder point is stated in terms of the level of inventory at which an order should be placed for replenishing the current stock of inventory. In other words, **reorder point** may

Reorder point is the point at which to order inventory expressed equationally as:
 $\text{lead time in days} \times \text{daily usage}$.

be defined as the level of inventory when fresh order should be placed with the suppliers for procuring additional inventory equal to the economic order quantity. Although some sophisticated reorder point formula are available, they are outside the scope of this book. We have, therefore, used a simple formula to calculate the reorder point. It is based on the following assumptions: **(i)** constant daily usage of inventory, and **(ii)** fixed lead time. In other words, the formula assumes conditions of certainty.

The reorder point = Lead time in days \times average daily usage of inventory **(16.2)**

Lead time is time normally taken in receiving delivery after placing orders with suppliers.

The term **lead time** refers to the time normally taken in receiving the delivery after placing orders with the suppliers. It covers the time-span from the point when a decision to place the order for the procurement of inventory is made to the actual receipt of the inventory by the firm. Another way of saying it is that the lead time consists of the number of days required by the suppliers to receive and process the order as well as the number of days during which the goods will be in transit from

the supplier. The lead time may also be called as the procurement time of inventory.

The average usage means the quantity of inventory consumed daily. *We can, therefore, define reorder point as the inventory level which should be equal to the consumption during the lead time.*

The average consumption (daily usage) of inventory of a firm is 5,000 units. The number of days required to receive the delivery of inventory after placing order (lead i.e. processing and transit time) is 15 days. The reorder point = 5,000 units \times 15 days = 75,000 units. The implication is that the firm should place an order for replenishing the stock of inventory as soon as the level reaches 75,000 units. The size of the order would obviously be equal to the EOQ.

Safety Stock

The economic order quantity and the reorder point, as inventory management techniques, have been explained, to keep the discussion simple, on the assumption of *certainty conditions*. That is to say, we had assumed **(i)** constant/fixed usage/requirement of inventory, and **(ii)** instantaneous replenishment of inventory. The assumptions are, however, of questionable validity in actual situations,

that is, under conditions of uncertainty. For instance, the demand for inventory is likely to fluctuate from time to time. In particular, at certain points of time the demand may exceed the anticipated level. In other words, a discrepancy between the assumed (anticipated/expected) and actual usage rate of inventory is likely to occur in practice. Similarly, the receipt of inventory from the suppliers may be delayed beyond the expected lead time. The delay may arise from strikes, floods, transportation and other bottlenecks. Thus, a firm would come across situations in which the actual usage of inventory is higher than the anticipated level and/or the delivery of the inventory from the suppliers is delayed.

The effect of increased and/or slower delivery would be a shortage of inventory. That is, the firm would face a stock-out situation. This, in turn, as explained in detail below, would disrupt the production schedule and alienate the customers. The firm would, therefore, be well-advised to keep a sufficient safety margin by having additional inventory to guard against stock-out situations. Such stocks are called **safety stocks**. This would act as a buffer or cushion against a possible shortage of inventory caused either by increased usage or delayed delivery of inventory. The safety stock may, then, be defined as the *minimum additional inventory to serve as a safety margin or buffer or cushion to meet an unanticipated increase in usage resulting from an unusually high demand and or an uncontrollable late receipt of incoming inventory*.

- Safety stock
- implies extra
- inventories that can
- be drawn down
- when actual lead
- time and/or usage
- rates are greater
- than expected.

How can a financial manager determine the safety stock? What is his responsibility?

The safety stock involves two types of costs: **(i)** stock-out, and **(ii)** carrying costs. The job of the financial manager is to determine the appropriate level of safety stock on the basis of a trade-off between these two types of conflicting costs.

The term *stock-out costs* refers to the cost associated with the shortage (stock-out) of inventory. It is, in fact, an opportunity cost in the sense that due to the shortage of inventory the firm would be deprived of certain benefits. The denial of those benefits which would otherwise be available to the firm are the stock-out costs. The first, and the most obvious, of these costs is the loss of profit which the firm could have earned from increased sales if there was no shortage of inventory. Another category of stock-out costs is the damage to the relationship with the customers.¹⁰ Owing to shortage of inventory, the firm would not be able to meet the customer's requirements and the latter may turn to the firm's competitors. It should, of course, be clearly understood that this type of cost cannot be easily and precisely quantified. Last, the shortage of inventory may disrupt the production schedule of the firm. The production process would grind to a halt involving idle time.

The carrying costs, as already explained in the earlier part of this chapter, are the costs associated with the maintenance of inventory. Since the firm is required to maintain additional inventory, in excess of the normal usage, additional carrying costs are involved.

The stock-out and the carrying costs are counterbalancing. The larger the safety stock, the larger would be the carrying costs and *vice-versa*. Conversely, the larger is the safety stock, the smaller would be the stock-out costs. In other words, if the firm minimises the carrying costs, the stock-out costs are likely to rise; on the other hand, an attempt to minimise the stock-out costs implies increased carrying costs. The object of the financial managers should be to have the lowest total cost (i.e. carrying cost plus stock-out cost). The safety stock with the minimum carrying and stock-out costs is the economic (appropriate) level which financial managers should aim at. In brief, the appropriate level of safety stock is determined by the trade-off between the stock-out and the carrying costs. We illustrate in Example 16.5, using a simple method,¹¹ the determination of the optimum (least-cost) safety stock.

Example 16.5

The experience of a firm being out of stock is summarised below:

(a) Stock-out (number of units)	Number of times
500	1 (1)
400	2 (2)
250	3 (3)
100	4 (4)
50	10 (10)
0	80 (80)
Total	100 (100)

Figures in brackets represents percentage of time the firm has been out of stock.

(b) Assume that the stock-out costs are ₹40 per unit.

(c) The carrying cost of inventory per unit is ₹20.

Determine the optimum level of stock-out inventory.

Solution

TABLE 16.5 Computation of Expected Stock-out Costs

Safety stock level (units)	Stock-out (units)	Stock-out costs (₹40 per unit)	Probability of stock-out	Expected stock-out cost at this level	Total expected stock-out cost
(1)	(2)	(3)	(4)	(5)	(6)
500	0	0	0	0	0
400	100	₹4,000	0.01	₹40	₹40
250	250	10,000	0.01	100	220
	150	6,000	0.02	120	
100	400	16,000	0.01	160	580
	300	12,000	0.02	240	
	150	6,000	0.03	180	
50	450	18,000	0.01	180	780
	350	14,000	0.02	280	
	200	8,000	0.03	240	
	50	2,000	0.04	80	
0	500	20,000	0.01	200	1,180
	400	16,000	0.02	320	
	250	10,000	0.03	300	
	100	4,000	0.04	160	
	50	2,000	0.10	200	

Working Notes

(i) The determination of the optimum safety stock involves dealing with *uncertain* demand. The first step, therefore, is to estimate the probability of being out of stock as well as the size of stock-out in terms of the shortage of inventory at different levels of safety stock.

Size of stock-out (units) The shortage of inventory at different levels of safety stock can be computed as follows:

(a) The firm's experience has been that it has been short of inventory by 500 units only once in 100 times. If, therefore, the level of safety stock is 500 units, it will never be short of inventory. It means that with 500 units of safety stock, the size of stock-out would be zero.

- (b) When the firm has a safety stock of 400 units, it could be short by 100 units.
- (c) Further, with 250 units of safety stock, the firm could be short by 250 units if the actual demand turns out to be 500 units greater than expected; 150 units short if the demand turn out to be 400 units greater than expected. Thus, the size of stock-out could be 250 units or 150 units depending upon the level of actual demand.
- (d) It should be obvious that the size of stock-out increases with a decrease in the level of safety stock. The size of the stock-out for safety stock levels of 100 units, 50 units and 0 units can be computed on the lines of step (c).

The stock-out size at different safety stock levels is computed in column (2) of Table 16.5.

Probability of Stock-out The probability of stock-out at different levels of safety stock can be computed as follows:

- (a) If the safety stock of the firm is 500 units, there is no chance of the firm being out of stock. The probability of stock-out is, therefore, zero.
- (b) When the safety stock is 400 units, there is 1 per cent chance that the firm will be short of inventory. The probability of stock-out is, therefore, 0.01.
- (c) The probability of stock-out for other levels of safety stock is similarly computed in column (4) of Table 16.5.

(ii) After the determination of the size and probability of stock-out, the next step is the calculation of the stock-out cost. The expected stock-out cost can be found out by multiplying the stock-out cost and the probability of stock-out.

When the stock-out is expected to be 100 units (safety stock being 400 units), the stock-out cost would be $100 \times ₹40 = ₹4,000$. But the probability of stock-out of this size is only 0.01. Therefore, the expected cost stock-out would be $₹4,000 \times 0.01 = ₹40$. For other levels of safety stock, the expected stock-out cost can be similarly computed (column 5 of Table 16.5).

(iii) The next step is to compute the total expected stock-out costs (column 6 of Table 16.5).

(iv) Then, the carrying costs should be calculated. The carrying costs are equal to the safety stock multiplied by the carrying costs per unit. (Table 16.6 column 3).

TABLE 16.6 Computation of Total Safety Stock Costs

Safety stock level (units) (1)	Expected stock-out costs* (2)	Carrying costs (₹20 per unit) (3)	Total safety stock cost (4) (2 + 3)
0	₹1,180	0	₹1,180
50	780	₹1,000	1,780
100	580	2,000	2,580
250	220	5,000	5,220
400	40	8,000	8,040
500	0	10,000	10,000

*from Table 16.5 column 6.

(v) Finally, the carrying costs and the expected stock-out costs at each safety stock level should be added (Table 16.6, column 4). The optimum safety stock would be that level of inventory at which total of these two costs is the lowest.

Thus, the optimum safety stock is zero units.

LO 16.3 JUST-IN TIME INVENTORY/PRODUCTION

The level of inventories by retailers are influenced by the demand patterns of their customers and supply relationship with their distributors and manufacturers, the suppliers to their manufacturers and so on. Supply chain describes the flow of goods/services/information from the initial source of materials and services to the delivery of products to consumers regardless of whether those activities occur in the same organisation or in other organisations. There are significant gains to companies in the supply chain from coordinating their activities and sharing information. There would be **(a)** fewer stock-outs at the retail level, **(b)** reduced manufacture of goods not immediately needed by retailers, **(c)** fewer manufacturing orders that have to be “rushed” or “expedited” and **(d)** lower inventories held by each company in the supply chain. Of the numerous systems developed by manufacturing companies to plan and implement production and inventory activities within their plants, just-in-time (JIT) production/inventory is a widely used system.

Just-in-time

refers to acquiring materials and manufacturing goods only as needed to fill customer orders.

Concept

The JIT is an innovative manufacturing system. It refers to acquiring materials and manufacturing goods only as needed to fill customer orders. The JIT production, also called *lean production*, is a **demand-pull**¹² manufacturing system because each component in a production line is produced as soon as and only when needed by the next step in the production line. Demand triggers each step of the production process, starting with customer demand for a finished product at the end of the process and working all the way back to the demand for direct materials at the beginning of the process. In this way, demand pulls an order through the production line. The JIT production systems aim to simultaneously **(i)** meet customer demand in a timely way, **(ii)** with high quality products and **(iii)** at the lowest possible total cost.¹³

Non-value

added activities refers to those functions that do not directly increase the worth of a product to a customer.

As a demand-pull manufacturing system, JIT contrasts with more traditional *supply push* system in which manufacturers simply produce as many goods as possible. The JIT system is characterised by extremely small/non-existent inventories of material, work-in-process, and finished goods. Materials are scheduled to arrive only as needed, and products flow quickly from one production process to the next without having to move into temporary storage facilities. Finished goods in excess of existing customer orders are not produced.

Value added

activities do increase the value of a product to the customers.

The JIT is, however, more than an approach to inventory management. It is a philosophy of eliminating *non-value-added activities* and increasing product quality throughout the manufacturing process. Non-value-added activities refer to those functions that do not directly increase the worth of a product to a customer. Examples of such activities are: storing direct materials, setting up machinery and time during which machinery/employees stand idle. Cost savings through the reduction/elimination of such activities usually do not influence customer satisfaction. In contrast, value-added-activities do increase the value of the product to the customers. Included in such activities are product design, all manufacturing processes, manufacturing to customer specifications and convenient channels of distribution.

Financial Benefits of JIT and Relevant Costs

In computing the relevant benefits and costs of reducing inventories in JIT production systems, account should be taken of all benefits. In addition to lower carrying costs of inventory, other

benefits of lower inventory are¹⁴: (i) greater transparency of the production process, (ii) heightened emphasis on eliminating the specific causes of rework, scrap and waste, and (iii) lower manufacturing to lead times.

Example 16.6

To illustrate, Hindustan Tools Corporation (HTC), manufacturer of brass fittings, is considering implementing a JIT production system. The HTC would have to incur ₹10,00,000 in annual tooling costs to reduce setup times. It is expected that JIT will reduce average inventory by ₹50,00,000. The relevant costs of insurance, storage, materials handling and setup are likely to decline by ₹3,00,000. The HTC's required rate of return on inventory investment is 10 per cent.

The other benefits associated with low inventories in JIT production system of HTC are: (i) improved quality and reduced rework on 500 units each year would result in a saving of ₹500 per unit; and (ii) better quality and faster delivery will enable HTC to charge ₹20 more per unit on the 20,000 units that it sells every year.

Based on the cost savings in carrying costs of inventory only, HTC would not find the implementation of JIT system feasible as the additional tooling cost (₹10,00,000) exceeds the annual cost savings in carrying costs of ₹8,00,000 [(0.10 × ₹50,00,000) + ₹3,00,000]. However, on the basis of the total benefits in terms of cost savings in carrying costs plus the annual relevant quality and delivery benefits, HTC would be well advised to implement the JIT systems as the total benefits exceed the annual implementation costs of ₹10,00,000 as shown below.

1. Cost savings in carrying cost of inventory	₹8,00,000	
2. Plus quality and delivery benefits:		
• Rework savings (₹500 × 500 units)	₹2,50,000	
• Additional contribution margin (₹20 × 20,000)	<u>4,00,000</u>	<u>₹6,50,000</u>
		<u>14,50,000</u>

Performance Measure

The measures that managers can use to evaluate and control JIT production are discussed below.

Personal Observation The production layout in a JIT plant is streamlined and operations are not obscured by piles of inventory/rework. For this reason, personal observation is more effective in JIT plants compared to traditional plants.

Financial Performance Measure The financial measure that is widely used is inventory turnover ratio, that is, cost of goods sold ÷ inventory. This ratio would increase in a JIT system.

Non-financial Performance Measures Included in this category of measures are:

- Decrease in manufacturing lead time
- Increase in units produced per hour
- Decrease in number of days inventory on hand
- Decrease in total setup time for machines ÷ total manufacturing time
- Decrease in number of units requiring rework or scrap ÷ total number of units started and completed.

Effect on Costing System

The JIT system has effect on the costing systems. In the first place, by reducing material handling, warehousing and inspection, it reduces overhead costs. Second, it facilitates direct tracing of some costs usually classified as indirect, for example, material handling, and machine operating costs. Finally, the use of multi-skilled workers allows the costs of setup, maintenance and quality inspection to be traced as direct costs.

SUMMARY

Inventory refers to the stockpile of the products a firm would sell in future in the normal course of business operations and the components that make up the product. The firm stores three types of inventories, namely, raw materials, work-in-process/semi-finished goods and finished good.

The management of inventory is different from the management of other current assets in that virtually all the functional areas are involved. The job of the finance manager is to reconcile the conflicting viewpoints of the various functional areas regarding the appropriate inventory levels.

The objectives of inventory management consists of two counterbalancing parts: (i) to minimise investments in inventory and (ii) to meet the demand for products by efficiently organising the production and sales operations. In operational terms, the goal of inventory management is to have a trade-off between these two conflicting objectives which can be expressed in terms of costs and benefits associated with different levels of inventory.

The costs of holding inventory are ordering costs and carrying costs. While ordering costs are associated with the acquisition or ordering of inventory, carrying costs arise due to the storing of inventory. The major benefits of holding inventory are in the area of purchasing, production and sales. The total cost of inventory are to be compared with the total benefits arising out of inventory to determine its optimum level.

There are four decision areas in inventory management: (i) classification problem, (ii) order quantity problem, (iii) order point problem and (iv) safety stock.

The ABC system is a widely-used classification technique to identify various items of inventory for purposes of inventory control. On the basis of the cost involved, the various items are classified into three categories: (i) A, consisting of items with the large investment, (ii) C, with relatively small investments but fairly large number of items and (iii) B, which stands mid-way between category A and C. Category A needs the most rigorous control, C requires minimum attention and B deserves less attention than A but more than C.

The order quantity problem relates to the determination of the quantity of inventory which should be ordered. The economic order quantity (EOQ) is that level of inventory order which minimises the total cost associated with inventory management. Symbolically, $EOQ = \sqrt{2AB/C}$.

The re-order point is that level of inventory when a fresh order should be placed with suppliers to procure additional inventory equal to the EOQ. It is that inventory level which is equal to the consumption during the lead time plus safety stock.

Safety stocks are the minimum additional inventory which serve as a safety margin to meet an unanticipated increase in usage resulting from an unusually high demand and/or an uncontrollable late receipt of incoming inventory.

JIT, as an innovative manufacturing system, refers to acquiring materials and manufacturing goods only as needed to fill customer orders. Also called lean production system, it is a demand-pull manufacturing system because each component in a production line is produced as soon as and only when needed by the next step in the production line.

However, it is more than an approach to inventory management. It is a philosophy of eliminating non-value-added activities.

The benefits of JIT are in addition to lower carrying cost of inventory, improved quality, reduced rework, faster delivery and so on.

The measures of performance that managers use to evaluate and control JIT are personal observations, financial, and non-financial measures.

The effects of JIT on costing system are reduced overheads and direct tracing of some indirect costs.

SOLVED PROBLEMS

P.16.1 Economic Enterprises require 90,000 units of certain items annually. The cost per unit is ₹3. The cost per purchase order is ₹300 and the inventory carrying cost is ₹6 per unit per year.

(a) What is the EOQ?

(b) What should the firm do if the suppliers offer discounts as detailed below:

LO 16.2	LOD M
---------	----------

Order quantity	Discount
4,500 – 5,999	2 per cent
6,000 and above	3

Solution

$$(a) \text{EOQ} = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 90,000 \times ₹300}{₹6}} = 3,000 \text{ units}$$

(b) Determination of optimal order quantity

1. Order size (units)	3,000	4,500	6,000
2. Average inventory (units)	1,500	2,250	3,000
3. Annual requirements (units)	90,000	90,000	90,000
4. Number of orders	30	20	15
5. Price per unit (₹)	3	2.94 ^a	2.91 ^b
6. Cost of purchase (₹)	2,70,000	2,64,600	2,61,900
7. Carrying cost @ ₹6 per unit (₹)	9,000	13,500	18,000
8. Total ordering cost (₹)	9,000	6,000	4,500
9. Total cost (6 + 7 + 8)	2,88,000	2,84,100	2,84,400

^a[(3) – (2%)]

^b[(3) – (3%)]

The total cost is minimum at the order size of 4,500 units and, therefore, the firm should place order for 4,500 units.

SUBJECT: [Illegible]

Reference is made to the report of the New York Office dated [Illegible] and captioned as above.

It is noted that the [Illegible] of the [Illegible] is [Illegible].

P.16.2 Two components, A and B are, used as follows:

LO 16.2 LOD M

Normal usage	:	50 units each per week
Minimum usage	:	25 units each per week
Maximum usage	:	75 units each per week
Re-order quantity	:	A: 300 units; B: 500 units
Re-order period	:	A: 4 to 6 weeks; B: 2 to 4 weeks

Calculate for each component:

- (a) Reorder level, (b) Minimum level, (c) Maximum level, and (d) Average stock level.

Solution

- (a) Reorder level = (maximum usage × maximum delivery time)

$$A = 75 \times 6 \text{ weeks} = 450 \text{ units}$$

$$B = 75 \times 4 \text{ weeks} = 300 \text{ units}$$

- (b) Minimum level = Reorder level – (normal usage × average delivery time in weeks)

$$A = 450 \text{ units} - (50 \text{ units} \times 5 \text{ weeks}) = 200 \text{ units}$$

$$B = 300 \text{ units} - (50 \text{ units} \times 3 \text{ weeks}) = 150 \text{ units}$$

- (c) Maximum level = Reorder level – (minimum usage × minimum delivery time) + reorder quantity

$$A = 450 \text{ units} - (25 \times 4) + 300 \text{ units} = 650 \text{ units}$$

$$B = 300 \text{ units} - (25 \times 2) + 500 \text{ units} = 750 \text{ units}$$

- (d) Average stock level = minimum level + (Reorder quantity/2)

$$A = 200 + 300/2 = 350 \text{ units}$$

$$B = 150 + 500/2 = 400 \text{ units}$$

P.16.3 The Peekay Company has been buying a given item in lots of 1,200 units which is a six months' supply, the cost per units is ₹12, order cost is ₹8 per order, and carrying cost is 25 per cent. You are required to calculate the savings per year by buying in economical lot quantities.

LO 16.2 LOD M

Solution

$$EOQ = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 2,400 \times 8}{3}} = 114 \text{ units}$$

$$\text{Total carrying cost} = \frac{2,400 \times ₹12 \times 25}{100} = ₹7,200$$

$$\text{Carrying cost per unit (C)} = ₹7,200 \div 2,400 \text{ units} = ₹3$$

Savings due to EOQ

Particulars	Present	With EOQ
1. Size of order (units)	1,200	114
2. Number of orders	2	22
3. Cost per order (₹)	8	8
4. Total ordering cost (2 × 3) (₹)	16	176
5. Carrying cost per unit (₹)	3	3
6. Average inventory (units)	600	57
7. Total carrying cost (5 × 6) (₹)	1,800	171
8. Total cost (4 + 7) (₹)	1,816	347
Differential costs (savings) (₹)		1,469

P.16.4 The Ganges Pump Company uses about 75,000 valves per year and the usage is fairly constant at 6,250 per month. The valve costs ₹1.50 per unit when bought in quantities and the carrying cost is estimated to be 20 per cent of average inventory investment on an annual basis. The cost to place an order and process the delivery is ₹18. It takes 45 days to receive delivery from the date of an order and a safety stock of 3,250 valves is desired.

LO 16.2 LOD M

You are required to determine:

- The most economical order quantity and frequency of orders.
- The order point.
- The most economical order quantity if the valves cost ₹4.50 each instead of ₹1.50 each.

Solution

$$(a) \text{ EOQ} = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 75,000 \times 18}{0.3}} = 3,000 \text{ units}$$

Working Notes

$$(a) \text{ (i) Total carrying cost} = \frac{75,000 \times ₹1.50 \times 20}{100} = ₹22,500$$

$$\text{(ii) Carrying cost per unit} = ₹22,500/75,000 = 0.30$$

$$(b) \text{ Order point} = (\text{Lead Time} \times \text{Normal usage during lead time}) + \text{Safety stock} (1.5 \text{ months} \times 6,250 \text{ units per month}) + 3,250 \text{ units} = 12,625 \text{ units.}$$

(c) EOQ when cost per valve is ₹4.50:

$$\text{EOQ} = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 75,000 \times 18}{0.90}} = 1,733 \text{ units}$$

$$\text{Total carrying cost} = \frac{75,000 \times ₹4.50 \times 20}{100} = ₹67,500$$

$$\text{Carrying cost per unit} = ₹67,500/75,000$$

P.16.5 Royal Industries manufactures plastic lunch boxes in a moulding process. On an annual basis, the industry manufactures 1,000 plastic lunch boxes at a cost of ₹4 per unit. The industry's differential costs of carrying the item in the finished goods inventory are 20 per cent of the inventory value per year and the set-up costs per production run is ₹200. What is the optimum production-run?

LO 16.2 LOD E

Solution The optimum production run is = $\sqrt{\frac{2AB}{C}}$, B = set-up costs per production run

$$= \sqrt{\frac{2 \times 1,000 \times 200}{₹0.80}} = 707 \text{ units.}$$

P.16.6 M/s Tubes Ltd are the manufacturers of picture tubes for T.V. The following are the details of the operations during the current year.

LO 16.2 LOD E

Average monthly market demand (tubes)	2,000
Ordering cost (per order)	₹100
Inventory carrying cost (per cent per annum)	20
Cost of tubes (per tube)	500
Normal usage (tubes per week)	100
Minimum usage (tubes per week)	50
Maximum usage (tubes per week)	200
Lead time to supply (weeks)	6-8

Compute from the above:

- Economic order quantity. If the supplier is willing to supply quarterly 1,500 units at a discount of 5 per cent, is it worth accepting?
- Maximum level of stock
- Minimum level of stock
- Reorder level

Solution**1. Economic order quantity**

Annual demand (A) = Normal usage per week × 52 weeks = 100 tubes × 52 = 5,200 tubes. Ordering

cost per order (B) = ₹100 per order

Inventory carrying cost per unit per annum (C) = ₹500 × 0.20 = ₹100 per unit per annum

$$EOQ = \sqrt{2 AB/C} = \sqrt{(2 \times 5,200 \text{ units} \times ₹100) \div ₹100} = 102 \text{ tubes}$$

If supplier is willing to supply 1,500 units at a discount of 5 per cent:

Total cost (When order size is 1,500 units) = Cost of 5,200 units + Ordering cost + Carrying cost

$$= [5,200 \times (500 \times 0.95)] + \left[(5,200/1,500) \times ₹100 \right] + \left(\frac{1}{2} \times 1,500 \times 0.20 \times 475 \right)$$

$$= ₹24,70,000 + ₹346.67 + ₹71,250 = ₹25,41,596.67$$

$$\text{Total cost (when order size is 102 units)} = (5,200 \times 500) + (5,200/102 \times ₹100) + (1/2 \times 102 \times 0.20 \times 500)$$

$$= ₹26,00,000 + ₹5,098.03 + ₹5,100 = ₹26,10,198.03$$

Since the total cost under quarterly supply of 1,500 units with 5 per cent discount is lower than when order size is 102 units, the offer should be accepted. While accepting this offer, consideration of capital blocked on order size of 1,500 units per quarter has been ignored.

2. Maximum level of stock = Reorder level + Reorder quantity – (Minimum usage × Minimum reorder period)

$$= 1,600 \text{ units} + 102 \text{ units} - (50 \text{ units} \times 6 \text{ weeks}) = 1,402 \text{ units}$$

3. Minimum level of stock = Reorder level – (Normal usage × Average reorder period)

$$= 1,600 \text{ units} - (100 \text{ units} \times 7 \text{ weeks}) = 900 \text{ units}$$

4. Reorder level = Maximum consumption × Maximum reorder period = 200 units × 8 weeks = 1,600 units.

P.16.7 The purchase department of an organisation has received an offer of quantity discounts on its order of materials as under:

LO 16.2	LO D
----------------	-------------

Price per tonne	Tonnes
₹1,400	Less than 500
1,380	500 and less than 1,000
1,360	1,000 and less than 2,000
1,340	2,000 and less than 3,000
1,320	3,000 and above

The annual requirement of the material is 5,000 tonnes. The delivery cost per order is ₹1,200 and the annual stock holding cost is estimated at 20 per cent of the average inventory.

The purchase department wants you to consider the following purchase options and advise which among them will be the most economical order quantity, presenting the information in a tabular form:

The purchase quantity options to be considered are: 400 tonnes, 500 tonnes, 1,000 tonnes, 2,000 tonnes, and 3,000 tonnes

Solution

Determination of economic order quantity (EOQ)

1. Annual requirements (tonnes)	5,000	5,000	5,000	5,000	5,000
2. Order size (tonnes)	400	500	1,000	2,000	3,000
3. Number of orders (1 ÷ 2)*	12.5	10	5	2.5	1.67
4. Price per tonne (₹)	1,400	1,380	1,360	1,340	1,320
5. Cost of inventory (1 × 4) ₹lakh	70	69	68	67	66
6. Ordering cost (₹) (No. of orders × ₹1,200)	15,000	12,000	6,000	3,000	2,004
7. Average inventory (tonnes)	200	250	500	1,000	1,500
8. Average inventory (₹ lakh)	2.8	3.45	6.8	13.4	19.8
9. Carrying cost (0.20 × Average inventory) (₹ lakh)	0.56	0.69	1.36	2.68	3.96
10. Total cost (5 + 6 + 9) (₹ lakh)	70.71	69.81	69.42	69.71	69.98

*Number of orders can be in fraction figure as per going concern concept.

Recommendation The purchase department is advised to have order size of 1,000 tonnes as at this order size total cost is minimum.

P.16.8 G. Ltd. produces a product which has a monthly demand of 4,000 units. The product requires a component X which is purchased at ₹20. For every finished product, one unit of component X is required. The ordering cost is ₹120 per order and the holding cost is 10 per cent per annum. **LO 16.2**

You are required to calculate:

- Economic order quantity.
- If the minimum lot size to be supplied is 4,000 units, what is the extra cost, the company has to incur?
- What is the minimum carrying cost, the company has to incur?

Solution

- Determination of EOQ

$$EOQ = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 48,000 \text{ units} \times ₹120}{₹2}} = 2,400 \text{ units}$$

A = 4,000 units per month × 12 months = 48,000 units

C = ₹20 cost per unit × 0.10 = ₹2 per unit per annum

- Determination of extra cost when lot size is 4,000 units

Particulars	Cost when lot size is	
	4,000 units	2,400 units
1. Annual usage (units)	48,000	48,000
2. Size of order	4,000	2,400
3. Number of orders (1 ÷ 2)	12	20
4. Cost per order	₹120	₹120
5. Total ordering costs (3 × 4)	1,440	2,400
6. Carrying cost per unit per annum	2	2
7. Average inventory (size of order/2)	2,000	1,200
8. Total carrying cost (6 × 7)	4,000	2,400
9. Total costs (5 + 8)	5,400	4,800

Extra costs to be incurred is ₹640 (₹5,440 – ₹4,800), when the order size is 4,000 units.

- (iii) There is a positive relationship between the total carrying cost the firm incurs and the size of the average inventory it carries; this average size of inventory, in turn, is positively related to the size of order. In view of these facts, the minimum carrying costs the firm is to incur is ₹2,400 (corresponding to EOQ of 2,400 units and the average inventory level of 1,200 units)

P.16.9 A company manufactures a product from a raw material, which is purchased at ₹60 per kg. The company incurs a handling cost of ₹360 plus freight of ₹390 per order. The incremental carrying cost of inventory of raw material is ₹0.50 per kg per month. In addition, the cost of working capital **LO 16.2 LOD D** finance on the investment in inventory of raw material is ₹9 per kg per annum. The annual production of the product is 1,00,000 units and 2.5 units are obtained from one kg of raw material.

Required:

- (i) Calculate the economic order quantity of raw materials.
- (ii) Advise, how frequently should orders for procurement be placed.
- (iii) If the company proposes to rationalise placement of orders on quarterly basis, what percentage of discount in the price of raw materials should be negotiated?

Solution

$$(i) \text{EOQ} = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 40,000 \text{ kgs} \times ₹750}{₹15}} = 2,000 \text{ kgs}$$

Annual usage in kgs (A) = 1,00,000 units/2.5 units = 40,000 kgs

Ordering cost per order (B) = ₹360 + ₹390 = ₹750

Carrying cost per kg per annum (C) = (₹0.50 per kg per month × 12 months) + ₹9 per kg cost of working capital finance per annum = ₹15

- (ii) Frequency of placing an order in a year

Annual usage (in kgs)	40,000
EOQ (in kgs)	2,000
Number of orders placed in a year (40,000 kgs/2,000 kgs)	20*

*Frequency of placing an order is 18 days (360 days/20)

- (iii) (a) Incremental total cost to be incurred when orders are placed on quarterly basis i.e. 10,000 kgs (40,000 annual usage/4 quarters)

Particulars	On EOQ Basis	On Quarterly Basis
1. Annual usage (kgs)	40,000	40,000
2. Size of orders	2,000	10,000
3. Number of order (1 + 2)	20	4
4. Cost per order	₹750	₹750
5. Total ordering costs (3 × 4)	15,000	3,000
6. Carrying cost per unit	15	15
7. Average inventory (size of order/2) (kgs)	1,000	5,000
8. Total carrying cost (6 × 7)	15,000	75,000
9. Total cost (5 + 8)	30,000	78,000
Incremental costs (₹78,000 – ₹30,000) per year = ₹48,000		

- (b) The firm should be able to earn discount of ₹48,000 on its total annual purchases of 40,000 kgs (40,000 kgs × ₹60 per kg = ₹24,00,000). The negotiated discount sum will be: (₹48,000/₹24,00,000) × 100 = 2 per cent

P.16.10 A Company has the option to procure a particular material from two sources:

Source I assures that defectives will not be more than 2 per cent of supplied quantity.

Source II does not give any assurance, but on the basis of past experience of supplies received from it, it is observed that defective percentage is 2.8 per cent.

The material is supplied in lots of 1,000 units. Source II supplies the lot at a price, which is lower by ₹100 as compared to source 1. The defective units of material can be rectified for use at a cost of ₹5 per unit.

You are required to find out which of the two sources is more economical.

LO 16.2 M

Solution

Statement showing comparative costs associated with two sources of material supplies

Particulars	Material source I	Material source II
1. Material supplied (in units)	1,000	1,000
2. Defective units (in percentage)	2	2.8
3. Total defective units (1 × 2)	20	28
4. Rectification cost per unit	₹5	₹5
5. Total rectification (3 × 4)	100	140
6. Additional price paid in Source I	100	—
7. Total additional costs (5 + 6)	200	140

Material Source II is more economical as it entails lower cost. The company is advised to buy materials from Source II.

P.16.11 A factory uses 4,000 varieties of inventory. In terms of inventory holding and inventory usage, the following information is compiled.

LO 16.2 LOD M

Number of varieties of inventory	Percentage	% value of inventory holding (average)	% of inventory usage (in end-product)
3,875	96.875	20	5
110	2.750	30	10
15	0.375	50	85
4,000	100.00	100	100

Classify the items of inventory as per ABC analysis with reasons.

Solution

- (i) 15 number of varieties of inventory items should be classified as 'A' category (as per ABC analysis) as, while they constitute less than one per cent (0.375 per cent) of total number of inventory items handled by the store, their value is 50 per cent. Besides, these varieties (15) account for 85 per cent of total inventory usage (in end-product). Thus, this group is the most important.
- (ii) 3,875 number of inventory items should be classified as 'C' category as they constitute 96.875 per cent of total varieties of inventory items handled by the store; such inventories account for only for 20 per cent of total value and 5 per cent of total inventory usage (in-end product). Thus, this group is the least important.
- (iii) 10 number of inventory items should be classified as 'B' category as they occupy intermediate position between A category (15 items) and C category (3,875 items). These items (110) require more attention than C category items but less attention than A category items as per ABC analysis. In financial terms also, these items require 30 per cent investment (less than A category but more than C category) with 2.75 per cent of total number of varieties of inventory handled by store; such number is much higher for C category (96.875 per cent) and lower for A category (0.375 per cent).

REVIEW QUESTIONS

LOD: Easy

RQ.16.1 Fill in the following blanks:

[LO 16.1.2]

- (i) Finance manager is to _____ of the various functional areas regarding the appropriate inventory levels.
- (ii) _____ is fixed cost of placing and receiving an order for acquisition of inventory.
- (iii) Costs of holding inventory are referred to as _____.
- (iv) _____ is a widely-used classification technique to identify various items of inventory for purposes of inventory control.
- (v) While category _____ items warrant the most rigorous control, category _____ items minimum attention.
- (vi) _____ is the level of inventory at which total cost of inventory consisting of acquisition/ordering and carrying cost is minimal.
- (vii) _____ is the level of inventory at which fresh order for procuring additional inventory is placed.
- (viii) _____ refers to the time normally taken in receiving the inventory supplies after placing orders with suppliers.
- (ix) _____ is the amount of inventory that needs to be maintained to meet unforeseen situations, say, unanticipated increase in daily usage and increase in lead time.
- (x) In EOQ, average inventory is determined dividing _____.

[Answers: (i) Reconcile the conflicting consideration/viewpoints (ii) Ordering costs

(iii) Carrying costs (iv) ABC system (v) A, C, (vi) Economic order quantity

(vii) Reorder point (viii) Lead time (ix) Safety stock (x) order size/2]

RQ.16.2 What is inventory? Why do firms maintain inventory? What are the objectives of inventory management? [LO 16.1]

RQ.16.4 What is the financial manager's role in management of inventory? [LO 16.1.2]

RQ.16.5 From the following data, determine the EOQ. [LO 16.2]

- (i) Annual requirement, 12,00,000 units
- (ii) Purchase price, ₹3 per unit
- (iii) Ordering cost, ₹50 per order
- (iv) Carrying cost of inventory, 10 per cent of cost

LOD: Medium

RQ.16.6 What is meant by the ABC inventory control system? On what key premise is this system based? What are its limitations? [LO 16.2]

RQ.16.7 Define economic order quantity (EOQ). How can it be computed? What are the limitations of the EOQ model? [LO 16.2]

RQ.16.8 (a) What is inventory reorder point? How is it determined? [LO 16.3]

(b) Define JIT. What are its benefits? What measures can managers take to control and evaluate JIT?

RQ.16.9 The following information is available relating to the stock-out of a firm: [LO 16.2]

Stock-out (units)	Number of months
800	2
600	3
400	5
200	10
0	30
	50

The selling price of each unit is ₹200. The carrying costs are ₹19 per unit. The stock-out costs are ₹50 per unit.

- (i) If the firm wishes to never miss a sale, what should be its safety stock? What is the total cost associated with this level of safety stock? What are the associated costs with safety stock of 300, 200, 100 and 20 units, respectively?
- (ii) What is the optimal safety stock level?

RQ.16.10**[LO 16.2]**

- (i) From the following data, determine the EOQ.
- List price of product X is ₹800 per gross.
 - 40 per cent trade discount is allowed on list price on purchases in gross lots.
 - Freight cost is ₹20 per gross from the transport company to the factory premises.
 - Annual usage of product X: 36 gross per year.
 - Cost of placing an order is ₹10, the cost of receiving an order is ₹20.
 - Carrying cost is 20 per cent of the effective purchase price of goods per year.
 - Insurance and taxes are approximately 12 per cent of the net delivered cost of inventory.
- (ii) Determine the total annual cost of inventory based on uniform order lot sizes of 1, 2, 3, 4, 5 and 6 gross of product X.
- (iii) Determine the minimum stock re-order point of product X, given the following: (a) Working days: 240; (b) Normal delivery time to receive an order: 20 working days from the date of purchase request is initiated; (c) Safety stock: 1 gross.

LOD: Difficult

RQ.16.11 ABC Ltd has several items of inventory. The average number of each of these as well as their unit costs is listed below:

[LO 16.2]

Item	Average inventory (units)	Average cost per unit	Item	Average inventory (units)	Average cost per unit
1	4,000	₹1.96	11	1,800	₹25
2	200	10	12	130	2.70
3	440	2.40	13	4,400	9.50
4	2,000	16.80	14	3,200	2.60
5	20	165	15	1,920	2
6	800	6	16	800	1.20
7	160	76	17	3,400	2.20
8	3,000	3	18	2,400	10
9	1,200	1.90	19	120	21
10	6,000	0.50	20	320	4

The company wishes to adopt an ABC inventory system. How should the items be classified into A, B and C?

ANSWERS

- 16.5 20,000 units
- 16.9 (i) 800 units safety stock; ₹15,200 total cost
(ii) 200 units
- 16.10 (i) 4.4
(ii) 1,080; 540; 360; 270; 240; 180 (for size of gross order 1 to 6 respectively)
(iii) 4 Gross
- 16.11 A : 68.24; B : 21.17; C : 10.46

CHAPTER

17

Working Capital Financing

LEARNING OBJECTIVES

LO 17.1	Review the key features and characteristics of, and the costs associated with, trade credit as a source of working capital financing
LO 17.2	Describe the various forms of bank credit and the modes of security and outline a rating and scoring model used by banks to assess borrowers for lending
LO 17.3	Explain the key features of commercial papers (CPs) as sources of working capital financing
LO 17.4	Discuss the main features of Certificate of Deposits (CDs) as a source of working capital financing
LO 17.5	Analyse the key features of factoring and evaluate its role in working capital financing

INTRODUCTION

After determining the level of working capital, as illustrated in Chapter 13, a firm is to decide how it is to be financed. The need for financing arises mainly because the investment in working capital/current assets, that is, raw materials, work/stock-in-process, finished goods and receivables typically fluctuates during the year. The present chapter discusses the main sources of finance for working capital. Although long-term funds partly finance current assets and provide the margin money for working capital, such assets/working capital are also, to a marked extent, supported by short-term sources; this is true, in particular, for seasonal industries. The main sources of working capital financing, namely, trade credit, bank credit, commercial papers, certificate of deposits and factoring are covered in this chapter. The major points are summarised by way of recapitulation.

LO 17.1 TRADE CREDIT

Features

Trade credit refers to the credit extended by the supplier of goods and services in the normal course of transaction/business/sale of the firm. According to trade practices, cash is not paid immediately for purchases but after an agreed period of time. Thus, deferral of payment (trade credit) represents a source of finance for credit purchases.

- **Trade credit**
- is the credit
- extended by
- suppliers of goods
- and services in the
- normal course of
- business.

1978

1. The first part of the paper discusses the general theory of the firm, and the role of the firm in the economy. It is shown that the firm is a profit-maximizing entity, and that its behavior is determined by the market structure and the technology available to it.

2. The second part of the paper discusses the role of the firm in the economy, and the impact of government policy on the firm's behavior. It is shown that government policy can have a significant impact on the firm's behavior, and that this impact can be both positive and negative.

Working Capital Financing

1. Introduction

The first part of the paper discusses the general theory of the firm, and the role of the firm in the economy. It is shown that the firm is a profit-maximizing entity, and that its behavior is determined by the market structure and the technology available to it.

The second part of the paper discusses the role of the firm in the economy, and the impact of government policy on the firm's behavior. It is shown that government policy can have a significant impact on the firm's behavior, and that this impact can be both positive and negative.

2. Conclusion

The paper concludes that the firm is a profit-maximizing entity, and that its behavior is determined by the market structure and the technology available to it. It also concludes that government policy can have a significant impact on the firm's behavior, and that this impact can be both positive and negative.

There is, however, no formal/specific negotiation for trade credit. It is an informal arrangement between the buyer and the seller. There are no legal instruments/acknowledgements of debt which are granted on an open account basis. Such credit appears in the records of the buyer of goods as sundry creditors/accounts payable.

A variant of accounts payable is bills/notes payable. Unlike the open account nature of accounts payable, bills/notes payable represent documentary evidence of credit purchases and a formal acknowledgement of obligation to pay for credit purchases on a specified (maturity) date failing which legal/penal action for recovery will follow. A notable feature of bills/notes payable is that they can be rediscounted and the seller does not necessarily have to hold it till maturity to receive payment. However, it creates a legally enforceable obligation on the buyer of goods to pay on maturity whereas the accounts payable have more flexible payment obligations. Although most of the trade credit is on open account as accounts payable, the suppliers of goods do not extend credit indiscriminately. Their decision whether or not to extend the trade credit as well as the quantum is based on a consideration of factors such as earnings record over a period of time, liquidity position of the firm and past record of payment.

Advantages

Trade credit, as a source of short-term/working capital finance, has certain advantages. It is easily, almost automatically, available. Moreover, it is a flexible and spontaneous source of finance. The availability and magnitude of trade credit is related to the size of operations of the firm in terms of sales/purchases. For instance, assume the requirement of credit purchases to support the existing sales is ₹5 lakh per day. If the purchases are made on a credit of 30 days, the average outstanding accounts payable/trade credit (finance) will amount to ₹1.5 crore (₹5 lakh × 30 days). The increase in purchases of goods to support higher sales level to ₹6 lakh will imply a trade credit finance of ₹1.8 crore (₹6 lakh × 30 days). If the credit purchases of goods decline, the availability of trade credit will correspondingly decline. Trade credit is also *an informal, spontaneous source of finance*. Not requiring negotiation and formal agreement, trade credit is free from the restrictions associated with formal/negotiated source of finance/credit.

Costs

- Trade credit does not involve any explicit interest charge. However, there is an implicit cost of trade credit. It depends on the credit terms offered by the supplier of goods. If the terms of the credit are, say, 45 days net, the payable amount to the supplier of goods is the same whether paid on the date of purchase or on the 45th day and, therefore, trade credit has no cost, that is, it is cost-free. But if the credit terms are, say, 2/15, net 45, that is, there is **cash discount** for prompt payment, the trade **credit period** beyond the **cash discount period** has a cost = $[(\text{Discount}/1 - \text{Discount}) \times (360 \text{ days}/\text{Credit period} - \text{Discount period})]$. The implicit interest rate/cost = $[(0.02/1 - 0.02) \times (360/45 - 15)] = 24.5$ per cent. Alternatively, the credit terms, 2/15, net 45, imply that the firm (buyer) is entitled to 2 per cent discount for payment made within 15 days when the entire payment is to be made within 45 days. Since the net amount is due in 45 days, failure to take the discount means paying an extra 2 per cent for using the money for an additional 30 days. If a firm were
- **Cash discount period** implies a percentage deduction from the purchase price if the buyer pays within a specified time that is shorter than the credit period.
 - **Cash discount period** implies the number of days after the beginning of the credit period during which the discount is available.
 - **Trade credit period** is the number of days until full payment of an account payable is required.

to pay 2 per cent for every 30 days period over a year, there would be 12 such periods (360 days ÷ 30 days). This represents an annual interest rate/cost of 24 per cent. If the terms of credit are 2/10, net 30, the cost of credit works out to 36.4 per cent. *The smaller the difference between the payment day and the end of the discount period, the larger is the annual interest/cost of trade credit.*

To sum up, as the **cost of trade credit** is generally very high beyond the discount period, firms should avail of the discount on prompt payment. If, however, they are unable to avail of discount, the payment of trade credit should be delayed till the last day of the credit (net) period and beyond without impairing their credit-worthiness. But a precondition for obtaining trade credit particularly by a new company is cultivating good relationship with suppliers of goods and obtaining their confidence by honouring commitments.

- **Cost of trade credit**
- is the implicit cost of not availing cash discount.

LO 17.2 BANK CREDIT

Bank credit is the primary institutional source of working capital finance in India. In fact, it represents the most important source for financing of current assets.

Forms of Credit

Working capital finance is provided by banks in five ways: **(i)** cash credits/overdrafts, **(ii)** loans, **(iii)** purchase/discount bills, **(iv)** letter of credit and **(v)** working capital term loans. Proposal form for obtaining working capital funds from Punjab National Bank is given in *Appendix 17.A* on website: www.mhhe.com/khanjainfm8e.

A rating and scoring model used by an Indian bank to assess working capital requirements of clients is also given.

Cash credit/Overdrafts Under cash credit/overdraft form/arrangement of bank finance, the bank specifies a predetermined borrowing/credit limit. The borrower can draw/borrow up to the stipulated credit/overdraft limit. Within the specified limit **line of credit**, any number of draws/drawings are possible to the extent of his requirements periodically. Similarly, repayments can be made whenever desired during the period. The interest is determined on the basis of the running balance/amount actually utilised by the borrower and not on the sanctioned limit. However, a minimum (commitment) charge may be payable on the unutilised balance irrespective of the level of borrowing for availing of the facility. This form of bank financing of working capital is highly attractive to the borrowers because, firstly, it is flexible in that although borrowed funds are repayable on demand, banks usually do not recall cash advances/roll them over and, secondly, the borrower has the freedom to draw the amount in advance as and when required while the interest liability is only on the amount actually outstanding. However, cash credit/overdraft is inconvenient to the banks and hampers credit planning.

- **Line of credit**
- is an agreement between a bank and a firm specifying the amount of short-term borrowing the bank would make available to the firm over a given period of time.

Loans Under this arrangement, the entire amount of borrowing is credited to the current account of the borrower or released in cash. The borrower has to pay interest on the total amount. The loans are repayable on demand or in periodic instalments. They can also be renewed from time to time. As a form of financing, loans imply a financial discipline on the part of the borrowers.

Bills Purchased/Discounted This arrangement is of relatively recent origin in India. With the introduction of the New Bill Market Scheme in 1970 by the Reserve Bank of India (RBI), bank credit is

being made available through discounting of *usance bills* by banks. The RBI envisaged the progressive use of bills as an instrument of credit as against the prevailing practice of using the widely-prevalent cash credit arrangement for financing working capital. The cash credit arrangement gave rise to unhealthy practices. As the availability of bank credit was unrelated to production needs, borrowers enjoyed facilities in excess of their legitimate needs. Moreover, it led to double financing. This was possible because credit was taken from different agencies for financing the same activity. This was done, for example, by buying goods on credit from suppliers and raising cash credit by hypothecating the same goods. The bill financing is intended to link credit with the sale and purchase of goods and, thus, eliminate the scope for misuse or diversion of credit to other purposes.

The amount made available under this arrangement is covered by the cash credit and overdraft limit. Before discounting the bill, the bank satisfies itself about the credit-worthiness of the drawer and the genuineness of the bill. To popularise the scheme, the discount rates are fixed at lower rates than those of cash credit, the difference being about 1-1.5 per cent. The discounting banker asks the drawer of the bill (i.e. seller of goods) to have his bill accepted by the drawee (buyers) bank before discounting it. The latter grants acceptance against the cash credit limit, earlier fixed by it, on the basis of the borrowing value of stocks. Therefore, the buyer who buys goods on credit cannot use the same goods as a source of obtaining additional bank credit.

The *modus operandi* of bill finance as a source of working capital financing is that a bill arises out of a trade sale-purchase transaction on credit. The seller of goods draws the bill on the purchaser of goods, payable on demand or after a usance period not exceeding 90 days. On acceptance of the bill by the purchaser, the seller offers it to the bank for discount/purchase. On discounting the bill, the bank releases the funds to the seller. The bill is presented by the bank to the purchaser/acceptor of the bill on due date for payment. The bills can also be rediscounted with the other banks/RBI. However, this form of financing is not popular in the country.

Term Loans for Working Capital Under this arrangement, banks advance loans for 3-7 years repayable in yearly or half-yearly instalments.

Letter of Credit While the other forms of bank credit are direct forms of financing in which banks provide funds as well as bear risk, letter of credit is an indirect form of working capital financing and banks assume only the risk, the credit being provided by the supplier himself.

Letter of credit is a letter written by a bank stating that the bank guarantees payment of an invoiced amount if all the underlying agreements are met.

The purchaser of goods on credit obtains a **letter of credit** from a bank. The bank undertakes the responsibility to make payment to the supplier in case the buyer fails to meet his obligations. Thus, the *modus operandi* of letter of credit is that the supplier sells goods on credit/extends credit (finance) to the purchaser, the bank gives a guarantee and bears risk only in case of default by the purchaser.

Mode of Security

Banks provide credit on the basis of the following modes of security:

Hypothecation Under this mode of security, the banks provide credit to borrowers against the security of movable property, usually inventory of goods. The goods hypothecated, however, continue to be in the possession of the owner of these goods (i.e., the borrower). The rights of the lending bank (hypothecatee) depend upon the terms of the contract between the borrower and the lender. Although the bank does not have physical possession of the goods, it has the legal right to sell the goods to realise the outstanding loan. Hypothecation facility is normally not available to new borrowers.

Hypothecation is the use of inventory as a security/collateral to obtain a short-term loan.

Pledge **Pledge**, as a mode of security, is different from hypothecation in that in the former, unlike in the latter, the goods which are offered as security are transferred to the physical possession of the lender. An essential prerequisite of pledge, therefore, is that the goods are in the custody of the bank. The borrower who offers the security is, called a 'pawnor' (pledgor), while the bank is called the 'pawnee' (pledgee). The lodging of the goods by the pledgor to the pledgee is a kind of bailment. Therefore, pledge creates some liabilities for the bank. It must take reasonable care of goods pledged with it. The term '*reasonable care*' means care which a prudent person would take to protect his property. He would be responsible for any loss or damage if he uses the pledged goods for his own purposes. In case of non-payment of the loans, the bank enjoys the right to sell the goods.

- **Pledge**
- is the use of
- goods as security/
- collateral to obtain
- a short-term loan.

Lien The term '**lien**' refers to the right of a party to retain goods belonging to another party until a debt due to him is paid. Lien can be of two types: **(i)** particular lien, and **(ii)** general lien. Particular lien is a right to retain goods until a claim pertaining to these goods is fully paid. On the other hand, general lien can be applied till all dues of the claimant are paid. Banks usually enjoy general lien.

- **Lien**
- is a publicly
- disclosed legal
- claim on collateral.

Mortgage It is the transfer of a legal/equitable interest in specific immovable property for securing the payment of debt. The person who parts with the interest in the property is called 'mortgagor' and the bank in whose favour the transfer takes place is the 'mortgagee'. The instrument of transfer is called the 'mortgage deed'. **Mortgage** is, thus, conveyance of interest in the mortgaged property. The mortgage interest in the property is terminated as soon as the debt is paid. Mortgages are taken as an additional security for working capital credit by banks.

- **Mortgage**
- is the additional
- security of
- immovable property
- to obtain short-
- term loan.

Charge Where immovable property of one person is, by the act of parties or by the operation of law, made security for the payment of money to another and the transaction does not amount to mortgage, the latter person is said to have a charge on the property and all the provisions of simple mortgage will apply to such a charge. The provision are as follows:

- A charge is not the transfer of interest in the property though it is security for payment. But mortgage is a transfer of interest in the property.
- A charge may be created by the act of parties or by the operation of law. But a mortgage can be created only by the act of parties.
- A charge need not be made in writing but a mortgage deed must be attested.
- Generally, a charge cannot be enforced against the transferee for consideration without notice. In a mortgage, the transferee of the mortgaged property can acquire the remaining interest in the property, if any is left.

Scoring and Rating Model of X Bank

The RBI has prescribed a comprehensive risk rating and scoring framework to serve as a single point indicator of the diverse risk factors of the borrowers to help in taking a credit decision in a consistent manner. We outline below a scoring and rating model of an Indian bank.

Rating of Borrowers Based on Percentage of Score as Given Below

% Score obtained	Credit rating
80% and above	AAA
79%–65%	AA
64%–50%	A
49%–35%	B

LO 17.3 COMMERCIAL PAPERS

Features

The CP is a short-term unsecured negotiable instrument consisting of usance primary notes with a fixed maturity, thus, indicating the short-term obligation of an issuer. It is generally issued by companies as a means of raising short-term debt and, by a process of securitisation, intermediation of the bank is eliminated. The PDs and all-India financial institutions can also issue CPs. It is issued on a discount to face value basis but it can also be issued in interest-bearing form. The issuer promises the buyer a fixed amount at a future date but pledges no assets. His liquidity and earning power are the only guarantee. In other words, the CP is not tied to any specific self liquidating trade transaction in contrast to the commercial bills that arise out of specific trade/commercial transaction. A CP can be issued by a company directly to the investor or through bank/merchant banks (dealers). When the companies directly deal with the investors, rather than use a securities dealer as an intermediary, the CP is called a *direct paper*. Such companies/borrowers announce the current rates of CPs of various maturities. Investors can then select those maturities that closely approximate their holding period and acquire the security/paper directly from the issuer. When CPs are issued by security dealer/dealers on behalf of their corporate customers, they are called *dealer papers*. They buy at a price less the commission and sell at the highest possible level. It is generally backed by a revolving underwriting facility from banks to ensure continuous availability of funds on each roll-over of the CP. Moreover, unlike commercial bills, maturities, within the range can be tailored to specific requirements.

- **Commerical paper**
- is a form of financing consisting of short-term unsecured promissory notes issued by a firm with high credit rating.

Advantages

A CP, as a short-term financial instrument, has several advantages both to the issuers and the investors. It is a simple instrument and hardly involves any documentation between the issuer and the investor. It is additionally flexible in terms of maturities of the underlying promissory note, which can be tailored to match the cash flow of the issuer. Further, a well rated company can diversify its sources of finance from banks to the short-term money market at a cheaper cost. This is particularly relevant in a system, such as in India, in which reserve requirements on banks are in vogue in the form of SLR and CRR, which raise the effective cost of bank lending. Also, the CP provides investors with returns higher than what they obtain from the banking system. In addition, companies that are able to raise funds through CPs become better known in the financial world and are thereby placed in a more favourable position for raising long-term capital. Thus, there is an in-built incentive for companies to remain financially strong. Unlike bank credit which is secured by a first charge on the current assets, CP is unsecured. There are no limitations on the end-use of funds raised through CPs, and as negotiable/transferable instruments, they are highly liquid. Finally, in the Indian context, the creation of a commercial paper market has resulted in a part of the inter-corporate funds flowing into this market, which is under the control of the monetary authorities.

Framework of Indian CP Market

Commercial paper (CP) is an unsecured money market instrument issued in the form of a promissory note. As a privately placed instrument, CP was introduced in India in 1990 with a view to enabling highly rated corporate borrowers to diversify their sources of short-term borrowings and to provide

additional instrument to investors. Subsequently, primary/satellite dealers and all-India financial institutions (FIs) were also permitted to issue CP to enable them to meet their short-term funding requirements for their operations. The issue of CP is governed by the directions/guidelines issued by the RBI from time to time. These guidelines provide the broad framework of the CPs market in India. The main elements of the present framework of the Indian CP market, prescribed by the RBI, are outlined below.

Eligibility for Issue of CP Companies, primary dealers (PDs) and financial institutions (FIs) that have been permitted to raise short-term resources under the umbrella limit fixed by the RBI are eligible to issue CP. A company would be eligible to issue CP provided: **(a)** the tangible net worth of the company, as per the latest audited balance sheet, is not less than ₹4 crore; **(b)** company has been sanctioned working capital limit by bank(s) or FIs; and **(c)** the borrowal account of the company is classified as a standard asset by the financing bank(s)/institution(s). **Working capital** limit means the aggregate limits including those by way of purchase/discount of bills sanctioned by banks/FIs for meeting the working capital requirements.

Rating Requirements All eligible participants/issuers should obtain the credit rating for issuance of the CP from any one of the SEBI-registered credit rating agencies. The minimum credit rating should be **A-3** as per the standardised rating symbols/definitions provided by the SEBI. The issuers should ensure at the time of issuance of the CP that the rating obtained is current and has not fallen due for review.

Tenor A CP can be issued for maturities between a minimum of 7 days and a maximum up to one year from the date of issue. The maturity date of the CP should not go beyond the date up to which the credit rating of the issuer is valid.

Issue of CP: Credit Enhancement Limits A CP can be issued as a "stand alone" product. It would not be obligatory for banks/FIs to provide stand-by facility. Banks/FIs may, based on their commercial judgement, subject to the prudential norms applicable to them, with the specific approval of their respective Board of Directors, choose to provide stand-by assistance/credit, backstop facility by way of credit enhancement for a CP issue. Non-bank entities (including corporates) may provide unconditional/irrevocable guarantee for credit enhancement for CP issue provided: **(i)** the issuer fulfils the eligibility criteria for issuance of CP, **(ii)** the guarantor has a credit rating at least one notch higher than the issuer by an approved agency, and **(iii)** the offer document properly discloses the networth of the guarantor company, the names of companies to which the guarantor has issued similar guarantees, the extent of guarantee offered and the condition under which the guarantee would be invoked. The aggregate amount of a CP from an issuer should be within the limit as approved by its Board of Directors or the quantum indicated by the credit rating agency for the specified rating, whichever is lower. Banks and FIs will, however, have the flexibility to fix working capital limits duly taking into account the resource pattern of companies' financing including CPs. An FI can issue a CP within the overall umbrella limit fixed by the RBI.

The total amount of CP proposed to be issued should be raised within a period of two weeks from the date on which the issuer opens the issue for subscription. The CP may be issued on a single date or in parts on different dates provided that in the latter case, each CP should have the same maturity date. Every issue of CP, including renewal, should be treated as a fresh issue.

Investment in CP Individuals, banks, other corporate bodies registered or incorporated in India and unincorporated bodies, NRIs and FIIs would be eligible to invest in CP. However, FPIs would be eligible to invest subject to (i) conditions set by the SEBI, and (ii) compliance with the provisions of the FEMA/Foreign Exchange Deposit Regulations and Foreign Exchange Management (Transfer/Issue of Security by a Person Resident Outside) Regulations.

Mode of Issuance The CP can be issued either in the form of a promissory note or in a dematerialised form through any depository approved by and registered with the SEBI. However, RBI-regulated entities are required to make fresh investments and hold CPs only in dematerialised form. The CPs should be issued in denominations of ₹5 lakh and multiples. The amount invested by a single investor should not be less than ₹5 lakh (face value). It will be issued at a discount to face value as may be determined by the issuer. No issuer should have the issue of a CP underwritten or co-accepted. Options (call/put) are not permitted on CPs.

Investment/Redemption The investor in CP (primary subscriber) should pay the discounted value of the CP to the account of the issuer through the IPA. When CP is held in demat form, the holder of the CP will have to get it redeemed and receive payment from the IPA.

Procedure for Issuance Every issuer must appoint an IPA for issuance of a CP. He should disclose to the potential investors its financial position as per the standard market practice. After the exchange of deal confirmation between the investor and the issuer, the issuer should arrange for crediting the CP to the investor's account with a depository through the IPA. The investors should be given a copy of the IPA certificate to the effect that the issuer has a valid agreement with the IPA and documents are in order.

Trading and Settlement All OTC trades in CP should be reported within 15 minutes of the trade to the Financial Markets Trade Reporting and Confirmation Platform (F-TRAC) of Clearcorp Dealing System (India) Ltd (CDSL). The requirement of exchange of physical confirmation of trades matched on F-TRAC is waived subject to the participants (i) entering into one-time bilateral agreement for eliminating the exchange of confirmation or multilateral agreement drafted by the FIMMDA, (ii) adhering to the applicable laws such as stamp duty and (iii) ensuring adherence to a sound risk management framework and complying with all the regulatory/legal requirements/practices in this regard. They should be settled through the clearing house of the NSE/BSE. The settlement cycle for OTC trades in CPs should be T+0/T+1.

Buyback of CP Issuers may with the approval of their Board of Directors, buy-back CPs from the investors before maturity through the secondary market at prevailing market price. The buy-back cannot be before a minimum period of seven days from the issue date and the issuer should intimate the IPA of the buy-back undertaken.

Duties/Obligations The duties/obligations of the issuer, the issuing and the paying agent (IPA) and credit rating agency (CRA) are set out below:

(a) **Issuer** They should ensure that the guidelines and procedures laid down for the CP issuance are strictly adhered to.

(b) **Issuing and Paying Agent (IPA)** The IPA should ensure that the issuer has the minimum credit rating as stipulated by the RBI and the amount mobilised through issuance of CP is within the quantum indicated by the CRA for the specified rating or as approved by its Board of Directors,

The first part of the book is devoted to a general history of the world, from the beginning of time to the present day. It covers the various ages and periods of human history, and the progress of civilization and knowledge.

The eighth part of the book is devoted to a history of the various revolutions and changes, from their origin to their present state. It describes the various causes and effects, and the progress of each revolution and change.

The ninth part of the book is devoted to a history of the various discoveries and inventions, from their origin to their present state. It describes the various methods and processes, and the progress of each discovery and invention.

The tenth part of the book is devoted to a history of the various improvements and reforms, from their origin to their present state. It describes the various plans and measures, and the progress of each improvement and reform.

The eleventh part of the book is devoted to a history of the various customs and manners, from their origin to their present state. It describes the various habits and practices, and the progress of each custom and manner.

The twelfth part of the book is devoted to a history of the various languages and literatures, from their origin to their present state. It describes the various dialects and styles, and the progress of each language and literature.

The thirteenth part of the book is devoted to a history of the various philosophies and systems, from their origin to their present state. It describes the various doctrines and principles, and the progress of each philosophy and system.

The fourteenth part of the book is devoted to a history of the various governments and constitutions, from their origin to their present state. It describes the various forms of government, and the progress of each constitution.

whichever is lower. It has to verify all the documents submitted by the issuer, namely, copy of the Board resolution, signatures of authorised executants (when CP in physical form) and issue a certificate that the documents are in order. It should also certify that it has a valid agreement with the issuer. The certified copies of original documents verified by the IPA should be held in its custody. All banks acting as IPAs should report the details of issuance of CPs on the Online Returns Filing System (ORFS) module of the RBI within two days from the date of issuance. They should immediately report, on occurrence, full particulars of default in repayment of CP in the prescribed format to the RBI. They should similarly report all instances of buy-back undertaken by the issuers.

(c) Credit Rating Agency (CRA) The code of conduct prescribed by the SEBI for CRAs for undertaking rating of capital market instruments would be applicable to them for rating a CP. Further, the CRA would have the discretion to determine the validity period of the rating depending upon its perception about the strength of the issuer. Accordingly, the CRA should at the time of rating, clearly indicate the date when the rating is due for review. They would have to closely monitor the rating assigned to the issuers vis-à-vis their track record at regular intervals and make their revision in the ratings public through their publications and website.

Documentation Procedure Standardised procedures/documentation for CPs are prescribed by the Fixed Income Money Market and Derivatives Association of India (FIMMDA) in consonance with international best practices. Issuers/IPAs should follow the guidelines issued by the FIMMDA with the RBI's approval.

Non-applicability of Certain Other Directions Nothing contained in the RBI NBFCs Directions, would apply to any NBFC insofar as it relates to the acceptance of deposits by issuance of CP, in accordance with these guidelines.

Effective Cost/Interest Yield As CPs are issued at discount and redeemed at their face value, their effective pre-tax interest yield

$$= \left(\frac{\text{Face value} - \text{Net amount realised}}{\text{Net amount realised}} \right) \times \left(\frac{360}{\text{Maturity period}} \right)$$

where net amount realised = face value – discount – issuing and paying agent (IPA) charges, that is, stamp duty, rating charges, dealing bank fee and fee for stand by facility.

Assuming face value of a CP to be ₹5,00,000, maturity period to be 90 days, net amount realised = ₹4,80,000, discount and other charges associated with the issue of CP = 1.5 per cent, the pre-tax

$$\text{effective cost of CP} = \left(\frac{₹5,00,000 - (₹4,80,000 - ₹7,500)}{(₹4,80,000 - ₹7,500)} \right) \times \left(\frac{360}{90} \right) = 23.3 \text{ per cent}$$

The participants in the market are corporate bodies, banks, mutual funds, the UTI, LIC, GIC and so on, which have surplus funds and are on a lookout for opportunities for short-term investments. The PDs also operate both in the primary and secondary markets for CPs by quoting its bid and offering prices.

Although the CP market has become fairly popular now, a secondary market is yet to develop and when fully developed, it would impart strength and vitality to the money market. Investors, with temporary surplus, would be able to get attractive yields for their short-term funds and borrowers would be able to raise resources at market-related rates. The development of a secondary market with the active participation of the PDs will improve the liquidity of CPs.

LO 17.4 CERTIFICATE OF DEPOSITS (CDs)

A CD is a document of title to a time deposit and can be distinguished from a conventional time deposit in respect of its free negotiability and, hence, marketability. In other words, CDs are a marketable receipt of funds deposited in a bank for a fixed period at a specified rate of interest. They are bearer documents/instruments and are readily negotiable. They are attractive both to the bankers and the investors in the sense that/he former is not required to encash the deposit prematurely, while the latter can sell the CDs in the secondary market before its maturity and thereby the instrument has liquidity/ready marketability.

- Certificate of deposit
- is a marketable receipt of funds deposited in a bank for a fixed period at a specified rate of interest.

RBI Guidelines

A CD is a negotiable money market instrument, issued in a demat form or a usance promissory note for funds deposited at a bank/other eligible financial institutions (FIs) for a specified time period.

Eligibility The CDs can be issued by (i) commercial banks [excluding the RRBs/Local Area Banks (LABs)] and (ii) select all-India FIs permitted by the RBI to raise resources by way of term money/deposits, certificate of deposits, CPs and inter-corporate deposits within the umbrella limit fixed by it.

Aggregate Amount Banks have freedom to issue CDs depending on their funding requirements. An FI may issue CDs within the overall umbrella limit fixed by the RBI, time to time.

Minimum Size of Issue and Denominations The minimum amount of a CD should be ₹1 lakh, that is, the minimum deposit that could be accepted from a single subscriber should not be less than ₹1 lakh and in multiples of ₹1 lakh.

Investors The CDs can be issued to individuals/corporations/companies/(including banks/PDs) trusts/funds/associations and so on. The NRIs may also subscribe to CDs on a non-repatriable basis only. They cannot be endorsed to another NRI in the secondary market.

Maturity The maturity period of a CD issued by a bank should be between 7 days (minimum) and one year (maximum). The FIs can issue CDs with maturity of 1-3 years.

Discount/Coupon Rate The CDs may be issued at a discount on face value. They can also be issued on floating rate basis provided the methodology of the compiling the floating rate is objective, transparent and market-based. The issuer is free to determine the discount/coupon rate. The interest rate on the floating rate CDs should be set periodically according to the predetermined formula that indicates the spread over a transparent benchmark. The investors should be clearly informed of the same.

Reserve Requirements Banks have to maintain the appropriate SLR and CRR on the issue price of the CDs.

Transferability The physical CDs can be freely transferred by endorsement and delivery. The demated CDs can be transferred as per the procedure applicable to other demat securities. There is no lock-in period for the CDs.

Trade in CDs The trading procedure applicable to the CPs (**discussed earlier**) is also applicable to the CDs.

...the ... of ...

...

Settlement All OTC traders in CDs must be cleared and settled through the authorised clearing houses of the stock exchanges, that is, NSCCL/ICCL/CCL.

Loans/Buy-backs Loans against CDs and buy-back of CDs by the issuers before maturity are not permitted.

Format The CDs should be issued only in demat form. Issuance of CDs in physical form, if any, on the insistence of the investors should be separately reported to the RBI. The issuance of CD would attract stamp duty. There would be no grace period for repayment.

Security Since physical CDs are freely transferable by endorsement and delivery, they should be printed on good quality security paper and necessary precautions should be taken to guard against tampering with the document. They should be signed by two/more authorised signatories.

Payment of Certificate Since CDs are transferable, the physical certificate may be presented for payment to the last holder. Since the question of liability on account of any defect in the chain of endorsements may arise, banks should be cautious and make payments only by a crossed cheque. The holders of the dematted CD should approach their respective Depository Participants (DPs) and give transfer/delivery instructions to transfer the demat security represented by informational securities identification number (ISIN) to the CD Redemption Account maintained by the issuer. The holder should also communicate to the issuer by a letter/fax a copy of the delivery instruction given to the DP and intimate the place at which the payment is requested to facilitate prompt payment. Upon receipt of the demat credit of CDs in the CD Redemption Account, the issuer on maturity date would arrange to pay to the holder/transferor by way of bankers cheque/high value cheque.

Duplicate Certificate Duplicate certificates can be issued in case of loss of physical certificates only in physical form after compliance with the following: **(i)** a notice in at least one local newspaper of loss of CD certificate, **(ii)** lapse of 15 days from the date of notice and **(iii)** execution of an indemnity bond by the investor to the satisfaction of the issuer of the CD. The duplicate certificates should be only in physical form and fresh stamping would not be required.

LO 17.5 FACTORING

Factoring provides resources to finance receivables as well as facilitates the collection of receivables. Although such services constitute a critical segment of the financial services scenario in the developed countries, they appeared in the Indian financial scene only in the early nineties as a result of RBI initiatives. There are two bank-sponsored organisations which provide such services: **(i)** SBI Factors and Commercial Services Ltd, and **(ii)** Canbank Factors Ltd. The first private sector factoring company, Foremost Factors Ltd, started operations since the beginning of 1997.

Factoring involves the outright sale of receivables at a discount to a factor to obtain funds.

Definition and Mechanism

Definition Factoring can broadly be defined as an agreement in which receivables arising out of sale of goods/services are sold by a firm (client) to the 'factor' (a financial intermediary) as a result of which the title of the goods/services represented by the said receivables passes on to the factor. Henceforth, the factor becomes responsible for all credit control, sales accounting and debt collection from the buyer(s). In a full service factoring concept (without recourse facility), if any of the debtors fails to pay the dues as a result of his financial inability/insolvency/bankruptcy, the

factor has to absorb the losses.

Mechanism Credit sales generate the factoring business in the ordinary course of business dealings. Realisation of credit sales is the main function of factoring services. Once a sale transaction is completed, the factor steps in to realise the sales. Thus, the factor works between the seller and the buyer and sometimes with the seller's banks together.

Functions of a Factor

Depending on the type/form of factoring, the main functions of a **factor**, in general terms, can be classified into five categories:

- Financing facility/trade debts;
- Maintenance/administration of sales ledger;
- Collection facility/of accounts receivable;
- Assumption of credit risk/credit control and credit restriction; and
- Provision of advisory services.

Financing Trade Debts The unique feature of factoring is that a factor purchases the book debts of his client at a price and the debts are assigned in favour of the factor who is usually willing to grant advances to the extent of, say, 80 per cent of the assigned debts. Where the debts are factored **with recourse**, the finance provided would become refundable by the client in case of non-payment of the buyer. However, where the debts are factored **without recourse**, the factor's obligation to the seller becomes absolute on the due date of the invoice whether or not the buyer makes the payment.

Administration of Sales Ledger The factor maintains the clients' sales ledgers. On transacting a sales deal, an invoice is sent by the client to the customer and a copy of the same is sent to the factor. The ledger is generally maintained under the **open-item method** in which each receipt is matched against the specific invoice. The customer's account clearly reflects the various open invoices outstanding on any given date. The factor also gives periodic (fortnightly/weekly depending on the volume of transactions) reports to the client on the current status of his receivables, receipts of payments from the customers and other useful information. In addition, the factor also maintains a customer-wise record of payments spread over a period of time so that any change in the payment pattern can be easily identified.

Provision of Collection Facility The factor undertakes to collect the receivables on behalf of the client relieving him of the problems involved in collection, and enables him to concentrate on other important functional areas of the business. This also enables the client to reduce the cost of collection by way of savings in manpower, time and efforts. The use of trained manpower with sophisticated infrastructural back-up enables a factor to systematically follow up and make timely demands on the debtors to make payments. Also, the debtors are more responsible to the demands from a factor being a credit institution.

Collection of receivables can be considered as the most important function of a factor. He is generally not required to consult the client with regard to the collection procedure. But he may consult the client if legal action has to be initiated in case of non-payment and so on.

- **Factor**
- is a financial institution that specialises in purchasing accounts receivables from business firms.

- **With recourse**
- is the basis on which receivables are sold to the factor with the understanding that all credit risks would be borne by the firm.

- **Without recourse**
- is the basis on which accounts receivables are sold to a factor with the understanding that the factor accepts all credit risks on the purchased accounts.

Credit Control and Credit Restriction Assumption of credit risk is one of the important functions of a factor. This service is provided where debts are factored without recourse. The factor in consultation with the client fixes credit limits for approved customers. Within these limits, the factor undertakes to purchase all trade debts of the customer without recourse. In other words, the factor assumes the risk of default in payment by the customer. Arising from this function of the factor, there are two important incidental benefits accruing to the client: firstly, factoring relieves the client of the collection work; secondly, with access to extensive information available on the financial standing and credit rating of individual customers and their track record of payments, the factor is able to advise the client on the credit worthiness of potential customers leading to better credit control.

Operationally, the line of credit/credit limit up to which the client can sell to the customer depends on his financial position, his past payment record and the value of the goods sold by the client to the customer. One approach followed by the factors is to define the monthly sales turnover for each customer which will be automatically covered by the approved credit limit. If, for instance, the approved limit for a customer is ₹5 lakh and the average collection period is 60 days, sales up to ₹2.5 lakh $[(5 \times 30)/60]$ per month will be automatically covered. Alternatively, some factors provide periodic reports to the clients on customer-credit utilisation before any major sale is made. The credit-worthiness of customers is assessed by the factors on the basis of information from a number of sources such as credit rating reports, if available; bank reports and trade references; analysis of financial statements on the basis of current ratio, quick ratio, net profit margin and return on investment (ROI); prior collection experience; and customer visits.

Advisory Services These services are a *spin-off* of the close relationship between a factor and a client. By virtue of their specialised knowledge and experience in finance and credit dealings and access to extensive credit information, factors can provide a variety of incidental advisory services to their clients:

- Customer's perception of the client's products, changes in the marketing strategies, emerging trends and so on;
- Audit of the procedures followed for invoicing, delivery and dealing with sales returns;
- Introduction to the credit department of a bank/subsidiaries of banks engaged in leasing, hire-purchase and merchant banking.

Cost of Services The factors provide various services at a charge. The charge for collection and sales ledger administration is in the form of a commission expressed as a per cent of debt purchased.

- It is collected up-front/in advance. The commission for short-term financing as advance
 - part-payment is in the form of interest charge for the period between the date of advance payment and the date of collection/guaranteed payment date. It is also known as **discount charge**.
- Discount charge** is the interest charge for short-term financing by the factor for the period between the date of advance payment and date of guaranteed payment/collection.

Advantages and Evaluation

Advantages Factoring has several positive features from the point of view of the firm (client of the factor). Some of these advantages are briefly discussed as follows:

Impact on the Balance Sheet The impact of factoring on the balance sheet of the client and its implications are illustrated in Tables 17.1 and 17.2.

TABLE 17.1 Balance Sheet: Pre-Factoring Scenario

<i>Current liabilities</i>		<i>Current assets</i>		(₹ lakh)
Bank borrowings:		Inventory		100
Cash credit against inventory	70	Receivables		80
Cash credit against receivables	40	Other current assets		20
Other current liabilities (OCL)	40			
Net working capital (NWC)	50			
Total current liabilities + NWC	200	Total current assets		200

Current ratio = 1.33:1

The requirement of NWC is ₹50 lakh (current assets minus current liabilities). As the borrower carries other current liabilities to the extent of ₹40 lakh, he is eligible for a maximum permissible bank finance (MPBF)/ working capital limit of ₹110 lakh. This is bifurcated into cash credit limits of ₹70 lakh against inventory and ₹40 lakh against receivables, taking into account the stipulated margins for inventory and receivables and also the proportion of individual levels of inventory of ₹100 lakh and receivables of ₹80 lakh.

On the basis of the above configuration, the borrower is eligible for working capital limits aggregating ₹110 lakh under the second method of lending.

Assume the borrower decides to factor his debts. The factoring transaction is as follows: Receivables aggregating ₹80 lakh are purchased by a factor who makes prepayment of 80 per cent, that is, ₹64 lakh. He retains ₹16 lakh (factor reserve) which will be repaid on payment by the customer. The impact on the balance sheet is shown in Table 17.2.

TABLE 17.2 Balance Sheet: Post-Factoring Scenario

<i>Current liabilities</i>		<i>Current assets</i>		(₹ lakh)
Bank borrowings:		Inventory		100
Cash credit against inventory	70	Receivables		16
Cash credit against receivables	—	Other current assets		20
Other current liabilities (OCL)	16			
Net working capital (NWC)	50			
Total current liabilities + NWC	136	Total current assets		136

Current ratio = 1.58:1

The impact of factoring on the balance sheet as revealed by Tables 17.1 and 17.2 is three fold:

Off-balance Sheet Financing As the client's debts are purchased by the factor, the finance provided by him is off the balance sheet and appears in the balance sheet only as a contingent liability in the case of recourse factoring. In case of non-recourse factoring, it does not appear anywhere in the financial statements of the borrower. The prepayment of ₹64 lakh made by the factor goes off the balance sheet getting converted into cash, leaving the balance of ₹16 lakh in the balance sheet as due from the factor.

THE FIFTEENTH PART OF THE HISTORY OF THE UNITED STATES OF AMERICA, FROM THE DISCOVERY OF THE CONTINENT TO THE PRESENT TIME. BY JOHN ADAMS, ESQ. VOLUME THE FIFTEENTH.

THE SIXTEENTH PART OF THE HISTORY OF THE UNITED STATES OF AMERICA, FROM THE DISCOVERY OF THE CONTINENT TO THE PRESENT TIME. BY JOHN ADAMS, ESQ. VOLUME THE SIXTEENTH.

Reduction of Current Liabilities From the factoring proceeds of ₹64 lakh, the bank borrowings are liquidated to the extent of ₹40 lakh. The balance of ₹24 lakh can be used by the client for paying off other current liabilities comprising of trade creditors for goods and services, creditors for expenses, loan instalments payable, statutory liabilities and provisions. The client may meet any of these obligations with the balance of ₹24 lakh. The net effect is to reduce current liabilities by ₹64 lakh.

Improvement in Current Ratio As the factoring transaction is off the balance sheet, it removes from the asset side the receivables factored to the extent of the prepayment made and on the liabilities side, the current liabilities are also reduced. The result is a desirable improvement in the current ratio, from 1.33:1 to 1.58:1.

In brief, the effect of factoring is to improve the financial discipline of the firm.

Higher Credit Standing There are several reasons why factoring should improve a client's standing. With cash flow accelerated by factoring, the client is able to meet his liabilities promptly as and when they arise. The factor's acceptance of the client's receivables itself speaks highly of the quality of the receivables. In the case of non-recourse factoring, the factor's assumption of credit risk relieves the client, to a significant extent, from the problem of bad debts. This enables him to minimise his bad debts reserve.

Improved Efficiency In order to accelerate cash flow, it is essential to ensure the flow of critical information for decision making and follow-up and eliminate delays and wastage of man-hours. This requires sophisticated infrastructure for high level specialisation in credit control and sales ledger administration. Small and medium-sized units are likely to face a resource constraint in this area. Factoring is designed to place such units on the same level of efficiency in the areas of credit control and sales ledger administration as that of the more sophisticated large companies.

More Time for Planning and Production In any business concern, it is inevitable that a certain proportion of management time has to be diverted to credit control. Large companies can afford to have special departments for the purpose. However, smaller units cannot afford it. The factor undertakes the responsibility for credit control, sales ledger administration and debt collection problems. Thus, the client can concentrate on functional areas of the business line planning, purchase, production, marketing and finance.

Reduction of Cost and Expenses Since the client need not have a special administrative set-up to look after credit control, he can have the benefit of reduced overheads by way of savings on manpower, time and efforts. With the steady and reliable cash flow facilitated by factoring, the clients have many opportunities to cut costs and expenses like taking supplier's prompt payment and quantity discounts, ordering for materials at the right time and at the right place, avoidance of disruption in the production schedule, and so on.

Additional Source The supplier gets an additional source of funding the receivables which eliminates the uncertainty associated with the collection cycle. More importantly, funds from a factor is an additional source of finance for the client outside the purview of bank credit.

Evaluation Framework The distinct advantages of factoring notwithstanding, it does involve costs. The evaluation framework should be on a consideration of the relative costs and benefits associated with the two alternatives to receivables management. They are: (i) in-house management by the firm itself, (ii) factoring service, either recourse or non-recourse. The relevant costs and benefits associated with these are listed below.

Cost Associated with In-house Management (i) cash discount, (ii) cost of funds invested in receivables, (iii) bad debts, (iv) lost contribution on foregone sales and (v) avoidable costs of sales ledger administration and credit monitoring.

Costs Associated with Recourse and Non-recourse Factoring (i) factoring commission, (ii), discount charge and (iii) cost of long-term funds invested in receivables.

Benefits Associated with Recourse Factoring They are in terms of the costs associated with the in-house management alternative with the exception of item (iii), namely, bad debt loss.

Benefit Associated with Non-Recourse Factoring The above plus the bad debt losses relevant to in-house management of receivables.

The evaluation framework of factoring is elaborated in Example 17.1.

Example 17.1

The Reliance Industries Ltd (RIL) is presently managing its accounts receivable internally by the sales and credit department. Its credit terms for sales are 2/10 net, 30. The past experience of RIL has been that on an average 30 per cent of the customers avail of the discount, while the balance of the receivables is collected on an average 60 days after the invoice date. Further, 2 per cent of the sales turnover results in bad debts.

The firm is financing its investments in receivables through a mix of bank finance and long-term finance (own funds) in the ratio of 2:1. The effective rate of interest on bank finance is 12 per cent and the cost of own funds is 15 per cent.

The projected sales for the next year is ₹500 lakh. The credit and collection department spends on an average one-fourth of its time on collection of receivables.

A proposal to avail of factoring service from Fairgrowth Factors Ltd (FFL) as an alternative to in-house management of receivables collection and credit monitoring is under the consideration of the Board of Directors of the RIL. If the proposal, details of which are given as follows, is accepted, it is expected that the projected sales for the next year can increase by ₹50 lakh as a result of the diversion of the time of the executives of the sales, credit and collection department to sales promotion. For the type of product the RIL is producing, the gross margin on sales in the past has been 20 per cent. Moreover, there would be a saving in administrative overheads amounting to ₹2.5 lakh due to discontinuance of sales ledger administration and credit monitoring.

According to the factoring proposal, the FFL offers a guaranteed payment of 30 days. The other details are listed as follows:

The FFL would advance 80 per cent and 85 per cent in case of recourse and non-recourse factoring deals respectively, the balance would be retained as factor reserve. The discount charge in advance (up-front) would be 13 per cent of recourse type and 14 per cent for non-recourse type of service. The FFL would also charge a commission @ 2 per cent (recourse) and 4 per cent (non-recourse). The commission is payable up-front.

Before taking a decision on the proposal, the Board seeks your advice as a financial consultant, on the course of action. What advice would you give? Why?

Solution

Relevant Costs: In-House Management Alternative

Relevant costs	Amount (₹ lakh)	
1. Cash discount	3.0	(₹500 × 0.02 × 0.30)
2. Cost of funds in receivables	8.125	(Working note 1)
3. Bad debt losses	10.0	(₹500 × 0.02)
4. Lost contribution on foregone sales	9.0	₹50 × (0.20 - 0.02 Bad debts)
5. Avoidable administrative overheads	2.50	
Total	32.625

Working Note (1)

Cost of funds invested in receivables:

Average collection period = $(10 \text{ days} \times 0.3) + (60 \text{ days} \times 0.70) = 45 \text{ days}$

Cost of bank finance = ₹500 lakh $\times \frac{2}{3} \times \frac{45}{360} \times 0.12 = ₹5.0 \text{ lakh}$

Cost of own funds = ₹500 lakh $\times \frac{1}{3} \times \frac{45}{360} \times 0.15 = 3.125 \text{ lakh}$

Total = ₹8.125 lakh

Relevant Costs: Recourse Factoring Alternative

Relevant costs		Amount (₹ lakh)
6. Factoring commission	11.0	(₹550 \times 0.02)
7. Discount charge	4.671	(Working note 2)
8. Cost of long-term funds invested in receivables	1.485	[(₹550 - ₹431.2) \times 0.15 \times 30/360]
Total	17.156	

Working Note (2)

Eligible amount of advance = $0.80 \times (\text{₹}550 - \text{₹}11) = \text{₹}431.2 \text{ lakh}$

Discount charge = $\text{₹}431.2 \times 0.13 \times \frac{30}{360} = \text{₹}4.671 \text{ lakh}$

Relevant Costs: Non-recourse Factoring Alternative

Relevant costs		Amount (₹ lakh)
9. Factoring commission	22.0	(₹550 \times 0.04)
10. Discount charge	5.236	(Working note 3)
11. Cost of long-term funds invested in receivables	1.265	[(₹550 - ₹448.8) \times 0.15 \times 30/360]
Total	28.501	

Working Note (3)

Eligible amount of advance = $0.85 \times (\text{₹}550 - \text{₹}22) = \text{₹}448.8 \text{ lakh}$

Discount charge = $\text{₹}448.8 \times 0.14 \times \frac{30}{360} = \text{₹}5.236 \text{ lakh}$

Decision Analysis: Recourse Factoring (₹ lakh)

Benefits (₹32.625 - ₹10.00 Bad debts yet to be met by RIL)	22.625
Costs	17.156
Net benefits	5.469

Decision Analysis: Non-Recourse Factoring (₹ lakh)

Benefits (₹32.625 + ₹1.00 Bad debts loss to be borne by factor)	33.625
Costs	28.501
Net benefits	5.124

Alternatively, incremental analysis approach can be used for the decision.

(i) Incremental Analysis to Decide whether the Company should go for Recourse Factoring or not.

Particulars	Amount (₹ lakh)	
Incremental Benefits		
1. Incremental contribution on additional sales (₹50 \times 0.18)	₹9.00	
2. Savings in cost of investment in receivables (₹8.125 - 1.485)	6.64	
3. Savings in avoidable administrative overheads	2.50	
4. Savings in cash discount	3.00	21.14
Incremental Costs		
5. Factoring commission	11.00	
6. Discount charge	4.671	15.671
Net benefits		5.469

(ii) Incremental Analysis to decide whether the Company should go for Non-Recourse Factoring or Not

Particulars	Amount (₹ lakh)	
Incremental Benefits		
1. Incremental profit on additional sales (₹50 × 0.20)	₹10.00	
2. Savings in cost of investment in receivables (₹8.125 – 1.265)	6.86	
3. Savings in avoidable administrative overheads	2.50	
4. Savings in cash discount	3.00	
5. Savings in existing bad debts (₹500 lakh × .02)	10.00	32.36
Incremental costs		
6. Factoring commission	22.00	
7. Discount charge	5.236	27.236
Net benefits		5.124

As a financial consultant, my advice to the Board of RIL would be to choose recourse factoring due to higher net benefits.

Factoring in India

Factoring service is of recent origin in India. There was no codified legal framework to regulate factoring in India. The legal relationship between the factor and the client was governed by the provisions of the factoring contract. In recognition of the importance of the factoring services in the emerging financial services scenario in the country, the legal framework relating to them has been codified recently. The three elements of the framework are: **(i)** Factoring Regulation Act (FRA) 2011, **(ii)** Registration of Assignment of Receivables (Government) Rules, 2012, and **(iii)** RBI's Non-Banking Financial Company – Factor Directions, 2012. The main elements of the Factoring Act are discussed below.

The object of the **FRA** is to provide for and regulate **(i)** assignment of receivables through registration and **(ii)** rights and obligations of partners to the contract for assignment of receivables. **Assignment** means transfer by agreement of individual interest of any assignor in any receivable due from any debtors in favour of a factor in India or abroad. However, individual interest would not include creation of rights in receivables as security for loans/advances/other obligations by a bank/financial institution. **Debtor** means any person liable to the assignor to pay any receivables/discharge any obligation in respect of the receivables. The main provisions of the FRA are: **(i)** registration of factors, **(ii)** assignment of receivables, **(iii)** rights and obligations of parties to the contract for assignment of receivables, **(iv)** registration of assignments, **(v)** offences and penalties and **(vi)** miscellaneous.

Assignment
means transfer by agreement of individual interest of any assignor in any receivable due from any debtors in favour of a factor in India or abroad.

Factoring business
means the business of acquisition of receivables of assignor (i.e. the owner of any receivables) by accepting or financing their assignment by way of loans/advances or otherwise against the security interest over any receivables.

Registration of Factors To commence/carry on factoring business by a factor, a certificate of registration from the RBI is necessary excepting a bank/Government company/company under the Companies Act. **Factoring business** means the business of acquisition of receivables of assignor (i.e. the owner of any receivables) by accepting or financing their assignment by way of loans/advances or otherwise against the security interest over any receivables but excludes **(i)** credit facilities by banks in the ordinary course of business against the security of receivables, and **(ii)** any activity **(a)** as commission agent or otherwise for sale of agricultural produce/

[Faint, illegible text, possibly bleed-through from the reverse side of the page. The text is arranged in several paragraphs and includes some numbers.]

[Faint, illegible text, possibly bleed-through from the reverse side of the page. The text is arranged in several paragraphs and includes some numbers.]

goods of any kind, **(b)** relating to production, storage, supply, distribution, acquisition or control of such produce/goods or provision of any services. **Factor** means a RBI-registered NBFC, a body corporate, a bank, a company engaged in factoring business.

An existing NBFC engaged in factoring business would be granted registration by the RBI only if factoring is its **principal business** in terms of at least 50 per cent of its **(i)** assets are financial assets and **(ii)** gross income from factoring business. The provisions of the RBI Act relating to the registration of NBFCs would *mutatis mutandis* apply to factors also. (**These are discussed in Chapter 1**). All factors would be governed by RBI Act/rules/directions/guidelines. All provisions of Chapter III-B of the RBI Act relating to the NBFCs would apply *mutatis mutandis* to a factor. The RBI may at any time by general/special order direct a factor to furnish statements/ information/particulars relating to its business in the specified form/intervals/time. It may also issue directions in the interest of **(a)** business enterprise (i.e. enterprise/medium/micro/small enterprise in terms of Micro, Small and Medium Enterprise Development Act) availing of factoring services, **(b)** factors, **(c)** other stakeholders in respect of any matters relating to/connected with their factoring business.

Assignment of Receivables Any assignor (i.e. owner of the receivables) may by a written agreement assign any receivables due/payable to him by any debtor in favour of a factor as an **assignee** for a mutually agreed consideration. The assignor should disclose to the assignee any defences/rights of set-off available to the debtor. All the rights/remedies and any security interest created over any property exclusively to secure the due payment of the receivables would vest in the assignee who will have an absolute right to recover it and exercise all the rights/remedies of the assignor. **Property**

Property means **(i)** movable/immovable property, **(ii)** any secured/unsecured debt/right to receive payment of money, **(iii)** receivables, and **(iv)** intangible assets (i.e. know-how, patent, copyright, design, trade mark, licence, franchise or another similar business/commercial right). **Receivables** mean all/part of, or individual interest in, any existing/future/accruing/conditional/contingent right of any person under a contract including international contract to payment of toll or any other monetary sum, by whatever name called, for the use of any infrastructure facility/services. The assignee/factor would pay to a bank/creditor the consideration for assignment of receivables constituting security for repayment of any loan in case the assignor/owner of the receivables has given notice of the encumbrance.

Receivables mean all/part of, or individual interest in, any existing/future/accruing/conditional/contingent right of any person under a contract including international contract to payment of toll or any other monetary sum for the use of any infrastructure facility/services. A notice of assignment should be given to the debtor by the assignor/assignee with express authority in favour of the assignor to demand/receive payment from the debtor. Payment made to the assignee would fully discharge the debtor from corresponding liability in respect of such payment. Where such a notice is not given, any payment by the debtor to the assignor would be held in trust for the benefit of the assignee and paid forth to him/duly authorised agent.

Rights and Obligations of Parties to Contract for Assignment of Receivables The rights/obligations of the respective parties relate to: **(i)** notice of assignment, **(ii)** liability of debtors, **(iii)** assignors to be trustees of assignee, **(iv)** principle of debtor protection, **(v)** liability of debtor in case of micro/small enterprises, **(vi)** defences and rights of set-off of debtors, **(vii)** modification of original contract and **(viii)** breach of contract.

Notice of Assignment The debtor would have the right to notice of assignment to make payment to the assignee failing which he would be entitled to make payments

to the assignor(s) in accordance with the original contract in full discharge of his corresponding liability under the original contract.

Liability of Debtors In case of the notice of assignment, the debtor would be **(i) (a)** obliged to intimate the assignee the details of deposits/advances/payments on account already made to the assignor, **(b)** provide any other information sought by the assignor; **(ii)** entitled to a valid discharge of his liability only by making payment to the assignee.

Assignor to be Trustee of Assignee A payment due on an assigned receivables by a debtor to an assignor would be deemed to be for the benefit of the assignee and as a trustee the assignor should pay the amount to the assignee.

Liability of Debtor in Case of Micro/Small Enterprises In the event of delay in payment of receivables of a micro/small enterprise by a debtor, the assignee would be entitled to interest for the delayed period under the provisions of the Micro/Small and Medium Enterprises Development Act and he should take necessary steps to recover the interest on behalf of the assignor.

Principles of Debtor Protection The rights/obligations of a debtor including the terms/conditions of the contract can be changed only with his written consent. Consequent upon the assignment of receivables, however, no changes can be made in the payment instruction between the debtor and the assignor in regard to the original: **(i)** amount of debt, **(ii)** place of payment, and **(iii)** date of payment/other terms relating to payment.

Defences and Rights of Set-off of Debtor In any claim of payment by any assignee, the debtor may raise all defences/rights of set-off arising from the original contract which he could avail of as if the assignment had not been made and the claim was made by the assignor and not the assignee. The assignee would be entitled to recover from the assignor any loss suffered resulting from the defences/rights of set-off. The debtor may also raise against the assignee any other right of set-off if it was available to it at the time the notice of assignment from the assignor/assignee was received by him.

Modification of Original Contract Any modification in the original contract before notice of assignment of receivables between the assignor and the debtor would be binding on the assignee and he will acquire the modified rights in the assigned receivables. However, any modification made after the notice of agreement adversely affecting the rights of the assignee would be effective against him only with his consent as a reasonable assignee.

Breach of Contract If the assignor commits any breach of the original contract, the debtor would not be entitled to recover from the assignee any sum paid to the assignor/assignee pursuant to the factoring transaction. He would, however, have the right to claim from the assignor any loss/damages caused to him by the breach.

Registration of Assignments For purposes of registration, factors should file the particulars of every transaction of assignment of receivables in his favour with the Central Registry set up under the provisions of the Securitisation and Reconstruction of Financial Assets and Enforcement of Security Interest (SRFAESI) Act within 30 days from the date of assignment in the prescribed manner and on payment of the specified fee. The receivables may be described specifically/generally with reference to the debtor/period to which they relate/other identifiable general description. The central registry would maintain a central register to enter the particulars of the transaction(s) in favour of factor(s). The provisions for registration of transactions contained in the SRFAESI Act/rules would, *mutatis*

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

mutandis, apply to the record of assignment of receivables in favour of a factor in the Central Register with the Central Registry.¹

The particulars of transactions of assignment of receivables entered in the Central Register would be open for inspection by any person on payment of the prescribed fee. The provisions for maintenance of Central Register and its public inspection contained in the SRFAESI Act/rule would, *mutatis mutandis* apply.¹

Offences and Penalties Penalties (i) Default in filing penalties of any transaction with the Central Registry would be punishable with fine upto five thousand rupees for every day of default; (ii) Penalty for non-compliance of any direction of the RBI may extend upto five lakh rupees payable within 14 days and upto ten thousand rupees for every day of continuing default. Failure to pay within the specified period would be punishable with a levy/sum specified by the principal civil court/having jurisdiction in the area where the registered office/principal business of the factor is located. The levy would be enforceable in the same manner as if it were a decree made by the court in a civil suit.

Offences Contravention/attempt to contravention/abetment to contravention of the provisions of the Factoring Regulation Act/rules, for which no penalty has been provided, would be punishable with imprisonment upto one year or with fine or with both.

In case of an offence by a factor, the factor as well as every person who was in charge of/responsible to the factor for the conduct of business would be deemed to be guilty of offence and punished accordingly, unless it is proved that the offence was committed without his knowledge and he exercised due diligence to prevent commission of the offence.

Miscellaneous Some other provisions of the **FRA**, namely, confidentiality of information, inapplicability of provisions and stamp duty exemption, are discussed below:

Confidentiality of Information A factor should maintain confidentiality and not disclose to any person information obtained by it from any (i) assignor, (ii) present/future customers, (iii) its commercial/business activities and (iv) the term of sale between the assignor and any debtor and other details about the assignor except when required by order of a court/tribunal/other statutory authority.

SUMMARY

Typically, working capital requirements/current assets are financed by a combination of long-term and short-term sources. The important traditional short-term sources of current assets financing are trade credit and bank credit. Two newly emerging sources of working capital finance are factoring and commercial papers.

Trade credit represents credit extended by suppliers of goods and services in the normal course of transactions of the firm. As cash is not paid immediately for purchase but after an agreed period of time, the deferral of payment (trade credit) represents a source of finance for credit purchases (current assets). It does not involve any explicit interest charge/cost. The implicit cost of trade credit depends on the terms offered by the supplier of goods. When the terms include cash discount for prompt payment, the cost of trade credit is generally very high beyond the discount period.

Bank credit is the single most important institutional source of working capital finance. It is provided mainly in three forms (i) cash credit/overdraft, (ii) loans, and (iii) purchase/discount of bills. Of these, loans contribute the most important component. The security for working capital advances by banks is in the form of hypothecation or pledge.

¹For details refer to Khan, M Y, *Indian Financial System*, McGraw Hill Education (India), 2018, Chapter 11.

LO 17.3

Commercial papers which are unsecured promissory notes issued by firms which enjoy high credit rating are emerging as an innovative short-term source of current assets financing.

LO 17.4

Certificate of deposit is negotiable instrument issued in demat form or as usance promissory note for funds deposited at banks/FIs for a specified time period. It is a marketable receipt of funds. The framework of CD market is prescribed by the RBI.

LO 17.5

Factoring means the sale of receivables (book debts) by a firm (client) to a financial intermediary (factor) who pays when they are collected or in a guaranteed payment date. It basically involves transfer of collection of receivables and the related maintenance of records from the client to the factor. In essence, factoring is a source of financing of receivables and facilitates the process of their collection

- Depending on the type of factoring, the main functions of a factor, in general terms, are five-fold: (i) maintenance of sales ledger, (ii) collection of receivables, (iii) financing of trade debts, (iv) assumption of credit risk/control/protection and (v) provision of advisory services. For providing these services, the factors levy two types of charges. The charge for collection of receivables and sales ledger administration in the form of a commission/fee payable in advance expressed as a flat percentage of the value of the debt purchased. The charge for short-term financing in the form of advance part-payment is an interest charge/discount charge for the period between date of advance payment and the date of collection/guaranteed payment date.
- On the basis of the features built into the factoring deal to cater to the varying needs of the trade/clients, there are different types of factoring. The main classification of factoring arrangements are: (a) Recourse and non-recourse based on the assumption of credit risk associated with the collection of the receivables, (b) Advance, maturing and participation factoring related to the time of payment on account of receivables by the factor to the client, (c) Full factoring, (d) Disclosed and undisclosed factoring on the basis of the disclosure/non-disclosure of the name of the factor in the invoice, (e) Domestic and export/cross-border/international factoring based on the domicile of the parties involved.
- There is no codified legal framework to regulate factoring in India. The legal relationship between the factor and the client is governed by the provisions of the factoring contract.
- Domestic factoring, as a fund-based service, differs from bills discounting and export factoring from forfaiting which finances deferred credit transactions related to exports.
- Factoring offers several advantages to a client including (1) off-balance sheet financing, (2) reduction in current liabilities, (3) improvement in current ratio, (4) higher credit standing, (5) improved efficiency, (6) reduction of costs (7) additional sources and of funds so on. However it involves a cost in terms of fee and discount charge and evaluation of factoring should be done as a cost-benefit analysis before resorting to factoring.
- Factoring offers several advantages to a client including (1) off-balance sheet financing, (2) reduction in current liabilities, (3) improvement in current ratio, (4) higher credit standing, (5) improved efficiency, (6) reduction of costs (7) additional sources and of funds so on. However it involves a cost in terms of fee and discount charge and evaluation of factoring should be done as a cost-benefit analysis before resorting to factoring.
- There was no codified legal framework to regulate factoring in India. The legal relationship between the factor and the client was governed by the provisions of the factoring contract. In recognition of the importance of the factoring services in the emerging financial services scenario in the country, the legal framework relating to them has been codified recently. - The object of the **FRA** is to provide for and regulate (i) assignment of receivables through registration and (ii) rights and obligations of partners to the contract for assignment of receivables. **Assignment** means transfer by agreement of individual interest of any assignor in any receivable due from any debtors in favour of a factor in India or abroad. Debtor means any person liable to the assignor to pay any receivables/discharge any obligation in respect of the receivables. The main provisions of the FRA are: (i) registration of factors, (ii) assignment of receivables, (iii) rights and obligations of parties to the contract for assignment of receivables, (iv) registration of assignments, (v) offences and penalties and (vi) miscellaneous.
- To commence/carry on factoring business by a factor, a certificate of registration from the RBI is necessary excepting a bank/Government company/company under the Companies Act. **Factoring business** means the business of acquisition of receivables of assignor (i.e. the owner of any receivables) by accepting or financing their assignment by way of loans/advances or otherwise against the security interest over any receivables. Factor means a RBI-registered NBFC, a body corporate, a bank, a company engaged in factoring business.
- All factors would be governed by RBI Act/rules/directions/guidelines. All provisions of Chapter III-B of the RBI Act relating to the NBFCs would apply mutatis mutandis to a factor.
- Any assignor (i.e. owner of the receivables) may by a written agreement assign any receivables due/payable to him by any debtor in favour of a factor as an **assignee** for a mutually agreed consideration. All the rights/remedies and any security interest created over any property exclusively to secure the due payment of the receivables would vest in the assignee who will have an absolute right to recover it and exercise all the rights/remedies of the assignor. **Receivables** mean all/part of, or individual interest in, any existing/future/acruing/conditional/contingent right of any person under a contract including international contract to payment of toll or any other monetary sum, by whatever name called, for the use of any infrastructure facility/services.
- The rights/obligations of the respective parties relate to: (i) notice of assignment, (ii) liability of debtors, (iii) assignors to be trustees of assignee, (iv) principle of debtor protection, (v) liability of debtor in case of micro/small enterprises, (vi) defences and rights of set-off of debtors, (vii) modification of original contract and (viii) breach of contract.
- The debtor would have the right to notice of assignment to make payment to the assignee.
- In case of the notice of assignment, the debtor would be entitled to a valid discharge of his liability only by making payment to the assignee.
- A payment due on an assigned receivables by a debtor to an assignor would be deemed to be for the benefit of the assignee.
- In the event of delay in payment of receivables of a micro/small enterprise by a debtor, the assignee would be entitled to interest for the delayed period under.
- Consequent upon the assignment of receivables, however, no changes can be made in the payment instruction between the debtor and the assignor in regard to the original: (i) amount of debt, (ii) place of payment, and (iii) date of payment/other terms relating to payment.
- If the assignor commits any breach of the original contract, the debtor would not be entitled to recover from the assignee any sum paid to the assignor/assignee pursuant to the factoring transaction.
- For purposes of registration, factors should file the particulars of every transaction of assignment of receivables in his favour with the Central Registry set up under the provisions of the Securitisation and Reconstruction of Financial Assets and Enforcement of Security Interest (SRFAESI) Act within 30 days from the date of assignment in the prescribed manner and on payment of the specified fee.
- Default in filing details of any transaction with the Central Registry would be punishable with fine upto five thousand rupees for every day of default; (ii) Penalty for non-compliance of any direction of the RBI may extend upto five lakh rupees payable within 14 days and upto ten thousand rupees for every day of continuing default. Failure to pay within the specified period would be punishable with a levy/sum specified by the principal civil.
- Contravention/attempt to contravention/abetment to contravention of the provisions of the Factoring Regulation Act/rules, for which no penalty has been provided, would be punishable with imprisonment upto one year or with fine or with both.

SOLVED PROBLEMS

P.17.1 The turnover of R Ltd is ₹60 lakh of which 80 per cent is on credit. Debtors are allowed one month to clear off the dues. A factor is willing to advance 90 per cent of the bills raised on credit for a fee of 2 per cent a month plus a commission of 4 per cent on the total amount of debts. R. Ltd as a result of this arrangement is likely to save ₹21,600 annually in management costs and avoid bad debts at 1 per cent on the credit sales.

LO 17.5 **LOD M**

A bank has come forward to make an advance equal to 90 per cent of the debts at an annual interest rate of 18 per cent. However, its processing fee will be at 2 per cent on the debts. Would you accept factoring or the offer from the bank?

Solution

Cost of factoring:		
Fee ($0.02 \times 0.90 \times ₹4,00,000$) [⊙]		₹7,200
Commission ($0.04 \times ₹4,00,000$)		16,000
		23,200
Less: Savings in cost:		
Management costs ($₹21,600 + 12$)	₹1,800	
Savings in bad debts ($0.01 \times ₹4,00,000$)	4,000	5,800
Net cost of factoring		<u>17,400</u>
Cost of bank advance:		
Interest ($0.18 \times 1/12 \times 0.90 \times ₹4,00,000$)		5,400
Processing fee ($0.02 \times ₹4,00,000$)		8,000
Bad debts ($0.01 \times ₹4,00,000$)		4,000
		<u>17,400</u>

[⊙](Annual credit sales ₹48 lakh ÷ 12 months)

Note: It is assumed that R Ltd will continue to incur management costs.

Since the costs of both the alternatives are equal, R Ltd is likely to be indifferent between factoring and bank advance.

P.17.2 The Udar Ltd sells goods on credit. Its current annual credit sales amount to ₹900 lakh. The variable cost ratio is 80 per cent. The credit terms are 2/10, net 30. On the current level of sales, the bad debts are 0.75 per cent. The past experience has been that 50 per cent of the customers avail of the cash discount, the remaining customers pay on an average 50 days after the date of sale.

LO 17.5 **LOD D**

The book debts (receivables) of the firm are presently being financed in the ratio of 2:1 by a mix of bank borrowings and owned funds which cost per annum 25 per cent and 28 per cent respectively.

As an alternative to the in-house management of receivables, Udar Ltd is contemplating use of full advance non-recourse factoring deal with the Indbank Factors Ltd. The main elements of such a deal structured by the factor are (i) factor reserve, 15 per cent; (ii) guaranteed payment date, 24 days after the date of purchase; (iii) discount charge, 22 per cent and (iv) commission for other services (payable up-front), 4 per cent of the value of receivables.

The finance manager of Udar Ltd seeks your advice, as a consultant, on the cost-benefit of the factoring arrangement. What advice would you give? You can make your own assumptions, where necessary.

Solution

Relevant Costs: In-House Management Alternative

Relevant costs		Amount (₹ lakh)
Cash discount	9.00	(₹900 × 0.02 × 0.5)
Cost of funds in receivables	19.50	(working note 1)
Bad debt losses	6.75	(₹900 × 0.0075)
Total	35.25	

Working Note**1. Cost of funds invested in receivables:**

Average collection period = $(10 \text{ days} \times 0.5) + (50 \text{ days} \times 0.5) = 30 \text{ days}$

Average investment in debtors = $\text{₹}900 \text{ lakh} / 12 = \text{₹}75 \text{ lakh}$

Cost of bank funds = $(\text{₹}75 \text{ lakh} \times 2/3 \times 0.25) = \text{₹}12.5 \text{ lakh}$

Cost of owned funds = $\text{₹}75 \text{ lakh} \times 1/3 \times 0.28) = \text{₹}7 \text{ lakh}$

Total cost = $\text{₹}12.5 \text{ lakh} + \text{₹}7 \text{ lakh} = \text{₹}19.5 \text{ lakh}$

Decision Analysis: Non-recourse Factoring Alternative

<i>Relevant costs</i>		<i>Amount (₹ lakh)</i>
Factoring commission	36.00	$(\text{₹}900 \times 0.04)$
Discount charge	10.77	(working note 2)
Cost of owned funds invested in receivables	3.09	$(\text{₹}900 \text{ lakh} - \text{₹}734.4 \text{ lakh})$ $\times 0.28 \times 24/360$
Total	49.86	

Working Note**2. Eligible amount of advance = $0.85 \times (\text{₹}900 \text{ lakh} - \text{₹}36 \text{ lakh}) = \text{₹}734.4 \text{ lakh}$**

Discount charge = $(\text{₹}734.4 \text{ lakh} \times 0.22 \times 24/360) = \text{₹}10.77 \text{ lakh}$

Decision Analysis: Cost Benefit of Non-recourse Factoring

	<i>Amount (₹ lakh)</i>
Benefits (savings of cost as per in-house management alternative)	35.25
Cost (of non-recourse factoring alternative)	49.86
Net loss	(14.61)

Recommendation Udar Limited should not go for the factoring alternative.

MINI CASES

17.C.1 (Factoring) Sunlight Industries Ltd manages its accounts receivables internally by its sales and credit department. The cost of sales ledger administration stands at ₹9 crore annually. It supplies chemicals to heavy industries. These chemicals are used as raw material for further use or are directly sold to industrial units for consumption. There is good demand for both the types of uses. For the direct consumers, the company has a credit policy of 2/10, net 30. Past experience of the company has been that on average 40 per cent of the customers avail of the discount while the balance of the receivables are collected on average 75 days after the invoice date. Sunlight Industries also has small dealer networks that sell the chemicals. Bad debts of the company are currently 1.5 per cent of total sales.

Sunlight Industries finances its investment in debtors through a mix of bank credit and own long-term funds in the ratio of 60:40. The current cost of bank credit and long-term funds are 12 per cent and 15 per cent respectively.

There has been a consistent rise in the sales of the company due to its proactive measures in cost reduction and maintaining good relations with dealers and customers. The projected sales for the next year are ₹800 crore, up 15 per cent from last year. Gross profits have been maintained at a healthy 22 per cent over the years and are expected to continue in future.

With escalating cost associated with the in-house management of debtors coupled with the need to unburden the management with the task so as to focus on sales promotion, the CEO of Sunlight Industries is examining the possibility of outsourcing its factoring service for managing its receivables. He assigns

the responsibility to Anita Guha, the CFO of Sunlight. Two proposals, the details of which are given below, are available for Anita's consideration.

Proposal from Canbank Factors Ltd: The main elements of the proposal are: (i) Guaranteed payment within 30 days (ii) Advance, 88 per cent and 84 per cent for the recourse and non-recourse arrangements respectively (iii) Discount charge in advance, 21 per cent for with recourse and 22 per cent without recourse (iv) Commission, 4.5 per cent without recourse and 2.5 per cent with recourse.

Proposal from Indbank Factors: (i) Guaranteed payment within 30 days (ii) Advance, 84 per cent with recourse and 80 per cent without recourse (iii) Discount charge upfront, without recourse 21 per cent and with recourse, 20 per cent and (iv) Commission upfront, without recourse 3.6 per cent and with recourse 1.8 per cent.

The opinion of the Chief Marketing Manager is that in the context of the factoring arrangement, his staff would be able to exclusively focus on sales promotion which would result in additional sales of ₹75 crore.

Required The CFO of Sunlight Industries seeks your advice as a financial consultant on the alternative proposals. What advice would you give? Why? Calculations can be upto one digit only.

Solution

Financial Analysis of Receivables Management Alternatives (₹ crore)

(A) In-house Management:

Cash discount ($₹800 \text{ crore} \times 0.40 \times 0.02$)	₹6.4
Bad debts ($₹800 \text{ crore} \times 0.015$)	12.0
Opportunity cost (Foregone contribution on lost sales) [$₹75 \text{ crore} \times 0.205$ net of bad debts]	15.4
Avoidable administrative and selling expenses	9.0
Cost of investment in receivables [⊗]	14.4
Total cost	57.2

[⊗] Average collection period ($0.40 \times 10 \text{ days}$) + ($.60 \times 75 \text{ days}$) = 49 days

Investment in debtors = $₹800 \text{ crore} \times 49/360 = ₹108.9 \text{ crore}$

Cost of investment in debtors: ($₹108.9 \times 0.60 \times 0.12$) + ($₹108.9 \times 0.40 \times 0.15$) = ₹14.4 crore

(B) Canbank Factors Proposal:

	With recourse	Without recourse
Factoring commission ($₹875 \text{ crore} \times 0.025$)	21.9	—
($₹875 \text{ crore} \times 0.045$)	—	39.4
Discount charge ($₹750.7^* \text{ crore} \times 0.21 \times 30/360$)	13.1	—
($₹701.9^{**} \times 0.22 \times 30/360$)	—	12.9
Cost of long-term funds invested in debtors:		
[($₹875 \text{ crore} - ₹750.7 \text{ crore}$) $\times 0.15 \times 30/360$]	1.6	—
[($₹875 - ₹701.9 \text{ crore}$) $\times 0.15 \times 30/360$]	—	2.2
	36.6	54.5

* Amount of advance = $0.88 \times (₹875 \text{ crore} - ₹21.9 \text{ crore}) = ₹750.7 \text{ crore}$

** Amount of advance = $0.84 \times (₹875 \text{ crore} - ₹39.4 \text{ crore}) = ₹701.9 \text{ crore}$

(C) Indbank Factors Proposal:

	With recourse	Without recourse
Factoring commission ($₹875 \text{ crore} \times 0.018$)	15.7	—
($₹875 \text{ crore} \times 0.036$)	—	31.5
Discount charge ($₹721.8^{\text{£}} \text{ crore} \times 0.20 \times 30/360$)	12.0	—
($₹674.8^{\text{££}} \text{ crore} \times 0.21 \times 30/360$)	—	11.8
Cost of long-term funds invested in debtors:		
[($₹875 \text{ crore} - ₹721.8 \text{ crore}$) $\times 0.15 \times 30/360$]	1.9	—
[($₹875 - ₹674.8 \text{ crore}$) $\times 0.15 \times 30/360$]	—	2.5
	29.6	45.8

£ Amount of advance = $(₹875 \text{ crore} - ₹15.7 \text{ crore}) \times 0.84 = ₹721.8 \text{ crore}$

££ Amount of advance = $(₹875 \text{ crore} - ₹31.5 \text{ crore}) \times 0.80 = ₹674.8 \text{ crore}$

Decision Analysis: Recourse Factoring

(₹ crore)

Particulars	Can bank	Ind bank
Benefits (₹57.2 – ₹12 Bad debts to be borne by company)	45.2	45.2
Costs	36.6	29.6
Net benefits	8.6	15.6

Decision Analysis: Non-Recourse Factoring

(₹ crore)

Particulars	Can bank	Ind bank
Benefits (₹57.2 + ₹1.1 Bad debts loss to be borne by factor)	58.3	58.3
Costs	54.5	45.8
Net benefits	3.8	12.5

Advice My advice to the CFO of Sunlight Industries would be to accept the proposal of Indbank Factors for recourse factoring.

REVIEW QUESTIONS

LOD: Easy

RQ.17.1 Indicate whether the following statements are true or false.

LO 17.1,2,3,4,5

- (i) Trade credit is a spontaneous source of finance.
- (ii) There are neither explicit nor implicit financial (interest) costs of trade credit.
- (iii) Cash credits and working capital term loans are two ways by which working capital finance is obtained by banks in India.
- (iv) Like cash credit, letter of credit is also a direct form of working capital finance provided by banks.
- (v) Under hypothecation mode of security, banks provide credit to borrowers against the security of movable property, say, inventory of goods.
- (vi) Under hypothecation mode of security, goods hypothecated continue to be in the possession of the borrower.
- (vii) Like hypothecation, under pledge mode of security, goods continue to be in possession of the borrower.
- (viii) While a mortgage can be created only by the act of parties, a charge may be created by the operation of law also.
- (ix) Commercial paper is a short-term secured negotiable instrument of a fixed maturity.
- (x) Commercial papers are regulated by the SEBI.
- (xi) All public limited companies whose securities are listed on the stock exchange are entitled to raise funds by issuing commercial papers.
- (xii) Factoring involves the outright sale of receivables at a discount to a factor to obtain funds.
- (xiii) Since factoring involves the outright sale of receivables, bad-debts losses are to be borne by the factor.
- (xiv) Rate of commission charged by a factor is the same whether the debts are factored with recourse or without recourse.
- (xv) Factoring without recourse facilitates off-balance sheet financing.

[Answers: (i) True (ii) False (iii) False (iv) False (v) True (vi) True (vii) False (viii) True (ix) False (x) False (xi) False (xii) True (xiii) False (xiv) False (xv) True]

RQ. 17.2 What are the features of trade credit as a short-term source of working capital finance? How can the cost of trade credit be calculated? [LO 17.1]

LOD: Medium

RQ. 17.3 Discuss the main forms of working capital advance by banks. What is the kind of security required by them? [LO 17.2]

RQ. 17.4 Briefly outline the main elements of the emerging system of bank financing of industry. [LO 17.2,3]

RQ. 17.5 Discuss the main features of certificates of deposits (CDs) as a source of working capital financing. [LO 17.4]

RQ. 17.6 Discuss briefly commercial papers as source of working capital finance. How would you compute the cost of commercial papers? [LO 17.3]

RQ. 17.7 What is factoring? Give a brief account of the major functions of a factor. [LO 17.5]

LOD: Difficult

RQ. 17.8 Show, with illustration, the impact of factoring on the balance sheet of the client. [LO 17.5]

RQ. 17.9 Explain and illustrate the framework of evaluation of a factoring deal. [LO 17.5]

RQ.17.10 Discuss the main elements of the Factoring Act. [LO 17.5]

RQ.17.11 The Udar Ltd sells goods on credit. Its current annual credit sales (turnover) amount to ₹810 lakh. The credit terms of Udar Ltd are 2/10, net 30. On the current level of sales, the bad debts are 1 per cent. The past experience has been that 50 per cent of the customers avail of the cash discount; the remaining customers pay on an average 70 days after the date of sale. [LO 17.5]

The book debts (receivables) of Udar Ltd are at present being financed on a 67:33 basis by a mix of bank borrowings and owned funds which cost per annum 25 per cent and 28 per cent respectively.

As an alternative to the in-house management of receivables, Udar Ltd is contemplating the use of full advance non-recourse factoring deal with the Fairgrowth Factors Ltd. The main elements of such a deal structured by the factor are (i) factor reserve, 15 per cent; (ii) guaranteed payment date, 24 days after the date of purchase; (iii) discount charge, 22 per cent and (iv) commission for other services, 4 per cent of the value of receivables.

The finance manager of Udar Ltd seeks your advice, as a consultant, on the cost-benefit of the factoring arrangement. What advice would you give? You can make your own assumptions, where necessary.

RQ.17.12 The following facts relate to the Avon Industries Ltd (AIL): [LO 17.5]

- Annual credit turnover in the current financial year, ₹1,200 lakh;
- Average collection period, 75 days;
- Cost of funds, 0.21 per annum;
- Annual credit and collection expenditure, ₹20 lakh of which three-fourths is avoidable;
- Bad debts, 1 per cent of sales

The Foremost Factors Ltd offers a factoring deal to the AIL. It proposes to charge a commission as percentage of the value of book debts of 2 per cent for recourse factoring and 3.5 per cent for non-recourse factoring. In addition, it would charge 22 per cent per annum as discount/interest for pre-payment (advance against uncollected and not due receivables) to the extent of 80 per cent of the value of the receivables. The guaranteed payment/collection date is 60 days.

Making your own assumption where necessary, what advice would you give to AIL, to continue with the in-house management of receivables or accept the factoring arrangement?

ANSWERS

- 17.11** Cost of non-recourse factoring alternative, ₹44.87 lakh; Cost of In-house management alternative, ₹39.59 lakh; Factoring alternative is not recommended.
- 17.12** Factoring alternative is not recommended; Non-recourse factoring, net loss (6.05 lakh); Recourse factoring, net loss (0.07 lakh).

Chapter 19

CAPITAL STRUCTURE, COST OF CAPITAL AND VALUATION

Chapter 20

DESIGNING CAPITAL STRUCTURE

The second major area in financial management is the financing/capital structure decision. The financing decision involves the choice of an appropriate mix of different sources of financing, namely, owners' funds and outsider/lenders' funds. The selection of the capital structure will obviously depend on the bearing that it has on the firm's objective of maximisation of shareholders' wealth. A financing mix which will lead to maximisation of shareholders' wealth as reflected in the market price of shares is termed as an optimum capital structure. This Part of the book is devoted to a comprehensive discussion of the important dimensions of the financing decision of a firm. Chapter 18 discusses operating, financial and combined leverage as a setting to the in-depth analysis of the relationship between the composition of the source of financing and the value of the firm. The theoretical relationship between capital structure and the valuation of a firm is examined in Chapter 19. The appropriateness of a capital structure will vary from firm to firm and, therefore, an optimum capital structure should be designed in the light of facts and circumstances of each firm. The factors having a bearing on designing a suitable capital structure are outlined in Chapter 20.

ANSWERS

1. The firm's operating leverage is 1.5. The firm's financial leverage is 1.5. The firm's combined leverage is 2.25. The firm's operating leverage is 1.5. The firm's financial leverage is 1.5. The firm's combined leverage is 2.25.

PART

2. The firm's operating leverage is 1.5. The firm's financial leverage is 1.5. The firm's combined leverage is 2.25.

Operating, Financial and Combined Leverage

LEARNING OBJECTIVES

LO 18.1	Understand the concept, measurement and behaviour of operating
LO 18.2	Discuss the financial leverage, financial BEP, indifference point and the EBIT-EPS approach to compare alternative capital structures using both algebraic determination and graphic presentation
LO 18.3	Explain the relationship between total/combined leverage and total risk of a firm

INTRODUCTION

The purpose of this Chapter is to set forth a framework for the financing decision of a firm. It discusses the principles and types of leverage. As mentioned earlier, a firm can make use of different sources of financing whose costs are different. These sources may be, for purposes of exposition, classified into those which carry a fixed rate of return and those on which the returns vary. The fixed returns on some sources of finance have implications for those who are entitled to a variable return. Thus, since debt involves the payment of a stated rate of interest, the return to the ordinary shareholders is affected by the magnitude of debt in the capital structure of a firm.

The employment of an asset or source of funds for which the firm has to pay a fixed cost or fixed return may be termed as **leverage**. Consequently, the earnings available to the shareholders as also the risk are affected. If earnings less the variable costs exceed the fixed cost, or earnings before interest and taxes exceed the fixed return requirement, the leverage is called favourable. When they do not, the result is unfavourable leverage.

There are two types of leverage—'operating' and 'financial'. The leverage associated with investment (asset acquisition) activities is referred to as **operating leverage**, while leverage associated with financing activities is called **financial leverage**.¹ While we are basically concerned with financial leverage for purposes of the financing decision of a firm, the discussion of operating leverage is to serve as a background to the understanding of financial leverage because the two types of leverage are closely related.

- **Leverage**
- is the employment
- of an asset/source
- of finance for which
- firm pays fixed
- cost/fixed return.

2014

Dear Mr. [Name],

I am writing to you regarding the [Project Name] which is currently in progress. The project is aimed at [Project Description] and is expected to be completed by [Timeline].

The project is currently in the [Phase] stage and we are making good progress. We have identified several key areas for improvement and are working to address them as quickly as possible.

We are currently [Action] and we expect to have a final report ready by [Date]. We will be happy to provide you with a copy of the report as soon as it is available.

If you have any questions or need further information, please do not hesitate to contact me at [Contact Information].

Thank you for your interest in the project and for your support.

Sincerely,
[Name]

Operating leverage is determined by the relationship between the firm's sales revenues and its earnings before interest and taxes (EBIT). The earnings before interest and taxes (albeit includes non-operating incomes) are also generally called as **operating profits**. Financial leverage represents the relationship between the firm's earnings before interest and taxes (operating profits) and the earnings available for ordinary shareholders. The operating profits (EBIT) are, thus, used as the pivotal point in defining operating and financial leverage. In a way, operating and financial leverage represent two stages in the process of determining the earnings available to the equity shareholders and, hence, their discussion in this chapter. Apart from the elaboration of the return-risk implications, their combined effect has also been discussed. The major points are also summarised by way of recapitulation.

LO 18.1 OPERATING LEVERAGE

Operating leverage results from the existence of fixed operating expenses in the firm's income stream.

Operating leverage is caused due to fixed operating expenses in a firm.

The operating costs of a firm fall into three categories: **(i)** fixed costs which may be defined as those which do not vary with sales volume; they are a function of time and are typically contractual; they must be paid regardless of the amount of revenues available; **(ii)** variable costs which vary directly with the sales volume; and **(iii)** semi-variable or semi-fixed costs are those which are partly fixed and partly variable. They are fixed over a certain range of sales volume and increase to higher levels for higher sales volumes. Since the last category of costs can be broken down into fixed and variable components, the costs of a firm, in operational terms, can be divided into **(a)** fixed, and **(b)** variable.

The operating leverage may be defined as the *firm's ability to use fixed operating costs to magnify the effects of changes in sales on its earnings before interest and taxes*. Operating leverage occurs any time a firm has fixed costs that must be met regardless of volume. We employ assets with fixed cost in the hope that volume will produce revenues more than sufficient to cover all fixed and variable costs. In other words, with fixed costs, the percentage change in profits accompanying a change in volume is greater than the percentage change in volume. This occurrence is known as operating leverage. Consider Example 18.1.

Example 18.1

A firm sells products for ₹100 per unit, has variable operating costs of ₹50 per unit and fixed operating costs of ₹50,000 per year. Show the various levels of EBIT that would result from sale of (i) 1,000 units (ii) 2,000 units and (iii) 3,000 units.

Solution

If sales level of 2,000 units are used as a base for comparison, the operating leverage is illustrated in Table 18.1

TABLE 18.1 EBIT for Various Sales Levels

	Case 2	Base	Case 1
	-50%		+50%
1. Sales in units	1,000	2,000	3,000
2. Sales revenue	₹1,00,000	₹2,00,000	₹3,00,000
3. Less: Variable operating cost	50,000	1,00,000	1,50,000
4. Contribution	50,000	1,00,000	1,50,000
5. Less: Fixed operating cost	50,000	50,000	50,000
6. EBIT	Zero	50,000	1,00,000
	-100%		+100%

From the results contained in Table 18.1, certain generalisations follow:

- (i) **Case 1:** A 50 per cent increase in sales (from 2,000 to 3,000 units) results in a 100 per cent increase in EBIT (from ₹50,000 to ₹1,00,000).
 (ii) **Case 2:** A 50 per cent decrease in sales (from 2,000 to 1,000 units) results in a 100 per cent decrease in EBIT (from ₹50,000 to zero).

Example 18.2

A firm sells its products for ₹50 per unit, has variable operating costs of ₹30 per unit and fixed operating costs of ₹5,000 per year. Its current level of sales is 300 units. Determine the degree of operating leverage. What will happen to EBIT if sales change: (a) rise to 350 units, and (b) decrease to 250 units?

Solution

The EBIT for various sales levels is computed in Table 18.2.

TABLE 18.2 EBIT at Various Sales Levels

	Case 2 -16.7%	Base	Case 1 +16.7%
1. Sales in units	250	300	350
2. Sales revenue	₹12,500	₹15,000	₹17,500
3. Less: Variable cost	7,500	9,000	10,500
4. Contribution	5,000	6,000	7,000
5. Less: Fixed operating cost	5,000	5,000	5,000
6. EBIT	Zero	1,000	2,000
	-100%		+100%

Interpretation In case 2, 16.7 per cent decrease in sales volume (from 300 units to 250 units) leads to 100 per cent decline in the EBIT (from ₹1,000 to zero). On the other hand, a 16.7 per cent increase in the sales level in case 1 (from 300 units to 350 units) results in 100 per cent increase in EBIT (from ₹1,000 to ₹2,000).

The two illustrations (Tables 18.1 and 18.2) clearly show that when a firm has fixed operating costs, an increase in sales volume results in a more than proportionate increase in EBIT. Similarly, a decrease in the level of sales has an exactly opposite effect. This is operating leverage; the former being favourable leverage, while the latter is unfavourable. Leverage, thus, works in both directions.

Alternative Definition of Operating Leverage

Operating leverage can also be defined and illustrated in another way. This is a more precise measurement in terms of degree of operating leverage (DOL). The DOL measures in quantitative terms the extent or degree of operating leverage.

When proportionate change in EBIT as a result of a given change in sales is more than the proportionate change in sales, operating leverage exists. The greater the DOL, the higher is the operating leverage. Symbolically,

$$\text{DOL} = \frac{\text{Percentage change in EBIT}}{\text{Percentage change in sales}} > 1 \quad (18.1)$$

$$\text{Alternatively, DOL} = \frac{\Delta \text{EBIT} + \text{EBIT}}{\Delta Q + Q}$$

Income Statement for the year ended 31st March 1955. The total income for the year was £100,000. The total expenses for the year were £80,000. The net income for the year was £20,000. The net income for the year was £20,000. The net income for the year was £20,000.

INCOME STATEMENT

Income Statement for the year ended 31st March 1955. The total income for the year was £100,000. The total expenses for the year were £80,000. The net income for the year was £20,000. The net income for the year was £20,000. The net income for the year was £20,000.

Income	£100,000	
Expenses	(80,000)	
Net Income		£20,000

Income Statement for the year ended 31st March 1955. The total income for the year was £100,000. The total expenses for the year were £80,000. The net income for the year was £20,000. The net income for the year was £20,000. The net income for the year was £20,000.

Income	£100,000	
Expenses	(80,000)	
Net Income		£20,000

Income Statement for the year ended 31st March 1955. The total income for the year was £100,000. The total expenses for the year were £80,000. The net income for the year was £20,000. The net income for the year was £20,000. The net income for the year was £20,000.

Income	£100,000	
Expenses	(80,000)	
Net Income		£20,000

$$\text{EBIT} = Q(S - V) - F, \Delta \text{EBIT} = \Delta Q(S - V)$$

Where Q = Sales quantity in units,
 S = Selling price per unit,
 V = Variable cost per unit, and
 F = Total fixed costs.

$$\text{DOL} = \frac{\Delta Q(S - V)}{Q(S - V) - F} \times \frac{Q}{\Delta Q} = \frac{Q(S - V)}{Q(S - V) - F} = \frac{\text{Total Contribution (at base level)}}{\text{EBIT (at base level)}} \quad (18.2)$$

Applying Equations 18.1 and 18.2 to Example 18.1 we get,

$$\text{DOL} = \frac{+100\%}{+50\%} = 2 \text{ (Case 1), } \frac{-100\%}{-50\%} = 2 \text{ (Case 2)}$$

$$\text{or} \quad = ₹1,00,000/₹50,000 = 2$$

Similarly, in Example 18.2,

$$\text{DOL} = \frac{+100\%}{+16.7\%} = 6 \text{ (Case 1), } \frac{-100\%}{-16.7\%} = 6 \text{ (Case 2)}$$

$$\text{or} \quad = ₹6,000/₹1,000 = 6$$

Since the DOL exceeds 1 in both the illustrations, operating leverage exists. However, the degree of operating leverage is higher (3 times) in the case of the firm in Example 18.2 as compared to the firm in Example 18.1, the respective quotients being 6 and 2. The quotients mean that for every 1 per cent change in sales, there will be 6 per cent (Examples 18.2) and 2 per cent (Example 18.1) change in EBIT in the direction the sales change.

However, operating leverage exists only when there are fixed operating costs. If there are no fixed operating costs, there will be no operating leverage. Consider Example 18.3.

Example 18.3

Particulars	Base Level	New Level
1. Units sold	1,000	1,100
2. Sales price per unit	₹10	₹10
3. Variable cost per unit	6	6
4. Fixed operating cost	Nil	Nil

Solution

The relevant computations are given in Table 18.3.

TABLE 18.3 EBIT for Various Sales Volume

Particulars	Base Level	New Level
1. Sales revenues	₹10,000	₹11,000
2. Less: Variable costs	6,000	6,600
3. Less: Fixed costs	—	—
4. EBIT	4,000	4,400

Applying Equation 18.1, $\text{DOL} = 1$. Since the quotient is 1, there is no operating leverage.

Since operating leverage (magnifying the effects of a change in sales) can be favourable or unfavourable, higher levels of risk are attached to higher degrees of leverage. Since DOL depends on fixed operating costs, it logically follows that the larger the fixed operating cost, the higher is

the firm's operating leverage and its operating risk. High operating leverage is good when revenues are rising and bad when they are falling. **Operating risk** is the risk of the firm not being able to cover its fixed operating costs. The larger the magnitude, the larger the volume of sales required to cover all fixed costs.

- **Operating risk**
- is risk of not being
- able to cover fixed
- operating costs.

LO 18.2 FINANCIAL LEVERAGE

As already indicated, financial leverage relates to the financing activities of a firm. The sources from which funds can be raised by a firm, from the point of view of the cost/charges, can be categorised into **(i)** those which carry a fixed financial charge, and **(ii)** those which do not involve any fixed charge. The sources of funds in the first category consist of various types of long-term debt, including bonds, debentures, and preference shares. Long-term debts carry a fixed rate of interest which is a contractual obligation for the firm. Although the dividend on preference shares is not a contractual obligation, it is a fixed charge and must be paid before anything is paid to the ordinary shareholders. The equity shareholders are entitled to the remainder of the operating profits of the firm after all the prior obligations are met. We assume in the subsequent discussions that all preference dividends are paid in order to ascertain the operating profits available for distribution to ordinary shareholders.

Financial leverage results from the presence of fixed financial charges in the firm's income stream. These fixed charges do not vary with the earnings before interest and taxes (EBIT) or operating profits. They are to be paid regardless of the amount of EBIT available to pay them. After paying them, the operating profits (EBIT) belong to the ordinary shareholders. Financial leverage is concerned with the effects of changes in EBIT on the earnings available to equityholders. It is defined as the **ability of a firm to use fixed financial charges to magnify the effects of changes in EBIT on the earnings per share**². In other words, financial leverage involves the use of funds obtained at a fixed cost in the hope of increasing the return to the shareholders.

- **Financial leverage**
- is caused due to
- fixed financial costs
- (interest).

Favourable or positive leverage occurs when the firm earns more on the assets purchased with the funds, than the fixed cost of their use. Unfavourable or negative leverage occurs when the firm does not earn as much as the funds cost. Thus, financial leverage is based on the assumption that the firm is to earn more on the assets that are acquired by the use of funds on which a fixed rate of interest/dividend is to be paid. The difference between the earnings from the assets and the fixed cost on the use of the funds goes to the equity holders. In a way, therefore, use of fixed-interest sources of funds provides increased return on equity investment without additional requirement of funds from the shareholders. Financial leverage is also, therefore, called as 'trading on equity'. However, in periods of persisting adversity when earnings are not adequate, the presence of fixed charges will imply that the shareholders will have to bear the burden. Thus, the leverage/trading on equity will operate in the opposite direction such that the earnings per share, instead of increasing, will actually fall as a result of the use of funds carrying fixed cost.

The financial leverage is illustrated in Example 18.4.

Example 18.4

The financial manager of the Hypothetical Ltd expects that its earnings before interest and taxes (EBIT) in the current year would amount to ₹10,000. The firm has 5 per cent bonds aggregating ₹40,000, while the 10 per cent preference shares amount to ₹20,000. What would be the earnings per share (EPS)? Assuming the EBIT being (i) ₹6,000, and (ii) ₹14,000, how would the EPS be affected? The firm can be assumed to be in the 35 per cent tax bracket. The number of outstanding ordinary shares is 1,000.

Solution**TABLE 18.4** EPS for Various EBIT Levels

	Case 2 -40%	Base	Case 1 +40%
EBIT	₹6,000	₹10,000	₹14,000
Less: Interest on bonds	2,000	2,000	2,000
Earnings before taxes (EBT)	4,000	8,000	12,000
Less: Taxes (35%)	1,400	2,800	4,200
Earning after taxes (EAT)	2,600	5,200	7,800
Less: Preference dividend	2,000	2,000	2,000
Earnings available for ordinary shareholders	600	3,200	5,800
Earnings per share (EPS)	0.6	3.2	5.8
	-81.25%		+81.25%

The interpretation of Table 18.4 is as follows:

Case 1: A 40 per cent increase in EBIT (from ₹10,000 to ₹14,000) results in 81.25 per cent increase in EPS (from ₹3.2 to ₹5.8).

Case 2: A 40 per cent decrease in EBIT (from ₹10,000 to ₹6,000) leads to 81.25 per cent decrease in EPS (from ₹3.2 to ₹0.6).

Example 18.5

A company has ₹1,00,000, 10% debentures and 5,000 equity shares outstanding. It is in the 35 per cent tax-bracket. Assuming three levels of EBIT (i) ₹50,000, (ii) ₹30,000, and (iii) ₹70,000, calculate the change in EPS (base level of EBIT = ₹50,000).

Solution**TABLE 18.5** EPS at Various EBIT Levels

	Case 2 -40%	Base	Case 1 +40%
EBIT	₹30,000	₹50,000	₹70,000
Less: interest	10,000	10,000	10,000
Earnings before taxes	20,000	40,000	60,000
Less: Taxes	7,000	14,000	21,000
Earning after taxes	13,000	26,000	39,000
Earnings per share (EPS)	2.6	5.2	7.8
	-50%		+50%

Thus, a 40 per cent increase in EBIT in case 2 from the base level of EBIT has led to 50 per cent increase in EPS. And a decrease of 40 per cent in EBIT has decreased the EPS by 50 per cent.

The preceding examples show that the presence of fixed-interest sources funds leads to a more than proportionate change in EPS as a result of change in EBIT level. Whenever a firm has fixed cost in its capital structure, financial leverage is present. The greater the amount of fixed-interest sources of funds (and, therefore, the larger is the fixed-financial cost), the higher is the financial leverage. For instance, in Example 18.4, the amount of fixed financial cost is higher than in Example 18.5 owing to the preference dividend. As a result of this difference, the proportionate change in EPS was much higher (± 81.25 per cent) for Example 18.4 as compared to Example 18.5 (± 50 per cent) although the changes in EBIT in both cases are the same (± 40 per cent).

Alternative Definition of Financial Leverage

The procedure outlined above is merely indicative of the presence or absence of financial leverage. Financial leverage can be more precisely expressed in terms of the degree of financial leverage (DFL). The DFL can be calculated by Eq. (18.3)

$$DFL = \frac{\text{Percentage change in EPS}}{\text{Percentage change in EBIT}} > 1 \quad (18.3)$$

$$\text{Alternatively, } DFL = \frac{\Delta \text{EPS} + \text{EPS}}{\Delta \text{EBIT} + \text{EBIT}}$$

$$\begin{aligned} \text{EPS} &= \frac{[(\text{EBIT} - I)(1 - t) - D_p]}{N} \\ &= \frac{[Q(S - V) - F - I](1 - t) - D_p}{N} \end{aligned}$$

Since, F , I and D_p are constants,

$$\Delta \text{EPS} = [\Delta Q(S - V)](1 - t)/N$$

$$\frac{\Delta \text{EPS}}{\text{EPS}} = \frac{[\Delta Q(S - V)](1 - t)}{[Q(S - V) - F - I](1 - t) - D_p}$$

Dividing numerator and denominator by $(1 - t)$

$$\begin{aligned} DFL &= \frac{\frac{\Delta Q(S - V)}{[Q(S - V) - F - I] - D_p/(1 - t)}}{\frac{Q(S - V) - F}{[Q(S - V) - F - I] - D_p/(1 - t)}} \times \frac{Q(S - V) - F}{\Delta Q(S - V)} \\ &= \frac{Q(S - V) - F}{[Q(S - V) - F - I] - D_p/(1 - t)} = \frac{\text{EBIT}}{\text{EBIT} - I - D_p/(1 - t)} \quad (18.4) \end{aligned}$$

Applying Equations 18.3 to Case 1 and Case 2 in Examples 18.4 and 18.5,

$$(i) \text{ For Example 18.4: Case 1} = \frac{+81.25\%}{+40\%} = 2.03, \text{ Case 2} = \frac{-81.25\%}{-40\%} = 2.03$$

$$= \frac{\text{₹}10,000}{\text{₹}10,000 - \text{₹}2,000 - [\text{₹}2,000/(1 - 0.35)]} = 2.03$$

$$(ii) \text{ Example 18.5: Case 1} = \frac{+50\%}{+40\%} = 1.25, \text{ Case 2} = \frac{-50\%}{-40\%} = 1.25$$

$$= \frac{\text{₹}50,000}{\text{₹}50,000 - \text{₹}10,000} = 1.25$$

As a rule, when a percentage change in EPS resulting from a given percentage change in EBIT is greater than the percentage change in EBIT, financial leverage exists. In other words, financial leverage occurs when the quotient in Equation 18.3 is more than one.

In both the examples, the relevant quotient is larger than one. Therefore, financial leverage exists. But the degree of financial leverage is higher in Example 18.4 (2.03) than in Example 18.5 (1.25). The higher the quotient of percentage change in EPS due to percentage change in EBIT, the greater is the degree of financial leverage. The quotient of 2.03 implies that 1 per cent change in EBIT will cause 2.03 per cent change in EPS in the same direction (\pm increase/decrease) in which the EBIT changes. With 1.25 quotient the proportionate change in EPS as a result of 1 per cent change in EBIT will be comparatively less, that is, 1.25 per cent in either direction.

There will be, however, no financial leverage, if there is no fixed-charged financing. (Table 18.6).

TABLE 18.6 EPS at Various EBIT Levels

	Case 2 -40%	Base	Case 1 +40%
EBIT	₹30,000	₹50,000	₹70,000
Less: Taxes (0.35)	10,500	17,500	24,500
Earnings available for equity-holders	19,500	32,500	45,500
Number of shares	10,000	10,000	10,000
EPS	1.95	3.25	4.55
	-40%		+40%

Degree of financial leverage (DFL): Applying Eq. (18.3)

$$(i) \text{ Case 1} = \frac{+40\%}{+40\%} = 1$$

$$(ii) \text{ Case 2} = \frac{-40\%}{-40\%} = 1$$

Thus, the quotient is 1. Its implication is that 1 per cent change in EBIT will result in 1 per cent change in EPS, that is, proportionate. There is, therefore, no magnification in the EPS.

Like operating leverage, higher levels of risks are attached to higher degrees of financial leverage also. High fixed financial costs increase the financial leverage and, thus, financial risk. The **financial risk** refers to the risk of the firm not being able to cover its fixed financial costs. With the increase in financial charges, the firm is also required to raise the level of EBIT necessary to meet financial charges. If the firm cannot cover these financial payments, it can be technically forced into liquidation. Therefore, the very existence of the business is at stake. Obviously, the financial manager should take into consideration all such factors while formulating the firm's financing

Financial risk is the risk of not being able to cover fixed financial costs by a firm.

plan in terms of the mix of various sources of long-term funds, viz. long-term debts, preference shares, equity funds including retained earnings. One of the objectives of planning an appropriate capital structure is to provide a high income for the equity owners, that is, to increase the EPS. To devise an appropriate capital structure or financing plan, the amount of EBIT under various financing plans should be related to EPS. Thus, one widely used means of examining the effect of leverage is to analyse the relationship between EBIT and EPS.

EBIT-EPS analysis involves

comparison of alternative methods of financing at various levels of EBIT.

EBIT-EPS Analysis

The **EBIT-EPS analysis**, as a method to study the effect of leverage, essentially involves the comparison of alternative methods of financing under various *assumptions* of EBIT. A firm has the choice to raise funds for financing its investment proposals from different sources in different proportions. For instance, it can

(i) exclusively use equity capital (ii) exclusively use debt, (iii) exclusively use preference capital, (iv) use a combination of (i) and (ii) in different proportions; (v) a combination of (i), (ii) and (iii) in different proportions, (vi) a combination of (i) and (iii) in different proportions, and so on. The choice of the combination of the various sources would be one which, given the level of earnings before interest and taxes, would ensure the largest EPS. Consider Example 18.6.

Example 18.6

Suppose a firm has a capital structure exclusively comprising of ordinary shares amounting to ₹10,00,000. The firm now wishes to raise additional ₹10,00,000 for expansion. The firm has four alternative financial plans:

- It can raise the entire amount in the form of equity capital.
- It can raise 50 per cent as equity capital and 50 per cent as 5% debentures.
- It can raise the entire amount as 6% debentures.
- It can raise 50 per cent as equity capital and 50 per cent as 5% preference capital.

Further assume that the existing EBIT are ₹1,20,000, the tax rate is 35 per cent, outstanding ordinary shares 10,000 and the market price per share is ₹100 under all the four alternatives.

Which financing plan should the firm select?

Solution

TABLE 18.7 EPS Under Various Financial Plans

Particulars	Financing plans			
	A	B	C	D
EBIT	₹1,20,000	₹1,20,000	₹1,20,000	₹1,20,000
Less: Interest	—	25,000	60,000	—
Earnings before taxes	1,20,000	95,000	60,000	1,20,000
Taxes	42,000	33,250	21,000	42,000
Earnings after taxes	78,000	61,750	39,000	78,000
Less: Preference dividend	—	—	—	25,000
Earnings available to ordinary shareholders	78,000	61,750	39,000	53,000
Number of shares	20,000	15,000	10,000	15,000
Earnings per share (EPS)	3.9	4.1	3.9	3.5

The calculations in Table 18.7 reveal that given a level of EBIT of ₹1,20,000, the financing alternative B, which involves 50 per cent ordinary shares and 50 per cent debt, is the most favourable with respect to EPS. Another disclosure of the table is that although the proportion of ordinary shares in the total capitalisation under the financing plan D is also 50 per cent, that is, equal to plan B, EPS is considerably different (lowest). The difference in the plans B and D is due to the fact that interest on debt is tax-deductible while the dividend on preference shares is not. With 35 per cent income tax, the explicit cost of preference shares would be higher than the cost of debt.

Table 18.7 also indicates that the annual before-tax costs of the various financing plans are:

- Financing Plan B ₹25,000
- Financing Plan C 60,000
- Financing Plan D $(₹25,000/1 - 0.35)$ 38,462

Financing plan A involves no cost as there is no fixed financial charge. That the financing plan involves a specific amount of cost, is another way of saying that an equal amount of earnings before interest and taxes is necessary to cover the fixed financial charges. Since preference dividend is not tax-deductible, we must divide the total dividends by one, minus the tax rate, in order to obtain

The first of these is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

TABLE I

Year	Total number of cases	Number of deaths
1930	1,000,000	100,000
1931	1,500,000	150,000

The second factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

The third factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

The fourth factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

The second factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

The third factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

TABLE II

Year	Total number of cases	Number of deaths
1930	1,000,000	100,000
1931	1,500,000	150,000

The fourth factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

The fifth factor is the fact that the total number of cases of influenza in the United States in 1930 was 1,000,000, and that the total number of cases in 1931 was 1,500,000. This increase in the number of cases is due to a number of factors, including a more widespread distribution of the virus, a more severe form of the disease, and a more prolonged duration of the illness.

the EBIT necessary to cover these dividends as a financial charge. Assuming a 35 per cent tax rate, preference dividend of ₹25,000 can be paid on EBIT of ₹38,462. The fixed financial charge would, therefore, be higher. Earnings per share would be zero for plans B, C and D for the EBIT level of ₹25,000, ₹60,000 and ₹38,462 respectively. This level of EBIT may be termed as **financial break even (BEP)** level of earnings before interest and taxes because it represents the level of EBIT necessary for the firm to break even on its fixed financial charge. In other words, it is the level of EBIT at which the firm can satisfy all fixed financial charges (i.e. interest and preference dividend). EBIT less than this level will result in negative EPS. The financial break-even point can be determined by Eq. (18.5).

Financial BEP is the level of EBIT which is equal to firm's fixed financial costs.

financial break even (BEP) level of earnings before interest and taxes because it represents the level of EBIT necessary for the firm to break even on its fixed financial charge. In other words, it is the level of EBIT at which the firm can satisfy all fixed financial charges (i.e. interest and preference dividend). EBIT less than this level will result in negative EPS. The financial break-even point can be determined by Eq. (18.5).

$$\text{Financial break-even point} = I + \frac{D_p}{1-t} \quad (18.5)$$

where I = Annual interest charges,

D_p = Preference dividend, and

t = Tax rate

Equation 18.5 gives before-tax earnings necessary to cover the firm's fixed financial obligations.

As fixed financial charges are added, the break-even point for zero EPS is increased by the amount of the additional fixed cost. Beyond the financial break-even point, increase in EPS is more than the proportionate increase in EBIT. This is illustrated in Table 18.8, which presents the EBIT-EPS relationship for the data in Example 18.6 under the various EBIT assumptions given in the box:

- (i) ₹80,000 (4 per cent return on total assets)
- (ii) 1,00,000 (5 per cent return on total assets)
- (iii) 1,30,000 (6.5 per cent return on total assets)
- (iv) 1,60,000 (8 per cent return on total assets)
- (v) 2,00,000 (10 per cent return on total assets)

TABLE 18.8 EBIT-EPS Analysis under Various EBIT Assumptions for the Four Financing Plans of Example 18.6

(i) EBIT = ₹80,000 (4 per cent return on investments)

Particulars	Financing Plans			
	A	B	C	D
EBIT	80,000	80,000	80,000	80,000
Less: Interest	—	25,000	60,000	—
EBT	80,000	55,000	20,000	80,000
Less: Taxes	28,000	19,250	7,000	28,000
EAT	52,000	35,750	13,000	52,000
Less: Preference dividend	—	—	—	25,000
EAT for equity-holders	52,000	35,750	13,000	27,000
EPS	2.6	2.38	1.3	1.8

(Contd.)

(Contd.)

(ii) EBIT = ₹1,00,000 (5 per cent return)

EBIT	1,00,000	1,00,000	1,00,000	1,00,000
Less: Interest	—	25,000	60,000	—
EBT	1,00,000	75,000	40,000	1,00,000
Less: Taxes	35,000	26,250	14,000	35,000
EAT	65,000	48,750	26,000	65,000
Less: Preference dividend	—	—	—	25,000
EAT for equity-holders	65,000	48,750	26,000	40,000
EPS	3.25	3.25	2.6	2.67

(iii) EBIT = ₹1,30,000 (6.5 per cent return)

EBIT	1,30,000	1,30,000	1,30,000	1,30,000
Less: Interest	—	25,000	60,000	—
EBT	1,30,000	1,05,000	70,000	1,30,000
Less: Taxes	45,500	36,750	24,500	45,500
EAT	84,500	68,250	45,500	84,500
Less: Preference dividend	—	—	—	25,000
EAT for equity-holders	84,500	68,250	45,500	59,500
EPS	4.22	4.55	4.55	3.97

(iv) EBIT = ₹1,60,000 (8 per cent return)

EBIT	1,60,000	1,60,000	1,60,000	1,60,000
Less: Interest	—	25,000	60,000	—
EBT	1,60,000	1,35,000	1,00,000	1,60,000
Less: Taxes	56,000	47,250	35,000	56,000
EAT	1,04,000	87,750	65,000	1,04,000
Less: Preference dividend	—	—	—	25,000
EAT for equity-holders	1,04,000	87,750	65,000	79,000
EPS	5.2	5.8	6.5	5.3

(v) EBIT = ₹2,00,000 (10 per cent return)

EBIT	2,00,000	2,00,000	2,00,000	2,00,000
Less: Interest	—	25,000	60,000	—
EBT	2,00,000	1,75,000	1,40,000	2,00,000
Less: Taxes	70,000	61,250	49,000	70,000
EAT	1,30,000	1,13,750	91,000	1,30,000
Less: Preference dividend	—	—	—	25,000
EAT for equity-holders	1,30,000	1,13,750	91,000	1,05,000
EPS	6.5	7.6	9.1	7

It can be seen from Table 18.8 that when the EBIT level exceeds the financial break-even level (₹25,000, ₹60,000 and ₹38,462 for financing alternatives, B, C and D respectively) EPS increases. The percentage increase in EPS is the greatest when EBIT is nearest the break-even point. Thus, in Plan C, an increase of 25 per cent in EBIT (from ₹80,000 to ₹1,00,000) results in a 100 per cent increase in EPS (from ₹1.3 to ₹2.6), whereas the percentage increase in EPS is only 40 per cent (from ₹6.5 to ₹9.1) as a result of the change in EBIT at higher levels from ₹1,60,000 to ₹2,00,000 (i.e. 25 per cent increase).

Handwritten notes at the bottom of the right page, including a date and several lines of text.

We can also see from Tables 18.7 and 18.8 that the EPS for different financing plans at a given level of EBIT is equal. At EBIT levels above or below the given level, the EPS is higher or lower. Thus, for alternatives *A* and *C* at the EBIT level of ₹1,20,000 (Table 18.7) the EPS is the same, that is, ₹3.9. If EBIT is below this level, alternative *A* (ordinary shares) will provide higher EPS; above this level, the debt alternative (*C*) is better from the viewpoint of EPS.

Between preference share (*D*) and ordinary share (*A*) alternatives, the EPS is equal (₹5.2) at ₹1,60,000 EBIT level. Above this level, alternative *D* will give better EPS; while below it, alternative *A* would provide higher EPS.

The earnings per share (EPS) in alternatives *A* and *B* are the same at EBIT level of ₹1,00,000. Above this, *B* plan would lead to higher EPS; at levels lower than this, financing plan *A* would provide higher EPS.

The debt alternative (*B*) gives higher EPS for all levels of EBIT as compared to the preference share alternative (*D*).

Indifference Point

The EBIT level at which the EPS is the same for two alternative financial plans is referred to as the **indifference point/level**. The indifference point may be defined as the *level of EBIT beyond which the benefits of financial leverage begin to operate with respect to earnings per share*

Indifference point is the EBIT level beyond which benefits of financial leverage accrue with respect to EPS.

(EPS). In operational terms, if the expected level is to exceed the indifference level of EBIT, the use of fixed-charge source of funds (debt) would be advantageous from the viewpoint of EPS, that is, financial leverage will be favourable and lead to an increase in the EPS available to the shareholders. The capital structure should include debt. If, however, the expected level of the EBIT is less than the indifference point, the advantage of EPS would be available from the use of equity capital.

The indifference point between two methods of financing can be obtained mathematically (algebraic approach) as well as graphically.

Algebraic Approach Mathematically, the indifference point can be obtained by using the following symbols:

- X = earnings before interest and taxes (EBIT) at the indifference point
- N_1 = number of equity shares outstanding if only equity shares are issued
- N_2 = number of equity shares outstanding if both debentures and equity shares are issued
- N_3 = number of equity shares outstanding if both preference and equity shares are issued
- N_4 = number of equity shares outstanding if both preference shares and debentures are issued
- I = the amount of interest on debentures
- D_p = the amount of dividend on preference shares
- t = corporate income tax rate
- Dt = tax on preference dividend

For a New Company The indifference point can be determined by using the following equations:

(i) **Equity shares versus Debentures/Debt:**

$$\frac{X(1-t)}{N_1} = \frac{(X-I)(1-t)}{N_2} \quad (18.6)$$

(ii) (a) **Equity shares versus Preference shares:**

$$\frac{X(1-t)}{N_1} = \frac{X(1-t) - D_p}{N_3} \quad (18.7)$$

(ii) (b) Equity shares versus Preference shares with tax on Preference dividend:

$$\frac{X(1-t)}{N_1} = \frac{X(1-t) - D_p(1+Dt)}{N_3} \quad (18.7A)$$

(iii) Equity shares versus Preference shares and Debentures/Debt:

$$\frac{X(1-t)}{N_1} = \frac{(X-I)(1-t) - D}{N_4} \quad (18.8)$$

For an Existing Company If the debentures are already outstanding, let us assume I_1 = interest paid on existing debt, and I_2 = interest payable on additional debt, then the indifference point would be determined by Equation (18.9).

$$\frac{(X - I_1)(1-t)}{N_1} = \frac{(X - I_1 - I_2)(1-t)}{N_2} \quad (18.9)$$

Example 18.7

The financial manager of a company has formulated various financial plans to finance ₹30,00,000 required to implement various capital budgeting projects:

- (i) Either equity capital of ₹30,00,000 or ₹15,00,000 10% debentures and ₹15,00,000 equity;
- (ii) Either equity capital of ₹30,00,000 or 13% preference shares of ₹10,00,000 and ₹20,00,000 equity;
- (iii) Either equity capital of ₹30,00,000 or 13% preference capital of ₹10,00,000, (subject to dividend tax of 10 per cent), ₹10,00,000 10% debentures and ₹10,00,000 equity; and
- (iv) Either equity share capital of ₹20,00,000 and 10% debentures of ₹10,00,000 or 13% preference capital of ₹10,00,000, 10% debentures of ₹8,00,000 and ₹12,00,000 equity.

You are required to determine the indifference point for each financial plan, assuming 35 per cent corporate tax rate and the face value of equity shares as ₹100.

Solution

TABLE 18.9 Determination of Indifference Point

$$\begin{aligned} \text{(i)} \quad \frac{X(1-t)}{N_1} &= \frac{(X-I)(1-t)}{N_2} \\ \text{Or} \quad \frac{X(1-0.35)}{30,000} &= \frac{(X - ₹1,50,000)(1-0.35)}{15,000} \\ \text{Or} \quad \frac{0.65X}{30,000} &= \frac{0.65X - ₹97,500}{15,000} \\ \text{Or} \quad 0.65X &= 1.3X - ₹1,95,000 \\ \text{Or} \quad -0.65X &= - ₹1,95,000 \\ &X = ₹1,95,000/0.65 = ₹3,00,000 \end{aligned}$$

Confirmation Table

Particulars	Equity financing	Equity + debt financing
EBIT	₹3,00,000	₹3,00,000
Less: Interest	—	1,50,000
Earning before taxes	3,00,000	1,50,000
Less: Taxes	1,05,000	52,500
Earnings for equity-holders	1,95,000	97,500
Number of equity shares	30,000	15,000
EPS	6.5	6.5

$$(ii) \frac{X(1-t)}{N_1} = \frac{X(1-t) - D_p}{N_3}$$

$$\text{Or } \frac{X(1-0.35)}{30,000} = \frac{X(1-0.35) - ₹1,30,000}{20,000}$$

$$\text{Or } \frac{0.65X}{30,000} = \frac{0.65X - ₹1,30,000}{20,000}$$

$$X = ₹6,00,000$$

Confirmation Table

Particulars	Equity financing	Equity + Preference financing
EBIT	₹6,00,000	₹6,00,000
Less: Taxes	2,10,000	2,10,000
Earning after taxes	3,90,000	3,90,000
Less: Dividends on preference shares	—	1,30,000
Earnings for equity-holders	3,90,000	2,60,000
Number of equity shares	30,000	20,000
EPS	13	13

$$(iii) \frac{X(1-t)}{N_1} = \frac{(X-I)(1-t) - D_p(1+Dt)}{N_4}$$

$$\text{Or } \frac{X(1-0.35)}{30,000} = \frac{(X - ₹1,00,000)(1-0.35) - ₹1,30,000(1+0.1)}{10,000}$$

$$\text{Or } \frac{0.65X}{30,000} = \frac{0.65X - ₹65,000 - ₹1,43,000}{10,000}$$

$$\text{Or } X = ₹4,80,000$$

Confirmation Table

Particulars	Equity financing	Equity + Preference + Debentures financing
EBIT	₹4,80,000	₹4,80,000
Less: Interest	—	1,00,000
Earnings after interest	4,80,000	3,80,000
Less: Taxes	1,68,000	1,33,000
Earning after taxes	3,12,000	2,47,000
Less: Dividends including dividend tax on preference shares	—	1,43,000
Earnings available for equity holders	3,12,000	1,04,000
Number of equity shares	30,000	10,000
EPS	18.4	18.4

$$(iv) \frac{(X-I)(1-t)}{N_2} = \frac{(X-I)(1-t) - D_p}{N_4}$$

$$\text{Or } \frac{(X - 1,00,000)(1-0.35)}{20,000} = \frac{(X - 80,000)(1-0.35) - 1,30,000}{12,000}$$

$$X = ₹5,50,000$$

Confirmation Table

Particulars	Equity financing	Equity + Debt + Preference financing
EBIT	₹5,50,000	₹5,50,000
Less: Interest	1,00,000	80,000
Earnings before taxes	4,50,000	4,70,000
Less: Taxes	1,57,500	1,64,500
Earning after taxes	2,92,500	3,05,500
Less: Dividends on preference shares	—	1,30,000
Earnings for equity-holders	2,92,500	1,75,500
Number of equity shares	20,000	12,000
EPS	14.625	14.625

Graphic Approach The indifference point can also be determined graphically. Figures 18.1 and 18.2 portray the graphic representation of financial plans (i) and (ii) of Example 18.7. The horizontal X-axis represents EBIT while EPS is represented on the Y-axis.

In order to graph the financial plan, two sets of EBIT-EPS coordinates are required. The EPS values associated with EBIT values of ₹2,00,000 and ₹6,00,000 are calculated and plotted on the graph paper under each financial plan in case of Figure 18.1. It may be noted that 100 per cent equity financing plan starts from origin (O) because EPS would be zero if EBIT is zero. However, EBIT required to have the value of the EPS as zero is ₹1,50,000, that is, the interest charges payable on 10% debentures of ₹15,00,000. Therefore, the starting point of 50 per cent equity financing plan is away from the point of the origin (i.e. it starts from ₹1.5 lakh). The point at which the two lines intersect is the **indifference point (IP)**. When we draw a perpendicular to the X-axis from the point of intersection, we have EBIT required for the IP. A line drawn from the point of intersection and joined with the Y-axis determines the EPS at the indifference point of EBIT.

An important point to be remembered in relation to the drawing of 13 per cent preference share financial plan (Fig. 18.2), is that EPS would not be zero if the firm's EBIT is ₹1,30,000, because dividend payable on preference share is not tax-deductible. The firm must earn so much more than

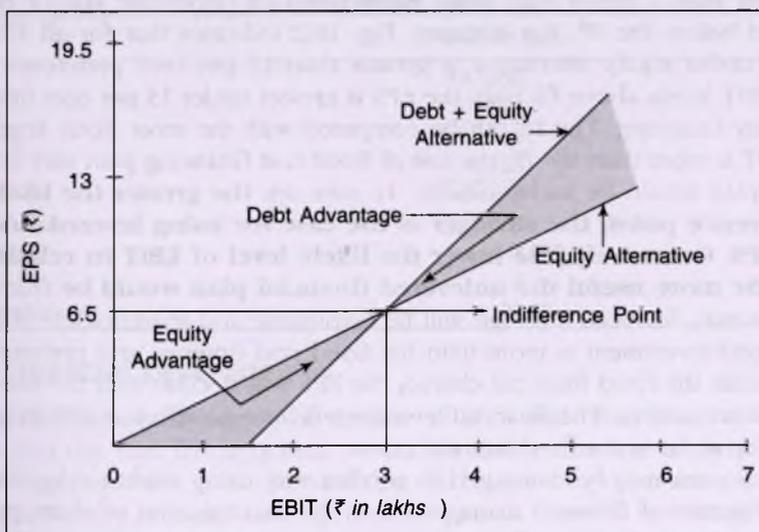

FIGURE 18.1 EBIT-EPS Analysis

...

...

...

...

...

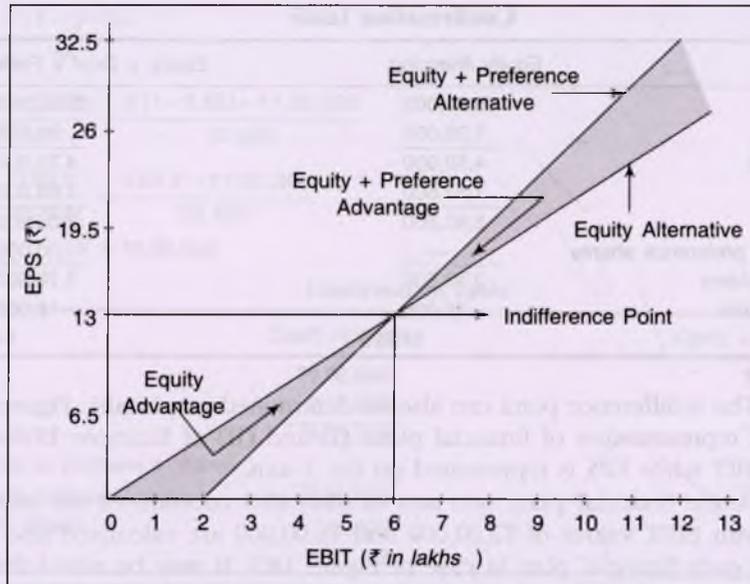

FIGURE 18.2 EBIT-EPS Analysis

₹1,30,000 that it is left with ₹1,30,000 after paying taxes. This amount can be calculated dividing ₹1,30,000 by $(1 - t)$. The required amount is ₹2,00,000 $[\text{₹}1,30,000] \div (1 - 0.35)$. Thus, the starting point of preference share financial plan would be ₹2 lakh.

The indifference points of Figs. 18.1 and 18.2 correspond to what we have determined through the algebraic approach. But the utility of the EBIT-EPS chart lies in its being more informative regarding the EBIT-EPS relationship. It gives a bird's eye view of EPS at various levels of EBIT. The EPS value at the estimated level of EBIT can be promptly ascertained. Moreover, it more easily explains why an equity financing plan is better than other plans requiring debenture and/or preference shares for the EBIT level below the IP. For instance, Fig. 18.2 indicates that for all EBIT levels below ₹6 lakh, the EPS under equity alternative is greater than 13 per cent preference share financing plan and for all EBIT levels above ₹6 lakh, the EPS is greater under 13 per cent financing plan than 100 per cent equity financing. The IP can be compared with the most likely level of EBIT. If the likely level of EBIT is more than the IP, the use of fixed cost financing plan may be recommended, otherwise equity plan would be more suitable. To sum up, **the greater the likely level of EBIT than the indifference point, the stronger is the case for using levered financial plans to maximise the EPS. Conversely, the lower the likely level of EBIT in relation to the indifference point, the more useful the unlevered financial plan would be** from the view point of EPS. In other words, financial leverage will be favourable and shareholders will get higher EPS if the return on total investment is more than the fixed cost (interest and preference dividend). If the return is less than the fixed financial charge, the EPS will decline with the use of debt and the leverage will be unfavourable. The financial leverage will have no effect on EPS in case the return on investment is exactly equal to the fixed financial costs.

The indifference point may be computed in another way using market value as the basis. Since the operational objective of financial management is the maximisation of share prices, the market price of shares of a firm with two different financial plans should be identical. Thus, on the basis

of level of EBIT which ensures identical market price for alternative financial plans, the indifference point can be symbolically computed by Equation 18.10.

$$P/E_1 \left[\frac{X(1-t)}{N_1} \right] = P/E_2 \left[\frac{(X-I)(1-t) - D_p}{N_2} \right] \quad (18.10)$$

where $PE_1 = P/E$ ratio of unlevered plan and $P/E_2 = P/E$ ratio of levered plan.

Example 18.8

Determine the indifference point at which market price of equity shares of a corporate firm will be the same from the following data:

1. Funds required, ₹50,000.
2. Existing number of equity shares outstanding, 5,000 @ ₹10 per share.
3. Existing 10% debt, ₹20,000
4. Funds required can be raised either by (a) issue of 2,000 equity shares, netting ₹25 per share or (b) new 15 per cent debt.
5. The P/E ratio will be 7 times in equity alternative and 6 times in debt alternative.
6. Corporate tax rate, 35 per cent.

Solution

$$P/E_1 \left[\frac{(x - I_1)(1-t)}{N_1} \right] = P/E_2 \left[\frac{(x - I_1 - I_2)(1-t)}{N_2} \right]$$

or $7 \left[\frac{(x - ₹2,000) 0.65}{7,000} \right] = 6 \left[\frac{(x - ₹9,500) 0.65}{5,000} \right]$

or $\frac{0.65x - ₹1,300}{7,000} = \frac{0.65x - ₹6,175}{5,000}$

or $5(4.55x - ₹9,100) = 7(3.9x \times ₹37,050)$

or $4.55x = ₹2,13,850$, i.e. $x = ₹47,000$

Confirmation Table

Particulars	15% Debt issue	Equity issue

Measures of Financial Leverages

Financial leverage measures the degree of the use of debt and other fixed-cost sources of fund to finance the assets the firm has acquired. As shown above, the use of debt has a magnifying effect on the earnings per share. It can be said that the higher the proportion of debt in the capital structure, the higher is the financial leverage and *vice-versa*. Broadly speaking, financial leverage can be measured in two ways: (i) stock terms, and (ii) flow terms.

Stock Terms It can be measured either by (a) a simple ratio of debt to equity, or (b) by the ratio of long-term debt plus preference share to total capitalisation. Each of these measures indicates the relative proportion of the funds to the total funds of the firm on which it is to pay fixed financial charges.

Flow Terms The financial leverage can be measured either by (a) the ratio of EBIT to interest payments or (b) the ratio of cash flows to interest payment, popularly called the **debt service capacity/coverage**. These coverage ratios are useful to the suppliers of the funds as they assess the degree of risk associated with lending to the firm.

In general, the higher the 'stock' ratios and the lower the 'flow' ratios, the greater is the risk and *vice-versa*.

LO 18.3 COMBINED LEVERAGE: TOTAL RISK

The operating leverage has its effects on operating risk and is measured by the percentage change in EBIT due to percentage change in sales. The financial leverage has its effects on financial risk and is measured by the percentage change in EPS due to percentage change in EBIT. Since both these leverages are closely concerned with ascertaining the ability to cover fixed charges (fixed-operating costs in the case of operating leverage and fixed-financial costs in the case of financial leverage), if they are combined, the result is total leverage and the risk associated with **combined leverage** is known as **total risk**. Symbolically, Degree of combined leverage (DCL)

$$DCL = DOL \times DFL \quad (18.11)$$

Substituting the values of DOL and DFL, we have:

$$DCL = \frac{\% \text{ change in EBIT}}{\% \text{ change in sales}} \times \frac{\% \text{ change in EPS}}{\% \text{ change in EBIT}} = \frac{\% \text{ change in EPS}}{\% \text{ change in sales}} \quad (18.12)$$

$$\text{or } DCL = \frac{\text{Contribution}}{\text{EBIT}} \times \frac{\text{EBIT}}{\text{EBIT} - I} = \frac{\text{Contribution}}{\text{EBIT} - I} \quad (18.13)$$

Thus, the DCL measures the percentage change in EPS due to percentage change in sales. If the degree of operating leverage of a firm is 6 and its financial leverage is 2.5, the combined leverage of this firm would be 15(6 x 2.5). That is, 1 per cent change in sales would bring about 15 per cent change in EPS in the direction of the change in sales. The combined leverage can work in either direction. It will be favourable if sales increase and unfavourable when sales decrease because changes in sales will result in more than proportionate returns in the form of EPS.

The usefulness of DCL lies in the fact that it indicates the effect that sales changes will have on EPS. Its potential is also great in the area of choosing financial plans for new investments. If, for example, a firm begins to invest heavily in more risky assets than usual, the operating leverage will obviously increase. If it does not change its financing policy, that is, the capital structure remains constant, there would be no change in its financial leverage. As a result, the combined leverages would increase causing an increase in its total risk. The firm, in order to keep its risk constant, may like to lower its financial leverage. This could be done if the new investments are financed with more equity than the firm has used in the past. This would lower the financial leverage and compensate for the increased operating leverage caused by investment in more risky investments. If the operating leverage has decreased due to low fixed costs, the firm can afford to have a more levered financial plan to keep the total risk constant at the same time having the same prospects of magnifying effects on EPS due to change in sales.

The degree of operating leverage (DOL), financial leverage (DFL) and combined leverage (DCL) of the Reliance Industries Ltd (RIL) in summarised in Exhibit 18.1.

EXHIBIT 18.1 DOL, DFL and DCL of RIL, 2005-2017

Years	DOL	DFL	DCL
2017	1.09	0.96	1.05
2016	-0.68	1.02	-0.69
2015	-0.28	0.72	-0.20

Mean 2009-2012	0.37	1.09	0.40
Mean 2013-2017	0.63	1.22	0.77

Note: Negative values are excluded for calculating mean values.

SUMMARY

Leverage refers to the use of an asset or source of funds which involves fixed costs or fixed returns. As a result, the earnings available to the shareholders/owners are affected as also their risk. There are three types of leverage, namely, operating, financial and combined.

Leverage associated with asset acquisition or investment activities is referred to as the operating leverage. It refers to the firm's ability to use fixed operating costs to magnify the effect of changes in sales on its operating profits (EBIT) and results in more than a proportionate change (\pm) in EBIT with change in the sales revenue.

Degree of operating leverage (DOL) is computed in two ways: (i) Percentage change in EBIT/Percentage change in sales and (ii) $(\text{Sales} - \text{Variable costs})/\text{EBIT}$.

The operating leverage is favourable when increase in sales volume has a positive magnifying effect on EBIT. It is unfavourable when a decrease in sales volume has a negative magnifying effect on EBIT. Therefore, high DOL is good when sales revenues are rising and bad when they are falling.

The DOL is a measure of the business/operating risk of the firm. Operating risk is the risk of the firm not being able to cover its fixed operating costs. The larger is the magnitude of such costs, the larger is the volume of sales required to recover them. Thus, the DOL depends on fixed operating costs.

Financial leverage is related to the financing activities of a firm. It results from the presence of fixed financial charges (such as interest on debt and dividend on preference shares). Since such financial expenses do not vary with the operating profits, financial leverage is concerned with the effect of changes in EBIT on the earnings available to equity-holders. It is defined as the ability of a firm to use fixed financial charges to magnify the effect of changes in EBIT on the earnings per share (EPS).

LO 18.1

LO 18.2

The degree of financial leverage (DFL) can be computed in the following ways:

- (i) $DFL = \text{Percentage change in EPS} / \text{Percentage change in EBIT}$.
- (ii) $DFL = EBIT / (EBIT - I)$, when debt is used.
- (iii) $DFL = EBIT / [EBIT - I - D_p / (1 - t)]$, when debt as well as preference capital is used.
- (iv) $DFL = EBIT / [EBIT - I - (D_p + D_d) / (1 - t)]$, when dividends paid on preference share capital are subject to dividend tax.

Financial leverage involves the use of funds obtained at a fixed cost in the hope of increasing the return to the equity-holders. When a firm earns more on the assets purchased with the funds than the fixed cost of their use, the financial leverage is favourable. Unfavourable leverage occurs when the firm does not earn as much as the funds cost.

High fixed financial costs increase the financial leverage and, thus, financial risk. The financial risk refers to the risk of the firm not being able to cover its fixed financial costs. In case of default, the firm can be technically forced into liquidation. The larger is the amount of fixed financial costs, the larger is EBIT required to recover them. Thus, the DFL depends on fixed financial costs.

To devise an appropriate capital structure, the amount of EBIT under various financing plans should be related to EPS. The EBIT-EPS analysis is a widely-used method of examining the effect of financial leverage/use of debt. A financial alternative that ensures the largest EPS is preferred, given the level of EBIT.

Financial break-even point (BEP) represents a point at which before-tax earnings are equal to the firm's fixed financial obligations. Symbolically, it is computed as follows: $[I + D_p + D_d] / (1 - t)$. In other words, at financial BEP, EPS is zero.

The EBIT level at which the EPS is the same for two alternative financial plans is known as the indifference point/level. Beyond the indifference level of EBIT, the benefits of financial leverage begin to operate with respect to EPS.

The indifference point (IP) can be determined by using the following equations:

(a) For a new company

$$(i) \frac{X(1-t)}{N_1} = \frac{(X-I)(1-t)}{N_2} \quad (\text{Equity versus Debentures/Debt})$$

$$(ii) \frac{X(1-t)}{N_1} = \frac{X(1-t) - D_p(1+D_t)}{N_3} \quad (\text{Equity versus Preference shares})$$

$$(iii) \frac{X(1-t)}{N_1} = \frac{(X-I)(1-t) - D_p(1+D_t)}{N_4} \quad (\text{Equity versus Preference shares and Debentures/Debt})$$

(b) For an existing company (having existing debentures/debt)

$$\frac{(X - I_1)(1-t)}{N_1} = \frac{(X - I_1 - I_2)(1-t) - D_p(1+D_t)}{N_4} \quad (\text{Equity versus Preference shares and Debentures/Debt})$$

The indifference point can also be determined graphically. In order to graph the financial plan, two sets of EBIT-EPS coordinates are required for each financial plan. The point at which the two lines intersect is the IP.

The greater is the likely level of EBIT than the IP, the stronger is the case for using levered plan (debt) to maximise the EPS. Conversely, the lower is the likely level of EBIT in relation to IP, the unlevered (equity) plan would be more useful from the perspective of EPS.

LO 18.2

The IP can be computed using market value (instead of EPS) as the basis. Under this method, the IP is that level of EBIT at which market price of the share (MPS) is the same for two alternative financial plans. Symbolically,

$$P/E_1 \left[\frac{X(1-t)}{N_1} \right] = P/E_2 \left[\frac{(X-I)(1-t) - D_p(1+D_t)}{N_2} \right]$$

(Equity versus preference shares and debentures)

LO 18.3

Combined leverage (DCL) is the product of operating and financial leverage. It indicates the effect that changes in sales will have on EPS. Symbolically, it can be computed by the following methods:

- (i) DCL = DOL × DFL
- (ii) DCL = Percentage change in EPS/Percentage change in sales
- (iii) DCL = (Sales – Variable costs)/(EBIT – I)

Combined leverage is a measure of the total risk of the firm. To keep the risk within manageable limits, a firm which has high degree of operating leverage should have low financial leverage and *vice-versa*.

SOLVED PROBLEMS

P.18.1 Calculate the operating leverage for each of the four firms, A, B, C and D from the following price and cost data. What conclusions can you draw with respect to levels of fixed cost and the degree of operating leverage result? Explain. Assume number of units sold is 5,000.

LO 18.1 **LOP E**

	Firms			
	A	B	C	D
Sale price per unit	₹20	₹32	₹50	₹70
Variable cost per unit	6	16	20	50
Fixed operating cost	80,000	40,000	2,00,000	Nil

Solution

	Firms			
	A	B	C	D
Sales (units)	5,000	5,000	5,000	5,000
Sales revenue (Units × price)	₹1,00,000	₹1,60,000	₹2,50,000	₹3,50,000
Less: Variable cost (Units × VC per unit)	30,000	80,000	1,00,000	2,50,000
Less: Fixed operating costs	80,000	40,000	2,00,000	Nil
EBIT	(10,000)	40,000	(50,000)	1,00,000

$$DOL = \frac{\text{Current sales (S) - Variable costs (VC)}}{\text{Current EBIT}}$$

$$DOL_{(A)} = \frac{₹1,00,000 - ₹30,000}{₹10,000} = 7$$

$$DOL_{(B)} = \frac{₹1,60,000 - ₹80,000}{₹40,000} = 2$$

$$DOL_{(C)} = \frac{₹2,50,000 - ₹1,00,000}{₹50,000} = 3$$

$$DOL_{(D)} = \frac{₹3,50,000 - ₹2,50,000}{₹1,00,000} = 1$$

The operating leverage exists only when there are fixed costs. In the case of firm D, there is no magnified

effect on the EBIT due to change in sales. A 20 per cent increase in sales has resulted in a 20 per cent increase in EBIT. In the case of other firms, operating leverage exists. It is maximum in firm A, followed by firm C and minimum in firm B. The interpretation of DOL of 7 is that 1 per cent change in sales results in 7 per cent change in EBIT level in the direction of the change of sales level of firm A.

P.18.2 A firm's sales, variable costs and fixed cost amount to ₹75,00,000, ₹42,00,000 and ₹6,00,000 respectively. It has borrowed ₹45,00,000 at 9 per cent and its equity capital totals ₹55,00,000.

LO 18.1,2,3 LOD
M

- What is the firm's ROI?
- Does it have favourable financial leverage?
- If the firm belongs to an industry whose asset turnover is 3, does it have a high or low asset leverage?
- What are the operating, financial and combined leverages of the firm?
- If the sales drop to ₹50,00,000, what will the new EBIT be?
- At what level will the EBT of the firm equal to zero?

Solution

- (a) $ROI = EBIT/Investment$

$$EBIT = Sales - VC - FC = ₹75 \text{ lakh} - ₹45 \text{ lakh} - ₹6 \text{ lakh} = ₹27 \text{ lakh.}$$

$$ROI = ₹27 \text{ lakh}/₹100 \text{ lakh} = 27 \text{ per cent.}$$

- (b) Yes, the firm has favourable financial leverage as its ROI is higher than the interest on debt.
 (c) Asset turnover = Sales/Total assets or Total investments. = ₹75 lakh/₹100 lakh = 0.75 It is lower than the industry average.

(d) Operating leverage = $\frac{Sales - Variable\ costs}{EBIT} = \frac{₹75 \text{ lakh} - ₹42 \text{ lakh}}{₹27 \text{ lakh}} = 1.22$

$$Financial\ leverage = \frac{EBIT}{EBIT - Interest} = \frac{₹27 \text{ lakh}}{(₹27 \text{ lakh} - ₹4.05 \text{ lakh})} = 1.18$$

$$Combined\ leverage = \frac{Sales - VC}{EBIT - Interest} = \frac{₹33 \text{ lakhs}}{₹22,95,000} = 1.44$$

$$Alternatively = OL \times FL = 1.22 \times 1.18 = 1.44$$

- (e) EBIT at sales level of ₹50 lakh

Sales revenue	₹50,00,000
Less: Variable costs (50 lakh × 0.56)	28,00,000
Less: Fixed costs	6,00,000
EBIT	16,00,000

- (f) Zero EBT implies break-even sales (BESR) = FC/CV ratio, CV ratio = ₹33 lakhs/₹75 lakhs = 44 per cent

$$BESR = (₹6 \text{ lakh} + ₹4.05 \text{ lakh})/0.44 = ₹22,84,091.$$

Confirmation table

Sales revenue	₹22,84,091
Less: VC (0.56)	12,79,091
Less: FC (operating)	6,00,000
Less: Interest (additional fixed cost)	4,05,000
EBT	ZERO

P.18.3 The selected financial data for A, B and C companies for the current year ended March 31 are as follows:

LO 18.1,2,3 LOD
D

Particulars	A	B	C
Variable expenses as a percentage of sales	66.67	75	50
Interest expenses (₹)	200	300	1,000
Degree of operating leverage	5	6	2
Degree of financial leverage	3	4	2
Income-tax rate	0.35	0.35	0.35

- (a) Prepare income statements for A, B, and C companies.
 (b) Comment on the financial position and structure of these companies.

Solution

(a) Income statement of companies A, B and C for the current year, ended March 31

Particulars	A	B	C
Sales	₹4,500	₹9,600	₹24,000
Less: Variable costs	3,000	7,200	12,000
Less: Fixed costs (Sales - VC - EBIT)	1,200	2,000	10,000
EBIT	300	400	2,000
Less: Interest	200	300	1,000
Earnings before taxes	100	100	1,000
Less: Taxes	35	35	350
EAT (Net income)	65	65	650

Working Notes

- (a) The preparation of the income statement requires data for (i) sales revenue, (ii) variable costs and (iii) fixed costs.

$$DFL = 3, DFL = \frac{EBIT}{EBIT - I}$$

Company A:

$$3 = \frac{EBIT}{EBIT - ₹200}$$

$$EBIT = ₹300$$

$$DOL = \frac{\text{Sales} - \text{Variable costs (V)}}{EBIT}$$

$$5 = \frac{S - 0.667 S}{₹300}$$

where $S = \text{sales} = ₹4,500$

$$VC = 0.667 \times ₹4,500 = ₹3,000$$

Company B:

$$4 = \frac{EBIT}{EBIT - ₹300}$$

$$EBIT = ₹400$$

$$6 = \frac{S - 0.75 S}{₹400} = ₹9,600$$

$$VC = 0.75 \times ₹9,600 = ₹7,200$$

Company C:

$$2 = \frac{EBIT}{EBIT - ₹1,000}$$

$$EBIT = ₹2,000$$

$$6 = \frac{S - 0.50 S}{₹2,000} = ₹24,000$$

$$VC = 0.50 \times ₹24,000 = ₹12,000$$

- (b) The financial position of company C can be regarded better than other companies: (i) It has the least financial risk as it has minimum degree of financial leverage. It is true that there will be a more magnified impact on EPS of A and B due to change in EBIT, but, their EBIT level due to low sales is very low. (ii) From the point of view of DCL, company C is better placed. The degree of combined leverage is maximum in company B (24); for company A (15) and for company C it is 4. The total risk (business plus financial) of company C is the lowest. (iii) The ability of the company C to meet interest liability is better. The EBIT/interest ratios for the three companies are:

C, 2.0 (₹2,000 ÷ ₹1,000)

B, 1.5 (₹300 ÷ ₹200)

A, 1.33 (₹400 ÷ ₹300)

P.18.4 Calculate operating leverage and financial leverage under situations A, B and C and financial plans 1, 2 and 3 respectively from the following information relating to the operation and capital structure of X, Y, Z Ltd. Also find out the combinations of operating and financial leverage which give the highest value and the least value.

LO 18.1,2	LOB	M

Sales level (units)	800	800	800
Sales revenue	₹12,000	₹12,000	₹12,000
Less: Variable costs	8,000	8,000	8,000
Less: Fixed cost	1,000	2,000	3,000
Operating profits (EBIT)	3,000	2,000	1,000
$DOL = \frac{S - VC}{EBIT}$	1.33	2	4

Determination of financial leverage

	Financial plan		
	1	2	3
Situation A:			
EBIT	₹3,000	₹3,000	₹3,000
Less: Interest	600	300	900
Earnings after interest	2,400	2,700	2,100
Financial leverage (EBIT/EBIT - I)	1.25	1.11	1.43
Situation B:			
EBIT	2,000	2,000	2,000
Less: Interest	600	300	900
Earnings after interest	1,400	1,700	1,100
Financial leverage	1.43	1.18	1.82
Situation C:			
EBIT	1,000	1,000	1,000
Less: Interest	600	300	900
Earnings after interest	400	700	100
Financial leverage	2.5	1.43	10

Determination of the highest and the lowest value of combined leverage (combined leverage = DOL × DFL)

Situations	Financial plan		
	1	2	3
A	1.66	1.48	1.90
B	2.86	2.36	3.64
C	10.00	5.72	40.00

The above calculations suggest that the highest value is in situation C financed by plan 3 and the lowest value is in situation A financed by plan 2.

P.18.5 Consider the following information about X Ltd.

LO 18.1,2,3 

EBIT	₹12,00,000
EBT	3,00,000
Operating fixed cost	24,00,000
Preference dividend	60,000
Tax rate (%)	40

Calculate the degree of operating, financial and combined leverage. By what percentage, the operating profits would increase, if sales increase by 10%?

Solution

Statement showing computation of DOL, DFL and DCL

Particulars	Amount
Total contribution (EBIT + Operating fixed cost)	₹36,00,000
Less fixed cost	24,00,000
EBIT	12,00,000
Less interest (EBT – EBT ₹3,00,000)	9,00,000
EBT	3,00,000
Less taxes (40%)	1,20,000
EAT	1,80,000
Less dividend paid to preference shareholders	60,000
Earnings available to equityholders (EAEHs)	1,20,000
DOL = Total contribution/EBIT: ₹36 lakh/₹12 lakh	3
DFL = EBIT/[EBIT – I – Dp(1 – t): = ₹12 lakh/[₹12 lakh – ₹9 lakh – ₹60,000/0.6] = ₹2 lakh	6
DCL = DOL × DFL : 3 × 6	18

DOL = Percentage change in EBIT/Percentage change in sales

3 × 10% = 30% increase in EBIT. Operating profits would increase by 30% when sales increases by 10%.

P.18.6 From the following data, calculate: (i) Operating, financial and combined leverage, (ii) Financial break-even point, and (iii) Percentage drop in sales to make the earnings per share zero.

LO 18.1,2,3 

Earnings before Interest and Taxes (EBIT)	₹20,00,000
Profit after tax (PAT)	9,60,000
Operating fixed cost	15,00,000
Tax rate (%)	40
Preference dividend	2,40,000

[₹20,00,000/(₹20,00,000 – ₹4,00,000 – ₹2,40,000/0.6)]	1.67
DCL = DOL × DFL: (1.75 × 1.67)	2.92
Financial BEP = I + Dp/(1 – f): (₹4,00,000 + ₹4,00,000)	₹8,00,000

(iii) In order to make EPS zero, EAEH should be zero. It would be sum of the following:

Operating fixed cost	₹15,00,000
Interest payment	4,00,000
Preference dividend (adjusted for taxes)	4,00,000
Required contribution	23,00,000

Desired reduction in contribution:

Present contribution	₹35,00,000
Less required contribution	23,00,000
Reduction in contribution (desired)	12,00,000
Desired drop in sales would be equal to desired drop in contribution to make EPS zero: (₹12 lakh/₹35 lakh) (%)	34.29

P.18.7 A firm has sales of ₹75,00,000, variable cost of ₹42,00,000 and fixed cost of ₹6,00,000. It has a debt of ₹45,00,000 at 9% and equity of ₹55,00,000. (i) What is the firm's ROI?, (ii) Calculate OL, FL and CL. Are leverages favourable or unfavourable?, and (iii) At what level of EBIT and sales, EPS will be equal to zero?

LO 18.1,2,3 M

Solution

Statement showing determination of ROI, DOL, DFL and DCL.

Particulars	Amount
Sales	₹ 75,00,000
Less variable cost (56%)	42,00,000
Total contribution (c/v ratio 44%)	33,00,000
Less fixed cost	6,00,000
EBIT	27,00,000
Less interest	4,05,000

(Contd.)

(Contd.)

EBT	22,95,000
ROI = EBIT/Total capital employed (₹ 45 lakh debt + ₹ 55 lakh equity): ₹ 27 lakh/₹ 100 lakh (%)	27
DOL = Contribution/EBIT: ₹ 33 lakh/₹ 27 lakh	11/9
DFL = -EBIT/EBT: ₹ 27 lakh/₹ 22.95 lakh	20/17
DCL = DOL × DFL: 11/9 × 20/17	1.44

Leverages are favourable as ROI is higher than rate of interest (9%).

(iii) BESR (comprehensive) at which total operating fixed cost and fixed interest costs are fully recovered would indicate sales at which EPS will be zero and EBIT = interest. BESR (comprehensive) = (₹ 6,00,000 + ₹ 4,05,000)/0.44 = ₹ 22,84,091

Income statement showing EPS at sales of ₹ 22,84,091

Sales	₹ 22,84,091
Less variable costs (56%)	12,79,091
Less fixed cost	6,00,000
EBIT	4,05,000
Less interest	4,05,000
EBT	0
Less taxes	0
EAT	0
EPS	0

P.18.8 Compute the operating leverage, financial leverage and combined leverage from the following data:

LO 18.1,2,3 LO M

Net worth	₹25,00,000
Debt/equity ratio	3:1
Interest rate	12 per cent
EBIT	₹20,00,000
Operating fixed costs	10,00,000

Solution

Determination of DOL, DFL and DCL

Contribution (EBIT + Operating fixed costs)	₹30,00,000
Less fixed costs (Operating)	10,00,000
EBIT	20,00,000
Less interest (₹75,00,000 × 12%)	9,00,000@
EBT	11,00,000
DOL = (Contribution/EBIT)	1.5
DFL = (EBIT/EBT)	1.82
DCL = (DOL×DFL)	2.73

@ Interest on debt = (₹25,00,000 Net worth × 3 D/E ratio = ₹75,00,000) × 0.12 = ₹9,00,000

P.18.9 Exel Limited is considering three financing plans. The key information is as follows:

LO 18.2 LO M

- (a) Total funds to be raised, ₹2,00,000.
- (b) Financing plans

Plans	Equity (%)	Debt (%)	Preference (%)
A	100	—	—
B	50	50	—
C	50	—	50

(c) Cost of debt 8 per cent; cost of preference shares 8 per cent

(d) Tax rate, 35 per cent

(e) Equity shares of the face value of ₹10 each will be issued at a premium of ₹10 per share.

(f) Expected EBIT, ₹80,000.

Determine for each plan:

(i) earnings per share (EPS) and financial break-even point.

(ii) indicate if any of the plans dominate, and compute the EBIT range among the plans for indifference.

Solution

(i) Determination of EPS under plans A, B and C

EBIT	₹80,000	₹80,000	₹80,000
Less: Interest	—	8,000	—
EBT	80,000	72,000	80,000
Less: Taxes (0.35)	28,000	25,200	28,000
EAT	52,000	46,800	52,000
Less: Dividend on preference shares	—	—	8,000
Earnings for equity-holders	52,000	46,800	44,000
+ number of shares	10,000	5,000	5,000
EPS	5.2	9.36	8.8

Financial BEP for plans, A, B and C

Plan A	= Zero
Plan B	= ₹8,000 (₹1,00,000 × 0.08)
Plan C	= ₹12,308

(ii) Indifference point among financial plans

(a) A and B:

$$\frac{X(1-t)}{N_1} = \frac{(X-I)(1-t)}{N_2}; \frac{0.65X}{10,000} = \frac{(X - ₹8,000)0.65}{5,000}$$

$$X = ₹10,400/0.65 = ₹16,000.$$

(b) B and C:

$$\frac{(X-I)(1-t)}{N_1} = \frac{X(1-t) - D_p}{N_2}; \frac{0.65(X - ₹8,000)}{5,000} = \frac{0.65X - ₹8,000}{5,000}$$

$$\text{or } 0.65X - ₹5,200 = 0.65X - ₹8,000$$

$$\text{or } 0.65X - 0.65X = ₹5,200 - ₹8,000$$

Thus, indifference point between plans B and C is indeterminate.

(c) A and C:

$$\frac{X(1-t)}{N_1} = \frac{X(1-t) - D_p}{N_2}; \frac{0.65X}{10,000} = \frac{0.65X - ₹8,000}{5,000}$$

or $0.65X = 13X - ₹16,000$ or $X = ₹16,000/0.65$ i.e. ₹24,615

Domination of plan: Plan B dominates plan C as the financial BEP of plan B is lower.

P.18.10 The XYZ Company plans to expand assets by 50 per cent. To finance the expansion it is choosing between a straight 6 per cent debt issue and equity issue. Its current balance sheet and income statement are shown below:

LO 18.2 LOD M

Balance sheet of XYZ company as on March 31

5% Debt	₹4,00,000	Total assets	₹20,00,000
Equity shares (₹10 per share)	10,00,000		
Earned surplus	6,00,000		
	20,00,000		20,00,000

Income statement for the year ended March 31

Sales	₹60,00,000
Total costs (excluding interest)	53,80,000
EBIT	6,20,000
Less: Interest on debt	20,000
EBT	6,00,000
Less: Taxes	2,10,000
Net income	3,90,000

If company finances the proposed expansion with debt, the rate on the incremental debt will be 6 per cent and the price/earning ratio of the equity shares will be 10. If expansion is financed by equity, the new shares can be sold at ₹33.33 and the price/earnings ratio of all the outstanding equity shares will remain 12.

- Assuming that net income before interest on debt and taxes (EBIT) is 10 per cent on sales, calculate EPS at assumed sales of ₹20 lakh, ₹40 lakh, ₹80 lakh and ₹100 lakh under the alternative forms of financing the expansion programme (assume no fixed costs).
- Using the price/earnings ratio indicated, calculate the market value for equity share for each sales level for both debt and equity methods of financing.
- If the firm follows the policy of seeking to maximise the price of its shares, which form of financing should be employed?

Solution

(a) and (b)

Determination of EPS and MPS under alternative financial plans

	Sales levels							
	₹20 lakh		₹40 lakh		₹80 lakh		₹100 lakh	
	Debt	Equity	Debt	Equity	Debt	Equity	Debt	Equity
EBIT	₹2,00,000	₹2,00,000	₹4,00,000	₹4,00,000	₹8,00,000	₹8,00,000	₹10,00,000	₹10,00,000
Less: Interest	80,000	20,000	80,000	20,000	80,000	20,000	80,000	20,000
Earnings before taxes	1,20,000	1,80,000	3,20,000	3,80,000	7,20,000	7,80,000	9,20,000	9,80,000
Less: Taxes (0.35)	42,000	63,000	1,12,000	1,33,000	2,52,000	2,73,000	3,22,000	3,43,000
EAT	78,000	1,17,000	2,08,000	2,47,000	4,68,000	5,07,000	5,98,000	6,37,000

(Contd.)

(Contd.)

Number of equity shares	1,00,000	1,30,000	1,00,000	1,30,000	1,00,000	1,30,000	1,00,000	1,30,000
EPS	0.78	0.90	2.08	1.90	4.68	3.9	5.98	4.9
P/E ratio	10	12	10	12	10	12	10	12
Market price of a share	7.8	10.80	20.8	22.80	46.80	46.80	59.80	58.80

Working Note

In debt financing, the number of equity shares outstanding = 1,00,000 (₹10,00,000 ÷ ₹10 per share). In the case of equity financing the total number of outstanding shares = 30,000 additional shares (total = 1,30,000 shares).

(c) The answer will depend on the expected level of sales. If the sales level is at ₹40 lakh, equity form of financing should be employed. At the sales level of ₹80 lakh, the company is indifferent. If the sales level is likely to be at ₹100 lakh, the debt form of financing should be employed.

P.18.11 The ABC Ltd has the following balance sheet and income statement information:

LO 18.1,2,3	LOD M
--------------------	--------------

Balance sheet as on March 31

Liabilities		Assets	
Equity capital (₹10 per share)	₹8,00,000	Net fixed assets	₹10,00,000
10% Debt	6,00,000	Current assets	9,00,000
Retained earnings	3,50,000		
Current liabilities	1,50,000		
	<u>19,00,000</u>		<u>19,00,000</u>

Income statement for the year ending March

Sales	₹3,40,000
Operating expenses (including ₹60,000 depreciation)	1,20,000
EBIT	2,20,000
Less: Interest	60,000
Earning before tax	1,60,000
Less: Taxes	56,000
Net earnings (EAT)	<u>1,04,000</u>

(a) Determine the degree of operating, financial and combined leverages at the current sales level, if all operating expenses, other than depreciation, are variable costs.

(b) If total assets remain at the same level, but sales (i) increase by 20 per cent and (ii) decrease by 20 per cent, what will be the earnings per share in the new situation?

Solution

$$(a) \quad DOL = \frac{\text{₹}3,40,000 - \text{₹}60,000}{\text{₹}2,20,000} = 1.27$$

$$DFL = \frac{\text{₹}2,20,000}{\text{₹}1,60,000} = 1.37$$

$$DCL = DOL \times DFL = 1.27 \times 1.37 = 1.75$$

(b) Earnings per share at the new sales level

Sales level	₹4,08,000	₹2,72,000
Less: Variable expenses	72,000	48,000
Less: Fixed cost	60,000	60,000
Earnings before interest and taxes	<u>2,76,000</u>	<u>1,64,000</u>

(Contd.)

(Contd.)

Less: Interest	60,000	60,000
Earnings before taxes	2,16,000	1,04,000
Less: Taxes	75,600	36,400
Earnings after taxes (EAT)	1,40,400	67,600
Number of equity shares (N)	80,000	80,000
EPS	1.75	0.84

Working Notes

(i) Variable costs = ₹60,000 (total cost – depreciation).

(ii) Variable costs = (a) at sales level, ₹4,08,000 = ₹72,000, (b) at the sales level, ₹2,72,000 = 48,000

P.18.12 The Well Established Company's most recent balance sheet is as follows:

LO 18.1,2,3

Liabilities	Amount	Assets	Amount
Equity capital (₹10 per share)	₹60,000	Net fixed assets	₹1,50,000
10% Long-term debt	80,000	Current assets	50,000
Retained earnings	20,000		
Current liabilities	40,000		
	2,00,000		2,00,000

The company's total assets turnover ratio is 3, its fixed operating costs are ₹1,00,000 and the variable operating costs ratio is 40 per cent. The income tax rate is 35 per cent.

(a) Calculate all the three types of leverages.

(b) Determine the likely level of EBIT if EPS is (i) ₹1, (ii) ₹3, and (iii) Zero.

Solution

Income statement

Sales	₹6,00,000
Less: Variable costs	2,40,000
Less: Fixed costs	1,00,000
EBIT	2,60,000
Less: Interest	8,000
Earnings before interest	2,52,000
Less: Taxes	88,200
Earnings after taxes	1,63,800

$$(a) \text{ DOL} = \frac{\text{₹}6,00,000 - 2,40,000}{\text{₹}2,60,000} = 1.38$$

$$\text{DFL} = \text{₹}2,60,000 / \text{₹}2,52,000 = 1.03$$

$$\text{DCL} = 1.38 \times 1.03 = 1.42$$

$$(b) (i) \text{ EPS} = \frac{(\text{EBIT} - I)(1 - t)}{N}$$

$$\text{₹}1 = \frac{(\text{EBIT} - \text{₹}8,000)(1 - 0.35)}{6,000}$$

$$\text{₹}6,000 = 0.65 \text{ EBIT} - \text{₹}5,200$$

$$\text{EBIT} = \text{₹}17,231$$

$$(ii) \text{ ₹}3 = \frac{(\text{EBIT} - \text{₹}8,000) \times 0.65}{6,000}$$

$$\text{EBIT} = \text{₹}35,692$$

$$(iii) 0(\text{Zero}) = \frac{(\text{EBIT} - \text{₹}8,000) \times 0.65}{6,000}$$

$$\text{EBIT} = \text{₹}8,000$$

Confirmation table

EBIT	₹8,000	₹17,231	₹35,692
Less: Interest	8,000	8,000	8,000
Earnings after interest	Nil	9,231	27,692
Less: Taxes	Nil	3,231	9,692
Net income (NI)	Nil	6,000	18,000
Number of shares (N)	6,000	6,000	6,000
EPS (NI + N)	Zero	1	3

Working Notes

Total assets turnover ratio, 3 = Sales/₹2,00,000 or Sales = ₹6,00,000

P.18.13 A company has 20,000 equity shares of ₹50 each outstanding. The following is the income statement relating to the previous year as well as four proforma statements reflecting different assumptions regarding a new project. The new project is expected to cost ₹5,00,000 in each case.

LO 18.2 LOD M

Proforma

	Actual (previous year)	Sell 10,000 equity shares		Sell 10% debentures	
		Optimistic	Pessimistic	Optimistic	Pessimistic
		₹12,00,000	₹9,00,000	₹12,00,000	₹9,00,000
Sales	₹8,00,000				
Variable expenses	2,40,000				
	5,60,000				
Fixed costs	3,00,000				
EBIT	2,60,000				
Interest	Nil				
Earning after interest	2,60,000				
Taxes	91,000				
EAT	1,69,000				
EPS	8.45				

Assuming variable cost as per cent of sales remains constant and additional fixed cost with new project is likely to be ₹1,00,000, complete the tabulation. Which plan would you recommend to finance the new project?

Solution

Completion of table

(Amount in ₹ thousand)

Particulars	Actual (Previous year)	Proforma			
		Sell 10,000 equity shares		Sell 10% debentures	
		Optimistic	Pessimistic	Optimistic	Pessimistic
Sales	800	1,200	900	1,200	900
Variable costs	240	360	270	360	270
	560	840	630	840	630
Fixed costs	300	400	400	400	400
EBIT	260	440	230	440	230
Interest	Nil	Nil	Nil	50	50
Earnings after interest	260	440	230	390	180
Taxes	91	154	80.5	136.5	63
EAT	169	286	149.5	253.5	117
EPS (₹)	8.45	9.53	4.98	12.67	5.85

The debt form of financing would be recommended to finance the new project as the EPS is more under debt form of financing than equity, in both optimistic and pessimistic situations.

Assumption: The company can sell its equity shares at ₹50 each without incurring any floatation costs.

P.18.14 A plastic manufacturing company is planning to expand its assets by 50 per cent. All financing for this expansion will come from external sources. The expansion will generate additional sales of ₹3 lakh with a return of 25 per cent on sales before interest and taxes. The finance department of the company has submitted the following plans for the consideration of the Board.

LO 18.2 **LOD M**

Plan 1: Issue of 10% debentures.

Plan 2: Issue of 10% debentures for half the required amount and balance in equity shares to be issued at 25 per cent premium.

Plan 3: Issue equity shares at 25 per cent premium.

Balance sheet of the company as on March 31

Liabilities	Amount	Assets	Amount
Equity capital (₹10 per share)	₹4,00,000	Total assets	₹12,00,000
8% Debentures	3,00,000		
Retained earnings	2,00,000		
Current liabilities	3,00,000		
	<u>12,00,000</u>		<u>12,00,000</u>

Income statement for the year ending March 31

Sales	₹19,00,000
Operating costs	<u>16,00,000</u>
EBIT	3,00,000
Interest	<u>24,000</u>
Earning after interests	2,76,000
Taxes	<u>96,600</u>
EAT	1,79,400
EPS	4.48

- Determine the number of equity shares that will be issued if financial plan 3 is adopted.
- Determine indifference point between (i) plans 1 and 2, (ii) plans 1 and 3, and (iii) plans 2 and 3.
- Assume that the price earnings ratio is expected to remain unchanged at 8 if plan 3 is adopted, but is likely to drop to 6 if either plan 1 or 2 is used to finance the expansion. Determine the expected market price of the shares in each of the situations.

Solution

$$(a) \text{ Number of shares issued} = 48,000 = \frac{₹6,00,000}{₹12.5}$$

$$(b) (i) \frac{(X - I_1 - I_2)(1 - t)}{N_1} = \frac{(X - I_1 - I_2)(1 - t)}{N_2}$$

$$\text{or } \frac{(X - ₹24,000 - ₹60,000) \times 0.65}{40,000} = \frac{(X - ₹24,000 - ₹30,000)(0.65)}{64,000}$$

$$X = ₹1,34,000$$

$$(ii) \frac{(X - I_1 - I_2)(1 - t)}{N_1} = \frac{(X - I_1)(1 - t)}{N_2}$$

$$\frac{(X - ₹84,000) \times (0.65)}{40,000} = \frac{(X - ₹24,000) \times 0.65}{88,000}$$

$$X = ₹1,34,000$$

Market price	28.38	19.56	20.72

P.18.15. Arvind Textile Mill currently has 10,00,000 shares of equity outstanding with a market price of ₹50 per share. It has also ₹4 crore in 12% bonds. The company is considering a ₹5 crore expansion programme that it can finance through: (1) All equity shares at ₹40 per share or (2) Straight bonds at 15% interest or (3) Half equity shares at ₹40 per share and half 15% bonds. You are required to do the following:

(i) Assume EBIT level of ₹2,50,00,000 after the expansion programme, calculate the earnings per share for each of the alternative modes of financing. Assume a corporate tax rate of 50%; (ii) What are the indifference points between alternatives? (iii) What is your interpretation of the results?

LO 18.2 **LOO D**

Solution

(i) Determination of EPS under 3 financing options

Particulars	Financial options		
	1 (E)	2 (D)	3 (E + D)
EBIT	₹2,50,00,000	₹2,50,00,000	₹2,50,00,000
Less interest (existing)	48,00,000	48,00,000	48,00,000
Less interest (additional)	—	75,00,000	37,50,000
EBT	2,02,00,000	1,27,00,000	1,64,50,000
Less taxes (50%)	1,01,00,000	63,50,000	82,25,000

(Contd.)

(Contd.)

EAT/Earnings for equity holders, EAEH	1,01,00,000	63,50,000	82,25,000
Number (N) of existing equity shares	10,00,000	10,00,000	10,00,000
Number of additional equity shares	12,50,000	—	6,25,000
EPS (EAEH/N)	₹4.49	₹6.35	₹5.06

(ii) Indifference point between plans 1 and 2

$$= \frac{(X - I_1)}{N_1} = \frac{(X - I_1 - I_2)(1 - t)}{N_2}$$

where, X = EBIT, I₁, and I₂ = existing and additional interest respectively.

$$= \frac{(X - ₹48,00,000)0.5}{22,50,000} = \frac{(X - ₹1,23,00,000)0.5}{10,00,000}$$

Multiplying left equation by 4 and right by 9.

$$4(0.5X - ₹24,00,000) = 9(0.5X - ₹61,50,000)$$

$$2X - ₹96,00,000 = 4.5X - ₹5,53,50,000$$

$$2.5X = ₹4,57,50,000 \text{ or } X = ₹4,57,50,000/2.5 = ₹1,83,00,000 \text{ (EBIT)}$$

(iii) Indifference point between plans 1 and 3

$$= \frac{(X - I_1)(1 - t)}{N_1} = \frac{(X - I_1 - I_3)(1 - t)}{N_3}$$

$$= \frac{(X - ₹48,00,000)0.5}{22,50,000} = \frac{(X - ₹85,50,000)0.5}{16,25,000}$$

Multiplying left equation by 13 and right by 18

$$13(0.5X - ₹24,00,000) = 18(0.5X - ₹42,75,000)$$

$$6.5X - ₹3,12,00,000 = 9X - ₹7,69,50,000$$

$$2.5X = ₹4,57,50,000 \text{ or } X = ₹4,57,50,000/2.5 = ₹1,83,00,000 \text{ (EBIT)}$$

(iv) Indifference point between plans 2 and 3

$$= \frac{(X - I_1 - I_2)}{N_1} = \frac{(X - I_1 - I_3)(1 - t)}{N_2}$$

$$= \frac{(X - ₹1,23,00,000)0.5}{10,00,000} = \frac{(X - ₹85,50,000)(0.5)}{16,25,000}$$

Multiplying left equation by 13 and right by 8

$$13(0.5X - ₹61,50,000) = 8(0.5X - ₹42,75,000)$$

$$6.5X - ₹7,99,50,000 = 4X - ₹3,42,00,000$$

$$2.5X = ₹7,99,50,000 - ₹3,42,00,000/2.5 = ₹4,57,50,000$$

$$X = ₹4,57,50,000/2.5 = ₹1,83,00,000$$

Interpretation: Indifference points are the same in all the options. Since EPS is maximum under option 2, the company is advised to raise funds through debt.

P.18.16. TeleTalk Ltd is a leading telecommunications service provider in India. It has recently launched its DTH (Direct To Home) services called "DigiTV". TeleTalk has decided to set up a small plant to manufacture the DTH devices within the country. The cost of required machine is ₹80 lakh and the working capital required is ₹20 lakh. With the new machine it is expected to have higher sales level of ₹70 lakh and the total operating (fixed and variable) costs of ₹20 lakh. The corporate tax rate is 35%.

The existing capital structure of TeleTalk Ltd. includes 10% Debentures of ₹50 lakh, 2 lakh equity shares (₹50 per share) and retained earnings of ₹20 lakh. The company is considering the two proposed financial plans to meet the required financing needs. Their details along with P/E ratios are as follows:

Plan 1

1.4 lakh Equity Shares (₹50 per share)	= ₹70 lakh
11% Debt	= 30 lakh
P/E ratio	= 10 times

Plan 2

1 lakh Equity Shares (₹50 per share)	= ₹50 lakh
12.5% Debt	= 50 lakh
P/E ratio	= 9 times

Required: (a) Which of the two financing alternatives should the company choose? Assume company wants to maximise market price per share. (b) Determine indifference point with respect to EPS and MPS.

Solution: Determination of MPS under two proposed financial plans

Particulars	Plan1	Plan2
Sales	₹70,00,000	₹70,00,000
Less : Total operating costs	20,00,000	20,00,000
EBIT	50,00,000	50,00,000
Less: Interest on existing debt	5,00,000	5,00,000
Less: Interest on additional debt	3,30,000	6,25,000
EBT	41,70,000	38,75,000
Less: Taxes (at 35%)	14,59,500	13,56,250
EAT	27,10,500	25,18,750
Total No. of Shares (existing + new)	3,40,000	3,00,000
EPS	7.97	8.40
P/E Ratio (times)	10	9
MPS	₹79.70	₹75.60

Recommendation: The Company should choose plan 2 as it has higher MPS.

Determination of indifference point with reference to EPS

$$(a) \quad \frac{(X - I_e - I_1)(1-t)}{(N_e + N_1)} = \frac{(X - I_e - I_2)(1-t)}{(N_e + N_2)}$$

$$\frac{(X - ₹5,00,000 - ₹3,30,000)(1-0.35)}{(2,00,000 + 1,40,000)} = \frac{(X - ₹5,00,000 - ₹6,25,000)(1-0.35)}{(2,00,000 + 1,00,000)}$$

$$X = ₹33,37,500$$

Determination of indifference point with reference to EPS

$$(b) \quad \left[\frac{(X - I_e - I_1)(1-t)}{(N_e + N_1)} \right] \times \left[\frac{P}{E} \right] = \left[\frac{(X - I_e - I_2)(1-t)}{(N_e + N_2)} \right] \times \left[\frac{P}{E} \right]$$

$$\left[\frac{(X - ₹5,00,000 - ₹3,30,000)(1-0.35)}{(2,00,000 + 1,40,000)} \right] \times 10 = \left[\frac{(X - ₹5,00,000 - ₹6,25,000)(1-0.35)}{(2,00,000 + 1,00,000)} \right] \times 9$$

$$X = ₹1,58,75,000$$

P.18.17 Mr Marker is an entrepreneur and has recently set up manufacturing unit of Pens. He currently sells 1 million pens a year at ₹5 each. His variable cost to produce the pen is ₹3 per pen and he has ₹15 lakh in fixed costs. His sales to assets ratio is 5 times, and 40 per cent of his assets are financed with 8% debt, with the balance being financed by ordinary shares of ₹10 per share. The tax rate is 35 per cent.

LO 18.1,2,3 LOD

His newly appointed finance manager, Mr Impression, feels that Mr Marker is doing it all wrong. By reducing his price to ₹4.50 per pen, he could increase his sales volume of pens by 40 per cent. Fixed costs would remain constant, and variable costs would remain ₹3 per unit. His sales to asset ratio would be 6.3 times. Furthermore, he could increase his debt to assets ratio to 50 per cent, with the balance in shares. It is assumed that the interest rate would go up 1 per cent and that the price of shares would remain constant.

- Compute the EPS under the Marker and Impression plans. Is Mr Impression's perception right?
- Mr Marker's partner does not think that fixed costs would remain constant under the Impression plan but they would go up by 15 per cent. If this is the case, should Mr Marker shift to the Impression plan, based on earnings per share.
- What is the effect on the total risk of the firm on switching from one plan to another?

Solution

(a) and (b) Computation of EPS under Marker and Impression Plans

Marker Plan:	
Sales revenue (1 million × ₹5)	₹50,00,000
Less: Variable cost (1 million × ₹3)	30,00,000
Contribution	20,00,000
Less: Fixed costs	15,00,000
EBIT	5,00,000
Less: Interest (Working note 1)	32,000
EBT	4,68,000
Less: Tax (0.35)	1,63,800
EAT	3,04,200
N (Number of shares)	60,000
EPS	5.07
Impression Plan:	
Sales revenue (1 million × 1.4 × ₹4.5)	63,00,000
Less: Variable cost (1 million × 1.4 × ₹3)	42,00,000
Contribution	21,00,000
Less: Fixed costs	15,00,000
EBIT	6,00,000
Less: Interest (Working note 2)	45,000
EBT	5,55,000
Less: Tax (0.35)	1,94,250
EAT	3,60,750
N (Number of shares)	50,000
EPS	7.72

Working Note 1

Sales/Assets = 5

₹50 lakh/Assets = 5 or Assets = ₹10 lakh

40% of assets financed by 8% debt = ₹4 lakh.

Interest ($0.08 \times ₹4 \text{ lakh}$) = ₹32,000.

Number of shares (₹6 lakh + ₹10 each share) = 60,000.

Working Note 2

Total assets = ₹10 lakh

Debt/Assets = 50%

∴ Debt = ₹5 lakh at $8\% + 1\% = 9\%$

Interest = $0.09 \times ₹5 \text{ lakh} = ₹45,000$

Number of shares (₹5 lakh + ₹10) = 50,000.

Yes, Mr Impression is right in his perceptions. Following his plan would increase the EPS to ₹7.22 from ₹5.07.

(c) Computation of EPS

The total risk is determined by the combined leverage which in turn is evaluated by combining operating and financial leverage. (Amount in rupees lakh, L)

Marker Plan:

$$\text{DOL} = \frac{\text{Contribution}}{\text{EBIT}} = \frac{20L}{5L} = 4 \quad \text{DFL} = \frac{\text{EBIT}}{\text{EBIT} - I} = \frac{5L}{5L - 0.32L} = 1.068$$

$$\text{DCL} = \text{DOL} \times \text{DFL} = 4.27$$

Impression Plan:

$$\text{DOL} = \frac{₹21L}{₹6L} = 3.5$$

$$\text{DFL} = \frac{6L}{6L - 0.45L} = 1.08$$

$$\text{DCL} = \text{DOL} \times \text{DFL} = 3.78$$

There is a decrease in the degree of combined leverage, reflecting a decline in the total risk of the company. With a lower degree of risk, the market price of its shares is likely to go up.

P.18.18 The current capital structure of RSS Ltd. as on 31st March 2018 is as follows:

LO 18.2 LOD D

Equity share capital (5 lakh shares @ ₹100 per share)	₹5,00,00,000
Reserves and surplus	1,00,00,000
10% Preference share capital (20 lakh shares @ ₹10 per share)	2,00,00,000
8% Debt	4,00,00,000
	<hr/> 12,00,00,000

Annual sales of the company for the year 2018 was at ₹30 crore and its EBIT was ₹3 crore.

The company wants to undertake a huge expansion plan for which an additional capital of ₹8 crore is required. The management of the company has two following financial plans for consideration of the Board:
Plan 1: Issue 1,25,000 equity shares of ₹100 each at ₹60 premium and raise a debt for the balance. However, the new debt will be available @ 9.5% interest rate per annum.

Plan 2: Raise the entire requirement by issuing equity shares of ₹100 each at ₹60 premium.

After the expansion, the sales level is estimated at ₹50 crore and EBIT is expected at 8% of sales.

The Board is having conflict of opinion. Some members of the Board opine that the company should go for Plan 1 as it would result in higher EPS (earnings per share); while others are in favour of Plan 2 as it would yield higher MPS (market price per share).

Which plan is better in your opinion? The P/E ratio is estimated to be 7 under Plan 1 and 10 under Plan 2.

Corporate tax rate is 35%.

Solution

Determination of EPS

EBIT	₹3,00,00,000
Less: Interest (₹4,00,00,000 × 8%)	32,00,000
EBT	2,68,00,000
Less: Taxes (@35%)	93,80,000
EAT	1,74,20,000
Less: Preference dividend (₹2,00,00,000 × 10%)	20,00,000
EAEH (Earnings available for equity-holders, EAEH)	1,54,20,000
Number of equity shares (N)	5,00,000
EPS (₹1,54,20,000/5,00,000)	₹30.84

Two proposed financial plans:

Plan 1: 1,25,000 Equity shares @ ₹(100 + 60)	₹2,00,00,000
Debt (balancing figure)	6,00,00,000
	8,00,00,000

Plan 2: Equity shares @ ₹(100 + 60)	
Number of shares = (₹8,00,00,000/₹160)	5,00,000 shares

Calculation of indifference point based on EPS (without considering P/E ratio):

$$\frac{(X - I_e - I_a)(1 - t) - D_p}{N_e + N_{a1}} = \frac{(X - I_e)(1 - t) - D_p}{N_e + N_{a2}}$$

Where:

N_e = Number of existing equity shares

N_{a1} = Number of additional equity shares issued under Plan 1

N_{a2} = Number of additional equity shares issued under Plan 2

$$\frac{[(X - ₹32,00,000 - ₹57,00,000)(1 - 0.35)] - ₹20,00,000}{5,00,000 + 1,25,000} = \frac{[(X - ₹32,00,000)(1 - 0.35)] - ₹20,00,000}{5,00,000 + 5,00,000}$$

$X = ₹2,14,76,923.08$

Verification Table

Particulars	Plan I	Plan II
EBIT	₹2,14,76,923.08	₹2,14,76,923.08
less: Interest		
Existing	32,00,000.00	32,00,000.00
Additional	57,00,000.00	0.00
EBT	1,25,76,923.08	1,82,76,923.08
less: Taxes	44,01,923.08	63,96,923.08
EAT	81,75,000.00	1,18,80,000.00
less: Preference dividend	20,00,000.00	20,00,000.00
EAEH	61,75,000.00	98,80,000.00
Number of equity shares	6,25,000	10,00,000
EPS	₹9.88	₹9.88

Since the estimated EBIT (₹4 crore) is sufficiently higher than required EBIT, it will be beneficial for the company to opt for a more levered plan 1, as it results in higher EPS (shown below):

Particulars	Plan 1	Plan 2
EBIT (10% of ₹50,00,00,000)	₹5,00,00,000	₹5,00,00,000
Less: Interest		
Existing: ₹4,00,00,000 × 8%	32,00,000	32,00,000
Additional: ₹6,00,00,000 × 9.5%	57,00,000	—
EBT	4,11,00,000	4,68,00,000
Less: Taxes (@35%)	1,43,85,000	1,63,80,000
EAT	2,67,15,000	3,04,20,000
Less: Preference dividend (₹2,00,00,000 × 10%)	20,00,000	20,00,000
EAEH	2,47,15,000	2,84,20,000
Number of equity shares	(5,00,000 + 1,25,000)	(5,00,000 + 5,00,000)
EPS (EAEH/Number of equity shares)	₹39.54	₹28.42

Thus, from EPS perspective, Plan 1 is better.

However, P/E ratio is not equal under the two Plans. Therefore, the P/E multiple for each plan should also be considered to have sound decision making. In other words, there is a need to compute real indifference point based on MPS.

Calculation of indifference point based on MPS (real indifference point):

$$\left[\frac{(X - I_e - I_a)(1 - t) - D_p}{N_e + N_{a1}} \right] \times P/E_1 = \left[\frac{(X - I_e)(1 - t) - D_p}{N_e + N_{a2}} \right] \times P/E_2$$

$$\left[\frac{[(X - ₹32,00,000 - ₹57,00,000)(1 - .35)] - ₹20,00,000}{5,00,000 + 1,25,000} \right]^7 = \left[\frac{[(X - ₹32,00,000)(1 - .35)] - ₹20,00,000}{5,00,000 + 5,00,000} \right]^{10}$$

$$X = ₹5,94,76,923.08$$

Verification Table:

Particulars	Alternative I	Alternative II
EBIT	₹5,94,76,923.08	₹5,94,76,923.08
less: Interest		
Existing	32,00,000.00	32,00,000.00
Additional	57,00,000.00	0.00
EBT	5,05,76,923.08	5,62,76,923.08
less: Taxes	1,77,01,923.08	1,96,96,923.08
EAT	3,28,75,000.00	3,65,80,000.00
less: Preference dividend	20,00,000.00	20,00,000.00
EAEH	3,08,75,000.00	3,45,80,000.00
Number of equity shares	6,25,000	10,00,000
EPS	49.40	34.58
P/E ratio	7	10
MPS	₹345.80	₹345.80

It may be noted that required EBIT at real indifference level is higher than estimated EBIT. Therefore, a less levered Plan 2 (in spite of lower EPS) would be more profitable for the company.

Particulars	Alternative 1	Alternative 2
EPS (already calculated)	₹39.54	₹28.42
P/E ratio	7	10
MPS (EPS × P/E)	₹276.8	₹284.2

Given the fact that maximisation of shareholders' wealth is the primary objective of financial decision making of any company, and it gets reflected in market price of shares, the company should opt for Plan 2 (as it results in higher market price).

MINI CASES

18.C.1 G Manufacturing company is an important producer of lawn furniture and decorative objectives for the patio and garden. The last year's income statement and balance sheet are as follows:

Income statement

Sales	₹75,00,000
Variable costs	46,90,000
Contribution	28,10,000
Fixed costs	14,00,000
Earnings before interest and tax (EBIT)	14,10,000
Interest	2,00,000
Earnings before tax (EBT)	12,10,000
Taxation	6,05,000
Net Income after tax	6,05,000

Balance sheet

Liabilities	Amount	Assets	Amount
Equity capital	₹10,00,000	Fixed assets	₹60,00,000
Reserves and surplus	42,00,000	Inventory	6,00,000
Long-term debt (10%)	20,00,000	Receivables	7,00,000
Current liabilities	5,00,000	Cash	4,00,000
	77,00,000		77,00,000

Figures for industry comparison:

Normal asset turnover 1.2 : 1. Normal profit margin 20 per cent

For the current year, the forecasted sales are ₹80,00,000 and it is likely that variable costs will remain at approximately the same percentage of sales as was in the last year. (Figures could be rounded off).

Fixed costs will rise by 10 per cent.

G has short-listed the following two product lines to be sold through its existing distribution channels:

- (1) Production and sale of metal table and chair unit that will be sold for use around swimming pools. This will require an investment of ₹20,00,000, which would involve installation of manufacturing and packaging machinery. Sales forecast are ₹15,00,000 per annum, variable costs account for 2/3rd of sales value, fixed costs are ₹2,00,000 and no additional working capital is needed.
- (2) Hardwood planter with three separate components, will be appropriate for medium sized shrubs. This will require an investment of ₹30,00,000 with forecasted sales per annum of ₹25,00,000, variable costs 64 per cent of sales value and fixed costs of ₹5,00,000.

Two financial plans are available:

- (a) It could borrow on a 10 years note at 9 per cent for either or both of the projects of an amount not to exceed ₹60,00,000.
- (b) Cumulative preference shares with a 10 per cent dividend upto an amount of ₹30,00,000. Financing through the issue of equity shares would not be possible at the present time.

Required

- (1) Without the new proposals, what would be the company's operating, fixed charges and combined leverages next year? Would the company have favourable financial leverage?
- (2) How does the acceptance of each project affect the differing leverages including asset leverages?
- (3) With each financing alternatives, do the company's future earnings per share increase or decrease, why?

Solution

(1) Income statement at projected sales of ₹80 lakh in current year

Sales revenue	₹80,00,000
Less: Variable costs (₹80 lakh × 62.5% V/V ratio)	50,00,000
Contribution	30,00,000
Less: Fixed costs (₹14 lakh + 10%)	15,40,000
EBIT	14,60,000
Less: Interest	2,00,000
Earnings before taxes (EBT)	12,60,000
Less: Taxes (0.50)	6,30,000
Earnings after taxes	6,30,000

Determination of leverages (without the new proposals)

DOL = Contribution/EBIT (₹30,00,000/₹14,60,000)	2.0548
DFL = EBIT/EBT (₹14,60,000/₹12,60,000)	1.1587
DCL = Contribution/EBT (₹30,00,000/₹12,60,000) Or 2.0548 × 1.1587	2.3809

The company is said to have favourable financial leverage if it earns more on the assets purchased (with debt funds) than the interest it pays on debt. For the purpose, ROR on capital employed is computed. It is (₹14,60,000/₹72,00,000) = 20.28 per cent. This return is higher than 10 per cent interest payable on long-term debt. Evidently, the firm is having positive financial leverage.

(2) Income statement showing earnings of two projects, DOL and assets leverage

Particulars	Projects	
	Metal table and chair unit	Hardwood planter
Sales revenue	₹15,00,000	₹25,00,000
Less: Variable costs	10,00,000	16,00,000
Contribution	5,00,000	9,00,000
Less: Fixed costs	2,00,000	5,00,000
EBIT	3,00,000	4,00,000
DOL (Contribution/EBIT)	1.667	2.25
Assets leverage (Sales/Total assets)	0.75	0.83

To determine other leverages, it will be useful to extend income statement to include the impact of financing costs.

Income statement showing other leverages (DFL and DCL) and other ratios

Particulars	Projects	
	Metal table and chair unit (Investments ₹20 lakh)	Hardwood planter (Investments ₹30 lakh)
(i) Financed through debt plan:		
EBIT	₹3,00,000	₹4,00,000
Less: Interest	1,80,000	2,70,000
Earnings before taxes (EBT)	1,20,000	1,30,000
Less: Taxes (0.50)	60,000	65,000
Earnings after taxes	60,000	65,000
DFL (EBIT/EBT)	2.5	2.0
DCL (DOL × DFL)	4.1675	4.5
Rate of return on capital employed (%)	15	13.33
(ii) Financed through cumulative preference share (₹30 lakh) + ₹20 lakh debt for two combined projects		
EBIT		7,00,000
Less: Interest (₹20 lakh × 9%)		1,80,000
Earnings before taxes		5,20,000
Less: Taxes (0.50)		2,60,000
Earnings after taxes		2,60,000
Less: Dividends to preference share holders (₹30 lakh × 10%)		3,00,000
EAT		(40,000) *

*Since EAT is negative, this financial plan is worth rejecting and hence warrants no more calculations for other leverages.

It is apparent that acceptance of the Hardwood Planter project will adversely affect risk level (reflected in higher DOL, DFL and DCL). While the acceptance of Metal Table project decreases operating risk (lower DOL), it increases total risk (as DCL is 4.15). The asset leverages are also very low.

Though the ROR on capital employed is higher for both the projects than the interest rate paid, the acceptance of these projects will decrease the firm's overall rate of return on capital employed (the existing ROR on capital employed is 20, 28 per cent).

(3) The impact of financing alternatives on company's future EPS:

Financial plan (a): Since the rate of return on capital employed is higher (for both the projects) than the rate of interest (9 per cent) payable on funds borrowed, the projects will increase EPS.

Financing plan (b): Under this plan, funds are to be raised by the issue of ₹30 lakh cumulative 10 per cent Preference shares, the EPS will decrease as payment of 10 per cent preference dividend requires 20 per cent pre-tax return on ₹30 lakh; the projected pre-tax return is 17.33 per cent (₹5,20,000/₹30,00,000). In fact, taking two projects in a combined manner, the firm has negative returns for equity-holders. As a result, this financial plan will have depressing effect on the EPS and is not desirable.

In sum, the firm should go for both projects only when debt financing is possible for both such projects.

18.C.2 AMR Paints (Operating, Financial and Combined Leverage) AMR Paints Ltd is a leading manufacturer of decorative and industrial paints in India. The income statement (Exhibit 1) and the balance sheet (Exhibit 2) for the current year are given. Its sales next year are estimated to be 25 per cent higher on account of increase in demand for paints from the housing and commercial real estate sectors. The variable costs as percentage to sale are likely to remain constant. An increase of 12.5 per cent is estimated in fixed costs.

AMR Paints is planning to launch two new brands of luxury emulsions—Supercoat and Luxurycoat. The Supercoat paint would generate an additional ₹600 crore sales and require an extra ₹400 crore investment involving installation of manufacturing and packaging machinery. While the additional fixed costs requirement would be ₹150 crore, variable cost to sales ratio would not change. For manufacturing

the Luxurycoat paint the additional investment requirement and sales generated would amount to ₹600 crore and ₹800 crore respectively. The variable cost ratio would remain constant but the fixed cost are expected to increase by ₹240 crore. The AMR has four alternative financing plans to choose from (Exhibit 3). Its current debt-equity ratio is 5:1.

AMR Paints has hired Mustafa Hakimuddin as a financial consultant to carry out the following tasks:

- (1) What would its operating, financial and total leverages be next year without the new proposal?
- (2) Assuming that the AMR paints finances the projects using financing plan (A), determine the three leverages for the two projects individually. Which new brand is better?
- (3) Which financing option should AMR choose to if only Supercoat is to be manufactured?
- (4) Calculate the financial breakeven points of each plan.

EXHIBIT 1 Income Statement, Current Year and Market Data (₹ crore)

Sales	₹5,000
Variable costs (0.50)	2,500
Contribution	2,500
Fixed costs	1,000
EBIT	1,500
Interest	500
EBT	1,000
Tax (0.35)	350
EAT	650
Shares outstanding	10
EPS (₹)	65
P/E ratio	20
Market price per share (MPS) (₹)	1,300

EXHIBIT 2 Balance Sheet As at March 31, Current Year (₹ crore)

Liabilities		Assets	
Equity capital	₹100	Fixed assets	₹5,850
Reserve and Surpluses	900	Current assets:	
10% Debt	5,000	Inventory	₹550
Current liabilities	950	Receivables	300
		Cash	250
	6,950		1,100
			6,950

EXHIBIT 3 Financing Options/Plans (₹ crore)

Plans	Debentures		Equity Shares		Preference Shares		P/E
	Coupon rate	Amount	Number (Crore)	Face value	Rate	Amount	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
A	0.12	₹1,000	—	—	—	—	14
B	—	—	100	₹10	—	—	30
C	0.11	400	60	10	—	—	20
D	—	—	70	10	0.11	₹300	28

Solution

(1) Determination of Leverage (Without New Proposal)

$$\text{Degree of operating leverage (DOL)} = \left[\frac{\text{Sales} - \text{VC}}{\text{EBIT}} \right] = 1.56$$

$$\text{Degree of financial leverage (DFL)} = \text{EBIT}/(\text{EBIT} - I) = 1.33$$

$$\text{Degree of combined leverage (DCL)} = [\text{DOL} \times \text{DFL}] = 2.07$$

Working Note

Income statement (₹ crore)

Project sales (₹5,000 + 0.25)	₹6,250
Variable costs (50%)	3,125
Contribution	3,125
Fixed costs (₹1,000 + 0.125)	1,125
EBIT	2,000
Interest	500
EBT	1,500
Taxes (0.35)	525
EAT	975
EPS	97.5
P/E	20
MPS	1,950

(2) Determination of Leverage

	Supercoat	Luxurycoat
DOL	2	2.5
DFL	1.47	1.82
DCL	2.94	4.55
ROCE (Return on capital employed)	0.375	0.267

Comment: Supercoat is a superior alternative as its leverages are lower and the ROCE is higher.

Working Note

Income Statement (₹ crore)

	Supercoat	Luxurycoat
Sales	₹600	₹800
Variable costs (0.50)	300	400
Contribution	300	400
Fixed costs	150	240
EBIT	150	160
Interest	48	72
EBT	102	88
Tax	35.7	30.8
EAT	66.3	57.2

(3) Determination of Leverages

Particulars	Financing Plans			
	A	B	C	D
DOL	1.59	1.59	1.59	1.59
DFL	1.34	1.30	1.32	1.32
DCL	2.13	2.07	2.10	2.10
Outstanding shares (crore)	10.00	50.00	34.00	38.00
EPS (₹)	104.13	21.45	31.21	27.88
P/E ratio	14	30	20	28
MPS (₹)	1,457.82	643.50	624.22	780.64

Comment: Plan A is preferable as it has the highest MPS.

Working Notes

Income Statement (₹ crore)

Particulars	Plans			
	A	B	C	D
Projected sales	₹6,850	₹6,850	₹6,850	₹6,850
Variable costs	3,425	3,425	3,425	3,425
Contribution	3,425	3,425	3,425	3,425
Fixed costs	1,275	1,275	1,275	1,275
EBIT	2,150	2,150	2,150	2,150
Interest	548	500	517.6	500

Preference dividend	—	—	—	13.2
Earning available for shareholders	1,041.3	1,072.5	1,061.0	1,059.3

(4) Financial Break-even Point

$$= (I + D/PD) \div (1 - t)$$

Plan A =	₹548.0	crore (Interest)
B	500.0	(Interest)
C	517.6	(Interest)
D	520.30	[₹500 + (₹13.2/0.65)]

REVIEW QUESTIONS**LOD: Easy**

RQ.18.1 Indicate whether the following statements are true or false.

[LO 18.1,2,3]

- (i) The degree of operating leverage is a measure of financial risk.
- (ii) The degree of financial leverage is a measure of business risk.
- (iii) The EBIT level at which the EPS is the same for two alternative financial plans is known as the financial break-even point.
- (iv) At financial break-even point, EPS is zero.
- (v) The greater the projected level of EBIT than the indifference point, the stronger is the case for the use of equity.

- (vi) The combined leverage is the summation of the degree of operating leverage and financial leverage.
- (vii) The combined leverage is a measure of total risk of the firm.
- (viii) High fixed operating costs increase the financial leverage.
- (ix) The larger the amount of fixed financial costs, the larger is the EBIT required to recover them.
- (x) There exists inverse relationship between fixed costs and leverage.
- (xi) Financial BEP is a summation of interest payable on debt and dividend on preference shares.

[Answers: (i) False (ii) False (iii) False (iv) True (v) False (vi) False (vii) True (viii) False (ix) True (x) False (xi) False]

RQ.18.2 What is the 'indifference point' and why is it so called? What is its usefulness? [LO 18.2]

RQ.18.3 How would you compute indifference point? [LO 18.2]

RQ.18.4 Royal Industries Ltd, a well-established firm in plastics, is considering the purchase of one of the two manufacturing companies. The financial manager of the company has developed the following information about the two companies. Both companies have total assets of ₹15,00,000. [LO 18.1]

Operating statement

Particulars	X Ltd	Y Ltd
Sales revenue	₹30,00,000	₹30,00,000
Less: cost of goods sold	22,50,000	22,50,000
selling expenses	2,40,000	2,40,000
administrative expenses	90,000	1,50,000
depreciation	1,20,000	90,000
EBIT	3,00,000	2,70,000
<i>Cost break-ups</i>		
Variable costs:		
Cost of goods sold	9,00,000	18,00,000
Selling expenses	1,50,000	1,50,000
Total	10,50,000	19,50,000

- (i) Prepare operating statements for both the companies, assuming that sales increase by 20 per cent. The total fixed costs are likely to remain unchanged and the variable costs are a linear function of sales.
- (ii) Calculate the degree of operating leverage.
- (iii) If Royal Industries Ltd wishes to buy a company which has a lower degree of business risk, which company would be purchased by it?

LOD: Medium

RQ.18.5 What is meant by the term 'leverage'? What are its types? With what type of risk is each leverage generally associated? Why is increasing leverage also indicative of increasing risk? State the situation when there is neither a financial risk nor business risk. [LO 18.1,2,3]

RQ.18.6 Why must the finance manager keep in mind the degree of financial leverage in evaluating various financing plans? When does financial leverage become favourable? [LO 18.2]

RQ.18.7 Premier Ltd's capital structure consists of the following: [LO 18.2]

Particulars	Amount (in ₹ lakh)
Equity shares of ₹100 each	20
Retained earnings	10
9% Preference shares	12
7% Debentures	8
	50

1. Introduction
 2. Methodology
 3. Results
 4. Discussion
 5. Conclusion

The first part of the report discusses the background of the study and the objectives. The methodology section describes the research design and the data collection process. The results section presents the findings of the study, and the discussion section interprets these findings in the context of the research objectives. The conclusion summarizes the main points of the study and suggests areas for further research.

The following table shows the distribution of the data across the different categories. The data indicates that there is a significant difference between the groups, which is supported by the statistical analysis. The results suggest that the intervention had a positive effect on the outcome variable.

The second part of the report focuses on the analysis of the data. The statistical methods used in this study are described in detail. The results of the statistical tests are presented, and the significance of the findings is discussed. The discussion section also addresses the limitations of the study and the implications of the results.

The final part of the report provides a summary of the key findings and conclusions. The overall message of the study is that the intervention is effective in improving the outcome variable. The study has several strengths, including a well-defined methodology and a clear focus on the research objectives. However, there are also some limitations, such as the relatively small sample size and the lack of long-term follow-up.

In conclusion, the study has provided valuable insights into the effectiveness of the intervention. The results suggest that the intervention is a promising approach for addressing the research problem. Further research is needed to confirm these findings and to explore the underlying mechanisms of the intervention's effect.

The company's EBIT is at the rate of 12 per cent on its capital employed which is likely to remain unchanged after expansion. The expansion involves additional finances aggregating ₹25 lakh for which the following alternatives are available to it:

- (i) Issue of 20,000 equity shares at a premium of ₹25 per share.
- (ii) Issue of 10% Preference shares.
- (iii) Issue of 8% Debentures.

It is estimated that the P/E ratio in case of equity shares, preference shares and debentures financing would be 15, 12, and 10 respectively.

Which of the financing alternatives would you recommend and why? The corporate tax rate is 35 per cent.

- RQ.18.8** Hypothetical Ltd is in need of ₹1,00,000 to finance its increased net working capital requirements. The finance manager of the company believes that its various financial costs and share price will be unaffected by the selection of a particular plan, since a small sum is involved. Debentures will cost 10 per cent, preference shares 11 per cent, and equity shares can be sold for ₹25 per share. The tax rate is 35 per cent. LO 18.2

Sources of funds	Financial plans (per cent)		
	1	2	3
Equity shares	100	30	50
Preference shares	0	10	20
Debentures	0	60	30

- (i) Determine the financial break even point.
- (ii) Which plan has greater risk? Assume EBIT level of ₹50,000.

LOD: Difficult

- RQ.18.9** A financial analyst is interested in ascertaining business risk of two similar firms. If all operating data for the two firms were the same, save the following differences, which firm would have greater amount of business risk in each instance? LO 18.1

(a) Firm X has a higher sales level than Firm Y, (b) Firm X has a higher EBIT level, and (c) Firm Y has a lower variable cost ratio.

- RQ.18.10** What is combined leverage? What does it measure? What would be the changes in the degree of combined leverage, assuming other things being equal, in each of the following situations?

(a) The fixed costs increase, (b) The EBIT level increases, (c) The sale price decreases, and (d) The variable cost decreases. LO 18.3

- RQ.18.11** Explain the significance of operating and financial leverage analysis for a financial executive in corporate profit and financial structure planning. LO 18.1.2

- RQ.18.12** Key information pertaining to the proposed new financing plans of Hypothetical Ltd is given below: LO 18.2

Sources of funds	Financing plans	
	1	2
Equity	15,000 shares of ₹100 each	30,000 shares of ₹100 each
Preference shares	12%, 25,000 shares of ₹100 each	—
Debentures	₹5,00,000 at a coupon rate of 0.10	15,00,000, coupon rate of 0.11

Assuming 35 per cent tax rate,

- (i) Determine the two EBIT - EPS coordinates for each financial plan.
- (ii) Determine the (a) indifference point, and (b) financial break-even point for each financing plan.
- (iii) Which plan has more financial risk and why?

- (iv) Indicate over what EBIT range, if any, one plan is better than the other.
 (v) If the firm is fairly certain that its EBIT will be ₹12,50,000, which plan would you recommend and why?

RQ.18.13 The operating and cost data of ABC Ltd are:

LO 18.1,2,3

Sales	₹20,00,000
Variable costs	14,00,000
Fixed costs	4,00,000 (including 15 per cent interest on ₹10,00,000)

Calculate its operating, financial and combined leverage.

ANSWERS

- 18.4** (i) EBIT ₹6,90,000 (X); ₹4,80,000 (Y)
 (ii) DOL (X) 6.5
 DOL (Y) 3.88
 (iii) Royal Industries Ltd should purchase Y Ltd.
- 18.7** Issuing equity shares is the best alternative as it maximizes the MPS (₹165.30).
- 18.8** (i) ₹6,385
 (ii) DFL of Financial Plan 1: 1
 Plan 2 : 1.18
 Plan 3 : 1.15
 Financial Plan 2 has higher financial risk.
- 18.12** (i) (a) EBIT : ₹5,11,538; ₹1,65,000
 (b) EPS : ₹32; ₹23.51
 (ii) (a) ₹8,58,077
 (b) ₹5,11,538 (Plan 1); ₹1,65,000 (Plan 2)
 (iii) Financial risk is measured by DFL. Plan 1 has more financial risk as its DFL is likely to be higher.
 (iv) Financial Plan 2 is better for EBIT level of less than ₹8,58,077; Plan 1 is better for EBIT ranges beyond that level.
 (v) Plan 1, as EPS will be higher.
- 18.13** DOL 1.71
 DFL 1.75

CHAPTER

19

Capital Structure, Cost of Capital and Valuation

LEARNING OBJECTIVES

LO 19.1	Review the assumptions, definitions and symbols relating to capital structure theories
LO 19.2	Explain the major capital structure theories—Net Income Approach, Net Operating Income Approach, Modigliani and Miller (MM) Approach and Traditional Approach—and evaluate them to explore the relationship between leverage and cost of capital from the standpoint of valuation

INTRODUCTION

The discussions in the preceding Chapter have shown that financial leverage has a magnifying effect on EPS, such that, for a given level of change in EBIT, there will be a more than proportionate change in the same direction in the EPS. But financial leverage also increases the financial risk, defined as the risk of possible insolvency arising out of inadequacy of available cash as well as the variability in the earnings available to the ordinary shareholders. Given the objective of the firm to maximise the value of the equity shares, the firm should select a financing-mix/capital structure/financial leverage which will help in achieving the objective of financial management. As a corollary, the **capital structure** should be examined from the viewpoint of its impact on the *value* of the firm. It can be legitimately expected that if the capital structure decision affects the total value of the firm, a firm should select such a financing-mix as will maximise the shareholders' wealth. Such a capital structure is referred to as the optimum capital structure. The **optimum capital structure** may be defined as the *capital structure or combination of debt and equity that leads to the maximum value of the firm*.

The importance of an appropriate capital structure is, thus, obvious. There is a viewpoint that strongly supports the close relationship between leverage and value of a firm. There is an equally strong body of opinion which believes that financing-mix or the combination of debt and equity has no impact on the shareholders' wealth and the decision on financial structure is irrelevant. In other words, there is nothing such as optimum capital structure.

- **Capital structure** is the proportion of debt and preference and equity shares on a firm's balance sheet.

- **Optimum capital structure** is the capital structure at which the weighted average cost of capital is minimum and thereby maximum value of the firm.

Capital Structure, Cost of Capital and Valuation

THEORY

The cost of capital is the rate of return required by investors to provide the funds for the firm's operations. It is the weighted average of the costs of the different sources of capital. The cost of capital is a function of the firm's capital structure, the risk of its assets, and the risk of its debt.

EMPIRICAL

The empirical relationship between capital structure and the cost of capital is complex. While the theory predicts that a higher debt-to-equity ratio will increase the cost of capital, empirical studies have shown that the relationship is non-linear and depends on the firm's size, industry, and risk. The trade-off theory suggests that firms with higher debt ratios face higher costs of debt due to the risk-shifting and asset substitution costs. The pecking order theory suggests that firms with higher debt ratios have higher costs of capital because they are more likely to have high-risk investments.

The empirical relationship between capital structure and the cost of capital is complex. While the theory predicts that a higher debt-to-equity ratio will increase the cost of capital, empirical studies have shown that the relationship is non-linear and depends on the firm's size, industry, and risk. The trade-off theory suggests that firms with higher debt ratios face higher costs of debt due to the risk-shifting and asset substitution costs. The pecking order theory suggests that firms with higher debt ratios have higher costs of capital because they are more likely to have high-risk investments.

In theory, capital structure can affect the value of a company by affecting either its expected earnings or the cost of capital, or both. While it is true that financing-mix cannot affect the total operating earnings of a firm, as they are determined by the investment decisions, it can affect the share of earnings belonging to the ordinary shareholders. The capital structure decision can influence the value of the firm through the earnings available to the shareholders. But the leverage can largely influence the value of the firm through the cost of capital. In exploring the relationship between leverage and value of a firm in this chapter, we are concerned with the relationship between leverage and cost of capital from the standpoint of valuation. We discuss the assumptions, definitions and symbols relating to capital structure theories first. The next four major capital structure theories, namely: **(i)** Net Income Approach, **(ii)** Net Operating Income Approach, **(iii)** Modigliani-Miller (MM) Approach, and **(iv)** Traditional Approach are explained and evaluated from the standpoint of valuation. The main points are summarised by way of recapitulation.

LO 19.1 ASSUMPTIONS, DEFINITIONS AND SYMBOLS

Assumptions

1. There are only two sources of funds used by a firm: *perpetual riskless* debt and *ordinary* shares.
2. There are no corporate taxes. This assumption is removed later.
3. The dividend-payout ratio is 100. That is, the total earnings are paid out as dividend to the shareholders and there are no retained earnings.
4. The total assets are given and do not change. The investment decisions are, in other words, assumed to be constant.
5. The total financing remains constant. The firm can change its degree of leverage (capital structure) either by selling shares and use the proceeds to retire debentures or by raising more debt and reduce the equity capital.
6. The operating profits (EBIT) are not expected to grow.
7. All investors are assumed to have the same subjective probability distribution of the future expected EBIT for a given firm.
8. Business risk is constant over time and is assumed to be independent of its capital structure and financial risk.
9. Perpetual life of the firm.

Definitions and Symbols

In addition to the above assumptions, we shall make use of some symbols in our analysis of capital structure theories:

- S = total market value of equity
- B = total market value of debt
- I = total interest payments
- V = total market value of the firm ($V = S + B$)
- NI = net income available to equity-holders.

We shall also make use of some basic definitions:

$$(1) \text{ Cost of debt } (k_d) = \frac{I}{B} \quad (19.1)$$

$$\text{Value of debt } (B) = \frac{I}{k_i} \quad (19.2)$$

$$(2) \text{ Cost of equity capital } (k_e) = \frac{D_1}{P_0} + g \quad (19.3)$$

where D_1 = net dividend; P_0 = current market price of shares and g is the expected growth rate. According to assumption (3), the percentage of retained earnings is zero. Since $g = br$, where r is the rate of return on equity shares and b is the retention rate, $g = 0$, the growth rate is zero. This is consistent with assumption (6). In operational terms $D_1 = E_1$, $g = 0$. Therefore,

$$k_e = \frac{E_1}{P_0} + g = \frac{E_1}{P_0} + 0 = \frac{E_1}{P_0} \quad (19.4)$$

where E_1 = earnings per share. Equation 19.4 is on a per share basis. Multiplying both the numerator and the denominator by the number of shares outstanding (N) and assuming there are no income taxes, we have

$$K_e = \frac{E_1 (\times) N}{P_0 (\times) N} = \frac{\text{EBIT} - I \text{ or } NI}{S}$$

Or
$$= \frac{\text{Net income available to equity holders}}{\text{Total market value of equity shares}} \quad (19.5)$$

Thus, k_e may be defined on either per share or total basis.

From Eqs. 19.4 and 19.5 follow the equations of determining the value of equity shares on per share basis and total basis.

$$(i) \text{ Per share basis, } P_0 = \frac{E_1}{k_e} \quad (19.6)$$

$$(ii) \text{ Total basis, } S = P_0 N = \frac{\text{EBIT} - I}{k_e} \quad (19.7)$$

(iii) Overall cost of capital or weighted average cost of capital:

$$K_0 = W_1 k_i + W_2 k_e \text{ (where } W_1 \text{ and } W_2 \text{ are relative weights)}$$

$$= (B/V)k_i + (S/V)k_e = \left[\frac{B}{B+S} \right] k_i + \left[\frac{S}{B+S} \right] k_e \quad (19.8)$$

$$\text{or } K_0 = \frac{I + NI}{V} = \frac{\text{EBIT}}{V} \quad (19.9)$$

From Eq. 19.9 follows the equation of total value of the firm. Thus,

$$V = \frac{\text{EBIT}}{k_0} \quad (19.10)$$

$$\text{Alternatively: } V = \frac{I}{k_i} + \frac{\text{EBIT} - I}{k_e} \quad (19.11)$$

1. The first part of the book is devoted to a general introduction to the subject of the book. It is divided into two parts: the first part is devoted to a general introduction to the subject of the book, and the second part is devoted to a general introduction to the subject of the book.

Another useful way of measuring the cost of equity capital is described below:

We know k_0 is the weighted average of the cost of equity and the cost of debt. Symbolically,

$$k_0 = \left[\frac{B}{B+S} \right] k_i + \left[\frac{S}{B+S} \right] k_e \quad (19.8)$$

$$= k_i \left(\frac{B}{V} \right) + k_e \left(\frac{S}{V} \right) \quad (19.8.1)$$

$$k_e = \frac{k_0 - k_i (B/V)}{S/V} \quad (19.8.2)$$

We know that $V = B + S$. Therefore, equity ratio, S/V can be expressed as:

$$\frac{S}{V} = \frac{S}{B+S} = 1 - \frac{B}{B+S} \quad (19.8.3)$$

Substituting the value of Eq. 19.8.3 in Eq. 19.8.2, we have

$$\begin{aligned} k_e &= k_0 - k_i \left[\frac{B}{B+S} \right] \left/ 1 - \frac{B}{B+S} \right. \\ &= \frac{k_0 (B+S) - k_i B}{B+S} \left/ \frac{B+S-B}{B+S} \right. \end{aligned} \quad (19.8.4)$$

$$\text{Or} \quad = \frac{k_0 B + k_0 S - k_i B}{B+S} \left/ \frac{S}{B+S} \right. \quad (19.8.5)$$

Simplifying Eq. 19.8.5, we have

$$k_e = \frac{k_0 B + k_0 S - k_i B}{S} \quad (19.8.6)$$

$$k_e = k_0 + (k_0 - k_i) B/S \quad (19.12)$$

While exploring the relationship between capital structure and value of the firm, our concern is with the cost of equity capital (k_e), cost of debt (k_i) and overall cost of capital (k_0) when the capital structure/leverage changes, as measured by the change in the relationship between total value of debt and debt to total of ordinary shares (B/S).

LO 19.2 CAPITAL STRUCTURE THEORIES

The capital structure theories explain the relationship between leverage and cost of capital from the standpoint of valuation. The major capital structure theories explored here are Net income, Net operating income, MM and Traditional approaches.

Net Income Approach

According to the Net Income (NI) Approach, suggested by the Durand¹, the capital structure decision is relevant to the valuation of the firm. In other words, a change in the financial leverage will lead to a corresponding change in the overall cost of capital as well as the total value of the firm. If, therefore, the degree of financial leverage as measured by the ratio of debt to equity is increased, the weighted average cost of capital will decline, while the value of the firm as well as the market price of ordinary shares will increase. Conversely, a decrease in the leverage will cause an increase in the overall cost of capital and a decline both in the value of the firm as well as the market price of equity shares.

The NI Approach to valuation is based on three assumptions: first, there are no taxes; second, that the cost of debt is less than the equity-capitalisation rate or the cost of equity; third, that the use of debt does not change the risk perception of investors. That the financial risk perception of the investors does not change with the introduction of debt or change in leverage implies that due to change in leverage, there is no change in either the cost of debt or the cost of equity. The implication of the three assumptions underlying the NI Approach is that as the degree of leverage increases, the proportion of a cheaper source of funds, that is, debt in the capital structure increases. As a result, the weighted average cost of capital tends to decline, leading to an increase in the total value of the firm. Thus, with the cost of debt and cost of equity being constant, the increased use of debt (increase in leverage), will magnify the shareholder's earnings and, thereby, the market value of the ordinary shares.

The financial leverage is, according to the NI Approach, an important variable to the capital structure of a firm. With a judicious mixture of debt and equity, a firm can evolve an optimum capital structure which will be the one at which value of the firm is the highest and the overall cost of capital is the lowest. At that structure, the market price per share would be maximum.

If the firm uses no debt or if the financial leverage is zero, the overall cost of capital will be equal to the equity-capitalisation rate. The weighted average cost of capital will decline and will approach the cost of debt as the degree of leverage reaches one.

The NI Approach is illustrated in Example 19.1.

Example 19.1

A company's expected annual net operating income (EBIT) is ₹50,000. The company has ₹2,00,000, 10% debentures. The equity capitalisation rate (k_e) of the company is 12.5 per cent.

Solution

With no taxes, the value of the firm, according to the Net Income Approach is depicted in Table 19.1.

TABLE 19.1 Value of the Firm (Net Income Approach)

Net operating income (EBIT)	₹50,000
Less: Interest on debentures (I)	20,000
Earnings available to equity holders (NI)	30,000
Equity capitalisation rate (k_e)	0.125
Market value of equity (S) = NI/k_e	2,40,000
Market value of debt (B)	2,00,000
Total value of the firm ($S + B$) = V	4,40,000
Overall cost of capital = k_0 = $EBIT/V$ (%)	11.36
Alternatively: $k_0 = k_i (B/V) + k_e (S/V)$ where k_i and k_e are cost of debt and cost of equity respectively,	
$= 0.10 \left(\frac{₹2,00,000}{₹4,40,000} \right) + 0.125 \left(\frac{₹2,40,000}{₹4,40,000} \right)$ (%)	11.36

Increase in Value

In order to examine the effect of a change in financing-mix on the firm's overall (weighted average) cost of capital and its total value, let us suppose that the firm has decided to raise the amount of debenture by ₹1,00,000 and use the proceeds to retire the equity shares. The k_i and k_e would remain unaffected as per the assumptions of the NI Approach. In the new situation, the value of the firm is shown in Table 19.2.

TABLE 19.2 Value of the Firm (Net Income Approach)

Net operating income (EBIT)		₹50,000
Less: Interest on debentures (<i>I</i>)		30,000
Earnings available to equity holders (<i>N</i>)		20,000
Equity capitalisation rate (k_e)		0.125
Market value of equity (S) = N/k_e		1,60,000
Market value of debt (B)		3,00,000
Total value of the firm ($S + B$) = V		4,60,000
$k_0 = \frac{₹50,000}{₹4,60,000}$ Or $0.10 \left[\frac{₹3,00,000}{₹4,60,000} \right] + 0.125 \left[\frac{₹1,60,000}{₹4,60,000} \right]$		10.9 per cent

Thus, the use of additional debt has caused the total value of the firm to increase and the overall cost of capital to decrease.

Decrease in Value

If we decrease the amount of debentures in Example 19.1, the total value of the firm, according to the NI Approach, will decrease and the overall cost of capital will increase. Let us suppose that the amount of debt has been reduced by ₹1,00,000 to ₹1,00,000 and a fresh issue of equity shares is made to retire the debentures. Assuming other facts as given in Example 19.1, the value of the firm and the weighted average cost of capital are shown in Table 19.3.

TABLE 19.3 Value of the Firm (Net Income Approach)

Net operating income (EBIT)		₹50,000
Less: Interest on debentures (<i>I</i>)		10,000
Earnings available to equity holders (<i>N</i>)		40,000
Equity capitalisation rate (k_e)		0.125
Market value of equity (S) = N/k_e		3,20,000
Market value of debt (B)		1,00,000
Total value of the firm ($S + B$) = V		4,20,000
$k_0 = \frac{₹50,000}{₹4,20,000}$ Or $0.10 \left[\frac{₹1,00,000}{₹4,20,000} \right] + 0.125 \left[\frac{₹3,20,000}{₹4,20,000} \right]$ (%)		11.9

Thus, we find that the decrease in leverage has increased the overall cost of capital and has reduced the value of firm.

Market Price

Thus, according to the NI Approach, the firm can increase/decrease its total value (V) and lower/increase its overall cost of capital (k_0) as it increases/decreases the degree of leverage. As a result, the market price per share is affected. To illustrate, assume in Example 19.1 that the firm with ₹2,00,000 debt has 2,400 equity shares outstanding. The market price per share works out to ₹100 (₹2,40,000 ÷ 2,400). The firm issues ₹1,00,000 additional debt and uses the proceeds of the debt to repurchase/retire ₹1,00,000 worth of equity shares or 1,000 shares. It, then, has 1,400 shares outstanding. We have observed in Example 19.1 that the total market value of the equity after the change in the capital structure is ₹1,60,000 (Table 19.2). Therefore, the market price per share is ₹114.28 (₹1,60,000 ÷ 1,400), as compared to the original price of ₹100 per share.

Likewise, when the firm employs less amount of debt, the market value per share declines. To continue with Example 19.1, the firm raises ₹1,00,000 additional equity capital by issuing 1,000 equity shares of ₹100 each and uses the proceeds to retire the debenture amounting to ₹1,00,000. It would then have 3,400 shares (2,400 old + 1,000 new) outstanding. With this capital structure, we have seen in Example 19.1 that the total market value of equity shares is ₹3,20,000 (Table 19.3). Therefore, the market price per share has declined to ₹94.12 (₹3,20,000 ÷ 3,400) from ₹100 before a change in the leverage.

We can graph the relationship between the various factors (k_e , k_p , k_i) with the degree of leverage (Fig. 19.1).

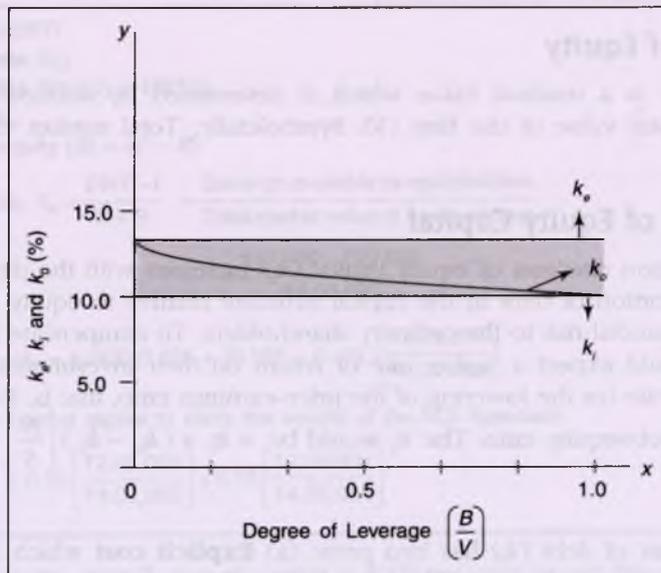

FIGURE 19.1 Leverage and Cost of Capital (NI Approach)

The degree of leverage (B/V) is plotted along the X-axis, while the percentage rates of k_p , k_e and k_0 are on the Y-axis. This graph is based on Example 19.1. Due to the assumptions that k_e and k_i remain unchanged as the degree of leverage changes, we find that both the curves are parallel to the X-axis. But as the degree of leverage increases, k_0 decreases and approaches the cost of debt when leverage is 1.0, that is, ($k_0 = k_i$). It will obviously be so owing to the fact that there is no equity capital in the capital structure. At this point, the firm's overall cost of capital would be minimum. The significant conclusion, therefore, of the NI Approach is that the firm can employ almost 100 per cent debt to maximise its value.

Net Operating Income (NOI) Approach

Another theory of capital structure, suggested by Durand², is the Net Operating Income (NOI) Approach. This Approach is diametrically opposite to the NI Approach. The essence of this Approach is that the capital structure decision of a firm is irrelevant. Any change in leverage will not lead to any change in the total value of the firm and the market price of shares as well as the overall cost of capital is independent of the degree of leverage.

THE NEWSPAPER INDUSTRY

The newspaper industry is a complex one, involving a wide range of activities and interests. It is a business that has evolved over the years, adapting to changing circumstances and technologies. The industry is characterized by its diversity, with a wide range of publications serving different audiences and interests. The newspaper industry is a vital part of our society, providing us with the news and information we need to live our lives. The NOI Approach is based on the following propositions.

Overall Cost of Capital/Capitalisation Rate (k_0) is Constant

The NOI Approach to valuation argues that the overall capitalisation rate of the firm remains constant, for all degrees of leverage. The value of the firm, given the level of EBIT, is determined by Eq. 19.13.

$$V = \frac{\text{EBIT}}{k_0} \quad (19.13)$$

In other words, the market evaluates the firm as a whole. The split of the capitalisation between debt and equity is, therefore, not significant.

Residual Value of Equity

The value of equity is a residual value which is determined by deducting the total value of debt (B) from the total value of the firm (V). Symbolically, Total market value of equity capital (S) = $V - B$.

Changes in Cost of Equity Capital

The equity-capitalisation rate/cost of equity capital (k_e) increases with the degree of leverage. The increase in the proportion of debt in the capital structure relative to equity shares would lead to an increase in the financial risk to the ordinary shareholders. To compensate for the increased risk, the shareholders would expect a higher rate of return on their investments. The increase in the equity-capitalisation rate (or the lowering of the price-earnings ratio, that is, P/E ratio) would match the increase in the debt-equity ratio. The k_e would be = $k_0 + (k_0 - k_i) \left[\frac{B}{S} \right]$

Cost of Debt

- Explicit cost** is the rate of interest paid on debt.
 - The cost of debt (k_i) has two parts: (a) **Explicit cost** which is represented by the rate of interest. Irrespective of the degree of leverage, the firm is assumed to be able to borrow at a given rate of interest. *This implies that the increasing proportion of debt in the financial structure does not affect the financial risk of the lenders* and they do not penalise the firm by charging higher interest; (b) **Implicit or 'hidden' cost**.
- Implicit cost** is the increase in cost of equity due to increase in debt.
 - As shown in the assumption relating to the changes in k_e , increase in the degree of leverage or the proportion of debt to equity causes an increase in the cost of equity capital. This increase in k_e being attributable to the increase in debt, is the implicit part of k_e .

Thus, the advantage associated with the use of debt, supposed to be a 'cheaper' source of funds in terms of the explicit cost, is exactly neutralised by the implicit cost represented by the increase in k_e . As a result, **the real cost of debt and the real cost of equity**, according to the NOI Approach, **are the same and equal k_0** .

Optimum Capital Structure

The total value of the firm is unaffected by its capital structure. No matter what the degree of leverage is, the total value of the firm will remain constant. The market price of shares will also not change with the change in the debt-equity ratio. There is nothing such as an *optimum capital structure*. Any capital structure is optimum, according to the NOI Approach.

The effect of NOI Approach on value of the firm, k_e and the market price per share is illustrated in Example 19.2.

Example 19.2

Assume the figures given in Example 19.1: operating income ₹50,000; cost of debt, 10 per cent; and outstanding debt, ₹2,00,000. If the overall capitalisation rate (overall cost of capital) is 12.5 per cent, what would be the total value of the firm and the equity-capitalisation rate?

Solution

The computation is depicted in Table 19.4.

TABLE 19.4 Total Value of the Firm (Net Operating Income Approach)

Net operating income (EBIT)	₹50,000
Overall capitalisation rate (k_0)	0.125
Total market value of the firm (V) = EBIT/ k_0	4,00,000
Total value of debt (B)	2,00,000
Total market value of equity (S) = ($V - B$)	2,00,000
Equity-capitalisation rate, $k_e = \frac{\text{EBIT} - I}{V - B} = \frac{\text{Earnings available to equityholders}}{\text{Total market value of equity shares}}$	
$= \frac{₹50,000 - ₹20,000}{₹2,00,000}$	0.15
Alternatively, $k_e = k_0 + (k_0 - k_d)B/S = 0.125 + (0.125 - 0.10) \left[\frac{₹2,00,000}{₹2,00,000} \right]$	0.15
The weighted average cost of capital to verify the validity of the NOI Approach:	
$k_0 = k_d(B/V) + k_e(S/V) = 0.10 \left[\frac{₹2,00,000}{₹4,00,000} \right] + 0.15 \left[\frac{₹2,00,000}{₹4,00,000} \right]$	0.125

Thus, we find that the overall cost of capital is 12.5 per cent as per the requirement of the NOI Approach.

In order to examine the effect of leverage, let us assume that the firm increases the amount of debt from ₹2,00,000 to ₹3,00,000 and uses the proceeds of the debt to repurchase equity shares. The value of the firm would remain unchanged at ₹4,00,000, but the equity-capitalisation rate would go up to 20 per cent as shown in Table 19.5.

TABLE 19.5 Value of the Firm (NOI Approach)

Net operating income (EBIT)	₹50,000
Overall capitalisation rate (k_0)	0.125
Total market value of the firm (V) = EBIT/ k_0	4,00,000
Total value of debt (B)	3,00,000
Total market value of equity (S) = ($V - B$)	1,00,000
$k_e = \frac{₹50,000 - ₹30,000}{₹1,00,000}$	0.20

(Contd.)

Let x be the number of apples and y be the number of oranges.

From the given information, we can write the following equations:

Equation (1): $x + y = 10$ (Total number of fruits)

+

Equation (2): $2x + 3y = 25$ (Total cost of fruits)

Solving the system:

From Equation (1), we can express y in terms of x : $y = 10 - x$.

Substituting into Equation (2):

Substituting $y = 10 - x$ into Equation (2), we get:
 $2x + 3(10 - x) = 25$
 $2x + 30 - 3x = 25$
 $-x + 30 = 25$
 $-x = 25 - 30$
 $-x = -5$
 $x = 5$

Conclusion:

There are 5 apples and 5 oranges.

Let's verify the solution:
 Total number of fruits: $5 + 5 = 10$
 Total cost: $2(5) + 3(5) = 10 + 15 = 25$

The solution is correct.

Therefore, the number of apples is 5 and the number of oranges is 5.

Final Answer:

There are 5 apples and 5 oranges.

The total number of fruits is 10, and the total cost is 25.

Let's solve the system of equations:

Equation (1): $x + y = 10$

Equation (2): $2x + 3y = 25$

From Equation (1), we can express y in terms of x : $y = 10 - x$.

Substituting $y = 10 - x$ into Equation (2), we get:

$2x + 3(10 - x) = 25$

$2x + 30 - 3x = 25$

$-x + 30 = 25$

$-x = 25 - 30$

$-x = -5$

$x = 5$

Substituting $x = 5$ into Equation (1), we get:

$5 + y = 10$

$y = 10 - 5$

$y = 5$

Therefore, the number of apples is 5 and the number of oranges is 5.

The total number of fruits is 10, and the total cost is 25.

The solution is correct.

(Contd.)

$$\text{Alternatively: } k_e = 0.125 + (0.125 - 0.10) \left[\frac{\text{₹}3,00,000}{\text{₹}1,00,000} \right] \quad 0.20$$

$$k_0 = 0.10 \left[\frac{\text{₹}3,00,000}{\text{₹}4,00,000} \right] + 0.20 \left[\frac{\text{₹}1,00,000}{\text{₹}4,00,000} \right] \quad 0.125$$

Let us further suppose that the firm retires debt by ₹1,00,000 by issuing fresh equity shares of the same amount. The value of the firm would remain unchanged at ₹4,00,000 and the equity-capitalisation rate would come down to 13.33 per cent as manifested in the calculations in Table 19.6.

TABLE 19.6 Total Value of the Firm (NOI Approach)

Net operating income (EBIT)	₹50,000
Overall capitalisation rate (k_0)	0.125
Total market value of the firm (V) = EBIT/ k_0	4,00,000
Total value of debt (B)	1,00,000
Total market value of equity (S) = ($V - B$)	3,00,000
$k_e = \frac{\text{₹}50,000 - \text{₹}10,000}{\text{₹}3,00,000}$	0.133
Alternatively: $k_e = 0.125 + (0.125 - 0.10) \left[\frac{\text{₹}1,00,000}{\text{₹}3,00,000} \right]$	0.133
$k_0 = 0.10 \left[\frac{\text{₹}1,00,000}{\text{₹}4,00,000} \right] + 0.133 \left[\frac{\text{₹}3,00,000}{\text{₹}4,00,000} \right]$	0.125

The significant feature is that the equity-capitalisation rate, k_e , increases with the increase in the degree of leverage. It has gone up from 15 per cent to 20 per cent with the increase in leverage from 0.50 to 0.75. The equity capitalisation rate decreases with the decrease in the degree of leverage. It has come down from 15 per cent to 13.33 per cent with the decrease in leverage from 0.50 to 0.25.

Market Price of Shares

In Example 19.2, let us suppose the firm with ₹2 lakh debt has 2,000 equity shares (of ₹100 each) outstanding. The firm has issued additional debt of ₹1,00,000 to repurchase its shares amounting to ₹1,00,000; it has to repurchase 1,000 shares of ₹100 each from the market. It, then, has 1,000 equity shares outstanding, having total market value of ₹1,00,000. The market price per share, therefore, is ₹100 (₹1,00,000 ÷ 1,000) as before.

In the second situation the firm issues, 1,000 equity shares of ₹100 each to retire debt aggregating ₹1,00,000. It will have 3,000 equity shares outstanding, having total market value of ₹3,00,000, thus, giving a market price of ₹100 per share.

Thus, we note that there is no change in the market price per share due to change in leverage.

We have portrayed the relationship between the leverage and the various costs, viz. k_p , k_e and k_0 in Fig. 19.2.

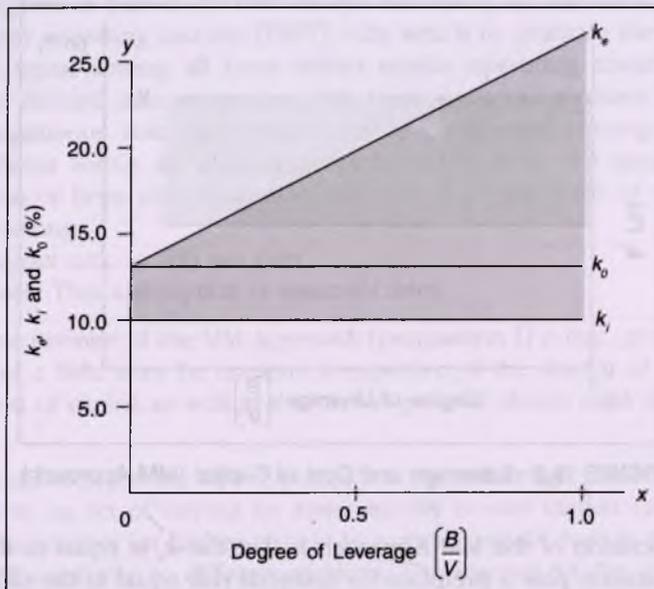

FIGURE 19.2 Leverage and Cost of Capital (NOI Approach)

The graph is based on Example 19.2. Due to the assumption that k_0 and k_i remain unchanged as the degree of leverage changes, we find that both the curves are parallel to the X-axis. But as the degree of leverage increases, the k_e increases continuously.

Modigliani-Miller (MM) Approach

The Modigliani-Miller Thesis³ relating to the relationship between the capital structure, cost of capital and valuation is akin to the NOI Approach. The NOI Approach, as explained above, is definitional or conceptual and lacks behavioural significance.⁴ The NOI Approach, in other words, does not provide operational justification for the irrelevance of the capital structure. The MM proposition supports the NOI Approach relating to the independence of the cost of capital of the degree of leverage at any level of debt-equity ratio. The significance of their hypothesis lies in the fact that it provides behavioural justification for constant overall cost of capital and, therefore, total value of the firm. In other words, the MM Approach maintains that the weighted average (overall) cost of capital does not change, as shown in Fig. 19.3, with a change in the proportion of debt to equity in the capital structure (or degree of leverage). They offer operational justification for this and are not content with merely stating the proposition.

Basic Propositions

There are three basic propositions of the MM Approach:

- I The overall cost of capital (k_0) and the value of the firm (V) are independent of its capital structure. The k_0 and V are constant for all degrees of leverage. The total value is given by capitalising the expected stream of operating earnings at a discount rate appropriate for its risk class.

$\frac{d}{dt} \left(\frac{1}{r} \right) = -\frac{1}{r^2} \frac{dr}{dt}$
 $\frac{d}{dt} \left(\frac{1}{r} \right) = -\frac{1}{r^2} \frac{dr}{dt}$

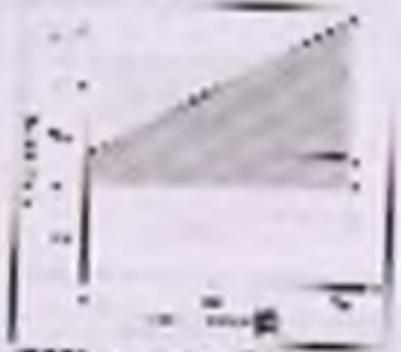

The rate of change of the reciprocal of the radius is equal to the negative of the rate of change of the radius divided by the square of the radius.

If the radius of a sphere is increasing at a constant rate, the rate of change of the reciprocal of the radius is constant and negative.

The rate of change of the reciprocal of the radius is constant and negative.

The rate of change of the reciprocal of the radius is constant and negative.

The rate of change of the reciprocal of the radius is constant and negative.

Graph showing a linear relationship between two variables.

The graph shows a linear relationship between two variables. The x-axis is labeled 'Time' and the y-axis is labeled 'Distance'. A straight line starts at the origin and goes up and to the right. A shaded triangular region is formed under the line from the origin to a point on the line. A vertical line segment is drawn from that point on the line down to the x-axis, and a horizontal line segment is drawn from that point on the x-axis to the y-axis, forming a right-angled triangle with the axes.

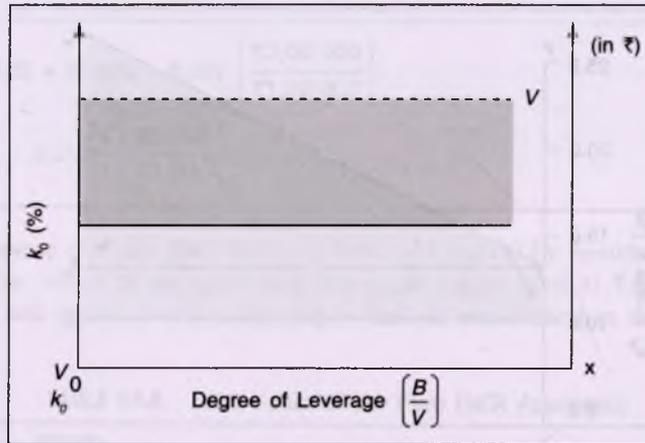

FIGURE 19.3 Leverage and Cost of Capital (MM Approach)

II The second proposition of the MM Approach is that the k_e is equal to the capitalisation rate of a pure equity stream plus a premium for financial risk equal to the difference between the pure equity-capitalisation rate (k_e) and k_i times the ratio of debt to equity. In other words, k_e increases in a manner to offset exactly the use of a less expensive source of funds represented by debt. MM proposition II states that the corporate's cost of equity (k_e) consists of two elements: (i) k_o , the required, rate of return on the total assets of the firm whose value depends on the business risk; and (ii) $(k_o - k_i) B/S$ which is determined by the company's capital structure.⁵ For a zero-debt company, this component is zero. As the company starts using debt, the k_e increases **and the equity-investor is to be compensated for it**. The higher the employment of debt in financing company's assets, the higher is the financial risk as well as the financial risk premium.

Debt financing increases financial risk. The cost of equity depends on business risk and financial risk. Business risk is affected by the business operations of the firm and is independent of its financing pattern. Financial risk is determined exclusively by the financing pattern/capital structure.

Thus, MM proposition II is in conformity with the NOI approach (**already explained**).

III The cut-off rate for investment purposes is completely independent of the way in which an investment is financed.

We are interested mainly in exploring the relationship between leverage and valuation. Our focus, therefore, is on proposition(1).

Assumptions

The proposition that the weighted average cost of capital is constant irrespective of the type of capital structure is based on the following assumptions:

- (a) **Perfect capital markets:** The implication of a perfect capital market is that (i) securities are infinitely divisible; (ii) investors are free to buy/sell securities; (iii) investors can borrow without restrictions on the same terms and conditions as firms can; (iv) there are no transaction costs; (v) information is perfect, that is, each investor has the same information which is readily available to him without cost; and (vi) investors are rational and behave accordingly.

- (b) Given the assumption of perfect information and rationality, all investors have the same expectation of firm's net operating income (EBIT) with which to evaluate the value of a firm.
- (c) Business risk is equal among all firms within similar operating environment. That means, all firms can be divided into 'equivalent risk class' or 'homogeneous risk class'. The term equivalent/homogeneous risk class means that the expected earnings have identical risk characteristics. Firms within an industry are assumed to have the same risk characteristics. The categorisation of firms into equivalent risk class is on the basis of the industry group to which the firm belongs.
- (d) The dividend payout ratio is 100 per cent.
- (e) There are no taxes. This assumption is removed later.

Proposition I The basic premise of the MM Approach (proposition I) is that, given the above assumptions, the total value of a firm must be constant irrespective of the degree of leverage (debt-equity ratio). Similarly, the cost of capital as well as the market price of shares must be the same regardless of the financing-mix.

The operational justification for the MM hypothesis is the **arbitrage process**. The term 'arbitrage' refers to an act of buying an asset/security in one market (at lower prices) and selling it in another (at higher price). As a result, equilibrium is restored in the market price of a security in different markets. The essence of the arbitrage process is the purchase of securities/assets whose prices are lower (undervalued securities) and, sale of securities whose prices are higher, in related markets which are temporarily out of equilibrium. The arbitrage process is essentially a balancing operation. It implies that a security cannot sell at different prices. The MM Approach illustrates the arbitrage process with reference to valuation in terms of two firms which are exactly similar in all respects except leverage so that one of them has debt in its capital structure while the other does not. Such homogeneous firms are, according to Modigliani and Miller, perfect substitutes. The total value of the homogeneous firms which differ only in respect of leverage cannot be different because of the operation of arbitrage. The investors of the firm whose value is higher will sell their shares and instead buy the shares of the firm whose value is lower. Investors will be able to earn the same return at lower outlay with the same perceived risk or lower risk. They would, therefore, be better off. The behaviour of the investors will have the effect of **(i)** increasing the share prices (value) of the firm whose shares are being purchased; and **(ii)** lowering the share prices (value) of the firm whose shares are being sold. This will continue till the market prices of the two identical firms become identical. Thus, the switching operation (arbitrage) drives the total value of two homogeneous firms in all respects, except the debt-equity ratio, together. The arbitrage process, as already indicated, ensures to the investor the same return at lower outlay as he was getting by investing in the firm whose total value was higher and yet, his risk is not increased. This is so because the investors would borrow in the proportion of the degree of leverage present in the firm. The use of debt by the investor for arbitrage is called as 'home-made' or 'personal' leverage. The essence of the arbitrage argument of Modigliani and Miller is that the investors (arbitrators) are able to substitute personal leverage or home-made leverage for corporate leverage, that is, the use of debt by the firm itself.

- **Arbitrage**
- implies buying a security in a market where price is low and selling where it is high.

- **Homemade leverage**
- can replicate the firm's capital structure, thereby causing investors to be indifferent to it.

The operation of the arbitrage process is illustrated in Example 19.3.

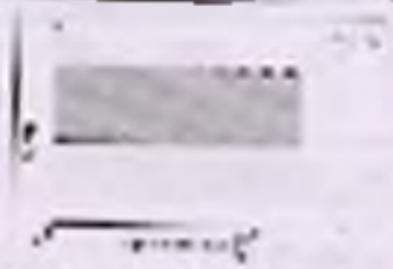

FIGURE 1. [Illegible text]

The first part of the study was conducted in the laboratory. The subjects were divided into two groups, one of which was given a certain amount of the substance under investigation. The results of the experiment were as follows: [Illegible text]

The second part of the study was conducted in the field. The subjects were given the same amount of the substance under investigation. The results of the experiment were as follows: [Illegible text]

DISCUSSION

The results of this study show that the substance under investigation has a significant effect on the subjects. The laboratory results were similar to the field results. This suggests that the substance under investigation has a consistent effect on the subjects. [Illegible text]

Example 19.3

Assume there are two firms, L and U, which are identical in all respects except that firm L has 10 per cent, ₹5,00,000 debentures. The earnings before interest and taxes (EBIT) of both the firms are equal, that is, ₹1,00,000. The equity-capitalisation rate (k_e) of firm L is higher (16 per cent) than that of firm U (12.5 per cent).

Solution

The total market values of firms L and U are computed in Table 19.7.

TABLE 19.7 Total Value of Firms L and U

Particulars	Firms	
	L	U
EBIT	₹1,00,000	₹1,00,000
Less: Interest	50,000	—
Earnings available to equity-holders	50,000	1,00,000
Equity-capitalisation rate (k_e)	0.16	0.125
Total market value of equity (S)	3,12,500	8,00,000
Total market value of debt (B)	5,00,000	—
Total market value (V)	8,12,500	8,00,000
Implied overall capitalisation rate/cost of capital (k_0) = EBIT/ V	0.123	0.125
Debt-equity ratio = B/S	1.6	—

Thus, the total market value of the firm which employs debt in the capital structure (L) is more than that of the unlevered firm (U). According to the MM hypothesis, this situation cannot continue as the arbitrage process, based on the substitutability of personal leverage for corporate leverage, will operate and the values of the two firms will be brought to an identical level.

Arbitrage Process The *modus operandi* of the arbitrage process is as follows:

Suppose an investor, Mr X, holds 10 per cent of the outstanding shares of the levered firm (L). His holdings amount to ₹31,250 (i.e. $0.10 \times ₹3,12,500$) and his share in the earnings that belong to the equity shareholders would be ₹5,000 ($0.10 \times ₹50,000$).

He will sell his holdings in firm L and invest in the unlevered firm (U). Since firm U has no debt in its capital structure, the financial risk to Mr X would be less than in firm L. To reach the level of financial risk of firm L, he will borrow additional funds equal to his proportionate share in the levered firm's debt on his personal account. That is, he will substitute personal leverage (or home-made leverage) for corporate leverage. In other words, instead of the firm using debt, Mr X will borrow money. The effect, in essence, of this is that he is able to introduce leverage in the capital structure of the the unlevered firm by borrowing on his personal account. Mr X in our example will borrow ₹50,000 at 10 per cent rate of interest. His proportionate holding (10 per cent) in the unlevered firm will amount to ₹80,000 on which he will receive a dividend income of ₹10,000. Out of the income of ₹10,000 from the unlevered firm (U), Mr X will pay ₹5,000 as interest on his personal borrowings. He will be left with ₹5,000 that is, the same amount as he was getting from the levered firm (L). But his investment outlay in firm U is less (₹30,000) as compared with that in firm L (₹31,250). At the same time, his risk is identical in both the situations. The effect of the arbitrage process is summarised in Table 19.8.

TABLE 19.8 Effect of Arbitrage

(A) Mr X's position in firm L (levered) with 10 per cent equity-holding	
(i) Investment outlay	₹31,250
(ii) Dividend Income	5,000

(Contd.)

(Contd.)

(B) Mr X's position in firm U (unlevered) with 10 per cent equity holding		
(i) Total funds available (own funds, ₹31,250 + borrowed funds, ₹50,000)		81,250
(ii) Investment outlay (own funds, ₹30,000 + borrowed funds, ₹50,000)		80,000
(iii) Dividend Income:		
Total Income ($0.10 \times ₹1,00,000$)	₹10,000	
Less: Interest payable on borrowed funds	5,000	5,000
(C) Mr X's position in firm U if he invests the total funds available		
(i) Investment costs		81,250.00
(ii) Total income		10,156.25
(iii) Dividend income (net) (₹10,156.25 – ₹5,000)		5,156.25

It is, thus, clear that Mr X will be better off by selling his securities in the levered firm and buying the shares of the unlevered firm. With identical risk characteristics of the two firms, he gets the same income with lower investment outlay in the unlevered firm. He will obviously prefer switching from the levered to the unlevered firm. Other investors will also, given the assumption of rational investors, enter into the arbitrage process. The consequent increasing demand for the securities of the unlevered firm will lead to an increase in the market price of its shares. At the same time, the price of the shares of the levered firm will decline. This will continue till it is possible to reduce the investment outlays and get the same return. Beyond this point, switching from firm L to firm U or arbitrage will not be identical. This is the point of equilibrium. At this point, the total value of the two firms would be identical. The cost of capital of the two firms would also be the same. Thus, it is unimportant what the capital structure of firm L is. The weighted cost of capital (k_0) after the investors exercise their home-made leverage is constant because investors exactly offset the firm's leverage with their own.⁶

Arbitrage Process: Reverse Direction According to the MM hypothesis, since debt financing has no advantage, it has no disadvantage either. In other words, just as the total value of a levered firm cannot be more than that of an unlevered firm, the value of an unlevered firm cannot be greater than the value of a levered firm. This is because the arbitrage process will set in and depress the value of the unlevered firm and increase the market price and, thereby, the total value of the levered firm. The arbitrage would, thus, operate in the opposite direction. Here, the investors will dispose of their holdings in the unlevered firm and obtain the same return by acquiring proportionate share in the equity capital and the debt of the levered firm at a lower outlay without any increase in the risk. This is illustrated in Example 19.4.

Example 19.4

Assume that in Example 19.3, the equity-capitalisation rate (k_e) is 20 per cent in the case of the levered firm (L), instead of the assumed 16 per cent. The total values of the two firms are given in Table 19.9.

TABLE 19.9 Total Value of Firms L and U

Particulars	L	U
EBIT	₹1,00,000	₹1,00,000
Less: Interest	50,000	—
Income to equity holders	50,000	1,00,000
Equity-capitalisation rate (k_e)	0.20	0.125
Market value of equity	2,50,000	8,00,000
Market value of debt	5,00,000	—
Total value (V)	7,50,000	8,00,000
(k_0)	0.133	0.125
B/S	2	0

Since both firms are similar, except for financing-mix, a situation in which their total values are different, cannot continue, as arbitrage will drive the two values together.

Suppose, Mr Y has 10 per cent shareholdings of firm U. He earns ₹10,000 ($0.10 \times ₹1,00,000$). He will sell his securities in firm U and invest in the undervalued levered firm, L. He can purchase 10 per cent of firm L's debt at a cost of ₹50,000 which will provide ₹5,000 interest and 10 per cent of L's equity at a cost of ₹25,000 with an expected dividend of ₹5,000 ($0.10 \times ₹50,000$). The purchase of a 10 per cent claim against the levered firm's income costs Mr Y only ₹75,000, yielding the same expected income of ₹10,000 from the equity shares of the unlevered firm. He would prefer the levered firm's securities as the outlay is lower. Table 19.10 portrays the reverse arbitrage process.

TABLE 19.10 Effect of Reverse Arbitrage Process

(A) Mr Y's current position in firm U		
Investment outlay		₹80,000
Dividend income		10,000
(B) Mr Y sells his holdings in firm U and purchases 10 per cent of the levered firm's equity and debentures		
	<i>Investment</i>	<i>Income</i>
Debt	₹50,000	₹5,000
Equity	25,000	5,000
Total	75,000	10,000
Y would prefer alternative B to A, as he is able to earn the same income with a smaller outlay.		
(C) He invests the entire sum of ₹80,000 in firm L		
	<i>Investment</i>	<i>Income</i>
Debt	₹53,333.00	₹5,333.30
Equity	26,667.00	5,333.40
Total	80,000.00	10,666.70
He augments his income by ₹666.70.		

The above illustrations establish that the arbitrage process will make the values of both the firms identical. Thus, Modigliani and Miller show that the value of a levered firm can neither be greater nor smaller than that of an unlevered firm; the two must be equal. There is neither an advantage nor a disadvantage in using debt in the firm's capital structure. The principle involved is simply that investors are able to reconstitute their former position by off-setting changes in corporate leverage with personal leverage. As a result the investment opportunities available to them are not altered by changes in the capital structure of the firm.⁷

Limitations

Does the MM hypothesis provide a valid framework to explain the relationship between capital structure, cost of capital and total value of a firm? The most crucial element in the MM Approach is the *arbitrage process* which forms the behavioural foundation of, and provides operational justification to, the MM hypothesis. The arbitrage process, in turn, is based on the crucial assumption of perfect substitutability of personal/home-made leverage with corporate leverage. The validity of the MM hypothesis depends on whether the arbitrage process is effective in the sense that personal leverage is a perfect substitute for corporate leverage. The arbitrage process is, however, not realistic and the exercise based upon it is purely theoretical and has no practical relevance.

Risk Perception In the first place, the risk perceptions of personal and corporate leverage are different. If home-made and corporate leverages are perfect substitutes, as the MM Approach assumes, the risk to which an investor is exposed, must be identical irrespective of whether the firm has borrowed (corporate leverage) or the investor himself borrows proportionate to his share in the firm's debt. If not, they cannot be perfect substitutes and consequently the arbitrage process will not be effective. The risk exposure to the investor is greater with personal leverage than with corporate leverage. The liability of an investor is limited in corporate enterprises in the sense that he is liable to the extent of his proportionate shareholdings in case the company is forced to go into liquidation. The risk to which he is exposed, therefore, is limited to his relative holding. The liability of an individual borrower is, on the other hand, unlimited as even his personal property is liable to be used for payment to the creditors. The risk to the investor with personal borrowing is higher. In Example 19.3, for instance, Mr X's liability (risk), when the firm has borrowed (levered firm), is ₹31,250, that is, his 10 per cent share in firm L. If he were to borrow equal to his proportionate share in the firm's debt (₹50,000), his total liability will be ₹80,000. Thus, investments in a levered firm (corporate leverage) and in an unlevered firm (personal leverage) are not on an equal footing from the viewpoint of risks to the investors. Since investors can reasonably be expected to prefer an arrangement which, while giving the same return, ensures lower risk, the personal and corporate leverages cannot be perfect substitutes.

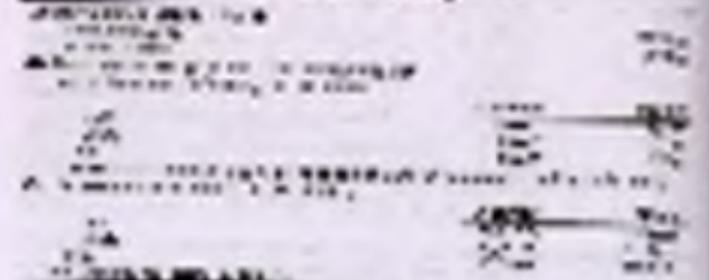

Convenience Apart from higher *risk exposure*, the investors would find the personal leverage *inconvenient*. This is so because with corporate leverage the formalities and procedures involved in borrowing are to be observed by the firms while these will be the responsibility of the investor-borrower in case of personal leverage. That corporate borrowing is more convenient to the investor means, in other words, that investors would prefer them rather than to do the job themselves. The perfect substitutability of the two types of leverage is, thus, open to question.

Cost Another constraint on the perfect substitutability of personal and corporate leverage and, hence, the effectiveness of the arbitrage process is the relatively *high cost of borrowing* with personal leverage. If the two types of leverage are to be perfect substitutes, the cost of borrowing ought to be identical for both: borrowing by the firm and borrowing by the investor-borrower. If the borrowing costs vary so that they are higher/lower depending on whether the borrowing is done by a firm or an individual, the borrowing arrangement with lower cost will be preferred by the investors. That lending costs are not uniform for all categories of borrowers is, as an economic proposition, well recognised. As a general rule, large borrowers with high credit-standing can borrow at a lower rate of interest compared to borrowers who are small and do not enjoy high credit-standing. For this reason, it is reasonable to assume that a firm can obtain a loan at a cost lower than what the individual investor would have to pay. As a result of higher interest charges, the advantage of personal leverage would largely disappear and the MM assumption of personal and corporate leverages being perfect substitutes would be of doubtful validity. In fact, borrowing by a firm has definite superiority over a personal loan from the viewpoint of the cost of borrowing. Investors can be expected to definitely prefer corporate borrowing as they would not be in the same position by borrowing on personal account.

Institutional Restrictions Yet another problem with the MM hypothesis is that *institutional restrictions* stand in the way of a smooth operation of the arbitrage process. Several institutional investors such as insurance companies, mutual funds, commercial banks and so on are not allowed to engage in personal leverage. Thus, switching the option from the unlevered to the levered firm

may not apply to all investors and, to that extent, personal leverage is an imperfect substitute for corporate leverage.

Double Leverage A related dimension is that in certain situations, the arbitrage process (substituting corporate leverage by personal leverage) may not actually work. For instance, when an investor has already borrowed funds while investing in shares of an unlevered firm. If the value of the firm is more than that of the levered firm, the arbitrage process would require selling the securities of the overvalued (unlevered) firm and purchasing the securities of the levered firm. Thus, an investor would have *double leverage* both in personal portfolio as well as in the firm's portfolio. The MM assumption would not hold true in such a situation.

Transaction Costs Transaction costs would affect the arbitrage process. The effect of transaction/flotation cost is that the investor would receive net proceeds from the sale of securities which will be lower than his investment holding in the levered/unlevered firm, to the extent of the brokerage fee and other costs. He would, therefore, have to invest a larger amount in the shares of the unlevered/levered firm, than his present investment, to earn the same return.

Personal leverage and corporate leverage are, therefore, not perfect substitutes. This implies that the arbitrage process will be hampered and will not be effective. To put it differently, the basic postulate of the MM Approach is not valid. Therefore, a firm may increase its total value and lower its weighted cost of capital with an appropriate degree of leverage. Thus, the capital structure of the firm is not irrelevant to its valuation and the overall cost of capital. In brief, imperfections in the capital market retard perfect functioning of the arbitrage. As a consequence, the MM Approach does not appear to provide a valid framework for the theoretical relationship between capital structure, cost of capital and valuation of a firm.

Taxes Finally, if corporate taxes are taken into account, the MM Approach will fail to explain the relationship between financing decision and value of the firm. Modigliani and Miller themselves, as shown below, are aware of it and have, in fact, recognised it.

Corporate Taxes

As already mentioned, MM agree⁸ that the value of the firm will increase and cost of capital will decline with leverage, if corporate taxes are introduced in the exercise. Since interest on debt is tax-deductible, the effective cost of borrowing is less than the contractual rate of interest. Debt, thus, provides a benefit to the firm because of the *tax-deductibility* of interest payments. Therefore, a levered firm would have greater market value than an unlevered firm. Specifically, MM state that the value of the levered firm would exceed that of the unlevered firm by an amount equal to the levered firm's debt multiplied by the tax rate. Symbolically,

$$V_l = V_u + Bt \quad (19.14)$$

where V_l = value of levered firm,
 V_u = value of unlevered firm,
 B = amount of debt and
 t = tax rate

Since the value of the levered firm is more than that of the unlevered firm, it is implied that the overall cost of capital of the former would be lower than that of the latter.

Equation 19.14 also implies that the market value of a levered firm (V_l) is equal to the market value of an unlevered firm (V_u) in the same risk class plus the discounted present value of the tax saving resulting from tax-deductibility of interest payments.⁹

Example 19.5

The earnings before interest and taxes are ₹10 lakh for companies L and U. They are alike in all respects except that Firm L uses 15 per cent debt of ₹20 lakh; Firm U does not use debt. Given the tax rate of 35 per cent, the stakeholders of the two firms will receive different amounts as shown in Table 19.11.

TABLE 19.11 Effect of Leverage on Shareholders

Particulars	Company L	Company U
EBIT	₹10,00,000	₹10,00,000
Less: Interest	3,00,000	—
Earnings before taxes	7,00,000	10,00,000
Less: Taxes	2,45,000	3,50,000
Income available for equity-holders	4,55,000	6,50,000
Income available for debt-holders and equity-holders	7,55,000	6,50,000

The total income to both debt holders and equity holders of levered Company L is higher. The reason is that while debt-holders receive interest without tax-deduction at the corporate level, equity-holders of Company L have their incomes after tax-deduction. As a result, total income to both types of investors increases by the interest payment times the rate, that is, ₹3,00,000 × 0.35 = ₹1,05,000.

Assuming further that the debt employed by Company L is permanent, the advantage to the firm is equivalent to the present value of the tax shield, that is, ₹7 lakh (₹1,05,000/0.15). Alternatively, it can be determined with reference to Equation 19.15.

$$\frac{Brt}{r} = Bt \quad (19.15)$$

where t = Corporate tax,

r = Rate of interest on debt and

Bt = Amount of debt = 0.35 × ₹20 lakh = ₹7 lakh.

It may be noted that value of levered firm (as shown by equation 19.14) reckons this tax shield due to debt.

The implication of MM analysis in this case is that the value of the firm is maximised when its capital structure contains only debt. In other words, a firm can lower its cost of capital continually with increased leverage. However, the extensive use of debt financing would expose business to high probabilities of default; it would find it difficult to meet the promised payments of interest and principal. Moreover, the firm is likely to incur costs and suffer penalties if it fails to make payments of interest and principal when they become due. Legal expenses, disruption of operations, and loss of potentially profitable investment opportunities may result. As the amount of debt in the capital structure increases, so does the probability of incurring these costs. Consequently, there are disadvantages of debt; and excessive use of debt may cause a rise in the cost of capital owing to the increased financial risk and may reduce the value of the firm.¹⁰ Again, we find that MM's proposition is unjustified when leverage is extreme, that is, when the firm uses virtually 100 per cent debt and no equity. Clearly, the optimal capital structure is not one which has the maximum amount of debt, but, one which has the desired amount of debt, determined at a point and/or range where the overall cost of capital is minimum. Modigliani and Miller also recognise that extreme leverage increases financial risk as also the cost of capital. They suggest that firms should adopt 'target debt ratio' so as not to violate limits of leverage imposed by the creditors. This suggestion indirectly admits that there is a safe limit for the use of debt and firms should not use debt beyond that limit/point. It implies that the cost of capital rises beyond a certain level on the use of debt. There is, therefore, an optimal capital structure.

Bankruptcy Costs

Bankruptcy costs imply high probability of default. MM assume that there are no bankruptcy costs. However, in practice, excessive use of debt would involve such costs. These costs expose businesses to high probabilities of default. A firm would find it difficult to meet the obligations relating to payments of interest and repayment of principal. This, in turn, may lead to liquidation of the firm. Bankruptcy costs can be classified into two categories: (1) direct bankruptcy costs and (2) indirect bankruptcy costs.

Direct bankruptcy costs are legal and administrative costs associated with bankruptcy proceedings and dismantling/removal costs of undersold assets. **Direct Bankruptcy Costs** These are the legal and administrative costs associated with the bankruptcy proceedings of the firm. They also include the costs of selling assets at a price lower than their worth/book value. In fact, it is very hard to find buyers for the expensive assets like plant and equipment as they are configured to a company's specific needs and it is not easy to dismantle and move them.¹¹ The firm may incur heavy dismantling and removal costs.

Direct bankruptcy costs can be staggering and may be a disincentive to debt financing. Such costs are referred to as **bankruptcy tax**.¹² There is a tax shield on debt/borrowings, but it has potential dangers/threats in that the more a company borrows, the more likely it is that it will become bankrupt and pay the bankruptcy tax. Therefore, a company faces a trade-off between advantages and disadvantages of debt financing.

Indirect bankruptcy costs are costs of the threat of bankruptcy in terms of disruption of normal business and adverse effect on sales. **Indirect Bankruptcy Costs** These are the costs of avoiding a bankruptcy filing by a financially distressed firm.¹³ What happens in such firms is that valuable employees leave, suppliers do not grant credit, customers seek more reliable suppliers and lenders demand higher interest rates and impose more restrictive/protective covenants in loan agreements. In brief, normal business operations are disrupted and sales are adversely affected. Customers avoid buying from such firms as they fear that the company might not honour the warranty and it might be difficult to purchase/replaced parts. All these costs are the costs of the threat of bankruptcy and not bankruptcy *per se*. Therefore, prohibitive bankruptcy costs discourage corporates to use excessive levels of debts. Debt should, therefore, be used in safe limits. Figure 19.4 is modified to incorporate the impact of bankruptcy costs on k_e .

Figure 19.4 portrays the cost components of k_e (Risk-free rate of return R_f , Business risk premium, B_p , Financial risk premium, F_p) and the impact of bankruptcy costs on it. Business risk premium is a constant amount as it is not affected by debt financing. Therefore, the line representing it is parallel to the 'X' axis. Financial risk premium increases with the increased debt-equity ratio. Bankruptcy costs result when debt is used beyond some point and such costs increase with higher debt-equity ratio entailing increasing probability of bankruptcy. As leverage increases, so does the penalty. For extreme leverage, the penalty becomes very substantial indeed.¹⁴

Thus, the value of a levered firm would be lower due to bankruptcy costs. As a result, the value of a levered firm would be less than the value shown as per equation 19.14 by the amount of bankruptcy costs (BC). Symbolically,

$$V_l = V_u + Bt - BC \quad (19.16)$$

Figure 19.5 shows the impact of MM approach on weighted average cost of capital, WACC (k_o) in three specific cases. The Case I shows k_o remains constant at varying debt-equity ratios (in a world of no taxes). The advantage of debt as a cheaper source of finance is exactly offset by the increased equity capitalisation rate. In a situation of taxes (Case II), there is always an advantage in

using debt according to MM. Therefore, k_e consistently decreases with the increased leverage. Case III recognises the presence of bankruptcy costs due to excessive use of debt. As a result, beyond

Latent prints

1. A latent print is a mark left by a person's finger on a surface. It is made up of oils, sweat, and other substances from the skin. Latent prints can be seen with the naked eye, but they are often too faint to be seen. They can be developed using various techniques, such as dusting with powder or using chemical reagents.

2. The most common method for developing latent prints is dusting with powder. This involves applying a fine powder to the surface, which will adhere to the oils and sweat in the print. The powder can be seen with the naked eye or under a light source. Other methods include using chemical reagents, such as ninhydrin, which reacts with the amino acids in the print to form a purple color.

3. Another method is using a fuming chamber, which is a container that holds a chemical reagent that fumes. The print is placed in the chamber, and the fumes react with the print to make it visible. This method is often used for prints on non-porous surfaces.

4. Once a latent print has been developed, it can be lifted from the surface. This is done by placing a piece of clear tape over the print and pressing it down. The print will stick to the tape and can be removed. The print can then be examined under a microscope to see the ridges and valleys of the fingerprint.

5. Latent prints can be used to identify a person. Each person's fingerprint is unique, and by comparing a latent print to a known print, a person can be identified. Latent prints can also be used to determine the direction of travel of a person's finger when they touched a surface.

6. Latent prints are a valuable tool for investigators. They can provide evidence that can be used to identify a person or to determine the direction of travel of a person's finger. Latent prints can also be used to determine the time of day that a person touched a surface.

Figure 1: A line graph showing the development of a latent print over time. The x-axis is labeled 'Time' and the y-axis is labeled 'Intensity'. The curve starts at the origin and rises steeply, then levels off as it approaches a horizontal asymptote. There are several data points plotted along the curve.

Figure 2: A line graph showing the development of a latent print over time. The x-axis is labeled 'Time' and the y-axis is labeled 'Intensity'. The curve starts at the origin and rises steeply, then levels off as it approaches a horizontal asymptote. There are several data points plotted along the curve.

point, 'D', bankruptcy costs are higher than the advantage of using debt. Prior to point 'D', there is a net advantage of leverage. Therefore, $WACC/k_0$ is minimum at OD point of leverage.

Trade-off Theory

The preceding arguments on the use of debt as a means of corporate finance have led to the genesis of **the trade-off theory on capital structure**. It trades off the advantage of debt financing (interest tax shields) against the costs of financial distress (consisting of higher interest rates and bankruptcy costs).

Figure 19.5 illustrates the debt-equity trade-off. There is some threshold level of debt (indicated by labeled 'D' in Case III), at which the overall cost of capital is minimum (k_0^*). Beyond level 'D', the bankruptcy costs become increasingly important and exceed the tax benefits of debt. As a result, increased use of debt causes increase in k_0 and corresponding decrease in the valuation of the firm. Prior to level 'D', bankruptcy-related costs reduce the tax benefits of debt but not completely. Therefore, the increased use of debt upto level 'D' leads to decrease in k_0 and increase in value of the firm. **At the point of 'D' the company has an optimal structure.** The level of 'd' (debt) would vary from firm to firm depending on its business risk (indicated by degree of operating leverage) and bankruptcy costs.

The theory provides a useful explanation for inter-industry differences in capital structure. While debt ratios are relatively higher in industries with stable revenues and earnings, they are lower in more risky industries with volatile revenues and earnings.

The traditional theory (**explained subsequently in this chapter**) does not make a reference to bankruptcy-related costs and interest tax shield. Yet, it explicitly recognises the pros and cons of debt financing. **Its conclusion that debt should be used within safe limits converges with the trade-off theory.**

Signalling Theory

Asymmetric information is a situation in which managers have more information about operations/prospects of a firm than its investors.

MM assume that there is an information symmetry about the firm's prospects between management and investors/shareholders (i.e., **symmetric information**). Symmetric information refers to the situation in which shareholders and managers have identical information about a firm's prospects.¹⁵ In reality, this is not true. Managers, in general, have more information about business operations and future prospects of a firm than its investors. This situation is technically called **asymmetric information**. The empirical evidence suggests that the greater the asymmetry in information between the inside managers and outside investors, the greater is the likely share price reaction to a financing announcement.¹⁶ In operational terms, asymmetric information has an important impact on the capital structure decisions.

Let us assume that the management of a firm (through its Research and Development) has discovered a new product, leading to a very profitable investment opportunity. Its execution needs additional financing. In case the corporate decides to sell equity shares when profits start accruing from the new product, their prices would rise sharply and the new subscribers would be as much benefited as the current shareholders. Evidently, the existing shareholders would have benefited more, if the additional financing would not have been through the equity. The issue of equity shares has created a situation in which the existing shareholders have to share the benefits from increased earnings of a new product with the new subscribers. In other words, it would be more beneficial to the existing shareholders if the management uses debt instead of equity to raise the required funds. The decision of issuing debt in such a favourable situation is consistent with the basic objective of financial management to maximise the wealth of the existing shareholders.

In view of the above, it is expected that a corporate with very favourable prospects would avoid selling shares. The required funds should be raised through other means, including debt even beyond the normal target capital structure.¹⁷ The operational implication is that debt financing is a positive signal suggesting that the management believes that the share prices are under-valued.

In contrast, the management may apprehend poor outlook of the firm in the future. The reason may be that a competitor has come out with a better quality product due to installation of a new technology. Obviously, the management of the firm has no option but to buy new technology even to maintain its existing sales. As a result, there would be an adverse impact on its profitability. The firm would be required to raise additional funds. It would like to raise funds through issue of equity shares as the price of its shares would decline when the market comes to know of its depressed rates of return/lower profitability. Issuing of shares enables the existing shareholders to have the new subscribers to share the losses. Hence, the theory that the unfavourable business prospects warrant the equity issue so that the loss of the existing shareholders is minimised.

In view of the above, shareholders more often interpret the announcement of a share issue as a **negative signal** that the firm's prospects (as perceived by the management) are not bright and as a result share prices decline.¹⁸

In brief, as per the signalling theory, debt issues are considered as "**good news**" and share issues as "**bad news**", the underlying principle being that the management would prefer to issue overvalued security. The theory suggests that since share issue sends a negative signal, which in turn, causes decline in share prices even when future prospects are bright, the firm should maintain some **reserve borrowing capacity** by keeping relatively low levels of debt than suggested by the trade-off theory. This debt reserve can be used to avail of good investment opportunities in future without causing an adverse impact on the share price as the required finances would be raised through debt.

Pecking-Order Theory

The pecking-order theory enumerates the **preferred** order of financing normally followed by most of the corporates in practice. The firms prefer internal financing/retained earnings to external financing. The key principle of pecking-order theory is in conformity with the, signalling theory, the presence of asymmetric information and the need to incur flotation costs for new issues. The rationale for the preference for retained earnings is that selling securities to raise funds externally involves flotation costs and which the corporates would like to avoid. The most profitable companies within an industry tend to have the least amount of debt/leverage.¹⁹ In view of their large earnings, more often than not, they never need external financing.

- **Pecking-order theory**
- enumerates the preferred order of raising finance normally followed by corporates.

Retentions are justifiable from the view point of equity-owners. As such companies can earn more on retained earnings than what the shareholders themselves could have earned, if the earnings were distributed among them as dividends. The payment of lower dividend is more than offset by the enhanced market price of their shares.

Continuing with the argument of very profitable investment opportunities with such firms and now assuming that the retained earnings falling short of investment requirements, the management would prefer, as per asymmetric information and signalling theory, debt to raise the residual required funds. It may not be out of place to mention here that the flotation costs of raising debt are lower *vis-à-vis* share issue. It is for these reasons that the pecking-order theory aptly suggests the first preference for debt, among the external sources of finance, followed by preference shares and hybrid securities like convertible debentures. The issue of new equity shares is the last resort.²⁰

In a nutshell, the financing choices in order of preferences are: (1) retained earnings, (2) non-convertible debt, (3) preference shares, (4) hybrid securities like convertible debentures, and (5) equity.

Implications of the Pecking-Order²¹ The significant implications of the pecking-order theory are as follows:

(1) No Target-Capital Structure Finance theory strongly advocates for target and sound capital structure which minimises the overall cost of capital and maximises the value of a firm. In contrast, the pecking-order choice virtually ignores the concept of target or optimal debt-equity mix. In fact, a firm's capital structure is dictated essentially with reference to the availability of current retained earnings, *vis-à-vis* its current investment requirement. In case of a deficiency, debt is to be raised, disregarding the requirement of target/optimal capital structure.

(2) Relatively Less Use of Debt by Profitable Firms Profitable firms, in view of large internal cash accruals at their disposal to meet their investment requirements, tend to use less amount of debt as external financing requirement not because they have low target debt-ratios, but because of preference for internally-generated funds. This again flouts sound tenets of finance theory. Such firms, due to favourable financial leverage, can magnify their **RoR** (rate of return) for their equity owners by employing higher debt.

(3) Need to Build-up Cash Reserves Corporates would need to have reserves in the form of cash and marketable securities so that they are readily available to finance investment projects.

(4) Tax-shield on Interest is Secondary In the pecking-order theory, the tax-shield on interest is regarded as the secondary consideration and relegated to the second place in designing capital structure.

In brief, the capital structure decisions under pecking-order theory are essentially a by-product of the corporate's financial requirements and internally generated cash surplus retained after meeting the dividend requirements (**explained in Chapter 30**).

PECKING ORDER THEORY IN INDIA

Findings related to pecking order adherence among Indian corporates are summarized below:

- The survey (2013-14) reveals that Indian firms prefer internal funds first and banks form the second important source, indicating adherence to pecking order theory.
- Indian corporates prefer debt (long-term debt) to equity in both deficit and surplus situations. The major reasons for debt preference are its being cheaper than equity, flexibility and easier to raise.
- The regression results indicate that corporate firms frequently issue debt to fill up their deficiency requirements (coefficient value of 1.13). Most of these new proceeds are used to finance investments or other operational needs.
- In marked contrast, surplus firms occasionally redeem debt (coefficient value of 0.39) to reduce their existing debt levels. They retain funds for future expansion and other operational needs.
- Surplus firms prefer to deposit their surpluses with banks for a short-period.
- During deficiency, large firms use more debt compared to other firms. Small and medium firms have large deficiencies but low-debt capacities that are quickly exhausted. Therefore, a significant portion of funds for these firms is obtained through equity issues.
- Across surplus groups, firms across varying sizes do not make large debt redemptions.

- During surplus situation, industries affiliated to chemicals, Information technology, communication seem to redeem more debt. In deficit situations, most of the industries raise debt to finance their deficit requirements.

Traditional Approach

The preceding discussions clearly show that the Net Income Approach (NI) as well as Net Operating Income Approach (NOI) represent two extremes as regards the theoretical relationship between financing decisions as determined by the capital structure, the weighted average cost of capital and total value of the firm. While the NI Approach takes the position that the use of debt in the capital structure will *always* affect the overall cost of capital and the total valuation, the NOI Approach argues that capital structure is totally irrelevant. The MM Approach supports the NOI Approach. But the assumptions of MM hypothesis are of doubtful validity. The Traditional Approach is midway between the NI and NOI Approaches. It partakes of some features of both these Approaches. It is also known as the **Intermediate** Approach. It resembles the NI Approach in arguing that cost of capital and total value of the firm are not independent of the capital structure. But it does not subscribe to the view (of NI Approach) that value of a firm will necessarily increase for all degrees of leverage. In one respect it shares a feature with the NOI Approach that beyond a certain degree of leverage, the overall cost increases leading to a decrease in the total value of the firm. But it differs from the NOI Approach in that it does not argue that the weighted average cost of capital is constant for all degrees of leverage.

The crux of the traditional view relating to leverage and valuation is that through **judicious** use of debt-equity proportions, a firm can increase its total value and thereby reduce its overall cost of capital. The rationale behind this view is that debt is a relatively cheaper source of funds as compared to ordinary shares. With a change in the leverage, that is, using more debt in place of equity, a relatively cheaper source of funds replaces a source of funds which involves a relatively higher cost. This obviously causes a decline in the overall cost of capital. If the debt-equity ratio is raised further, the firm would become financially more risky to the investors who would penalise the firm by demanding a higher equity-capitalisation rate (k_e). But the increase in k_e may not be so high as to neutralise the benefit of using cheaper debt. In other words, the advantages arising out of the use of debt is so large that, even after allowing for higher k_e , the benefit of the use of the cheaper source of funds is still available. If, however, the amount of debt is increased further, two things are likely to happen: **(i)** owing to increased financial risk, k_e will record a substantial rise; **(ii)** the firm would become very risky to the creditors who also would like to be compensated by a higher return such that k_c will rise. The use of debt beyond a certain point will, therefore, have the effect of raising the weighted average cost of capital and conversely the total value of the firm. Thus, up to a point/degree of leverage, the use of debt will favourably affect the value of a firm; beyond that point, use of debt will adversely affect it. At that level of debt-equity ratio, the capital

structure is an optimal capital structure. **At the optimum capital structure, the marginal real cost of debt, defined to include both implicit and explicit, will be equal to the real cost of equity. For a debt-equity ratio before that level, the marginal real cost of debt would be less than that of equity capital, while beyond that level of leverage, the marginal real cost of debt would exceed that of equity.**

There are, of course, variations to the Traditional Approach. According to one of these, the equity-capitalisation rate (k_e) rises only after a certain level of leverage and not before, so that the use of debt does not necessarily increase the k_e . This happens only after a certain degree of leverage. The implication is *that a firm can reduce its cost of capital significantly with the initial use of leverage.*

Another variant of the Traditional Approach suggests that there is no one single capital structure, but, there is a range of capital structures in which the cost of capital (k_0) is the minimum and the value of the firm is the maximum. In this range, changes in leverage have very little effect on the value of the firm.

The *modus operandi* of the Traditional Approach is illustrated in Example 19.6.

Example 19.6

Let us suppose that a firm has 20 per cent debt and 80 per cent equity in its capital structure. The cost of debt and the cost of equity are assumed to be 10 per cent and 15 per cent respectively. What is the overall cost of capital, according to the traditional Approach?

Solution

The overall cost of capital (k_0) = k_i i.e. $0.10 \left[\frac{20}{100} \right] + k_e$ i.e. $0.15 \left[\frac{80}{100} \right] = 14$ per cent

Further, suppose, the firm wants to increase the percentage of debt to 50. Due to the increased financial risk, the k_i and k_e will presumably rise. Assuming, they are 11 per cent (k_i) and 16 per cent (k_e), the cost of capital (k_0) would be: $= 0.11 \left[\frac{50}{100} \right] + 0.16 \left[\frac{50}{100} \right] = 13.5$ per cent

It can, thus, be seen that with a rise in the debt-equity ratio, k_e and k_i increase, but, k_0 has declined presumably because these increases have not fully offset the advantages of the cheapness of debt.

Assume further, the level of debt is raised to 70 per cent of the capital structure of the firm. There would consequently be a sharp rise in risk to the investors as well as creditors. The k_e would be, say, 20 per cent and the k_i 14 per cent. The $k_0 = 0.14 \left[\frac{70}{100} \right] + 0.20 \left[\frac{30}{100} \right] = 15.8$ per cent

The overall cost of capital has actually risen when the firm tries to employ more of what appeared, at the previous debt-equity ratio, to be the least costly source of funds, that is, debt. Therefore, the firm should take into account the consequences of raising the percentage of debt to 70 per cent on the cost of both equity and debt.

The above illustration eloquently demonstrates that the increasing use of debt does not always lower k_0 . In fact, excessive use of debt greatly increases financial risk and completely offsets the advantage of using the lower-cost debt. Therefore, the firm should consider the two off-setting effects of increasing the proportion of debt in the capital structure: the rise in k_i and k_e and the decrease or increase in k_0 and total value (V), generated by using a greater proportion of debt. The traditional Approach is illustrated in Example 19.7.

Example 19.7

Assume a firm has EBIT of ₹40,000. The firm has 10 per cent debentures of ₹1,00,000 and its current equity capitalisation rate is 16 per cent. The current value of the firm (V) and its overall cost of capital would be, as shown in Table 19.12.

TABLE 19.12 Total Value and Cost of Capital (Traditional Approach)

Net operating income (EBIT)	₹40,000
Less: Interest (<i>I</i>)	10,000
Earnings available to equityholders (<i>NI</i>)	30,000
Equity capitalisation rate (k_e)	0.16
Total Market value of equity (S) = NI/k_e	1,87,500
Total Market value of debt (B)	1,00,000
Total value of the firm (V) = $S + B$	2,87,500
Overall cost of capital, $k_0 = EBIT/V$	0.139
Debt-equity ratio (B/S) = (₹1,00,000 + ₹1,87,500)	0.53

The firm is considering increasing its leverage by issuing additional ₹50,000 debentures and using the proceeds to retire that amount of equity. If, however, as the firm increases the proportion of debt, k_i would rise to 11 per cent and k_e to 17 per cent, the total value of the firm would increase and k_0 would decline as shown in Table 19.13.

TABLE 19.13 Total Value and Cost of Capital (Traditional Approach)

Net operating income (EBIT)	₹40,000
Less: Interest (<i>I</i>)	16,500
Earnings available to equityholders (<i>NI</i>)	23,500
Equity capitalisation rate (k_e)	0.17
Total Market value of equity (S) = NI/k_e	1,38,235
Total Market value of debt (B)	1,50,000
Total value of the firm (V) = $S + B$	2,88,235
Overall cost of capital, $k_0 = EBIT/V$	0.138
Debt-equity ratio (B/S)	1.08

Let us further suppose that the firm issues additional ₹1,00,000 debentures instead of ₹50,000 (that is, having ₹2,00,000 debentures) and uses the proceeds to retire that amount of equity. Due to increased financial risk, k_i would rise to 12.5 per cent and k_e to 20 per cent, the total value of the firm would decrease and k_0 would rise as is clear from Table 19.14.

TABLE 19.14 Total Value and Cost of Capital (Traditional Approach)

Net operating income (EBIT)	₹40,000
Less: Interest (<i>I</i>)	25,000
Earnings available to equityholders (<i>NI</i>)	15,000
Equity capitalisation rate (k_e)	0.20
Total Market value of equity (S) = NI/k_e	75,000
Total Market value of debt	2,00,000
Total value of the firm (V) = $S + B$	2,75,000
Overall cost of capital, $k_0 = EBIT/V$	0.145
Debt-equity ratio (B/S) (₹2,00,000 + ₹75,000)	2.67

In Example 19.7, it is clear that the optimal debt-equity ratio must be less than 2.67 since at this ratio, the value of the firm is ₹2,75,000, while at a debt-equity ratio of 1.08 it is ₹2,88,235.

...the ... of ...

The traditional Approach suggests that:

Other things being equal, the market value of a company's securities will rise as the amount of leverage (L) in its financial structure is increased from zero to some point determined by the capital market's evaluation of the level of business uncertainty involved. Beyond this point and up to a second point, changes in leverage have very little effect, that is, within this range of leverage the total market value of the company is unchanged as leverage changes. Beyond this range of 'acceptable' leverage, the total market value of securities will decline with further increase in L .²²

The effect of increase in leverage from zero, on cost of capital and valuation of the firm, can be thought to involve three distinct phase.²³

Increased Valuation and Decreased Overall Cost of Capital

During the first phase, increasing leverage increases the total valuation of the firm and lowers the overall cost of capital. As the proportion of debt in the capital structure increases, the cost of equity (k_e) begins to rise as a reflection of the increased financial risk. But it does not rise fast enough to offset the advantage of using the cheaper source of debt capital. Likewise, for most of the range of this phase, the cost of debt (k_i) either remains constant or rises to a very small extent because the proportion of debt by the lender is considered to be within safe limits. Therefore, they are prepared to lend to the firm at almost the same rate of interest. Since debt is typically a cheaper source of capital than equity, the combined effect is that the overall cost of capital begins to fall with the increasing use of debt. Example 19.7 has shown that an increase in leverage (B/S) from 0.53 to 1.08 has had the effect of increasing the total market value from ₹2,87,500 to ₹2,88,235 and decreasing the overall capitalisation rate from 13.9 to 13.8 per cent.

Constant Valuation and Constant Overall Cost of Capital

After a certain degree of leverage is reached, further moderate increases in leverage have little or no effect on total market value. During the middle range, the changes brought in equity-capitalisation rate and debt-capitalisation rate balance each other. As a result, the values of (V) and (k_0) remain almost constant.

Decreased Valuation and Increased Overall Cost of Capital

Beyond a certain critical point, further increases in debt proportions are not considered desirable. They increase financial risks so much that both k_e and k_i start rising rapidly causing (k_0) to rise and (V) to fall. In Example 19.7, the effect of an increase in B/S ratio from 1.08 to 2.67 is to increase (k_0) from 13.8 to 14.5 per cent and to decrease (V) from ₹2,88,235 to ₹2,75,000.

A numerical illustration, given in Table 19.15²⁴ and its graphic presentation in Fig. 19.4²⁵ further help to clarify the relationship between leverage and cost of capital. They present hypothetical changes similar to those envisaged by the traditional approach and examine the effect of leverage on the individual variables. We have assumed, in addition to other assumptions already stated at the beginning of the chapter, that given capital market conditions, the company can repurchase its own shares. The face value of a share is ₹10 and that of debentures ₹100 each. The symbols used in Table 19.15 have the same meaning as explained at the beginning of the chapter.

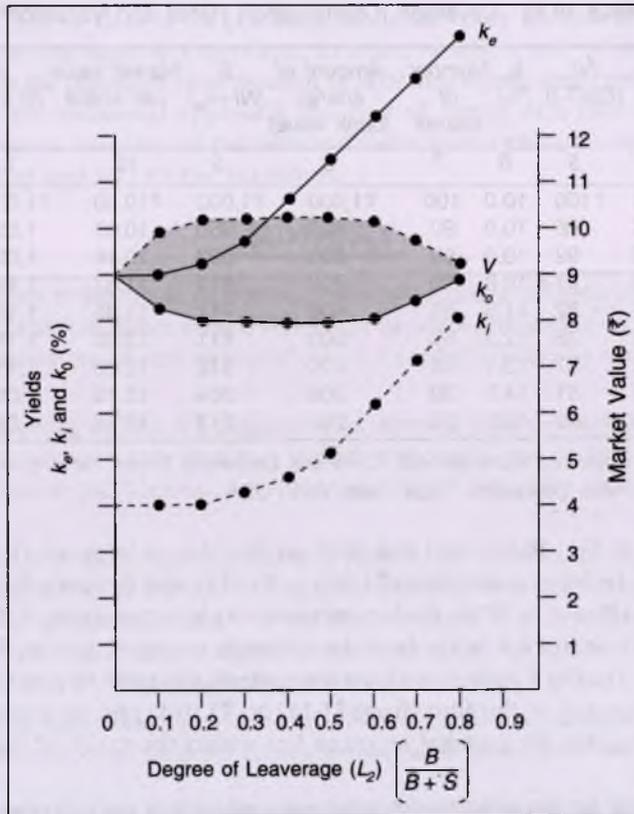

FIGURE 19.6 Leverage and Cost of Capital (Traditional Approach)

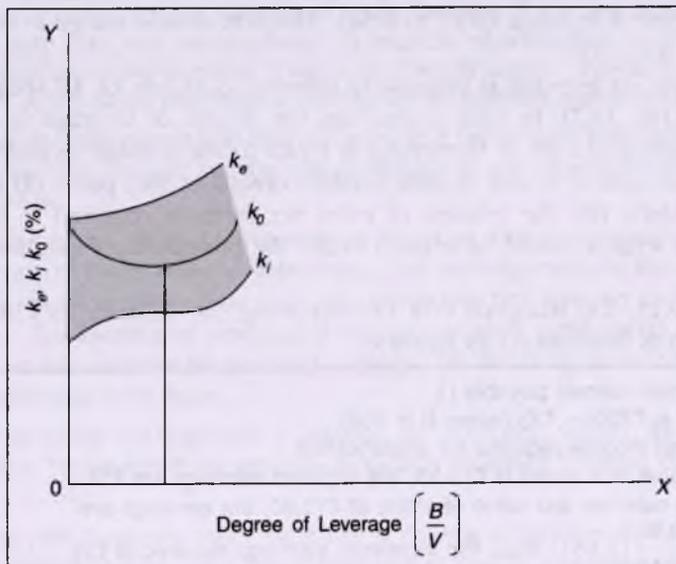

FIGURE 19.7 Leverage and Cost of Capital (Traditional Approach)

PROBLEM 1. (100 points)

Let $f(x)$ be a function defined on the interval $[0, 1]$ such that $f(0) = 0$ and $f(1) = 1$. Suppose that $f(x)$ is continuous and that $f'(x)$ exists for all x in $(0, 1)$. Prove that there exists a point c in $(0, 1)$ such that $f'(c) = 1$.

PROBLEM 2. (100 points)

Let $f(x)$ be a function defined on the interval $[0, 1]$ such that $f(0) = 0$ and $f(1) = 1$. Suppose that $f(x)$ is continuous and that $f'(x)$ exists for all x in $(0, 1)$. Prove that there exists a point c in $(0, 1)$ such that $f'(c) = 1$.

PROBLEM 3. (100 points)

Let $f(x)$ be a function defined on the interval $[0, 1]$ such that $f(0) = 0$ and $f(1) = 1$. Suppose that $f(x)$ is continuous and that $f'(x)$ exists for all x in $(0, 1)$. Prove that there exists a point c in $(0, 1)$ such that $f'(c) = 1$.

PROBLEM 4. (100 points)

Let $f(x)$ be a function defined on the interval $[0, 1]$ such that $f(0) = 0$ and $f(1) = 1$. Suppose that $f(x)$ is continuous and that $f'(x)$ exists for all x in $(0, 1)$. Prove that there exists a point c in $(0, 1)$ such that $f'(c) = 1$.

Figure 1: A graph showing a shaded region bounded by a curve and a straight line segment. The curve starts at the origin (0,0) and ends at (1,1). The straight line segment connects (0,0) and (1,1). The region between the curve and the line is shaded. The x-axis is labeled from 0 to 1, and the y-axis is labeled from 0 to 1.

Figure 2: A graph showing a shaded region bounded by a curve and a straight line segment. The curve starts at the origin (0,0) and ends at (1,1). The straight line segment connects (0,0) and (1,1). The region between the curve and the line is shaded. The x-axis is labeled from 0 to 1, and the y-axis is labeled from 0 to 1.

^a Solomon, E., *Theory of Financial Management*, Columbia University Press, New York, 1969, p. 95. Reprinted with permission from Columbia University Press, New York, USA.

Table 19.15 as well as Fig. 19.6 reveal that with an increase in leverage (B/V) from zero to 0.27, the market value of the firm increases (from ₹1,000 to ₹1,111) and the overall cost of capital declines from 10 to 9 per cent (Phase I). With further increases in leverage from 0.27 up to 0.54, there is no change either in (V) or in (k_0); both the values remain constant, that is, ₹1,111 and 9 per cent respectively (Phase 2). During Phase 3, with an increase in the ratio beyond 0.54 up to 0.79, there is a decrease in market value of the firm (from ₹1,111 to ₹1,013) and an increase in (k_0) (from 9 to 9.4 per cent), suggesting that the optimal leverage lies within the range of 0.27 to 0.54 debt-equity ratio.

In practice, it may not be possible to determine the minimum overall cost of capital. Therefore, a diagrammatic presentation is useful as it depicts a range over which the cost of capital is minimised. The (k_0) curve developed in Fig. 19.6 is a fairly shallow saucer with a horizontal section over the middle ranges of leverage (0.27 to 0.54). *The firm should not go to the left or to the right of the saucer part of the curve.*

The traditional view on leverage is commonly referred to as one of 'U' shaped cost of capital curve (as shown in Fig. 19.7). In such a situation, the degree of leverage is optimum at a point at which the rising marginal cost of borrowing is equal to the average overall cost of capital. For this purpose, marginal cost of a unit of debt capital consists of two parts: (i) the increase in total interest payable on debt; (ii) the amount of extra net earnings required to restore the value of equity component to what it would have been under the pre-existing capitalisation rate before the debt is increased.

Thus, in Table 19.15, the marginal cost of borrowing the seventh to ₹100 units of funds is ₹19 or 19 per cent. It is determined as follows:

(i) Increase in total interest payable (I)	₹16
₹49 (when B is ₹700) – ₹33 (when B is 600)	
Plus: (ii) Increase in net income required for shareholders	3
(When the value of a share is ₹12.13, the required earnings are ₹51.	
Therefore, to maintain the value of share at ₹12.80, the earnings are	
₹54 i.e. $\left[\frac{₹12.80}{₹12.13} \right] \times ₹51$; thus, the increased earnings required is ₹3).	

Since the marginal cost of debt is 19 per cent, while the over all cost of capital is 9 per cent, the use of more debt at this stage is imprudent. In other words, *a mix of debt of ₹600 with equity capital of ₹400 provides the optimum combination of debt and equity and optimum capital structure.*

Thus, according to the traditional approach, the cost of capital of a firm as also its valuation is dependent upon the capital structure of the firm and there is an optimum capital structure in which the firm's k_0 is minimum and its (V) the maximum.

SUMMARY

Capital structure refers to the mix or proportion of different sources of finance (debt and equity) to total capitalisation. A firm should select such a financing-mix which maximises its value/the shareholders' wealth (or minimises its overall cost of capital). Such a capital structure is referred to as the optimum capital structure.

Capital structure theories explain the theoretical relationship between capital structure, overall cost of capital (k_0) and valuation (V). The four important theories are: (i) Net income (NI) approach, (ii) Net operating income (NOI) approach, (iii) Modigliani and Miller (MM) approach and (iv) Traditional approach.

According to the NI approach, capital structure is relevant as it affects the k_0 and V of the firm. The core of this approach is that as the ratio of less expensive source of funds (i.e., debt) increases in the capital structure, the k_0 decreases and V of the firm increases. With a judicious mixture of debt and equity, a firm can evolve an optimum capital structure at which the k_0 would be the lowest, the V of the firm the highest and the market price per share the maximum.

The NOI approach is diametrically opposite to the NI approach. The essence of this approach is that capital structure decision of a corporate does not affect its cost of capital and valuation, and, hence, irrelevant.

The main argument of NOI is that an increase in the proportion of debt in the capital structure would lead to an increase in the financial risk of the equityholders. To compensate for the increased risk, they would require a higher rate of return (k_e) on their investment. As a result, the advantage of the lower cost of debt would exactly be neutralised by the increase in the cost of equity.

The cost of debt has two components: (i) explicit, represented by rate of interest, and (ii) implicit, represented by the increase in the cost of equity capital. Therefore, the real cost of debt and equity would be the same and there is nothing like an optimum capital structure.

Modigliani and Miller (MM) concur with NOI and provide a behavioural justification for the irrelevance of capital structure. They maintain that the cost of capital and the value of the firm do not change with a change in leverage.

They contend that the total value of homogeneous firms that differ only in respect of leverage cannot be different because of the operations of arbitrage. The arbitrage refers to the switching over operations, that is, the investors switch over from the over-valued firm (levered firm) to the under-valued firms (unlevered). The essence of arbitrage is that the investors (arbitrators) are able to substitute personal or home-made leverage for corporate leverage. The switching operation drives the total value of the two homogeneous firms equal.

The basic premises of the MM approach, in practice, are of doubtful validity. As a result, the arbitrage process is impeded. To the extent, the arbitrage process is imperfect, it implies that the capital structure matters.

MM contend that with corporate taxes, debt has a definite advantage as interest paid on debt is tax-deductible and leverage will lower the overall cost of capital. The value of the levered firm (V_L) would exceed the value of the unlevered firm (V_U) by an amount equal to levered firm's debt multiplied by tax rate.

The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land acquisition project in the State of California.

On October 10, 1950, the Department received a request from the State of California for information regarding the land acquisition project in the State of California.

The Department has reviewed the request and has determined that the information requested is available in the records of the Department.

The information requested is being provided to the State of California for its use in the land acquisition project.

Very truly yours,
Director

The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land acquisition project in the State of California.

APPENDIX

The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land acquisition project in the State of California.

The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land acquisition project in the State of California.

The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land acquisition project in the State of California.

Bankruptcy costs arise due to a firm's inability to meet the promised payments of interest and principal. These costs, sometimes, may lead to its liquidation.

Bankruptcy costs are of two types: direct and indirect. Direct bankruptcy costs are the legal and administrative costs associated with the bankruptcy proceedings of the firm. Indirect bankruptcy costs are the costs of avoiding a threat to bankruptcy which, in turn, causes valuable employees to leave, suppliers shy of granting credit, customers seeking more reliable suppliers and lenders demanding higher interest rates. As a result, normal business operations are disrupted and sales are adversely affected.

Bankruptcy costs can be exorbitant and a disincentive to use excessive levels of debt. Primarily due to these costs, the use of debt beyond safe limits offsets the tax advantage of using debt.

Bankruptcy costs depress the value of levered firm (V_l). MM suggest $V_l = V_u + B_t$. The $V_l = V_u + B_t - \text{Bankruptcy Costs}$.

Trade-off theory on capital structure trades off the advantages of debt financing (interest tax shield) against the costs of financial distress (consisting of higher interest rates and bankruptcy costs). It warns against the excessive use of debt.

While symmetric information refers to a situation in which inside managers and outside investors have identical information about business operations and future prospects of a firm, asymmetric information implies a situation in which managers have more information than the investors do.

Signalling theory is based on the premise of asymmetric information. The theory suggests that a corporate with favourable prospects would avoid selling shares as future increase in profits would tend to increase share prices. The advantage of increase in share prices would be shared with the new equity shareholders, if equity shares have been used as a source of financing. Debt financing is a positive signal to the market for upward trend of share price. Equity shares should be used to finance the projects if prospects of a firm are not good. It enables existing shareholders to have new subscribers to share the losses.

According to signalling theory, debt issues are considered as good news and share issues as bad news. Since issue of shares causes a decline in share prices, the corporates should maintain reserve borrowing capacity by keeping relatively low levels of debt to finance profitable investment projects in the future.

The pecking-order theory enumerates the preferred order of raising finances normally followed by the corporates in practice. These choices in order of preference are: (1) retained earnings, (2) non-convertible debt/straight debentures, (3) preference shares, (4) hybrid securities like convertible bonds and (5) equity.

The suggestions of pecking-order theory are in conformity with the signalling theory and the presence of asymmetric information. The rationale for the first preference for retained earnings is that corporates would like to avoid flotation costs associated with raising funds externally.

The major implications of pecking order theory are: (1) It, by and large, disregards target/optimal capital structure concept (2) Profitable firms depend more on retained earnings to finance investment projects and (3) Tax shield on debt is of secondary importance.

The traditional approach is mid-way between the two extreme (the NI and NOI) approaches. The crux of this approach is that through a judicious combination of debt and equity, a firm can increase its value (V) and reduce its cost of capital (k_0) upto a point. However, beyond that point, the use of additional debt will increase the financial risk of the investors as well as of the lenders and as a result will cause a rise in the k_0 . At such a point, the capital structure is optimum. In other words, at the optimum capital structure the marginal real cost of debt (both implicit and explicit) will be equal to the real cost of equity.

SOLVED PROBLEMS

P.19.1 Assuming no taxes and given the earnings before interest and taxes (EBIT), interest (I) at 10 per cent and equity capitalisation rate (k_e) below, calculate the total market value of each firm.

LO 19.2 LOD
E

Firms	EBIT	I	k_e (per cent)
X	₹2,00,000	₹20,000	12
Y	3,00,000	60,000	16
Z	5,00,000	2,00,000	15
W	6,00,000	2,40,000	18

Also, determine the weighted average cost of capital for each firm.

Solution

Determination of K_0 and V of firms X, Y, Z and W

Particulars	X	Y	Z	W
EBIT	₹2,00,000	₹3,00,000	₹5,00,000	₹6,00,000
Less: Interest	20,000	60,000	2,00,000	2,40,000
Net income for equity-holders	1,80,000	2,40,000	3,00,000	3,60,000
Equity capitalisation rate (k_e)	0.12	0.16	0.15	0.18
Market value of equity (S)	15,00,000	15,00,000	20,00,000	20,00,000
Market value of debt (B) = $1/0.10$	2,00,000	6,00,000	20,00,000	24,00,000
Total value of firm (V)	17,00,000	21,00,000	40,00,000	44,00,000
Weighted average cost of capital (k_0) = $EBIT/V$ (%)	11.76	14.29	12.5	13.64

P.19.2 Company X and Company Y are in the same risk class, and are identical in every respect except that company X uses debt, while company Y does not. The levered firm has ₹9,00,000 debentures, carrying 10 per cent rate of interest. Both the firms earn 20 per cent operating profit on their total assets of ₹15 lakhs. Assume perfect capital markets, rational investors and so on; a tax rate of 35 per cent and capitalisation rate of 15 per cent for an all-equity company.

LO 19.2

- Compute the value of firms X and Y using the Net Income (NI) Approach.
- Compute the value of each firm using the Net Operating Income (NOI) Approach.
- Using the NOI Approach, calculate the overall cost of capital (k_0) for firms X and Y.
- Which of these two firms has an optimal capital structure according to the NOI Approach? Why?

Solution

- (a) Valuation under NI approach

Particulars	Firm X	Firm Y
EBIT	₹3,00,000	₹3,00,000
Less: Interest	90,000	—
Taxable income	2,10,000	3,00,000
Less: Taxes	73,500	1,05,000
Earnings for equity holders	1,36,500	1,95,000
Equity capitalisation rate (k_e)	0.15	0.15
Market value of equity (S)	9,10,000	13,00,000
Market value of debt (B)	9,00,000	—
Total value of firm (V)	18,10,000	13,00,000

- (b) Valuation under NOI Approach

$$V_Y = \frac{₹3,00,000 (1 - 0.35)}{0.15} = ₹13,00,000$$

$$V_X = ₹13,00,000 + ₹9,00,000 (0.35) = ₹16,15,000$$

- (c)
- $K_0 = k_d (0.065) \left[\frac{₹9,00,000}{₹16,15,000} \right] + k_e (0.191) \left[\frac{₹7,15,000}{₹16,15,000} \right] = 12.1$
- per cent

Similarly, $K_{0Y} = 15$ per cent

Working Notes

EBIT	₹3,00,000
Less: Interest	90,000
Taxable income	2,10,000
Less: Taxes	73,500
NI	1,36,500
V as determined in (ii)	16,15,000
B	9,00,000
S (V - B)	7,15,000
$k_e = \frac{₹1,36,500}{₹7,15,000} = 19.1$ per cent	
$k_d = 0.10 (1 - 0.35) = 6.5$ per cent	

(d) Neither firm has an optimum capital structure according to the NOI Approach. Under the MM assumptions, the optimum capital structure requires 100 per cent debt.

P.19.3 Companies U and L are identical in every respect, except that U is unlevered while L is levered. Company L has ₹20 lakh of 8 per cent debentures outstanding. Assume (1) that all the MM assumptions are met, (2) that the tax rate is 35 per cent, (3) that EBIT is ₹6 lakh and that equity-capitalisation rate for company U is 10 per cent. LO 19.2 LOD M

- (a) What would be the value for each firm according to the MM's Approach?
 (b) Suppose $V_u = ₹25,00,000$ and $V_l = ₹35,00,000$. According to MM do they represent equilibrium values? If not, explain the process by which equilibrium will be restored.

Solution

$$(a) V_u = \frac{\text{EBIT} (1 - t)}{k_e} = \frac{₹6,00,000 (1 - 0.35)}{0.10} = ₹39,00,000$$

$$V_l = V_u + Bt = ₹39,00,000 + ₹20,00,000 (0.35) = ₹46,00,000$$

- (b) Firm U is undervalued and firm L is overvalued. Investors will be better off by investing in the undervalued firm as they will require lower investment cost to earn the same income as they earn in the overvalued firm. Therefore, they will sell their holdings of the overvalued firm (L) and buy shares of the undervalued firm (U). As a result, the price of shares of company L will come down while that of company U will rise. This process will continue until equilibrium in the values is restored.

P.19.4 In considering the most desirable capital structure of a company, the following estimates of the cost of debt and equity capital (after tax) have been made at various levels of debt-equity mix: LO 19.2 LOD M

Debt as percentage of total capital employed	Cost of debt (per cent)	Cost of equity (per cent)
0	5.0	12.0
10	5.0	12.0
20	5.0	12.5
30	5.5	13.0
40	6.0	14.0
50	6.5	16.0
60	7.0	20.0

You are required to determine the optimal debt-equity mix for the company by calculating the composite cost of capital.

Solution

Solution table

$k_d(\%)$	$k_e(\%)$	$W_1 (B/V)$	$W_2 S/V = (1 - B/V)$	$k_d(W_1) + k_e(W_2) = k_0(\%)$
5.0	12.0	0.0	1.0	12.00
5.0	12.0	0.1	0.9	11.30
5.0	12.5	0.2	0.8	11.00
5.5	13.0	0.3	0.7	10.75
6.0	14.0	0.4	0.6	10.80
6.5	16.0	0.5	0.5	11.25
7.0	20.0	0.6	0.4	12.20

Optimal debt-equity mix for the company is at a point where the composite cost of capital is minimum. When debt is 30 per cent of the total capital employed, the k_0 is minimum. Therefore, 30 per cent debt and 70 per cent equity mix would be an optimal debt-equity mix for the company.

P.19.5 A company wishes to determine the optimal capital structure. From the following selected information supplied to you, determine the optimal capital structure of the company.

LO 19.2 LOD
M

Situation	Debt	Equity	After tax cost of debt (%)	$k_e(\%)$
1	₹4,00,000	₹1,00,000	9	10
2	2,50,000	2,50,000	6	11
3	1,00,000	4,00,000	5	14

Solution

Situation	$k_d(\%)$	$k_e(\%)$	$W_1 (B/V)$	$W_2 (S/V)$	$k_d(W_1) + k_e(W_2) = k_0(\%)$
1	9	10	0.8	0.2	9.2
2	6	11	0.5	0.5	8.5
3	5	14	0.2	0.8	12.2

The optimal capital structure for the company is in situation 2, when it uses 50 per cent debt and 50 per cent equity, as its cost of capital at this level of debt is minimum.

P.19.6 Compute the equilibrium values and capitalisation rates of equity (K) of the companies A and B on the basis of the following data. Assume that (i) there is no income tax, and (ii) the equilibrium value of average cost of capital (P) is 8.5 per cent.

LO 19.2 LOD
M

Particulars	Initial disequilibrium	
	Company A	Company B
Total market value	₹250	₹300
Debt (L)	0	150
Equity (S)	250	150
Expected net operating income (X)	25	25
Interest ($K.L$)	0	9
Net income ($X - K.L$)	25	16
Cost of equity (k_e)	0.10	0.107
Leverage (L/V)	0	0.5
Average cost of capital (P)	0.10	0.833

Solution

(i) The equilibrium values $(V_e) = \frac{X}{P} = \frac{₹25}{₹0.085} = ₹294.12$

(ii) Equity-capitalisation rates for companies A and B

Particulars	Company A	Company B
Expected net operating income (X)	₹25	₹25
Less: Interest (K.L)	—	9
NI available for equity (X - K.L)	25	16
Equilibrium cost of capital (P)	0.085	0.085
Total value of company (X/P)	294.12	294.12
Market value of debt (L)	—	150.00
Market value of equity (S)	294.12	144.12
Cost of equity, $\frac{(X - K.L)}{S}$	0.085	0.111

Alternatively, k_e for the levered company B can be determined as follows:

$$k_e = k_0 + (k_0 - k_f) \frac{B}{S}, k_f = 0.06 \text{ (₹9 interest on ₹150 debt)}$$

$$= 0.085 + (0.085 - 0.06) \times \left[\frac{₹150}{₹144.12} \right] = 0.1111$$

For the unlevered company (A) $K_e = k_0$, as there is no k_f .

P.19.7 The values of two firms X and Y in accordance with the traditional theory are given below:

LO 19.2 **LOD M**

Particulars	X	Y
Expected operating income (X)	₹50,000	₹50,000
Total cost of debt ($k_f \cdot D = R$)	0	10,000
Net income ($\bar{X} - R$)	50,000	40,000
Cost of equity (k_e)	0.10	0.1111
Market value of shares (S)	5,00,000	3,60,000
Market value of debt (D)	0	2,00,000
Total value of firm ($V = S + D$)	5,00,000	5,60,000
Average cost of capital (k_0)	0.10	0.09
Debt equity ratio	0	0.556

Compute the values of firms X and Y as per the MM thesis. Assume that (i) corporate income taxes do not exist, and (ii) the equilibrium values of k_0 is 12.5 per cent.

Solution

Valuation of firms X and Y

Particulars	Company X	Company Y
Expected operating income (X)	₹50,000	₹50,000
Total cost of debt ($k_f \cdot D = R$)	0	10,000
Net income for equity, $\bar{X} - R$	50,000	40,000
Equilibrium cost of capital (k_0)	0.125	0.125
Total value of company = \bar{X}/k_0	4,00,000	4,00,000
Market value of debt (D)	—	2,00,000
Market value of equity ($V - D$)	4,00,000	2,00,000
Cost of equity ($k_e = \frac{\bar{X} - R}{S}$)	0.125	0.20

P.19.8 Given (i) the EBIT of ₹2,00,000, (ii) the corporate tax rate of 35 per cent, and (iii) the following data, determine the amount of debt that should be used by the firm in its capital structure to maximise the value of the firm. **LO 19.2** LOD D

Debt	k_i (before tax) (%)	k_e (%)
Nil	Nil	12.0
₹1,00,000	10.0	12.0
2,00,000	10.5	12.6
3,00,000	11.0	13.0
4,00,000	12.0	13.6
5,00,000	14.0	15.6
6,00,000	17.0	20.0

Solution

Valuation of firm at varying amount of debt

EBIT	I	NI	Taxes (t)	EAT ($NI - t$)	K_d (%)	K_e (%)	B	S	V
₹2,00,000	—	₹2,00,000	₹70,000	₹1,30,000	—	12.0	—	₹10,83,333	₹10,83,333
2,00,000	₹10,000	1,90,000	66,500	1,23,500	6.5	12.0	₹1,00,000	10,29,167	11,29,167
2,00,000	21,000	1,79,000	62,650	1,16,350	6.8	12.6	2,00,000	9,23,413	11,23,413
2,00,000	33,000	1,67,000	58,450	1,08,550	7.1	13.0	3,00,000	8,35,000	11,35,000
2,00,000	48,000	1,52,000	53,200	98,800	7.8	13.6	4,00,000	7,26,471	11,26,471
2,00,000	70,000	1,30,000	45,500	84,500	9.1	15.6	5,00,000	5,41,667	10,41,667
2,00,000	1,02,000	98,000	34,300	63,700	11.0	20.0	6,00,000	3,18,500	9,18,500

The firm should use ₹3,00,000 debt to maximise the value of the firm.

P.19.9 A company's current operating income is ₹4 lakh. The firm has ₹10 lakh of 10 per cent debt outstanding. Its cost of equity capital is estimated to be 15 per cent. **LO 19.2** LOD D

- Determine the current value of the firm, using traditional valuation approach.
- Calculate the overall capitalisation rate as well as both types of leverage ratio: (a) B/S (b) B/V .
- The firm is considering increasing its leverage by raising an additional ₹5,00,000 debt and using the proceeds to retire that amount of equity. As a result of increased financial risk, k_i is likely to go up to 12 per cent and k_e to 18 per cent. Would you recommend the plan?

Solution

(a) and (b)

Valuation of firm and overall capitalisation rate

EBIT	₹4,00,000
Less: Interest	1,00,000
Earnings for equityholders (NI)	₹3,00,000
Equity-capitalisation rate (k_e)	0.15
Market value of equity (S)	₹20,00,000
Market value of debt (B)	10,00,000
Total market value of firm ($S + B$)	₹30,00,000
Overall capitalisation rate = $EBIT/V$	0.1333
(a) Debt/equity ratio (B/S)	0.5
(b) Debt/value ratio (B/V)	0.33

$$\text{Alternatively, } k_0 = k_i(B/V) + k_e(S/V) = 0.10 \left[\frac{₹10,00,000}{₹30,00,000} \right] + 0.15 \left[\frac{₹20,00,000}{₹30,00,000} \right] = 0.1333$$

(c) Valuation of firm at higher level of debt

EBIT	₹4,00,000
Less: Interest	1,80,000
Earnings for equity-holders (NI)	2,20,000
Equity-capitalisation rate (k_e)	0.18
Market value of equity (S)	12,22,222
Market value of debt (B)	15,00,000
Total market value of firm ($S + B$) = V	27,22,222

No, we shall not recommend the plan, as the increased proportion of debt would lower the value of the firm from ₹30,00,000 to ₹27,22,222.

P.19.10 The two companies, U and L, belong to an equivalent risk class. These two firms are identical in every respect except that U company is unlevered while Company L has 10 per cent debentures of ₹30 lakh. The other relevant information regarding their valuation and capitalisation rates are as follows:

LO 19.2 LOD E

Particulars	Firm U	Firm L
Net operating income (EBIT)	₹7,50,000	₹7,50,000
Interest on debt (I)	—	3,00,000
Earnings to equityholders (NI)	7,50,000	4,50,000
Equity-capitalisation rate (k_e)	0.15	0.20
Market value of equity (S)	50,00,000	22,50,000
Market value of debt (B)	—	30,00,000
Total value of firm ($S + B$) = V	50,00,000	52,50,000
Implied overall capitalisation rate (k_0)	0.15	0.143
Debt-equity ratio (B/S)	0	1.33

- (a) An investor owns 10 per cent equity shares of company L. Show the arbitrage process and the amount by which he could reduce his outlay through the use of leverage.
- (b) According to Modigliani and Miller, when will this arbitrage process come to an end?

Solution

(a) Arbitrage process

(i) Investor's current position (in firm L)	
Dividend income	₹45,000
Investment cost	2,25,000
(ii) He sells his holdings of firm L for ₹2,25,000 and creates a personal leverage by borrowing ₹3,00,000 ($0.10 \times ₹30,00,000$ debt of firm L). The total amount with him is ₹5,25,000. Income required to break even would be:	
Dividend income (L firm)	45,000
Interest on personal borrowing ($0.10 \times ₹3,00,000$)	30,000
	75,000
(iii) He purchases 10 per cent equity holdings of the firm U for ₹5,00,000.	
Dividend income (U firm) ($0.10 \times ₹7,50,000$)	75,000
Amount of investment	5,00,000

He will reduce his outlay by ₹25,000 through the use of leverage.

- (b) According to Modigliani and Miller, this arbitrage process will come to an end when the values of both the firms are identical.

P.19.11 The two companies X and Y belong to the same risk class. They have everything in common except that firm Y has 10% debentures of ₹5 lakh. The valuation of the two firms is assumed to be as follows:

LO 19.2 LOD M

Particulars	X	Y
Net operating income (EBIT)	₹7,50,000	₹7,50,000
Interest on debt (<i>I</i>)	Nil	50,000
Earnings to equityholders (<i>N</i>)	7,50,000	7,00,000
Equity-capitalisation rate (k_e)	0.125	0.14
Market value of equity (<i>S</i>)	60,00,000	50,00,000
Market value of debt (<i>B</i>)	—	5,00,000
Total market value of the firm (<i>V</i>)	60,00,000	55,00,000
Implied overall capitalisation rate (k_0)	0.125	0.1363
Debt-equity ratio (<i>B/S</i>)	0	0.1

An investor owns 10 per cent of the equity shares of the overvalued firm. Determine his investment cost of earnings the same income so that he is at a break-even point? Will he gain by investing in the undervalued firm?

Solution

Arbitrage process

- (a) Investor's position in over valued firm X
 Investment cost ($0.10 \times ₹60,00,000$) ₹6,00,000
 Dividend income ($0.10 \times ₹7,50,000$) 75,000
- (b) He sells his holdings in firm X and purchases 10 per cent equity shares and 10 per cent of debentures of under valued firm Y to earn ₹75,000.

	Investment	Income
Shares	₹5,00,000	₹70,000
Debentures	50,000	5,000
	5,50,000	75,000

The investment of ₹5,50,000 earns the same amount of income which he was earning on an investment of ₹6,00,000 in the overvalued firm. Clearly, he will gain by investing in the under valued firm Y.

P.19.12 The following is the data regarding two companies 'X' and 'Y' belonging to the same risk class:

LO 19.2 

Particulars	Company X	Company Y
Number of ordinary shares	90,000	1,50,000
Market price per share	₹1.20	1.00
6% Debentures	60,000	—
Profit before interest	18,000	18,000

All profits after debentures interest are distributed as dividends.

Explain how under Modigliani and Miller Approach an investor holding 10 per cent of shares in Company X will be better off in switching his holdings to Company Y.

Solution

Arbitrage process

- (a) Investor's current position in Firm X with 10 per cent equity holdings:
 (i) Investments (9,000 shares \times ₹1.20) ₹10,800
 (ii) Dividend income $0.10 \times (₹18,000 - ₹3,600)$ 1,440
- (b) Investor sells his holdings of Firm X for ₹10,800 and creates a personal leverage by borrowing ₹6,000 ($0.10 \times ₹60,000$). Thus, the total amount available with him is ₹16,800.

(Contd.)

(Contd.)

(c) He purchases 10 per cent equity holdings of Company Y for ₹15,000 (15,000 shares × ₹1); his dividend income is ₹1,800 (₹18,000 × 0.10).	
(d) Gross income	1,800
Less: Interest on personal borrowings (0.06 × ₹6,000)	360
Net income	1,440
He breaks-even by investing in Firm Y. But in the process he reduces his investment outlay by ₹1,800. Therefore, he is better off by investing in Firm Y. Alternatively, by investing ₹16,800, he could augment his income to ₹1,656:	
Dividend income from Firm Y ₹18,000 $\left(\frac{₹16,800}{₹1,50,000} \right)$	₹2,016
Less: Interest on personal borrowings	360
Net income	1,656

MINI CASES

19.C.1 In considering the most appropriate capital structure for the NOID Manufacturers Ltd (NML), its finance department has made estimates of the interest rate on debt and the cost of equity capital at various levels of debt-equity mix summarised below:

Debt-equity mix (leverage)	Coupon rate (%)	Cost of equity (%)
0	8	12.0
10	8	12.0
20	9	12.5
30	9	13.5
40	10	14.5
50	13	16.0
60	15	20.0
70	18	25.0

The debt is in the form of 10-year redeemable at par ₹1,000 debentures with coupon rates varying with the equity-debt ratio and 5 per cent flotation cost. As a matter of policy, NML always keeps 10 per cent of its finances in the form of preference shares carrying 2 per cent extra return compared to the debenture coupon rates. The duration and the flotation costs are similar to debentures.

Required Assuming (i) 17.5 per cent dividend distribution tax and (ii) corporate tax rate, 35 per cent, determine the optimal capital structure (debt-equity mix) for the NML.

Solution

Determination of Optimum Capital Structure

Degree of leverage	Coupon rate (%) (I)	Preference dividend (%) (D_p)	Cost of equity (ke)	$K_d^{\text{①}}$	$K_p^{\text{②②}}$	$K_o^{\text{③③③}}$
0	8.0	10.0	12.0	0.0585	0.1256	0.1206
10	8.0	10.0	12.0	0.0585	0.1256	0.1144
20	9.0	11.0	12.5	0.0651	0.1377	0.1143
30	9.0	11.0	13.5	0.0651	0.1377	0.1143
40	10.0	12.0	14.5	0.0718	0.1497	0.1162
50	13.0	15.0	16.0	0.0918	0.1859	0.1285
60	15.0	17.0	20.0	0.1051	0.2100	0.1441
70	18.0	20.0	25.0	0.1251	0.2462	0.1622

Conclusion: The optimum capital structure lies between 20 and 30 per cent of leverage.

1. The first part of the report is a general introduction to the project. It describes the objectives and the scope of the work.

2. The second part of the report is a detailed description of the methodology used in the study.

3. The third part of the report is a presentation of the results of the study. It includes a table of the data collected.

4. The fourth part of the report is a discussion of the results and their implications.

5. The fifth part of the report is a conclusion and a list of references.

6. The sixth part of the report is a list of appendices.

7. The seventh part of the report is a list of figures and tables.

8. The eighth part of the report is a list of references.

APPENDIX

This appendix contains the data collected during the study.

Year	Value	Value
1980	100	100
1981	105	105
1982	110	110
1983	115	115
1984	120	120
1985	125	125
1986	130	130
1987	135	135
1988	140	140
1989	145	145
1990	150	150

The data shows a steady increase in the value of the variable over the period from 1980 to 1990.

Year	Value	Value	Value
1980	100	100	100
1981	105	105	105
1982	110	110	110
1983	115	115	115
1984	120	120	120
1985	125	125	125
1986	130	130	130
1987	135	135	135
1988	140	140	140
1989	145	145	145
1990	150	150	150

The data shows a steady increase in the value of the variable over the period from 1980 to 1990.

Working Notes

$$@k_d = [I(1 - t) + \text{Flotation costs}/M] + (RV + SV)/2$$

$$@@k_p = [D_p(1 + D_t) + \text{Flotation costs}/M] + (RV + SV)/2$$

where I = Interest, D_p = dividend on preference shares, t = tax rate, RV = redemption value, SV = sale value (face value – flotation cost), n = maturity period, D_t = dividend payment tax

@@@ $k_o = (W_d \times K_d) + (W_p \times K_p) + (W_e \times K_e)$. It may be noted that 10% debt-equity mix implies, 90% shareholders equity (consisting 10 % of preference shares and 80% of ordinary shares].

19.C.2 Royal Hotels Ltd. is a luxury hotel with following financials.

Income Statement of Royal Hotels Ltd for the year ending on March 31, 2014 (Amount in ₹ crore)

Particulars	Amount
Sales revenue	650
Operating costs	450
Operating profit	200
Financing costs	10
Earnings before tax	190
Taxes (30.9%)	58.71
Earnings after tax	131.29
Preference dividend	6.50
Preference dividend tax @ 16.995%	1.10
Earnings available to equity shareholders	123.68

Balance Sheet of Royal Hotels Ltd as at March 31, 2014 (Amount in ₹ crore)

Particulars	Amount
Shareholders' funds:	
Share capital:	
Equity	₹250
13% Preference shares	50
Reserves and surplus:	₹300
General reserve	90
Long-term assets replacement reserve	10
Non-current liabilities:

Current liabilities	
	100
	600
Application of funds:	
Long-term assets:	
Land and buildings (net)	200
Furniture and fittings	200
Current assets	
	200
	600

Due to growing concept of 3Ps (Planet, People and Profit) and the desire to emerge as socially responsible organisation, the Board of Directors of Royal Hotels, comes up with the novel idea of "Green Hotel". A

green hotel is to be environment friendly (in terms of reduced CFC emissions, reduced power usage, etc.) and economically sustainable. Building on this concept, various studies conducted have concluded that the project is likely to be technically feasible, economically viable, commercially profitable and financially sound. The Board also proposes to rename the hotel as Royal Greens Ltd. Projected Income statement of Royal Greens is as follows:

(Amount in ₹ crore)

Particulars	Amount
Total revenue	850
Operating costs	550
EBIT	300

To execute the investment proposal, the management is faced with the daunting task of raising the required finances of ₹100 crore. The CEO uses this opportunity to evaluate two Finance Managers, Mr. Rohan and Mr. Sohan, who are due for promotion. He asks each of them to suggest the soundest way of financing this expansion project.

Proposal of Mr. Rohan

He recommends raising ₹100 crore through 2 crore equity shares of face value of ₹10 each, issued at a premium of ₹40 each: Reasons to justify this proposal are: (1) Equity does not involve any fixed commitments, its cost is zero; (2) Payment of interest on debt and eventual redemption of debt will reduce available cash; (3) The benefit from increased revenues should go to equity-holders only; (4) Raising debt will increase financial risk of the firm; (5) Firm will be able to have a favourable debt equity ratio; and (6) Such favourable debt equity ratio and no risk of default of non-payment to financiers may increase the firm's overall rating.

Proposal of Mr. Sohan

He recommends raising ₹100 crore through issue of 11% debentures. The reasons for his proposal are:

1. EPS under debt plan is likely to be higher compared to equity plan as shown by lower indifference point (shown below) *vis-à-vis* projected EBIT.

$$\frac{(X - I_1)(1-t) - PD(1+PD_T)}{N_1} = \frac{(X - I_2)(1-t) - PD(1+PD_T)}{N_2}$$

$$\frac{(X - ₹10 \text{ crore})(1 - 0.309) - ₹6.5 \text{ crore}(1.16995)}{27 \text{ crore}} = \frac{X - ₹21 \text{ crore}(1 - 0.309) - ₹6.5 \text{ crore}(1.16995)}{25 \text{ crore}}$$

$$X (\text{EBIT}) = ₹169 \text{ crore}$$

Since expected EBIT ₹300 crore is more than required EBIT ₹169 crore (for indifference point), EPS (based on EBIT-EPS analysis) is higher under debt plan.

2. Interest on debt is tax deductible; it leads to cash inflow to the extent of tax saving on interest.
3. Equity is more costly *vis-à-vis* debt as a source of finance.
4. As per signaling Theory, issue of debt is a good signal, and leads to increase in market price of shares.
5. Even after raising debt, the firm will still have better debt equity ratio than industry average.
6. Above all, equityholders are in pensive mood due to uncertain and volatile conditions prevailing in Indian stock market; raising funds through equity is most likely to be difficult proposition.

Perplexed by the contradicting recommendations of his two prodigies, the CEO refers this complex task to consultant, Ms. Shivaani who is considered to be a financial wizard. She states that equity capital carries a higher cost due to higher risk compared to debt; leveraging up to a point reduces overall cost of capital (as enunciated in *Traditional approach of capital structure*) and equity-shareholders are benefitted

by a higher EPS. Thus, an optimum mix of debt and equity is a prerequisite of sound capital structure. She submits the following report to CEO of Royal Greens.

Evaluation of proposed financing mix on the basis of desirable attributes of sound financing mix:

S. No.	Attributes	Debt	Equity	Debt + Equity	Refer Note
1.	EBIT-EPS analysis	✓	✗	✓	1
2.	Compliance of covenants	✗	✓	✓	2
3.	Wealth maximisation	✓	✗	✓	1,4
4.	Avoidance of bankruptcy costs	✗	✓	✗	3
5.	Flexibility	✗	✗	✓	3
6.	Capital structure ratios	✗	✓	✓	5,6,
7.	Tolerable financial leverage	✓	✓	✓	7
8.	Signaling theory	✓	✗	✓	8
9.	Tax saving on interest	✓	✗	✓	9
10.	Absence of agency cost	✗	✓	✓	10
11.	Security rating	✓	✓	✓	11
12.	Timing	✓	✓	✓	12

Based on the above attributes, Shivaani recommends a mix of debt and equity to raise required funds of ₹100 crore. Due to a covenant in working capital loan agreement, it is advised to *raise debt and equity in ratio of 50:50* (refer Note 2), that is, ₹50 crore through issue of 50,00,000 11 per cent debentures of face value ₹100 and balance ₹50 crore through 1 crore equity shares of face value ₹10, issued at a premium of ₹40 per share.

Notes:

- The basic objective of financial management is maximisation of shareholders wealth, (MPS is a proxy for the same) and, therefore, *real* indifference point (instead of indifference point based on EPS) would be rational guide in determining the source of finance.

$$\frac{P/E_1 X [(X - I_1)(1-t) - PD(1+PD_T)]}{N_1} = \frac{P/E_2 X [(X - I_2)(1-t) - PD(1+PD_T)]}{N_2}$$

$$\frac{10[(X - ₹10 \text{ crore})(1 - 0.309) - ₹6.5 \text{ crore}(1.16995)]}{27 \text{ crore}}$$

$$= \frac{9.75[(X - ₹21 \text{ crore})(1 - 0.309) - ₹6.5 \text{ crore}(1.16995)]}{25 \text{ crore}}$$

$$X = ₹239.5 \text{ crore}$$

Since the projected EBIT at ₹300 crore is more than ₹239.5 crore, firm can finance through debt.

- In WC loan agreement, a restrictive covenant has been found stating that, the long-term debt/equity ratio cannot be more than 40 per cent at any given point of time.

So, maximum debt that can be raised = $(100 + x) = .4[400 + (100 - x)]$

This implies firm can raise only ₹71.4 crore through debt.

- Since raising debt can lead to bankruptcy costs, a schedule of bankruptcy cost at varying levels of debt is presented below.

Level of debt	₹100 crore	110	120	130	140	150	160	170
Bankruptcy costs	Zero	₹50 lakh	1 crore	2	4	7	11	16

In case the maximum possible debt, that is, ₹70 crore is raised, the total debt would amount to ₹170 crore, and accordingly bankruptcy costs are likely to be ₹16 crore. Also, exhausting the complete debt source reduces the flexibility to raise funds in future. Keeping this in mind, raising ₹50 crore through debt and the balance ₹50 crore through equity seems reasonable. This way total debt would amount to ₹150 crore, thereby leading to a saving of ₹9 crore towards bankruptcy costs. Therefore, a 50:50 debt-equity mix is proposed.

4. Statement showing determination of market price per share under various financing plans:

Figures in ₹ (crore)

Particulars	Existing	Proposed mix	Only debt	Only equity
Sales revenue	650	850	850	850
Operating costs	450	550	550	550
EBIT	200	300	300	300
Interest	10	15.50	21	10
EBT	190	284.50	279	290
Taxes @30.9%	58.71	87.91	86.21	89.61
EAT	131.29	196.58	192.78	200.39
Preference dividend	7.60	7.60	7.60	7.60
Earnings available to equity-holders	123.68	188.98	185.18	192.78
Number of equity shares	25	26	25	27
EPS (₹)	4.95	7.26	7.40	7.14
Expected P/E multiple*		9.95	9.5	10
MPS (₹)		72.32	70.37	71.40

*In view of high profitability, less financial risk, favourable ratios and lower fixed obligation, there is no significant difference in P/E ratio under varying financial alternative.

5. If the funds are raised in proposed ratio:

Long-term debt/ Equity ratio is likely to be:

₹150 crore/₹450 crore = 3 times or debt is 33.3 per cent of equity, hence, the covenant can be said to be complied with.

6. To ensure that the firm does not default on interest payment, interest coverage ratio has been calculated as follows:

EBIT ₹300 crore/ Interest ₹15.5 crore = 19.35 times

It means that even if EBIT falls by whopping 90 per cent, firm will be still able to meet its interest obligations. In operational terms, the firm is not likely to commit default in meeting its interest obligations.

7. To further assure that the proposed mix does not increase financial risk of the firm, degree of financial leverage is calculated as follows:

$$\frac{\text{EBIT}}{\frac{\text{EBT} - \text{Preference dividend} (1 + \text{dividend payment tax})}{(1 - \text{Tax rate})}} = 1.0968$$

$$\frac{\text{₹ 300 crore}}{\frac{\text{₹ 284.5 crore} - \text{₹ 6.5 crore} (1.16995)}{(1 - .309)}} = 1.0968$$

The degree of financial leverage is close to 1. It represents almost negligible chance of default in meeting commitments towards fixed charges.

8. Signaling theory states that investors see issue of debt as a good news.
9. Since interest on debentures is allowed to be deducted while calculating taxable income, interest \times tax rate is a tax saving.
10. Usually issue of debt leads to emergence of agency costs; in the present context, debt is just one-third of equity, therefore, it is believed agency costs are not likely to arise.
11. Given sound capital structure ratios, firm's security rating is not expected to deteriorate (subsequent to raising of debt).
12. Given firm's credentials and market conditions, issuance of either or both of debt and equity are likely to succeed.

REVIEW QUESTIONS

LOD: Easy

RQ.19.1 Provide the appropriate answers to the following:

[LO 19.2]

- (i) According to NI approach capital structure decision is _____ to the valuation of the firm. (relevant/irrelevant)
- (ii) Market price per share _____ if more debt is used in NI approach. (increases/decreases/remains unchanged)
- (iii) According to NOI approach, cost of equity is _____.
- (iv) _____ implies buying securities in a market where price is low and selling where it is high.
- (v) In the traditional approach, the cost of equity is independent of amount of debt. (True/False)
- (vi) In practice, equity financing allows firm to go for cheaper sources of finance in future. (True/False)
- (vii) What is the value of a levered firm L if it has the same EBIT as an unlevered firm U, (with value of ₹700 lakh), has a debt of ₹200 lakh, tax rate is 35 per cent under MM approach?
(a) ₹770 lakh (b) ₹500 lakh (c) ₹630 lakh (d) ₹900 lakh
- (viii) What is the value of an unlevered firm U if it has the same EBIT as a levered firm L, (with value of ₹700 lakh), has a debt of ₹200 lakh, tax rate of 35 per cent under MM approach?
(a) ₹770 lakh (b) ₹500 lakh (c) ₹630 lakh (d) ₹900 lakh
- (ix) According to the traditional approach, what is the effect of increase in degree of leverage on the valuation of the firm?
(a) Increases (b) Decreases
(c) Remains Unaffected (d) Increases first and then decreases
- (x) According to NOI approach, with increase in debt/equity ratio the financial risk of equityholders _____
(a) decreases (b) increases
(c) no Change (d) depends on degree of leverage

[Answers: (i) Relevant (ii) Increases (iii) Residual (iv) Arbitrage process (v) False (vi) True (vii) ₹770 lakh (viii) ₹630 lakh (ix) Increase first then decreases and (x) Increases]

RQ.19.2 What is meant by the concept 'financial risk'? What is the relationship between leverage and the cost of capital? Explain.

[LO 19.2]

RQ.19.3 State the order in which firms will obtain financing under the pecking-order theory. Also state, in brief, the rationale for the order.

[LO 19.2]

RQ.19.4 Companies U and L are identical in every respect except that the former does not use debt in its capital structure, while the latter employs ₹6 lakh of 15 per cent debt. Assuming that, (a) all the MM assumptions are met, (b) the corporate tax rate is 35 per cent, (c) the EBIT is ₹2,00,000, and (d) the equity capitalisation of the unlevered company is 20 per cent, what will be the value of the firms, U and L? Also, determine the weighted average cost of capital for both the firms.

[LO 19.2]

LOD: Medium

- RQ.19.5** Give a critical appraisal of the (a) traditional Approach and (b) the Modigliani-Miller Approach to the theory of capital structure. [LO 19.2]
- RQ.19.6** Explain briefly the view of traditional writers on the relationship between capital structure and the value of a firm. [LO 19.2]
- RQ.19.7** 'The total value of a firm remains unchanged regardless of variations in its financing mix'. Discuss this statement and point out the role of arbitraging and homemade leverage. [LO 19.2]
- RQ.19.8** Is the MM thesis realistic with respect to capital structure and the value of a firm? If not, what are its main weaknesses? [LO 19.2]
- RQ.19.9** Write notes on: (a) Home made leverage, (b) Arbitrage process, (c) NI and NOI Approaches, (d) Reverse leverage, and (e) MM's thesis with corporate taxes. [LO 19.2]
- RQ.19.10** How would you determine the following? [LO 19.2]
- The cost of equity in the NOI Approach,
 - The value of equity, given the equity capitalisation rate, EBIT and interest,
 - The overall capitalisation rate, given the EBIT, value of equity and value of debentures,
 - The value of levered firm under MM's thesis with taxes, and
 - The overall capitalisation rate, given k_e , k_d , S and B .
- RQ.19.11** Enumerate the direct and indirect bankruptcy costs. How do such costs affect the valuation of levered firm, in a world of taxes? [LO 19.2]
- RQ.19.12** Briefly describe the trade-off theory of capital structure. How does it differ from MM proposition with taxes? [LO 19.2]
- RQ.19.13** Determine the optimal capital structure of a company from the following information supplied to you, assuming 35 per cent tax rate: [LO 19.2]

Cost of debt, K_i (per cent)	Cost of equity, K_e (per cent)	Debt/(Equity + Debt) (B/V)
11	13	0
11	13	0.1
11.6	14	0.2
12	15	0.3
13	16	0.4
15	18	0.5
18	20	0.6

- RQ.19.14** From the following selected data, determine the value of the firms, P and Q belonging to the homogeneous risk class under (a) NI approach, and (b) the NOI approach. [LO 19.2]

	Firm P	Firm Q
EBIT	₹2,25,000	₹2,25,000
Interest (0.15)	75,000	
Equity capitalisation rate (K_e)		0.20
Tax rate		0.35

Which of the two firms has an optimal capital structure?

- RQ.19.15** Two companies, X and Y belong to equivalent risk group. The two companies are identical in every respect except that company Y is levered, while X is unlevered. The outstanding amount of debt of the levered company is ₹6,00,000 in 10 per cent debentures. The other information for the two companies is as follows: [LO 19.2]

1. The first part of the report is a general introduction to the subject of the study. It discusses the importance of the problem and the objectives of the research. It also mentions the scope of the study and the methods used.

2. The second part of the report is a detailed description of the experimental work. It includes a description of the apparatus used, the procedure followed, and the results obtained. The results are presented in a clear and concise manner, and are supported by appropriate data and graphs.

3. The third part of the report is a discussion of the results. It compares the results with those obtained in previous studies and discusses the implications of the findings. It also suggests possible reasons for any discrepancies and offers suggestions for further research.

CONCLUSIONS

1. The results of the study show that the rate of reaction is directly proportional to the concentration of the reactants. This is in agreement with the theoretical prediction that the reaction is first order with respect to each reactant.

2. The activation energy of the reaction was found to be approximately 15 kcal/mole. This value is in good agreement with the values reported in the literature for similar reactions.

3. The rate of reaction is also affected by the presence of a catalyst. The rate is significantly increased in the presence of the catalyst, and this is due to the fact that the catalyst provides an alternative reaction pathway with a lower activation energy.

4. The study has shown that the reaction is reversible, and the equilibrium constant is approximately 10. This indicates that the reaction favors the products.

5. The study has also shown that the reaction is exothermic, and the heat of reaction is approximately -10 kcal/mole. This is in agreement with the values reported in the literature for similar reactions.

1. The first part of the report is a general introduction to the subject of the study. It discusses the importance of the problem and the objectives of the research. It also mentions the scope of the study and the methods used.

	X	Y
NOI (net operating income)	₹1,50,000	₹1,50,000
Interest on debt	—	-60,000
Earnings to equityholders	1,50,000	90,000
Equity capitalisation rate	0.15	0.20
Market value of equity	10,00,000	4,50,000
Market value of debt	—	6,00,000
Total value of firm	10,00,000	10,50,000
Overall capitalisation rate	0.15	0.143
Debt/equity ratio	0	1.33

An investor owns 5 per cent equity shares of company Y. Show the process and the amount by which he could reduce his outlay through use of the arbitrage process. Are there any limits to the 'process'?

- RQ.19.16** "The value of a firm is independent of the proportion of debt to total capitalisation. The arbitrage process will establish a market equilibrium in which the total value of the firm will depend only on investor's estimate of the firm's business risk, and its expected future income." Explain the above mentioned statement (assume 10 per cent holding) with the help of the following data regarding two companies, A and B with the same expected annual income and same risk class. **[LO 19.2]**

Variables	Company A	Company B
Expected annual income (Y)	₹30,000	₹30,000
Market value of debt (L)	—	1,20,000
Rate of interest on debt (i)	—	0.125
Required rate of return on equity (K)	0.15	0.16
Market value of equity (E)	2,00,000	93,750
Market value of company (V), where $V = L + E$	2,00,000	2,13,750

LOD: Difficult

- RQ.19.17** How will a firm go about determining its 'optimal capital structure'? **[LO 19.2]**
- RQ.19.18** Explain how 'asymmetric information' and "signals" affect corporate's capital structure decisions. How do the firm's financing decisions give investors signals that reflect the management's view of share value. **[LO 19.2]**

ANSWERS

- 19.4** Value of unlevered firm ₹6,50,000
 Value of levered firm ₹8,60,000
 Ko of unlevered firm 0.20
 Ko of levered firm 0.1511
- 19.13** Capital structure, having a debt of 10 per cent, is optimal.
- 19.14** Firm P has better capital structure (compared to firm Q) under both the NI and NOI approaches.
- 19.15** The investor can reduce his outlay by ₹2,500 through the use of leverage.
 Yes, there are limits to the arbitrage process; this process will come to an end when the values of both firm become identical.
- 19.16** Mr X is earning the same amount of income as in company B. But his investment outlay in company A is less by ₹1,375.

CHAPTER

20

Designing Capital Structure

LEARNING OBJECTIVES

LO 20.1	Review the key factors having a bearing on the choice of an appropriate capital structure
LO 20.2	Illustrate EBIT-EPS analysis and coverage ratio as an approach to design capital structure
LO 20.3	Explain cash flow analysis as an approach to set debt policy for a firm
LO 20.4	Examine the other factors having a bearing on planning the sources of funds
LO 20.5	Analyse financing alternatives from the viewpoint of tax planning
LO 20.6	Outline capital structure practices by corporates in India

INTRODUCTION

The preceding chapter, focusing on the theoretical relationship between capital structure, cost of capital and valuation, has shown that although the empirical evidence is not conclusive, theoretically a judicious combination of debt and equity does affect the cost of capital as also the total value of the firm. There is, in other words, an optimum capital structure. The capital structure is said to be optimum when the marginal real cost (explicit as well as implicit) of each available source of financing is identical. With an optimum debt and equity mix, the cost of capital is minimum and the market price per share (or total value of the firm) is maximum. The use of debt in capital structure or financial leverage has both benefits as well as costs. While the principal attraction of debt is the tax benefit, its cost is *financial distress* and reduced commercial profitability. The term **financial distress**¹ includes a broad spectrum of problems ranging from relatively minor liquidity shortages to bankruptcy. The problem of financial distress will magnify with an increase in financial leverage. Beyond a certain point, the expected cost of financial distress will outweigh the tax benefit. A firm is, thus, concerned with a trade-off between risk and return emanating from the use of debt. A proper balance between the two is, therefore, called for.

Given the objective of maximisation of shareholders' wealth, the need for an optimal capital structure cannot, therefore, be overemphasised. In operational terms, every firm should try to design

- **Financial distress**
- includes a broad spectrum of problems ranging from minor liquidity shortages to bankruptcy.

such a capital structure. But the determination of an optimum capital structure is a formidable task. It should be clearly understood that identifying the *precise percentage* of debt that will maximise price per share is almost impossible. It is possible, however, to determine the *approximate proportion* of debt to use in the financial plan in conformity with the objective of maximising share prices.

In theory, one can speak of an **optimum** capital structure, but, in practice, it is very difficult to design one. There are significant variations among industries as also among individual companies within the same industry in respect of capital structure. This is so because there are a host of factors, both quantitative and qualitative, including subjective judgement of financial managers which determine the capital structure of a firm. These factors are highly complex and cannot fit entirely into a theoretical framework. From the operational standpoint, therefore, what should be attempted is an **appropriate** capital structure, given the facts of a particular case.

The present chapter which focuses on determining the *appropriate* mix of debt to be used along with equity in the capital structure discusses the important factors which have a bearing on designing capital structure of a firm. The terms **designing capital structure, capital structure decision, factors determining capital structure and capital structure planning** are used interchangeably here.

LO 20.1 KEY FACTORS

There are certain common, and often, conflicting considerations involved in determining the methods of financing assets because the position of each company is different. Accordingly, the weight given to various factors also varies widely, according to conditions in the economy, the industry and the company itself. Above all, the freedom of management to adjust the mix of debt and equity in accordance with these criteria is limited by the availability of the various types of debt to have an appropriate capital structure, but the debt may not be available to the company because the suppliers of the funds may think that it will involve too much financial risk for them. Consequently, the plans that management ultimately makes in the light of these considerations often involve a compromise between the desires and conditions imposed by the suppliers of funds. Moreover, none of the factors by itself is completely satisfactory. But, collectively, they provide sufficient information for taking rational decisions. The key factors governing the capital structure decisions are **(i)** profitability aspect, **(ii)** liquidity aspect, **(iii)** control, **(iv)** leverage ratios in industry, **(v)** nature of industry, **(vi)** consultation with investment banks/lenders, **(vii)** commercial strategy, **(viii)** timing, **(ix)** company characteristics and **(x)** tax planning.

LO 20.2 PROFITABILITY ASPECT: EARNINGS BEFORE INTEREST AND TAX (EBIT) – EARNINGS PER SHARE (EPS) ANALYSIS

EBIT-EPS analysis/ approach is an approach for selecting capital structure that maximises earnings per share (EPS) over the expected range of earnings before interest and taxes.

Keeping in view the primary objective of financial management of maximising the market value of the firm, the **EBIT-EPS analysis** should be considered logically as the first step in the direction of designing a firm's capital structure. As discussed in detail in Chapter 18, the EBIT-EPS analysis shows the impact of various financing alternatives on EPS at various levels of EBIT. This analysis is useful for two reasons: **(i)** the EPS is a measure of a firm's performance—given the P/E ratio, the larger the EPS, the larger would be the value of a firm's shares; and **(ii)** given the importance of EPS and the function of the EBIT-EPS analysis to show the value of EPS under various financial alternatives at different levels of EBIT, the EBIT-EPS analysis information can be extremely useful to the finance manager in arriving at an appropriate financing decision. The EBIT-EPS analysis

is illustrated in Chapter 18. From Fig. 18.5, [based on Example 18.8 (i)], we see that the EPS is ₹6.5 per share at the point of intersection of two financial alternatives: (i) 100 per cent equity financing, and (ii) 50 per cent equity financing and 50 per cent debt financing. At that point, EPS is equal under both the plans. At the point of intersection, the EBIT level is ₹3 lakh. Beyond the point of intersection, the EPS is higher under alternative (ii) which uses 50 per cent debt than alternative (i). Below the point of intersection, the EPS is higher under alternative (i) which exclusively uses equity rather than the half debt-mixed alternative (ii) which financial plan should be adopted, is to be determined with reference to the likely level of EBIT. If the company's likely level of EBIT is ₹4.5 lakh, the debt-mixed alternative should be preferred as the EPS is ₹13 under this alternative while it is ₹9.75 under the equity alternative. Thus, the finance manager can compare the point of intersection with the most likely level of EBIT and can decide the financing mix. The manager should determine the probability of 'critical' levels of EBIT. If the probability of EBIT going below ₹3 lakh is negligible or very low, the debt-mix alternative should be recommended by the finance manager. On the other hand, if the probability of EBIT falling below the indifference point is high, the equity-alternative should be preferred. In general, the higher the level of EBIT and the lower the probability of downward fluctuation, the greater is the amount of debt that can be employed. While taking a decision in this respect, it should be remembered that P/E ratio is less for a levered financial plan due to increased financial risk. Therefore, increase in EPS should be greater so that its advantage is not completely offset or more than offset by using debt in the capital structure. Moreover, if the debt alternative entails a provision for creating a sinking fund, the finance manager should keep in mind that earnings available for payment of dividends and reinvestment to further expand facilities would be reduced by the amount of the sinking fund payment. The indifference point would then be computed using Eq. 20.1.

$$\frac{\text{UEPS-Debt Plan}}{N_1} = \frac{\text{UEPS-Equity Plan}}{N_2} \tag{20.1}$$

$$\frac{(EBIT - I)(1 - t) - SF}{N_1} = \frac{(EBIT)(1 - t)}{N_2}$$

where UEPS = uncommitted earnings per share
 SF = sinking fund payment per annum
 I = interest payments

Let us suppose in our example 14.8, the sinking fund payment is ₹1,40,000 for 8 years. The indifference point would have to be escalated to ₹5,00,000. The earlier decision of going for debt at the most likely level of EBIT of ₹4.5 lakh will be reversed. Likewise, in calculating the indifference level of EBIT, he should take cognizance of fixed interest or sinking fund liability on the other debts already outstanding. If preference shares are outstanding, its dividend (and sinking fund, if any, in the case of redeemable preference shares) requirements should also be provided for.

Coverage Ratio

Apart from the EBIT-EPS/EBIT-MPS analysis, the ability of a firm to use debt, from the Profitability point of view, can also be judged in terms of a coverage ratio, namely,

$$\frac{EBIT}{I} \tag{20.2}$$

Or

$$\frac{EBIT}{I + \left[\frac{SF}{1 - t} \right]} \tag{20.3}$$

- Coverage ratio
- measures the
- size of interest
- payments relative
- to the EBIT and the
- adequacy of EBIT
- to meet payment
- obligations.

The ratio measures the size of the interest payments relative to the EBIT. The reciprocal of this ratio ($I/EBIT$) measures the proportion of EBIT devoted to interest payments. The higher the coverage ratio, the greater is the certainty that the firm would be in a position to meet its obligations of interest payment.

The coverage ratio can be calculated, like the EPS, for various levels of EBIT. This would provide a better picture of the firm's most likely EBIT to meet out specific commitments. It will throw light on the adequacy of EBIT to meet the firm's annual burden of payments connected with interest on loan, preference dividend, contribution to sinking fund (if any) and other repayments of principal.

LO 20.3 LIQUIDITY ASPECT: CASH FLOW ANALYSIS

EBIT-EPS analysis and coverage ratios are very useful in making explicit the impact of leverage on EPS and on the firm's ability to meet its commitments at various levels of EBIT. But the EBIT/interest ratio is less than a perfect measure to analyse the firm's ability to service fixed charges because the firm's ability to do so depends on the total payments required, that is, interest and principal, in relation to the cash flow available to meet them. Therefore, the analysis of the cash flow ability of the firm to service fixed charges is an important exercise to be carried out in capital structure planning in addition to profitability analysis. The exercise is of overwhelming significance in the context of the risk of bankruptcy. If the firm borrows more than its debt capacity and, therefore, fails to meet its obligations in future, the lenders may seize the assets of the company to satisfy their claims. Thus, the basic existence of the company would be endangered.

It may be possible that the company's EBIT is adequate to cover its specific commitments, arising out of debt obligations; but, the firm may not have sufficient cash to pay as its income is blocked within the firm in the form of higher inventory, receivables and/or sometimes purchases of fixed assets, particularly, when the company is a growing one. In the absence of cash flow analysis, a company, which is otherwise profitably sound, would, in case of default, run into great difficulties. Thus, cash flow analysis is an essential ingredient of any sound capital structure decision.

Cash flow analysis yields a number of distinct advantages in the crucial task of setting debt policy: **(i)** it focuses on the *solvency* of the firm during adverse circumstances in contrast to EBIT-EPS analysis which is concerned with the effects of leverage under normal circumstances; **(ii)** it takes into consideration the balance sheet changes and other cash flows that do not appear in the profit and loss account; **(iii)** it gives an insight into the **inventory of financial resources** available in the event of recession; and **(iv)** finally, it views the problem in a dynamic context over time whereas EBIT/EPS and coverage analysis normally consider only a single year. From all these points, it can be concluded that the cash flow analysis evaluates the risk of financial distress and should be recognised as a good supporting supplement to the EBIT/EPS analysis in framing the firm's capital structure.

In assessing the liquidity position of a firm in terms of its **cash flow analysis**, various measures can be employed. One such measure² is the *ratio of fixed charges to net cash inflows*.

Cash flow analysis evaluates the risk of financial distress.

This ratio measures the coverage of fixed financial charges (interest plus repayment of principal, if any) to net cash inflows. In other words, it indicates the number of times the fixed financial requirements are covered by the net cash inflows. The greater the

coverage ratio, the greater is the amount of debt (and other sources of funds carrying a fixed rate of interest/dividend) that a firm can use.

Another measure³ to analyse the cash flow ability of a firm to service fixed charges in determining an appropriate capital structure is to prepare a cash budget to determine whether the expected cash flows are sufficient to cover the fixed obligations.⁴ The purpose of preparing the cash budget is to find out possible deviations in actual cash flows from those that are expected. Therefore, cash budgets should be prepared for a range of possible cash inflows with a probability attached to each of them. This information can be used to evaluate the ability of the firm to meet its fixed obligations. Since the probability of various cash flow patterns is known, the firm can work out the amount of fixed charges as well as the debt that the firm can employ and still remain within an **insolvency limit tolerable to the management**.⁵

Suppose, the firm is of the view that 5 per cent is the maximum probability of not having cash to meet charges that can be tolerated (i.e. it will not cause insolvency). Further, suppose that the actual probability of being out of cash on the basis of the cash budget prepared under adverse circumstances is also 5 per cent. In such a situation, according to Van Horne, debt can be employed up to a point where the cash balance is just sufficient to cover the fixed charges. That is to say, debt can be increased up to the point at which the additional cash drain would cause the probability of cash insolvency to equal the risk tolerance specified by management. It is, of course, not necessary that the debt would be increased to that point. This method of analysis suggested by Van Horne provides a means for assessing the effect of increase in debt on the risk of cash insolvency. On the basis of the information available from this analysis, the firm would determine the most appropriate level of debt.

A similar type of analysis has been suggested by Gordon Donaldson.⁶ It is argued that a firm will normally be able to meet its fixed obligations in terms of interest as well as repayment of principal. It is only during adverse circumstances that firms will not be able to maintain their ability to meet contractual obligations and would be exposed to the *risk of bankruptcy* or the extreme form of **risk of financial distress**. Donaldson terms these as **recession** conditions. To examine the impact of alternative debt policies on the risk of bankruptcy, therefore, what is required is a careful analysis of how a firm's cash flows would be affected by recession conditions. We illustrate below the effect of alternative debt policies on the risk of bankruptcy so as to determine debt capacity or optimum amount of debt appropriate to a particular firm.⁷

- **Debt capacity**
- relates to how
- much debt can
- be comfortably
- serviced.

Cashflow Analysis in Recession The alternative debt policies in recession are illustrated in Example 20.1.

Example 20.1 A firm, Hypothetical Ltd, is planning its financial structure. At present the debt-equity ratio is 1:4, that is, debt is 20 per cent of the total. The firm has to choose an appropriate amount of debt. The question at issue is whether the Hypothetical Ltd should **(i)** continue with the present level of debt, **(ii)** use more debt or **(iii)** use less debt.

The Hypothetical Ltd manufactures a wide variety of industrial products. Its sales are moderately affected by the business cycle. Its sales and cash flow data for four years are given in Table 20.1.⁸

TABLE 20.1 Actual Sales and Cash Flows

(₹ lakh)

Particulars	Year 1	Year 2	Year 3	Year 4
Sales	116.6	121.1	112.0	126.5
Profits after taxes	5.8	7.7	6.7	6.5
Sources of funds:				
Operations	21.1	23.1	22.4	22.4
Working capital	3.0	(0.6)	3.1	(1.2)
Total	24.2	22.5	25.5	21.2
Uses of funds:				
Plant and equipment	(6.8)	(8.2)	(13.2)	(14.5)
Taxes	(3.8)	(3.7)	(3.4)	(3.2)
Lease payments	(1.9)	(2.0)	(2.1)	(2.1)
Interest	(2.0)	(1.8)	(1.7)	(1.6)
Repayment of debt	(1.4)	(1.4)	(1.4)	(1.4)
Dividend	(2.8)	(2.8)	(2.8)	(3.0)
Miscellaneous	(0.1)	(0.2)	(0.7)	(0.3)
Total	(18.8)	(20.1)	(25.3)	(26.1)
Changes in cash balance	5.4	2.4	0.2	(4.9)

The firm expects that in the subsequent years there will be recession. On the basis of past experience, the assumed pattern of sales during the recession is as given in Table 20.2.

TABLE 20.2 Assumed Patterns of Sales during Recession (Percentages)

Year prior to recession	Year of recession			
0	1	2	3	4
100	90	80	80	100

The implication of this pattern of sales is that the decline in sales during the recession period ranges between 10 and 20 per cent. Also, assume that the prices would decline by 3 per cent but would recover in the fourth year to the level of the year prior to the recession.

Prepare cash forecasts under recession conditions to determine the debt capacity of the Hypothetical Ltd.

Solution To prepare forecasts of cash flows under recession conditions, cash flows are divided into three categories: (i) operating; (ii) non-operating; and (iii) financial flows.

Operating Cash Flows cover sales revenues and cash operating expenses. Using the above information/assumptions regarding sales volume and price, the operating cash flows of the Hypothetical Ltd over the recession period are computed in Table 20.3.

TABLE 20.3 Operating Cash Flows Under Recession Conditions for Hypothetical Ltd (₹ lakh)

Particulars	Year prior to recession	Recession years			
		0	1	2	3
1. Sales at stable prices	126.5	113.9	101.2	101.2	126.5
2. As % of sales for year 4 (year prior to recession)	100	90	80	80	100
3. Sales at 3% price decline	126.5	110.5	98.2	98.2	126.5
4. Cash operating expenses	101.6	90.7	84.4	82.6	101.6
5. Net operating cash flows (3 - 4)	24.9	19.8	13.8	15.6	24.9

Non-operating Cash Flows include capital outlays and changes in working capital. The non-operating financial flows of the Hypothetical Ltd are given in Table 20.4.

TABLE 20.4 Non-operating CashFlows Under RecessionConditions for Hypothetical Ltd (₹ in lakh)

Particulars	Year prior to recession	Recession years			
		0	1	2	3
1. Plant and equipment	(10.0)	(10.0)	(5.0)	(3.0)	(7.0)
2. Expenditure for working capital:					
Cash	(0.2)	0.3	—	—	(0.4)
Marketable securities	—	0.4	—	—	—
Accounts receivable	(1.2)	(1.6)	2.4	(1.1)	(3.6)
Inventory	(1.7)	2.6	0.4	(1.2)	(3.4)
Accounts payable	1.6	(2.1)	(2.0)	0.8	1.0
Total	(1.5)	(0.4)	0.8	(1.5)	(6.4)
3. Net operating cash outflow (1 + 2)	(11.5)	(10.4)	(4.2)	(4.5)	(13.4)

Financial Flows cover lease payments, interest on debt, repayment of principal, taxes and dividends. The financial flows of the Hypothetical Ltd under the present capital structure are shown in Table 20.5.

TABLE 20.5 Projected Financial Flows Under the Existing Capital Structure (₹ in lakh)

Particulars	Year prior to recession	Recession years			
		0	1	2	3
1. Lease payments	(2.1)	(2.1)	(2.1)	(2.1)	(2.1)
2. Interest on debt*	(1.5)	(1.4)	(1.3)	(1.2)	(1.0)
3. Repayment of debt	(1.4)	(1.4)	(1.4)	(1.4)	(1.4)
4. Dividend ^a	(3.0)	(3.0)	(3.0)	(3.0)	(3.0)
5. Taxes	(3.2)	(2.6)	(2.1)	(2.6)	(3.2)
Total	(11.2)	(10.5)	(9.9)	(10.3)	(10.7)

* Principal due at the beginning of year. 0 = ₹18.6 lakh. Rate of interest 8 per cent. Interest shown for year 0 is that due in year, 0. Sinking fund payments are ₹1.4 lakh per year.

^a Dividend is ₹2 per share on 1.5 lakh outstanding shares.

TABLE VIII. SUMMARY OF RESULTS (Continued)

Alternative Debt Policies We now show cash flows for three debt policies: (i) for the current capital structure with 20 per cent debt; (ii) for Alternative A with 35 per cent debt; and (iii) for 50 per cent debt which may be referred to as Alternative B. While total financial flows for proposed alternative debt policies are presented in Table 20.6, Table 20.7 contains the relevant cash flows for the three alternative debt policies for the Hypothetical Ltd.

TABLE 20.6 Projected Total Financial Flows Under Proposed Debt Policies

Debt policies	Year prior to recession	Recession year			
	(0)	(1)	(2)	(3)	(4)
35% Debt	(12.3)	(11.5)	(10.8)	(11.1)	(11.5)
50% Debt	(13.3)	(12.4)	(11.6)	(11.8)	(12.1)

TABLE 20.7 Alternative Debt Policies for Hypothetical Ltd^{aa}

(₹ lakh)

Particulars	Year prior to recession	Recession years			
	0	1	2	3	4
	Current Capital Structure:				
1. Non-financial flows, net (Tables 20.3 & 20.4)	13.4	9.4	9.6	11.1	11.5
2. Financial flows (Table 20.5)	(11.2)	(10.5)	(9.9)	(10.3)	(10.7)
3. Change in cash balance (1 - 2)	2.2	(1.1)	(0.3)	0.8	0.8
4. Cumulative change	2.2	1.1	0.8	1.6	2.4
5. Change in cash with dividend eliminated in year 1 ^a (Item 3 + ₹3 lakh)	2.2	1.9	2.7	3.8	3.8
6. Cumulative change	2.2	4.1	6.8	10.6	14.4
Alternative A: 35% debt:					
7. Financial flows	(12.3)	(11.5)	(10.8)	(11.1)	(11.5)
8. Change in cash balance (1-7)	1.1	(2.1)	(1.2)	—	—
9. Cumulative change	1.1	(1.0)	(2.2)	(2.2)	(2.2)
10. Change in cash with dividend eliminated in year ^b (Item 8 + ₹2.4 lakh)	1.1	0.3	1.2	2.4	2.4
11. Cumulative change	1.1	1.4	2.6	5.0	7.4
Alternative B: 50% debt:					
12. Financial flows	(13.3)	(12.4)	(11.6)	(11.8)	(12.1)
13. Change in cash balance (1 - 12)	0.1	(3.0)	(2.0)	(0.7)	(0.6)
14. Cumulative change	0.1	(2.9)	(4.9)	(5.6)	(6.2)
15. Change in cash with dividend eliminated in year 1 ^c (Item 13 + ₹1.9 lakh)	0.1	(1.1)	(0.1)	1.2	1.3
16. Cumulative change	0.1	(1.0)	(1.1)	0.1	1.4

^{aa}Solomon, E and J J Pringle, *op. cit.* p. 486. Reprinted by permission from Goodyear Publishing Company, Santa Monica, USA.

^a Dividend of ₹3.0 lakh per year. Item 5 assumes that dividend is eliminated completely in year 1 and no dividend at all is paid in years 1-4.

^b Dividend of ₹2.4 lakh per year with less equity and more debt in capital structure. Same assumptions regarding elimination in year 1.

^c Dividend of ₹1.9 lakh per year, with same assumptions regarding elimination.

Interpretation of Cash Flow Analysis in Recession It can be seen from Table 20.7 that interest on incremental debt is 8 per cent a year, that is, the same in all alternatives. However, dividends, repayment of principal and tax payments change as a result of change in the amount of debt under various alternatives.

The conclusions that emerge from the cash flow analysis in Table 20.7 are:

1. Under the current financing plan, with 20 per cent debt, there is a cash deficit in years 1 and 2, assuming there is no cut in dividend (Item 3). These deficits are financed by the surplus in the year prior to the onset of recession (0 year). On a cumulative basis (Item 4), the firm could survive the recession without cutting the dividend to the shareholders.
2. Under Alternative A, with 35 per cent debt, the cash deficit is somewhat larger in years 1 and 2 (Item 8). The surplus (₹1.1 lakh) in year 0 is not sufficient to finance the subsequent deficits. To eliminate cash deficit, dividends are to be cut. It implies that the firm can survive the recession only if it cuts the dividends to the shareholders.
3. Finally, when the debt is increased to 50 per cent (Alternative B), there is cash deficit in all the years of recession (Item 13). Even after eliminating dividends, there is cash deficit in years 1 and 2, even on a cumulative basis (Items 15 and 16). Thus, Alternative B cannot be sustained during a recession even after no dividends are paid.

Given the above facts, it may be concluded that the Hypothetical Ltd can use 30-35 per cent debt and avoid financial bankruptcy during recession.

The approach illustrated above to analyse cash flows to determine debt capacity can be refined by introducing probabilities. Probability distributions would be required for revenues and other uncertain cash flows. Probability distributions then could be estimated for the changes in cash balance shown in Table 20.7. A complete analysis would yield a probability distribution for each cash balance figure in each year. Such a procedure is very difficult and complex. We have, therefore, excluded this aspect.⁹ Thus, cash flow analysis under recession conditions provides information on the effects of alternative financing plans on the risk of insolvency. This information is extremely useful in taking capital structure decisions.

LO 20.4 OTHER FACTORS

Control

Another consideration in planning the types of funds to use is the attitude of the management towards control. Lenders have no direct voice in the management of a company. They may, of course, place certain restrictions in the loan agreement on the management's activities. So long as there is no default in the payment of interest or the repayment of the principal, there is little that they can do legally against the company. For all practical purposes, they have very little say in the policy-decisions of the company or in the selection of the board of directors. Likewise, preference shareholders do not have the right to vote for the appointment of the board of directors. However, if the financial affairs of the company have deteriorated to such an extent that dividends on preference shares have not been paid for a certain number of years (2-year period in India), they are given the right to attend the meetings and participate in the voting. In most of the cases, they, like the creditors, do not have any say in the selection of the management. The power to choose the management in most cases rests with the equity-holders. Accordingly, if the main object of the management is to maintain control, they will like to have a greater weightage for debt and

preference shares in additional capital requirements, since by obtaining funds through them the management sacrifices little or no control. However, it should be remembered that if the company borrows more than what it can service or repay, the creditors may seize the assets of the company to satisfy their claims. In that situation, the management would lose all control. It might be better to sacrifice a measure of control by some additional equity financing rather than run the risk of losing all control to creditors by employing too much debt.¹⁰ The same holds true for preference shares. In such a situation, equity would be a better source of financing. However, if the firm has the ability, as determined by profitability and solvency considerations discussed above, and the management wants to maintain control in its own hands, the issue of senior securities will be recommended as the issue of additional equity shares would involve the risk of losing control. This will be all the more true if the company is *closely held*. The management of widely-held companies runs little risk of losing continuation of control. The shares of such companies are widely distributed. Most of the shareholders are interested simply in the return and have neither the time nor the inclination to participate in management. If they are not satisfied, they will switch over to other companies.

Leverage Ratios For Other Firms in the Industry

Yet another approach to the capital structure decisions is to make a comparison with the debt-equity ratios of companies belonging to the same industry, having a similar business risk. The rationale of the use of industry standards is that debt-equity ratios appropriate for other firms in a similar line of business should be appropriate for the company as well. Industry standards provide a useful benchmark. If the firm is out of line, it is conspicuous in the market place. This does not necessarily imply that the firm's capital structure planning is inappropriate. It may well be possible that other firms may not be using appropriate debt-equity ratios. They may be more conservative or more aggressive risk-takers than desired. However, comparison is helpful as it acts as a red signal to the management that there may be something wrong with the debt-equity mix of the company. In other words, what it suggests is that if a firm is out of line, it should know the reasons why and be satisfied that there are good reasons for it.¹¹

Nature of Industry

The nature of industry is one of the most important elements in determining the degree of financial leverage a firm can carry safely without any risk of bankruptcy. If an industry's sales are subject to wide fluctuations, over a business cycle, the firm should have a low degree of financial leverage. Such firms will already have a high operating leverage. In case both are high, the total risk of the firm as determined by the combined leverage (the product of operating leverage and financial leverage) would become unduly high.¹² The firms with high debt ratios belonging to industries such as refrigeration, televisions, machine tools and capital equipment manufacturing, run the risk of not being able to meet the required payments in lean years which would cause financial distress. Clearly, such firms should have a more conservative capital structure and rely less on debt. On the other hand, industries dealing with non-durable consumer goods (food) or with inexpensive items (paper clips, match boxes) or with items in habitual use (cigarettes) or all those products which have an inelastic demand are not likely to be subject to wide fluctuations in sales. Such industries can afford to have higher debt proportions in capital structure as in lean years they do not run the risk of being unable to meet their commitments.

Judging industry by its competitive nature, it may be inferred that those industries which have keen competition among themselves should have a relatively greater proportion of equity than debt.

For example, in the garment industry much of the competition is based on style. The styles being unpredictable and transitory the profits also fluctuate accordingly. Therefore, such firms should emphasise equity over debt because of the excessive risk of not being able to meet payments on borrowed funds. At the other extreme, there are public utility undertakings involved in the production of electricity, gas, water, transportation services or telephone services, which are relatively free from intra-industry competition. Their sales are more stable and predictable. Therefore, such companies can afford to use more debt.

The stage of the life cycle of the industry has also a crucial bearing in assigning relative weightage to various sources of raising finance. If the industry is in its infancy, the probability of the rate of mortality would be high. Therefore, more emphasis needs to be placed on equity capital. The firm would do well to avoid seeking funds from senior securities which require fixed payments. At such a stage, risk outweighs the attractions of financial leverage. When the industry has reached maturity and is passing through the period of rapid growth, the firm should pay special attention to manoeuvrability to assure that as it grows it obtains funds when needed and under acceptable terms. If the outlook is for a long-term decline in business, the firm should build such a plan which allows for easy contraction in the sources of the funds used.¹³ For this purpose, the firm can have 'call' provision in the case of senior securities.

Consultation with Investment Bankers and Lenders

Another useful approach in deciding the proportion of various securities in a firm's structure is to seek the opinion of investment analysts, institutional investors, investment bankers and lenders. These analysts, having been in business for a considerable period of time, acquire expertise and have access to information regarding securities of a large number of companies and know how the market evaluates them. They are, therefore, in a better position to assess a particular financial plan.

Similarly, the opinions of prospective lenders and investors are likely to be very useful to the firm; it is they who will ultimately provide funds to the firm. Therefore, the type of securities which they will prefer to buy is very significant information for the financial manager and helps him in taking a decision regarding the form of securities to be issued. It is imperative that if a financial decision is to contribute to the valuation of the firm, the finance manager must think in a way similar to that of the investors.

Maintaining Manoeuvrability for Commercial Strategy

Manoeuvrability refers to a firm's ability to adjust its sources of funds in either direction—increase or decrease—in response to changes in the need for funds. That is, the finance manager must keep himself in a situation where he can change positions. Therefore, while designing the capital structure, he should not lose sight of the future impact on the present financial plan. For instance, the firm may adopt an aggressive debt policy as it looks good at one point but if in future the firm is in need of additional funds, it may be forced to issue equity shares on unfavourable terms as the firm has a too heavy debt and is, therefore, unable to obtain funds in this form. Due to increased financial risk, the cost of equity would be higher. Clearly, the opportunity cost of an unwise debt-policy could turn out to be very high. Therefore, in order to preserve operating flexibility, a firm is well advised to have unused debt capacity for future needs, that is, it should operate below the maximum safe debt level. The preservation of unused debt capacity can be an

- **Manoeuvrability**
- implies the ability
- to adjust source of
- funds in response
- to change in the
- need for funds.

important consideration for the company whose funds requirements are sudden and unpredictable. It gives the company financial manoeuvrability by virtue of leaving the options open.¹⁴

There should be room for **flexibility** not only in obtaining funds but also in refunding them. To provide the desired flexibility, the firm might incorporate a call provision as one of the covenants of the agreement with the suppliers of funds. The call provision implies that the firm with an adequate notice can repay their principal sum.

Flexibility as to financing is important when future external financing will be necessary.

Flexibility, however, can be obtained only at a cost. When a finance manager achieves flexibility, it means that the party at the other end of the transaction is foregoing something and for doing this would like to be compensated. *Callable* preference shares and options for advance payment of long-term debt are devices for maintaining flexibility. But, they will require higher yield to be paid than *non-callable*

preference shares and long-term debts for a definite number of years. Therefore, the finance manager faces the task of risk/return trade-off. He is to assure himself that he is *not buying flexibility at a higher cost than is warranted by gains achieved through flexibility*.

Timing of Issue

Closely related to flexibility in deciding the types of funds to be used, is the question of timing. Frequently very substantial savings may be obtained by proper timing of security issues. Thus, the timing of the public offerings is also an important consideration in capital structure decisions of a firm. Public offering should be made at a time when the state of the economy as well as the capital market is ideal to provide the funds. The monetary and fiscal policies that are pursued by the government are also important in this regard. *The government follows a cheap money policy to boost the economy during a recession and a dear money policy during inflationary periods.* The type of policy pursued by the government reflects itself in prices as well as yields on senior securities and equity. High debentures yields are associated with relative scarcity of debt money and low P/E ratios on shares are an indication of the relative scarcity of equity funds. Frequently, therefore, the company has to decide whether to finance initially with an equity issue and later with a debt issue, or *vice-versa*. Consequently, it is forced to evaluate the alternative methods of financing in the light of general market conditions and expectations for the company itself. If the management feels that borrowed funds will become costly or scarce, the firm may like to use the benefit of financial leverage immediately. An expected decline in interest rates may encourage the firms to postpone borrowings, and remain in a flexible position which helps to take advantage of lower interest rates in the future.

At times, funds will be needed and must be obtained if they are relatively costly. This aspect of our discussion is related to the internal rate of return (IRR). If the project materialises just when demand for the product involved is strong, the early return to flow of funds is higher; the IRR is higher and perhaps a somewhat higher cost of capital can be profitably tolerated. The differential increase in the rate of return, at this time, is more than the differential in the cost of money. It is foolhardy for a finance manager to chase the lowest cost of money only to find that he has procured the funds at bargain rates when the time for their usefulness has passed.¹⁵

However, it should be borne in mind, that timing is not the only consideration. The timing analysis may suggest, for instance, use of debt. But the company cannot go in for debt if its existing capital structure is already top-heavy with debt. Agreements with the existing lenders of the funds may impose certain other restrictions. Thus, timing in obtaining funds is exercised within limits imposed by the timing of needs for funds, the extent of flexibility, and existing explicit agreements, sometimes an implicit understanding, with lenders and owners.

Characteristics of the Company

The characteristics of a company in terms of size and credit standing, among others, also play a vital role in determining the share of senior securities and equity in its capital structure.

The management's freedom of choice is extremely limited in the case of small and very large companies. Companies that are very small must rely, to a considerable degree, upon the owner's funds for their financing; they find it very difficult to obtain long-term debts. In the minds of investors, generally, small firms are considered to be more risky than large firms. Therefore, such firms do not have ready access to different types of funds from various sources. They are generally in a weak bargaining position in obtaining funds. Since their sources of raising funds are limited, they can assign larger weights to the factor of flexibility. In contrast, very large companies are compelled to make use of different sources of raising funds as no single source can cater to their total requirements of funds.

Firms enjoying a high credit standing among investors/lenders in the capital market are in a better position to get funds from the sources of their choice. If the credit standing is poor, the firm's choice of obtaining funds is rather limited.

LO 20.5 TAX PLANNING

Tax planning is likely to have a significant bearing on capital structure decisions. Under the Income Tax Act, 1961, while interest on borrowed funds is allowed as a deduction under Section 36(1)(iii), dividend on shares is not deductible from the operating profits of a company. With effect from April 1, 2003, distributed profits are subject to an extra 10 per cent tax under Sections 115O. Secondly, cost of raising finance through borrowings is deductible in the year of incurrence. If, however, it is incurred during pre-commencement of business period, it has to be capitalised. The cost of issue of shares is allowed as a deduction in 10 years under Section 35 D. As a result, corporate taxation is an important determinant of the choice between different sources of financing. For a widely-held company with expansion involving ₹100 lakh, the implication on taxes on the rate of return on equity capital with reference to the alternative capital structures are depicted in Table 20.8: (1) Alternative I, ₹100 lakh equity capital; (2) Alternative II, equity capital, ₹40 lakh + debentures, ₹40 lakh + institutional loans, ₹20 lakh, and (3) Alternative III, equity capital, ₹20 lakh + debentures, ₹30 lakh + loans from financial institutions, ₹50 lakh. The before-tax expected rate of return = 25 per cent. The rate of dividend is 20 per cent.

TABLE 20.8 Effect of Taxes on Capital Structure Decision

(₹ thousand)

Particulars	Alternative I	Alternative II	Alternative III
Return (₹100 lakh × 0.25)	₹2,500	₹2,500	₹2,500
Less: Interest on debentures (0.14)	—	560	420
Less: Interest on loan (0.18)	—	360	900
Taxable profit	2,500	1,580	1,180
Tax (0.35)	875	553	413
Return on equity capital	1,625	1,027	767
Rate of return on equity capital (before dividend tax)	16.25	25.68	38.35

The alternative III is obviously the best.

The effect of corporate taxation on capital structure decision is further illustrated in Example 20.2.

Example 20.2

The paid-up capital of a company is ₹100 lakh. It has been declaring 20 per cent dividend for the last 5 years.

It has under consideration an expansion programme involving an investment of ₹100 lakh and its board of directors desires to raise the dividend to 25 per cent. The expansion programme can be financed by four alternatives: A, 100 per cent equity; B, 18 per cent institutional loan (debt) and equity 50:50. C, equity and debt, 70:30; and D, 100 per cent debt. Income tax and dividend tax are 35 per cent and 10 per cent respectively.

Assuming rate of return of X, analyse the various financing alternatives from the point of view of taxes.

Solution The computation are shown in Table 20.9.

TABLE 20.9 Effect of Taxes on Financing Alternatives

(₹ lakh)

Particulars	A	B	C	D
1. Return on ₹100 lakh	100X	100X	100X	100X
2. Less: Interest (0.18)	—	9	5.4	18
3. Balance	100X	100X - 9	100X - 5.4	100X - 18
4. Less: Tax (0.35)	35X	35X - 3.16	35X - 1.9	35X - 6.30
5. Balance	65X	65X - 5.86	65X - 3.52	65X - 11.70
6. Add: Distributable profit before expansion (0.20 × ₹100 lakh)	20	20	20	20
7. Total profits available for distribution (a)	20 + 65X	14.14 + 65X	16.48 + 65X	8.30 + 65X
8. Expected rate of dividend (%)	25	25	25	25
9. Expected dividend (0.25 × [₹100 lakh + new capital])	50	37.50	42.50	25
10. Dividend tax (0.10)	5	3.76	4.26	2.5
11. Total of dividend and dividend tax (b) [9 + 10]	55	41.26	46.76	27.5
12. Rate of return (value of X) to pay dividend and dividend tax [value of X if (a) = (b)] (%)	54 [®]	42	47	30

[®] $20 + 65X = 55$ or $X = 35/65 = 54$ per cent; other values are also determined like this.

Thus, the company will be able to raise dividend on shares to 25 per cent only if the return on the new project under the four alternatives are 54(A), 42(B), 47(C) and 30(D).

The choice of an appropriate debt policy involves a trade-off between tax benefits and the cost of financial distress. The greater the operating risk, the less is the debt the firm can use. Moreover, the management should consider the implicit cost of the tax subsidy in using debt. 'The tax subsidy is valuable, but, to go too far in exploiting it can be costly. The use of debt in lieu of equity represents essentially a gamble in which the firm sets a part of its future to obtain the tax benefit today. Such sets should be placed with caution.'¹⁶

Above all, it should be remembered that 'financial theory has not developed to the point where data relative to these considerations are fed at one end of a computer and an ideal financial structure pops out of the other. Consequently, human judgement must be used to resolve the many conflicting forces in laying plans for the types of funds to be sought.'¹⁷

LO 20.6

CAPITAL STRUCTURE PRACTICES IN INDIA

- Indian corporates employ substantial amount of debt in their capital structure in terms of the debt-equity ratio as well as total debt to total assets ratio. Nonetheless, the foreign controlled companies in India use less debt than the domestic companies. The dependence of the Indian corporate sector on debt as a source of finance has over the years declined particularly since the mid-nineties.
- The study (for the period (2001-11) indicates that debt is steadily being replaced by equity for the majority of the sample companies in India. This gets support from many aspects of the survey: (i) retained earnings have been cited as the most preferred source by the sample companies; (ii) the majority of the sample companies state that debt should not be used to the maximum extent; and (iii) higher equity enables the firm to face bad periods better than firms with high debt-equity ratios.
- The corporate enterprises in India seem to prefer long-term borrowings over short-term borrowings. Over the years, they seem to have substituted short-term debt for long-term debt. The foreign controlled companies use more long-term loans relatively to the domestic companies.
- However, as per the study of 2001-11, there is a significant portion of short-term debt (primarily from banks) in total debt.
- As a result of debt-dominated capital structure, the Indian corporates are exposed to a very high degree of total risk as reflected in high degree of operating leverage and financial leverage and, consequently, are subject to a high cost of financial distress which includes a broad spectrum of problems ranging from relatively minor liquidity shortages to extreme cases of bankruptcy. The foreign controlled companies, however, are exposed to lower overall risk as well as financial risk.
- The debt service capacity of the a sizeable segment of the corporate borrowers as measured by (i) interest coverage ratio and (ii) debt service coverage ratio is inadequate and unsatisfactory.
- Retained earnings are the most favoured source of finance. There is significant difference in the use of internally generated funds by the highly profitable corporates relative to the low profitable firms. The low profitable firms use different form of debt funds more than the highly profitable firms.
- Loan from financial institutions and private placement of debt are the next most widely used source of finance. The large firms are more likely to issue bonds in the market than small corporates.
- The hybrid securities are the least popular sources of finance amongst corporate India. They are more likely to be used by low growth firms. Preference shares are used more by public sectors units and low growth corporates.
- Banks have been the major providers of debt requirements of the sample companies. The declining role of financial institutions in corporate financing in India is very evident.
- The sample companies show non-adherence to the pecking order hypothesis.
- There is a low component of secured loans to total borrowings.

SUMMARY

A host of factors, both quantitative and qualitative, including subjective judgment of financial managers, have a bearing on the determination of an optional capital structure of a firm. They are not only highly complex but also conflicting in nature and, therefore, cannot fit entirely into a theoretical framework. Moreover, the weights assigned to various factors also vary widely, according to conditions in the economy, the industry and the company itself. Therefore, a corporate should attempt to evolve an appropriate capital structure, given the facts of a particular case.

The key factors relevant to designing an appropriate capital structure are: (i) profitability, (ii) liquidity, (iii) control, (iv) leverage ratios in industry, (v) nature of industry, (vi) consultation with investment banks/lenders, (vii) commercial strategy, (viii) timing, (ix) company characteristics and (x) tax planning.

LO 20.2	<p>Given the objective of financial management to maximise the shareholders wealth, a corporate should carry out profitability analysis in terms of determining the amount of EBIT (indifference point) at which its MPS is identical under two proposed financial plans. In general, the higher the level of EBIT than the indifference point and the lower the probability of its downward fluctuation, the greater is the amount of debt that can be employed by a corporate.</p> <p>Coverage ratio can also be used to judge the adequacy of EBIT to meet the firm's obligations to pay financial charges, interest on loan, preference dividend and repayment of principal. A higher ratio implies that the firm can go for larger proportion of debt in its capital structure.</p>
LO 20.3	<p>Liquidity position of a firm is analysed by cash flow analysis. One measure relates the ratio of fixed financial charges to net cash inflows. A firm can afford higher debt if the ratio is high.</p> <p>Another measure to determine the adequacy of cash flows to meet the fixed obligations in cash budget. A cash budget should be prepared for a range of possible cash inflows with a probability attached to each of them. Since the probability of various cash flow pattern is known, the firm can determine the level of debt it can employ and still remain within an insolvency limit tolerable to the management. The impact of alternative debt policies should also be examined under adverse circumstances/recession conditions.</p>
LO 20.4	<p>To retain control over management, a firm would prefer use of debt to equity.</p> <p>The debt-equity ratio of a firm should be similar to those of other companies in the industry.</p> <p>In case sales are subject to wide fluctuations, a firm should employ less debt. Firms subject to keen competition should prefer a greater proportion of equity. The corporates in industry groups which are at their infancy should rely more on equity capital.</p> <p>Investment analysts/bankers/institutional investors understand the capital market better as well as requirements of investors/lenders. Their opinion is also useful in designing capital structure.</p> <p>An appropriate capital structure should provide room for flexibility not only in obtaining funds but also in refunding them.</p> <p>Public issue of share as well as debt capital should be made at a time when the state of the economy as well as the capital market is ideal to provide the funds. For instance, it will be useful to postpone borrowings if decline in interest rates is expected in the future.</p> <p>The characteristics of company, <i>inter-alia</i>, in terms of size and credit standing are decisive in determining its capital structure. While large firms enjoying a high credit standing among investors are in a better position to obtain funds from the sources of their choice, the relatively small firms, new firms and firms having poor credit standing have limited option in this regard.</p>
LO 20.5	<p>The choice of an appropriate debt policy involves a trade-off between tax benefits and the cost of financial distress. Moreover, the management should consider the implicit cost of the tax subsidy in using debt.</p>

SOLVED PROBLEMS

P.20.1 The Hardware Company Ltd has to make a choice between debt issue and equity issue for its expansion programme. Its current position is as follows:

LO 20.2 LOD
E

5% Debt	₹20,000
Equity capital (₹10 per share)	50,000
Surpluses	30,000
Total capitalisation	1,00,000
Sales	3,00,000
Total costs	2,69,000
Income before interest and taxes	31,000
Interest	1,000
Earnings before taxes	30,000
Income tax	10,500
Income after taxes	19,500

The expansion programme is estimated to cost ₹50,000. If this is financed through debt, the rate of interest on new debt will be 7 per cent and the price-earnings ratio will be 6. If the expansion programme is financed through equity, new shares can be sold netting ₹25 per share; and the price-earnings ratio will be 7. The expansion will generate additional sales of ₹1,50,000 with a return of 10 per cent on sales before interest and taxes.

If the company is to follow a policy of maximising the market value of its shares, which form of financing should it choose?

Solution

Determination of market value of a share under different financing alternatives

Particulars	Financial plan	
	7% debt issue	Equity issue
EBIT	₹46,000	₹46,000
Less: Interest	4,500	1,000
Earnings after interest	41,500	45,000
Less: Taxes	14,525	15,750
EAT	26,975	29,250
EPS (EAT/Number of shares)	5.395	4.18
Price earning ratio	6	7
Market value per share	32.37	29.25

Recommendation The company should choose debt form of financing to maximise the market value of its shares.

Working Notes

- | | |
|---------------------------------------|---------|
| (i) Present EBIT | ₹31,000 |
| Plus expected EBIT (0.10 × ₹1,50,000) | 15,000 |
| Total EBIT | 46,000 |
- (ii) Number of equity shares: With debt financing, the number of ordinary shares = 5,000 (₹50,000 ÷ ₹10). In case of equity financing = additional 2,000 (₹50,000 ÷ ₹25) new equity shares.

P.20.2 AB Limited provides you with the following information:

LO 20.2 LOD M

Profit	₹3,00,000
Less: Interest on debentures (0.12)	60,000
Earnings before taxes	2,40,000
Less: Taxes (0.35)	84,000
Earnings after taxes	1,56,000
Number of equity shares (₹10 each)	40,000
Earnings per share	3.9
Ruling market price	39
P/E ratio (Price/EPS) (times)	10

The company has undistributed reserves, ₹6,00,000. It needs ₹2,00,000 for expansion which will earn the same rate as funds already employed.

You are informed that a debt-equity ratio (debt/debt-equity) higher than 35 per cent will push the P/E ratio down to 8 and raise the interest rate on additional amount borrowed to 14 per cent.

You are required to ascertain the probable price of the equity share:

- (a) If the additional funds are raised as debt; and
 (b) If the amount is raised by rising equity shares (at current market price).

Solution

Probable price of equity share of AB Ltd under different alternatives

Particulars	14% Debt	Equity shares
EBIT at 20% on capital employed [®]	₹3,40,000	₹3,40,000
Less: Debenture interest	60,000	60,000
Less: Interest on borrowings	28,000	—
Earnings before taxes	2,52,000	2,80,000
Less: Taxes	88,200	98,000
Earnings after taxes	1,63,800	1,82,000
Number of equity shares	40,000	45,128
EPS	4.095	4.033
X P/E ratio (times)	8	10
MPS	32.76	40.33

[®] ₹17,00,000 [₹4,00,000 equity + ₹6,00,000 reserves + ₹5,00,000 (₹60,000/0.12 debentures) + ₹2,00,000 proposed to be raised].

* ₹3,00,000/₹15,00,000 = 0.20

P.20.3 The Evergreen Company has the choice of raising an additional sum of ₹50 lakh either by the sale of 10 per cent debentures or by issue of additional equity shares of ₹50 per share. The current capital structure of the company consists of 10 lakh ordinary shares.

LO 20.2 LOD D

At what level of earnings before interest and tax (EBIT) after the new capital is required, would earnings per share (EPS) be the same whether new funds are raised by issuing ordinary shares or by issuing debentures? Also, determine the level of EBIT at which uncommitted earnings per share (UEPS) would be the same if sinking fund obligations amount to ₹5 lakhs per year. Assume a 35 per cent tax rate. Discuss the relevance of the calculation.

Solution

(i) Determination of indifference point

<i>Debt alternative</i>	=	<i>Equity alternative</i>
$\frac{(X - I)(1 - t)}{N_1}$	=	$\frac{(X)(1 - t)}{N_2}$
$\frac{(X - ₹ 5,00,000)(1 - 0.35)}{10,00,000}$	=	$\frac{x(1 - 0.35)}{11,00,000}$
X	=	₹55,00,000

Verification table

<i>Particulars</i>	<i>10% Debt alternative</i>	<i>Equity alternative</i>
EBIT	₹55,00,000	₹55,00,000
Less: Interest	5,00,000	Nil
Earnings after interest	50,00,000	55,00,000
Less: Taxes	17,50,000	19,25,000
EAT	32,50,000	35,75,000
N	10,00,000	11,00,000
EPS	3.25	3.25

(ii) Determination of indifference point with sinking funds

<i>Debt alternative</i>	=	<i>Equity alternative</i>
$\frac{(X - I)(1 - t) - S}{N_1}$	=	$\frac{(X)(1 - t)}{N_2}$
$\frac{(X - ₹ 5,00,000) \times (0.65) - (₹ 5,00,000)}{10,00,000}$	=	$\frac{0.65 X}{11,00,000}$
X	=	₹1,39,61,538

Verification table

<i>Particulars</i>	<i>10% Debt</i>	<i>Equity</i>
EBIT	₹1,39,61,538	₹1,39,61,538
Less: Interest	5,00,000	Nil
EBT	1,34,61,538	1,39,61,538
Less: Taxes	47,11,538	48,86,538
Earnings after taxes	87,50,000	90,75,000
Less: Sinking fund payment	5,00,000	Nil
Earnings for equityholders	82,50,000	90,75,000
N	10,00,000	11,00,000
EPS	8.25	8.25

The relevance of indifference level of EBIT is that it enables the management to take better financial decisions. It is a point beyond which the leverage (use of debt) becomes favourable in that the use of debt could be employed to enhance the EPS. Therefore, if the estimated EBIT is more than the indifference level, debt alternative to raise finance should be used, otherwise the equity alternative would be preferred.

The uncommitted EPS approach is useful to the conservative decision makers, who look to debt not only in terms of interest payment but also in terms of its repayment. Therefore, they want to get an idea of earnings

which, could meet both the payments. However, this approach is of short-term significance only as after the redemption of debentures, the sinking fund balance is transferred to general reserves and thus forms a part of the equity holders' funds.

P.20.4 The balance sheet of Smart Ltd as on March 31, current year is as follows (*Figures in lakhs of rupees*):

LO 20.2,3 **LO D**

Liabilities	Amount	Assets	Amount
Share capital	200	Fixed assets	500
Reserves	140	Inventories	300
Long-term loans	360	Receivables	240
Short-term loans	200	Cash and bank	60
Payables	120		
Provisions	80		
	<u>1,100</u>		<u>1,100</u>

Sales for the current year were ₹600 lakh. For the next year ending on March 31, they are expected to increase by 20 per cent. The net profit margin after taxes and dividend payout are expected to be 4 and 50 per cent respectively.

You are required to:

- Quantify the amount of external funds required.
- Determine the mode of raising the funds given the following parameters.
 - current ratio should be 1.33.
 - Ratio of fixed assets to long-term loans should be 1.5.
 - Long-term debt to equity ratio should not exceed 1.06.
 - The funds are to be raised in the order of (1) short-term bank borrowings, (2) long-term loans and (3) equities.

Solution Assuming, assets will increase *pari passu* with sales, the level of projected assets will be ₹1,100 lakh $\times 1.2 = ₹1,320$ lakh. The incremental assets required are ₹1,320 lakhs $- ₹1,100$ lakh = ₹220 lakh.

Assuming that payables and other provisions (CL) are also likely to move with sales, the projected payables and provisions will be ₹200 lakh $\times 1.2 = ₹240$ lakh.

Expected retained earnings = (Expected EAT - Dividend paid) = $(0.04 \times ₹720 \text{ lakh} = ₹28.8 \text{ lakh} - ₹14.4 \text{ lakh Dividend paid}) = ₹14.4 \text{ lakh}$.

(a) External funds needed: (₹ lakh)

Projected level of assets	₹1,320
Less: Payable and provisions	240
Less: Retained earnings	14.4
Less: Existing funds used	(₹200 lakh + ₹140 lakh + ₹360 lakh + ₹200 lakh)
	900
External funds required	165.6

(b) Mode of raising funds:

- Short-term borrowings (additional)

$$1.33 = \text{CA/CL} = \frac{\text{Existing CA, ₹ 600 lakh} \times 1.2}{(\text{Existing payable + Provision}) \times 1.2 + \text{Short-term loan (STL)}}$$

$$1.33 = ₹720 \text{ lakh}/₹240 \text{ lakh} + \text{STL}$$

$$1.33 (240 \text{ lakh} + \text{STL}) = ₹720 \text{ lakh or } 1.33 \text{ STL} = ₹400.8 \text{ or } \text{STL} = ₹400.8/1.33 = ₹301.35 \text{ lakh.}$$

$$\text{Additional STL} = ₹301.35 \text{ lakh} - ₹200.00 = ₹101.35 \text{ lakh.}$$

(ii) Long-term loan (additional)

Desired ratio of fixed assets (FA) to long-term loan (LTL) = 1.5

$$1.5 = \frac{\text{FA (₹500 lakh} \times 1.2)}{\text{LTL}} = 1.5 \text{ LTL} = ₹600 \text{ lakh or LTL} = ₹400 \text{ lakh}$$

Additional LTL = ₹400 lakh – ₹360 lakh = ₹40 lakh

(iii) Equity funds (additional): (₹lakh)

Total external funds required	₹165.6
Less: Additional short-term bank borrowings	101.35
Less: Additional long-term loan	40.00
Equity capital to be issued	24.25

$$\frac{\text{New level of debt (long-term)}}{\text{Equity funds (ESC + Reserves)}} = ₹400 \text{ lakh} / (₹224.25 \text{ lakh} + ₹154.5 \text{ lakh}) = 1.056^*$$

*Requirement of LTD/equity ratio of not more than 1.06 is satisfied.

Funds required to be raised: (₹lakh)

Short-term bank borrowings	₹101.35
Long-term loans	40.00
Equity share capital	24.25
	165.60

P.20.5 The Heavy Metal Tools Company Ltd is embarking on an expansion plan requiring an outlay of ₹500 million. The management of the firm is confident that it can raise the entire amount by perpetual debt finance at the following rates: (i) 20% for the first ₹200 million, (ii) 22% for the next ₹200 million, and (iii) 25% for the balance ₹100 million. However, there is some apprehension about the firm's ability to meet interest burden during a recessionary year. The management feels that in a recessionary year, the net cash inflows of the company, not taking into account the interest burden on the new debt, would have an expected value of ₹180 million with a standard deviation of ₹80 million.

LO 20.2 LOD
D

- (a) If the management is prepared to accept only a 5 per cent chance of cash inadequacy, what proportion of the ₹500 million requirement should be raised as debt finance?
- (b) What is the probability of cash inadequacy during a recessionary year if the entire ₹500 million are raised as debt finance?

Solution

(a) Assuming the cash flows to be normally distributed with a mean of ₹180 million and standard deviation = ₹80 million for a 5 per cent chance of cash inadequacy, we have to find out the Z-value, the area to whose left is 0.05. From the normal distribution table (A-5) the Z-value is -1.645. Corresponding to this value, the cash inflow (C) is given by the equation $(C-180)/80 = -1.645$.

Given $C = ₹48.4$ million, the probability of the cash flow being less than ₹48.4 million is only 5 per cent which meets the management criterion. The interest on ₹200 million @ 20% = ₹40 million. The remaining amount of $(₹48.4 \text{ million} - ₹40 \text{ million}) ₹8.4$ million can service an amount of debt = $(8.4/0.22) = ₹38.2$ million. Thus, the cash flow of ₹48.4 million can service a maximum amount of debt = ₹200 million + ₹38.2 = ₹238.2 million, **OR** $(238.2/500) \times 100 = 47.64$ per cent of the total requirement. Thus, the firm should not finance more than 47.64 per cent of its total requirement through debt. In practice, it should restrict itself to somewhere around 40 per cent to keep some margin of safety.

(b) Interest burden each year on account of debt of ₹500 million = $(0.20 \times 200) + (0.22 \times 200) + (0.25 \times 100) = ₹109$ million. Thus, the minimum cash flow required to service the debt = ₹109 million. Assuming the cash flows to be normally distributed with a mean of ₹180 million and standard deviation = 80 million, the Z-value corresponding to ₹109 million is: $Z = (109 - 180)/80 = -0.8875$ or -0.89.

From the normal distribution table, the probability of the cash inflow being less than ₹109 million (or Z being less than -0.89) is 0.1867, that is, there is a 18.67 per cent chance of cash inadequacy during a recessionary year.

MINI CASES

20.C.1 A company is evaluating a new venture that will cost ₹10 crore. The venture will have a return on investment of 20 per cent and the firm forecasts a 12 per cent growth in earnings from the project. The treasurer has identified the following sources for financing the project:

- (a) Equity shares to be sold at ₹400 per share.
- (b) Convertible debentures with a 6 per cent coupon to net ₹980 (face value ₹1,000), and convertible at ₹500 per share after 2002.
- (c) Debentures with warrants with a 6 per cent coupon to net ₹980 (face value ₹1000), and with each bond having one warrant entitling the holder to buy one equity share at ₹500 after 2002.

The financing decision is being made in the fourth quarter of 2000. Over the past ten years, A company has been growing at a 10 per cent rate of sales and earnings.

The treasurer expects the company to continue to grow at 10 per cent even though the firm has traditionally paid 40 per cent of its earnings as dividends. The treasurer expects A's equity shares to continue to rise in price. Using the price trend over the past 5 years, he has projected probable market price ranges for the next three years. The historical data and the projections of the treasurer are given below:

Year	Historical market price	Year	Forecasted	
			Probability (%)	Market price
2002	₹220	2008	20	₹450
2003	250		60	500
2004	330		20	600
2005	270	2009	20	480
2006	380		60	550
Current 2007	450		20	620
		2010	20	500
			60	600
			20	700

The proforma balance sheet and income statement prepared by the treasurer for the year 2007 is shown as below:

Proforma balance sheet (December 31, 2007)

(₹ '000)

Liabilities	2007		Assets	2007	
	2007	2006		2007	2006
Equity shares (₹10 each)	₹10,000	₹10,000	Plant and equipment	₹2,25,000	₹2,31,000
Shares premium	40,000	40,000	(Less: Accumulated depreciation)	(62,000)	(59,000)
Retained earnings	1,36,000	1,27,000	Inventories	64,000	62,000
Bonds (7%)	90,000	52,000	Receivables	44,000	45,000
Mortgage (6%)	30,000	55,000	Cash and bank balance	22,000	18,000
Accounts payable	7,000	6,000	Other current assets	4,000	3,000
Other current liabilities	11,000	10,000			
	<u>3,24,000</u>	<u>3,00,000</u>		<u>3,24,000</u>	<u>3,00,000</u>

Proforma income statement

(₹ '000)

	Sales	EBIT	Interest*	EBT	NIAT	EPS
2007	4,20,000	71,500	8,000	63,500	31,750	31.75
2006	3,80,000	65,000	7,000	58,000	29,000	29.00

*Rounded off.

The management of A Ltd was initially impressed by the fact that the new venture will increase sales by ₹12 crore. Management is also interested in the expected 12 per cent growth rate of the venture. As per company's financial policy, the firm's debt-asset ratio should not be above 40 per cent.

With the above information and detailed analysis for next 3 years, what will be the long-term sources of financing for the new proposal?

Make suitable assumptions in your answer, wherever necessary figures could be rounded off. Income-tax rate applicable to the company is to be taken at 50 per cent.

Solution

Statement showing EPS in 2007 (end) under various financing options (Amount in ₹ lakh)

Particulars	With existing business	With new business financed by		
		Equity shares	Convertible debt	Debt (+) Warrant
EBIT ¹	₹786.50	₹986.50	₹986.50	₹986.50
Less: Interest on debt:				
Existing (₹9 crore × 0.07)	81.00	81.00	81.00	81.00
+ (₹3 crore × 0.06)				
New debt (1,02,040 ² debentures × ₹60 per debenture)	—	—	61.22	61.22
Earnings before taxes	705.50	905.50	844.28	844.28
Less: Taxes (0.50)	352.75	452.75	422.14	422.14
Earnings after taxes	352.75	452.75	422.14	422.14
Number of shares (in lakh)	10.00	12.5 ³	10.00	10.00
EPS (₹)	35.275	36.22	42.214	42.214

Statement showing EPS in 2010 (end) under various financing options (Amount in ₹ lakh)

Particulars	With existing business	With new business financed by		
		Equity shares	Convertible debt	Debt (+) Warrant
EBIT	₹951.66 ⁴	₹1,202.54 ⁵	₹1,202.54	₹1,202.54
Add: Additional EBIT due to additional funds raised ⁶	—	—	—	102.04 ⁷
Less: Interest on existing debt	81.00	81.00	81.00	81.00
Less: Interest on new debt (in the case of warrant option)	—	—	—	61.22
EBT	870.66	1,121.54	1,121.54	1,162.36
Less: Taxes (0.50)	435.33	560.77	560.77	581.18
EAT	435.33	560.77	560.77	581.18
Number of shares (lakh)	10.00	12.50	12.04 ⁸	11.02 ⁸
EPS (₹)	43.533	44.862	46.576	52.74

Statement showing debt (assumed to be long-term) to assets ratio in 2007 and 2010

(Amount in ₹ lakh)

Particulars	With existing business	With new business financed by		
		Equity shares	Convertible debt	Debt (+) Warrant
Year-end-2007				
Total assets	₹3,240	₹4,240	₹4,240	₹4,240
Existing debt	1,200	1,200	1,200	1,200
Additional debt	—	—	1,020	1,020
Total debt	1,200	1,200	2,220	2,220
Debt/Assets ratio (%)	37.03	28.3	52.36	52.36
Year-end 2010				
Total assets ⁹	3,949.27	5,152.17	5,124.62	5,142.99
Existing debt	1,200	1,200	1,200	1,200
Net debt	—	—	—	1,020
Total debt	1,200	1,200	1,200	2,220
Debt/Assets ratio (%)	30.39	23.29	23.42	43.19

Recommendation Though EPS is the highest (at ₹52.74) under debt plus warrant plan, it cannot be implemented as debt/assets ratio exceed 40 per cent (43.19%). In view of this, the next best alternative is that the company should opt for convertible debt plan as under this plan potential EPS is the maximum (at ₹46.576 in 2010 and at ₹42.214 in 2007).

Working Notes

(₹ lakh)

1. (a) Without new venture		
EBIT (2000)	₹715	
Add: 10 per cent growth	71.50	₹786.50
(b) With new venture		
Expected EBIT without new venture		786.50
Add: 20 per cent growth on ₹10 crore new investment (₹10 crore × 0.20)		200.00
		986.50
2. Number of new debentures to be issued		
(Amount to be raised ₹10 crore/Net proceeds per debenture, ₹980)		1,02,040
3. Number of new equity shares to be issued		
(₹10 crore/sale price of equity shares, ₹400)		2,50,000
4. EBIT in 2003 = Current EBIT, ₹715 lakh × Growth factor @ 10 per cent for 3 years i.e., 1.331		
		951.66
5. EBIT in 2003 with new business: ₹951.66 lakh + (₹10 crore × 20 per cent ROR × 12 per cent growth factor for 2 years i.e., 1.254 = 250.88 lakh)		
		1,202.54
6. Determination of expected market price in 2008 to 2010		

		Years			
		2008	2009	2010	
₹450 × 0.2 =	₹90	₹480 × 0.2 =	₹96	₹500 × 0.2 =	₹100
500 × 0.6 =	300	550 × 0.6 =	330	600 × 0.6 =	360
600 × 0.2 =	120	620 × 0.2 =	124	700 × 0.2 =	140
	510		550		600

Since expected market price is higher (at ₹550 in 2002 and at ₹600 in 2003) than the conversion price (i.e., ₹500 after 2002), it is reasonable to assume that debt-holders/warrant-holders will like to exercise their option, resulting in higher number of equity shares in 2003.

7. In the case of convertible debt, no additional funds will accrue. There will be additional funds in the case of warrant option equivalent to (1,02,040 warrants × ₹500 issue price of equity share) = ₹510.20 lakh.

As per the principle of conservatism, the ROR likely to be earned on these funds (₹510.20 lakh) is ROR promised by a new venture i.e., 20 per cent or existing ROR which-ever is lower. (Conventionally, ROR is computed on existing long-term funds employed in business at book value).

$$\begin{aligned} \text{ROR (on capital employed)} &= \frac{\text{EBIT}}{\text{Equity funds} + \text{Long-term debt}} \\ &= (\text{₹715 lakh} / (1860 \text{ lakh} + 1200 \text{ lakh})) = 23.37 \text{ per cent} \end{aligned}$$

Thus, expected additional EBIT with warrant option is = ₹510.20 lakh × 0.2 = 102.04 lakh

8. Number of new equity shares issued
 - (i) Convertible debts = 1,02,040 debentures × 2 = 2,04,080
 - (ii) Warrants = 1,02,040 × 1 = 1,02,040
9. Increase in retained earnings during 3 years under various options:
It is computed as per the following ratio:

$$\left[\frac{\text{EAT (year-end 2000)} + \text{EAT (year-end 2003)}}{2} \right] \times \text{Retention ratio} \times 3 \text{ years}$$

$$(i) \text{ No new venture} = \left[\frac{\text{₹352.75 lakh} + \text{₹435.33 lakh}}{2} \right] \times 0.6 \times 3 \text{ years} = \text{₹709.27 lakh}$$

$$(ii) \text{ Issue of equity shares} = \left[\frac{\text{₹452.75 lakh} + \text{₹560.77 lakh}}{2} \right] \times 0.6 \times 3 \text{ years} = \text{₹912.17 lakh}$$

$$(iii) \text{ Issue of convertible debentures} = \left[\frac{\text{₹422.14 lakh} + \text{₹560.77 lakh}}{2} \right] \times 0.6 \times 3 \text{ years} = \text{₹884.62 lakh}$$

$$(iv) \text{ Issue of debt + warrant} = \left[\frac{\text{₹422.14 lakh} + \text{₹581.18 lakh}}{2} \right] \times 0.6 \times 3 \text{ years} = \text{₹902.99 lakh}$$

It is assumed that the assets will increase by the amount of increase in retained earnings under various options.

20.C.2 Zip Zap Zoom Company is into manufacturing cars in the small car (800 cc) segment. Established 15 years back, it has since seen a phenomenal growth in both its market share and profitability. The financial statements (Statement of P&L and Balance Sheet) are shown in Exhibits 20.1 and 20.2 respectively.

The company enjoys the confidence of its shareholders who have been rewarded with growing dividends year after year. Last year too, the company had announced 20 per cent dividend, which was the highest in the automobile sector. The company has never defaulted on its loan payments and enjoys a favourable face with its lenders, which include financial institutions, commercial banks and other private debenture-holders.

The competition in the car industry has increased in the past few years and the company foresees further intensification of competition with the entry of several foreign car manufacturers; many of whom are market leaders in their respective countries. The small car segment especially, will witness entry of foreign majors in the near future, with latest technology being offered to the Indian customer. Zip Zap Zoom company's senior management realises the need for large scale investment in upgradation of technology and improvement of manufacturing facilities to preempt competition.

While on one hand, the competition in the car industry has been intensifying, on the other hand, there has been a slowdown in the Indian economy, which has not only reduced the demand for cars, but also led to adoption of price cutting strategies by various car manufacturers.

²Includes the cost of inventory and WIP which is dependant on demand (sales).

³The loans are to be retired in the next ten years and the firm redeems ₹40 crore every year.

The company is to decide how much to invest in upgradation of its plants and technology. Capital investment upto a maximum of ₹100 crore is required. The decision has three aspects:

- The company cannot forgo the capital investment as that could lead to reduction in its market share. Technological competence in this industry is a must. Customers would shift to manufacturers providing latest in car technology.
- The company does not want to issue new equity and its retained earnings are not enough for such a large investment. Thus, the only option is raising debt.
- The company wants to limit its additional debt to a figure that it can service without taking undue risks. With the looming recession and uncertain market conditions, the company perceives that additional fixed obligations could become a cause of financial distress, and, thus, wants to determine its additional debt capacity to meet the Investment requirements.

Mr. Shortsighted, the company's Finance Manager, is given the task of determining the additional debt that the firm can raise. He thinks that the firm can raise ₹100-crore debt and service it even in years of recession. The company can raise debt at 15% from a financial institution. While working out the debt capacity, Mr. Shortsighted takes the following assumptions for the recession years:

- (a) A maximum of 10% reduction in sales volume will take place.
 (b) A maximum of 6% reduction in sales price of cars will take place.

Mr. Shortsighted prepares the following income statement which is representative of the recession years. While doing so, he determines what he thinks are the "irreducible minimum" expenditures under recessionary conditions. For him, the risk of insolvency is the main concern while designing capital structure. To support his view, he presents the statement of profit and loss, as shown in Exhibit 20.3. He works on the assumptions (given after the Exhibit 20.3).

EXHIBIT 20.3 Statement of Projected Profit and Loss

(Amount in ₹ crore)

Sales volume	72,000	
(×) Selling price	(×) ₹235,000	
Sales revenue		₹1,692.0

*(₹40 crore (existing debt) + ₹10 crore (additional debt)).

Assumptions of Mr. Shortsighted

- R&D expenditures can be done away with till the economy picks-up.
- Marketing and advertising expenditure can be reduced by 40 per cent.
- Keeping in mind the investor confidence that the company enjoys, he feels that the company can forgo paying dividends in the recession period.

He goes with his worked-out statement to the Director (Finance) Mr. Arthashastra and advocates raising ₹100 crore worth of debt to finance the intended capital investments. Mr. Arthashastra does not feel comfortable with the statements and calls for the company's financial analyst Mr. Longsighted. Mr. Longsighted carefully analyses Mr. Shortsighted's assumptions and points out that insolvency should not be the sole criterion while determining the debt capacity of the firm. He also points out the following:

- "Apart from debt servicing, there are certain expenditures like that on R&D and marketing that need to be continued to ensure the long-term health of the firm".
- "Certain management policies like those relating to dividend pay-out, send out important signals to the investors. Zip Zap Zoom's management has been paying regular dividends and discontinuing this practice (even though just for the recession phase) could raise serious doubts in the investor's mind about the health of the firm. The firm should pay atleast 10 per cent dividend in the recession years".
- "Mr. Shortsighted has used the accounting profits to determine the amount available each year for servicing the debt obligations. This does not give the true picture. Net cash inflows should be used to determine the amount available for servicing the debt".
- "Net cash inflows are determined by interplay of many variables and such a simplistic view should not be taken while determining the cash flows in recession. It is not possible to accurately predict the fall in any of the factors such as sales volume, sales price, marketing expenditure etc.

Probability distribution of variation of each of the factors that affect net cash inflow should be analysed (the net cash inflows follow a normal probability distribution). This will give a true picture of how the company's cash flows will behave in recession conditions."

The management recognises that the alternative suggested by Mr. Longsighted rests on data, which are complex and require expenditure of time and effort to obtain and interpret. Considering the importance of capital structure design, The Director (Finance) asks Mr. Longsighted to carry out his analysis. Information on the behaviour of cash flows during the recession periods is taken into account.

The methodology undertaken is as follows:

- (a) Important factors that affect cash flows (especially contraction of cash flows), like sales volume, sales price, raw materials expenditure, etc., are identified and the analysis is carried out in terms of cash receipts and cash expenditures.

- (b) Each factor's behaviour (variation behaviour) in adverse conditions in the past is studied and future expectations are combined with past data, to describe limits (maximum favourable, most probable and maximum adverse) for all the factors.
- (c) Once this information is generated for all factors affecting cash flow, Mr. Longsighted comes up with a range of estimates of the cash flow in future recession periods based on all possible combinations of the several factors. He also estimates the probability of occurrence of each estimate of cash flow.

Assuming a normal distribution of the expected behaviour, the mean expected value of net cash inflow in adverse conditions came out be ₹220.27 crore with standard deviation of ₹110 crore.

Keeping in mind the looming recession and the uncertainty of the recession behaviour, Mr. Arthashastra feels that the firm should cater to a risk of cash inadequacy of 5 per cent even in the most adverse industry conditions. Thus, the firm should take up only that amount of additional debt that it can service 95 per cent of the times, while maintaining cash adequacy.

To maintain an annual dividend of 10 per cent, an additional ₹35 crore has to be kept aside. Hence, the expected available net cash inflow is ₹185.27 crore (subtracting ₹35 crore from ₹220.27 crore).

The following formula is used to calculate the additional cash available in recession conditions to service debt (catering for 5% risk tolerance):

$$\frac{X - \mu}{\sigma} = 1.64$$

X = is the additional cash available each year for servicing fixed obligations

μ = 185.27

σ = 110 crore

-1.64 is that value of Z which caters to 95% of the area of the standard normal curve.

Taking all the above into account, Mr. Longsighted works out the additional debt capacity as shown in Exhibit 20.4. The additional debt capacity as calculated by him is ₹73.15 crore.

EXHIBIT 20.4 Determination of Cash Flows

(Amount in ₹ crore)

Cash available for dividends (EAT + Depreciation - SF Obligation)	₹259.15
Cash available at 15% contraction	220.27
Cash required for dividends	35.00
Average cash flow available for additional debt obligations	185.27
Determination of Debt Capacity	
Tolerance limit	5%
Standard deviation	120
Cash flow under most adverse conditions*	4.45
Existing cash reserve	10.00
Cash available	14.45
Debt obligation per ₹ crore of additional debt	
Interest (35 % less tax shield)	0.0975
Sinking fund obligation	0.1000
Total	0.1975
Debt capacity (₹14.45 crore/0.1975)	73.15

*Calculation of cash flow under most adverse conditions is based on the normal distribution (Z distribution):

$$Z \text{ value} = \frac{\text{Cash inflow} - \text{Mean value of cash inflow}}{\text{Std. Deviation}}$$

The Z value corresponding to tolerance limit is -1.64

Replacing the values in equation, obtained is the value of cash inflow ₹4.45 crore.

TABLE 1

Summary of the results of the analysis of variance for the effect of the different factors on the yield of the different components of the soil.

Factor	Yield of organic matter	Yield of humic substances	Yield of fulvic acids
Soil	1.0	1.0	1.0
Temperature	1.0	1.0	1.0
Humidity	1.0	1.0	1.0
Time	1.0	1.0	1.0
Soil x Temperature	1.0	1.0	1.0
Soil x Humidity	1.0	1.0	1.0
Soil x Time	1.0	1.0	1.0
Temperature x Humidity	1.0	1.0	1.0
Temperature x Time	1.0	1.0	1.0
Humidity x Time	1.0	1.0	1.0
Temperature x Humidity x Time	1.0	1.0	1.0

1.0 = no significant difference.

Description of the soil

1. Soil: A dark brown, silty loam, with a high content of organic matter (15.5%) and humic substances (10.5%). The soil is rich in humic acids and fulvic acids, and is characterized by a high content of humic substances (10.5%) and fulvic acids (7.0%).
2. Temperature: The soil was incubated at 15°C and 25°C. The results show that the yield of organic matter, humic substances, and fulvic acids is higher at 25°C than at 15°C.
3. Humidity: The soil was incubated at 50% and 75% relative humidity. The results show that the yield of organic matter, humic substances, and fulvic acids is higher at 75% relative humidity than at 50% relative humidity.
4. Time: The soil was incubated for 1, 2, and 4 weeks. The results show that the yield of organic matter, humic substances, and fulvic acids increases with time.
5. Soil x Temperature: The results show that the yield of organic matter, humic substances, and fulvic acids is higher in the soil incubated at 25°C than in the soil incubated at 15°C.
6. Soil x Humidity: The results show that the yield of organic matter, humic substances, and fulvic acids is higher in the soil incubated at 75% relative humidity than in the soil incubated at 50% relative humidity.
7. Soil x Time: The results show that the yield of organic matter, humic substances, and fulvic acids increases with time in the soil.
8. Temperature x Humidity: The results show that the yield of organic matter, humic substances, and fulvic acids is higher at 25°C and 75% relative humidity than at 15°C and 50% relative humidity.
9. Temperature x Time: The results show that the yield of organic matter, humic substances, and fulvic acids increases with time at 25°C.
10. Humidity x Time: The results show that the yield of organic matter, humic substances, and fulvic acids increases with time at 75% relative humidity.
11. Temperature x Humidity x Time: The results show that the yield of organic matter, humic substances, and fulvic acids is highest at 25°C, 75% relative humidity, and 4 weeks.

The results of the analysis of variance for the effect of the different factors on the yield of the different components of the soil are shown in Table 1. The results show that the yield of organic matter, humic substances, and fulvic acids is higher at 25°C than at 15°C, higher at 75% relative humidity than at 50% relative humidity, and increases with time. The results also show that the yield of organic matter, humic substances, and fulvic acids is higher in the soil incubated at 25°C than in the soil incubated at 15°C, higher in the soil incubated at 75% relative humidity than in the soil incubated at 50% relative humidity, and increases with time. The results also show that the yield of organic matter, humic substances, and fulvic acids is highest at 25°C, 75% relative humidity, and 4 weeks.

The results of the analysis of variance for the effect of the different factors on the yield of the different components of the soil are shown in Table 1. The results show that the yield of organic matter, humic substances, and fulvic acids is higher at 25°C than at 15°C, higher at 75% relative humidity than at 50% relative humidity, and increases with time. The results also show that the yield of organic matter, humic substances, and fulvic acids is higher in the soil incubated at 25°C than in the soil incubated at 15°C, higher in the soil incubated at 75% relative humidity than in the soil incubated at 50% relative humidity, and increases with time. The results also show that the yield of organic matter, humic substances, and fulvic acids is highest at 25°C, 75% relative humidity, and 4 weeks.

Factor	Yield of organic matter	Yield of humic substances	Yield of fulvic acids
Soil	1.0	1.0	1.0
Temperature	1.0	1.0	1.0
Humidity	1.0	1.0	1.0
Time	1.0	1.0	1.0
Soil x Temperature	1.0	1.0	1.0
Soil x Humidity	1.0	1.0	1.0
Soil x Time	1.0	1.0	1.0
Temperature x Humidity	1.0	1.0	1.0
Temperature x Time	1.0	1.0	1.0
Humidity x Time	1.0	1.0	1.0
Temperature x Humidity x Time	1.0	1.0	1.0

Mr. Arthashastra too is convinced that there is no need to assume risk of not having required cash to service debt, especially in the present economic scenario. Mr. Shortsighted agrees with observations of Mr. Arthashastra. Based on the analysis, it has been decided that the firm will raise an additional debt of only ₹73.15 crore at present and not take any undue risk, additional investments can be undertaken when the industry conditions revive.

REVIEW QUESTIONS

LOD: Easy

RQ.20.1 Provide the appropriate answers for the following:

[LO 20.1.2.3.4]

- (i) Financial distress is exclusively related to the risk of bankruptcy. (True/False)
- (ii) In case, the projected level of EBIT is substantially higher than the indifference point, the levered plan is likely to be beneficial for the firm. (True/False)
- (iii) _____ analysis is better than EBIT-EPS analysis (from the point of view of profitability) in evaluating proposed financial plans.
- (iv) Indifference point which factors provision for sinking fund also provides _____ earnings per share. (uncommitted/committed)
- (v) Coverage ratio which considers sinking fund payments also is determined dividing EBIT by _____
- (vi) To retain control over management, a firm would prefer use of _____. (debt/equity)
- (vii) In case sales are subject to wide fluctuations, a firm should employ more _____. (debt/equity)
- (viii) Firms at their infancy should rely more on (debt/equity).
- (ix) The _____ implies that the firm with an adequate notice can repay the suppliers of funds.
- (x) Cost of debt relates only to the amount of interest payable on borrowings. (True/False)

[Answers: (i) False (ii) True (iii) EBIT-MPS (iv) Uncommitted (v) EBIT/I + [SF/(I-t)]
(vi) Debt (vii) Equity (viii) Equity (ix) Call provision (x) False]

RQ.20.2 Write a note on the important determinants of the capital structure of a firm.

[LO 20.2.3.4]

LOD: Medium

RQ.20.3 '.....an analysis of the magnitude and stability of cash flows relative to fixed charges is extremely important in determining an appropriate capital structure.' Comment.

[LO 20.2]

RQ.20.4 How can the effect of profitability on designing an appropriate capital structure be analysed? Illustrate your answer with the help of EBIT-EPS analysis.

[LO 20.2]

RQ.20.5 A growing company is confronted with a choice between 15% Debt issue and equity issue to finance its new investments. Its pre-expansion income statement is as follows:

[LO 20.2]

Sale (production capacity of ₹60,00,000 at current sales price)	₹45,00,000
Fixed cost	5,00,000
Variable cost (2/3 of sales)	30,00,000
EBIT	10,00,000
Interest at (0.125)	1,00,000
EBT	9,00,000
Income tax (0.35)	3,15,000
Net income	5,85,000
EPS	11.7

The expansion programme is estimated to cost ₹5,00,000. If this is financed through debt, the rate of interest will be 15 per cent and the P/E ratio will be 10. If expansion programme is financed through equity, new shares can be sold at ₹100 per share, and the P/E ratio will be 12. Expansion will generate additional sales of ₹12,75,000. No additional fixed costs would be needed to meet the expansion operation. If the company is to follow a policy of maximising the market value (MV) of its shares, which form of financing should be employed by the company?

RQ.20.6 The ZBB Ltd needs ₹5,00,000 for construction of a new plant. The following three financial plans are feasible: [LO 20.2]

- (i) The company may issue 50,000 equity shares of ₹10 per share.
- (ii) The company may issue 25,000 equity shares at ₹10 per share and 8 % debentures of ₹100 each.
- (iii) The company may issue 25,000 equity shares of ₹10 per share and 10 % preference shares of ₹100 per share.

If the company's EBIT are ₹40,000, ₹80,000 and ₹1,20,000, what are the EPS under each of the three financing plans? Which alternative would you recommend and why? Assume tax of 35 per cent and P/E ratio of 10 in equity plan, 9 in equity + preference plan and 8 in equity + debt plan.

RQ.20.7 The finance advisor of Aggarwal Industries Ltd is confronted with two alternative financing plans for raising ₹10 lakh that is needed for plant expansion and modernisation. One choice is 12% Debt issue. The other is to issue 8,000 equity shares at the current market price per of ₹125. [LO 20.2,3]

The modernisation and expansion programme is expected to increase the firm's operating profits (EBIT) by ₹2,00,000 annually. The firm's condensed financial statements for current year are given below:

Balance sheet as on March 31 current year

Liabilities	Amount	Assets	Amount
Current liabilities	₹5,00,000	Current assets	₹16,00,000
10% Long-term loan	15,00,000	Plant and equipment (net)	34,00,000
Reserves and surpluses	10,00,000		
Equity capital (shares of ₹100 each)	20,00,000		
	50,00,000		50,00,000

Income statement for the current year

Operating profits	₹8,00,000
Less interest expenses (0.10 × ₹15,00,000)	1,50,000
Income before taxes	6,50,000
Less taxes (0.35)	2,27,500
Net income	4,22,500
Earnings per share	21.12
Dividends per share	10.56

However, the finance advisor is concerned about the effect that issuing debt might have on the firm. The average debt ratio for firms in industry is 45 per cent. He believes that if this ratio is exceeded, the P/E ratio will be 7 because of the potentially greater risk. If the firm increases its equity capital, he expects the P/E ratio to increase to 8.5. He also wonders as to what will happen to the dividend yield under each plan. The firm follows the practice of paying dividends equal to 50 per cent of net income.

- (i) Determine the debt ratio, under each financing plan, after the securities are issued.
- (ii) Determine the expected net income in the next year, expected EPS and the expected market price of the equity shares.
- (iii) Determine the dividend yield.
- (iv) Which form of financing should be employed by the company, if the company is to follow a policy of maximising market value of its shares?

LOD: Difficult

RQ.20.8 ABC Ltd gives you the following information:

[LO 20.2.3]

Profit (before interest and tax)		₹24,00,000
Less interest on debentures (0.125)	₹2,00,000	
Less interest on long-term loans (0.16)	2,00,000	4,00,000
EBT		20,00,000
Less income tax (0.35)		7,00,000
Profit after tax		13,00,000
Number of equity shares (of ₹10 each)		4,00,000
EPS		3.25
Ruling market price		20
P/E ratio		6.15

The company has undistributed reserves and profits of ₹81,50,000. The company needs to raise ₹36,00,000 for repayment of debentures and modernisation of its plants.

It seeks your opinion on the advisability of taking recourse to one of the following modes of raising the required funds, on the consideration of the probable price of the share to rule on implementation.

- (a) Raising the entire amount by term loans from bank: Interest @ 16 per cent.
- (b) Raising partly by issue of 1,00,000 equity shares: Estimated price ₹18 per share, and the rest by term loan from bank @ 16 per cent.

The company expects that the operating profit on funds employed will improve by 4 per cent because of modernisation and that, if the debt equity ratio (debt/debt plus shareholders' fund) exceeds 25 per cent, the P/E ratio will go down to 6.

ANSWERS

RQ.20.5 Equity financing should be adopted by the company, as it maximizes the MPS (₹187.92).

RQ.20.6 (i) Equity plan is preferred when EBIT is ₹40,000 (ii) In cases of EBIT levels of ₹80,000 and ₹1,20,000, equity + debt plan is preferred.

RQ.20.7 (i) 0.50; 0.333

(ii) ₹4,74,500; 23.72; ₹166.1

₹5,52,500; 19.73; ₹167.72

(iii) The company should use the equity financing plan to maximize market value of its shares.

RQ.20.8 Plan A (16% loan) is better as the MPS is higher under this plan.

PART 6

LONG-TERM FINANCING

Chapter 21
CAPITAL MARKETS

Chapter 22
EQUITY/ORDINARY SHARES

Chapter 23
**TERM LOANS, DEBENTURES/
BONDS AND
SECURITISATION**

Chapter 24
**HYBRID FINANCING/
INSTRUMENTS**

Chapter 25
**LEASE FINANCING AND
HIRE-PURCHASE FINANCE**

Chapter 26
**VENTURE CAPITAL
FINANCING**

The long-term investment decisions of a firm involves the acquisition of long-term/fixed assets. They have to be financed with long-term sources of finance. The main sources of long-term finance fall into two broad groups: (i) Internal and (ii) External.

The internal sources of long-term funds of an existing company consist of depreciation charges and retained earnings. The depreciation charges are normally used to replace the concerned asset(s). In a way, therefore, the only internal source of financing expansion/growth/diversification for such companies are retained earnings. In fact, they are an important source of long-term finance for corporate enterprises in India.

As a source of long-term finance, retained earnings have some commendable features. They are readily available to the firm. Flotation/issue costs and losses on account of underpricing associated with external equity are avoided/eliminated. There is no dilution of control of the firm by the existing shareholders. However, the magnitude of financing through retained earnings may be limited and variable/unstable/fluctuating primarily as a result of the quantum and variability of profits after taxes. It has, moreover, high opportunity cost in terms of dividends foregone by the shareholders.

For the shareholders, retention of profits by a firm is a convenient way of reinvestment of their profits. But

shareholders who want a current income would find it inconvenient to the extent that they will be constrained to sell some shares to convert them into income. Moreover, the easy availability of retained earnings coupled with the notion of low cost may result in investment in sub-marginal/unprofitable projects which would have serious implications for, and hurt the interest of, the shareholders.

Thus, retained earnings have both positive and negative attributes from the viewpoint of the firm as well as the shareholders/investors and should be employed with caution. They involve high cost and no risk and put no restraint on management freedom and do not dilute control. Retained earnings, as an internal source of finance, are significantly affected by the dividend policy of the firm. The focus of Part 6 of the book is, therefore, on the long-term external financing sources.

The external sources of long-term funds comprise of (i) equity capital, (ii) term loans, (iii) debentures/notes/bonds including innovative debt instruments, (iv) hybrid sources such as preference capital, convertibles, warrants and options, (v) leasing and hire-purchase finance and (vi) venture capital financing. The equity and preference capitals represent ownership securities/capital, while debentures and term loans are creditorship securities/loan capital. Firms that require long-term funds from external sources obtain them from the capital market. This part of the book describes the features of the various sources and evaluates them from the point of both the firm which uses them and the investors who provide them. It also briefly outlines the procedures involved in raising funds from these sources. A brief overview of the organisation/structure of the capital market is presented in Chapter 21. The main instruments of long-term financing are covered in Chapters 22-24: Chapter 22 (Equity shares/capital); Chapter 23 (Debt instruments/capital) and Chapter 24 (Hybrid instruments). Chapters 25 and 26 discuss lease and hire-purchase finance and venture capital financing respectively.

CHAPTER

21

Capital Markets

LEARNING OBJECTIVES

LO 21.1	Define 'financial system' and describe its three main components—financial assets/instruments, financial intermediaries/institutions and the two key financial markets, namely, capital and money markets
LO 21.2	Compare and contrast the two parts of the capital/securities markets—stock exchanges/secondary market and new issue/primary market
LO 21.3	Discuss the three vital functions of secondary markets—nexus between savings and investments, market place and continuous price formation
LO 21.4	Understand the triple-service-functions of primary market—origination, underwriting and distribution—and the methods by which issues are made in the primary market

LO 21.1 FINANCIAL SYSTEM

Capital markets are a sub-part of the **financial system**. Conceptually, the financial system includes a complex of institutions and mechanism which affects the generation of savings and their transfer to those who will invest. It may be said to be made of all those channels through which savings become available for investments. The main elements of the financial system are a variety of **(i)** financial instruments/assets/securities, **(ii)** financial intermediaries/institutions and **(iii)** financial markets.

- **Financial system**
- includes a complex of institutions and mechanism which affects generation of savings and their transfer to those who invest.

Financial Assets

A **financial asset/instrument/security** is a claim against another economic unit and is held as a store of value and for the return that is expected. While the value of a tangible/physical asset depends on its physical properties such as buildings, machines, furniture, vehicles and so on, a financial asset represents a claim to future cash flows in the form of interest, dividends and so on. They are a claim on a stream of income and/or particular assets. The entity/economic unit that offers the future cash flows is the 'issuer of the financial instrument' and the owner of the security is the 'investor'. Depending upon the nature of claim/return, an instrument may be

- **Financial asset/instrument/security**
- is a claim against another economic unit and held as a store of value and for the expected return.

(i) debt (security) such as bonds, debentures, term loans, (ii) equity (security) shares and (iii) hybrid security such as preference shares and convertibles. Based on the type of issuer, the security may be (1) direct (2) indirect and (3) derivative. The securities issued by manufacturing companies are direct assets (e.g. shares/debentures). Indirect assets are claims against financial intermediaries (e.g. units of mutual funds). The derivative instruments include options and futures. The prevalence of a variety of securities to suit the investment requirements of heterogeneous investors offers differentiated investment choice to them and is an important element in the maturity and sophistication of the financial system.

Financial Intermediaries

Financial intermediaries are institutions that channelise the savings of investors into investments/loans. As institutional source of finance, they act as a link between the savers and the investors which results in institutionalisation of personal savings. Their main function is to convert direct financial assets into indirect securities. The indirect securities offer to the individual investor better investment alternative than the direct/primary security by pooling which it is created, for example, units of mutual funds. The main consideration underlying the attractiveness of indirect securities is that the pooling of funds by the financial intermediary leads to a number of benefits to the investors.

Financial intermediaries convert direct financial assets into indirect securities.

The services/benefits that tailor indirect financial assets to the requirements of the investors are (i) convenience, (ii) lower risk, (iii) expert management and (iv) lower cost.

Convenience Financial intermediaries convert direct/primary securities into a more convenient vehicle of investment. They divide primary securities of higher denomination into indirect securities of lower denomination. They also transform a primary security of a certain maturity into an indirect security of a different maturity. For instance, as a result of the redemption/repurchase facility available to unitholders of mutual funds, maturities on units would conform more with the desires of the investors than those on primary securities.

Lower Risk The lower risk associated with indirect securities results from the benefits of diversification of investments. In effect, the financial intermediaries transform the small investors in matters of diversification into large institutional investors as the former share proportionate beneficiary interest in the total portfolio of the latter.

Expert Management Indirect securities give to the investors the benefits of trained, experienced and specialised management together with continuous supervision. In effect, financial intermediaries place the individual investors in the same position in the matter of expert management as large institutional investors.

Low Cost The benefits of investment through financial intermediaries are available to the individual investors at relatively lower cost due to the economies of scale.

The major financial intermediaries are banks, insurance organisations, both life and non-life/general, mutual funds, non-banking financial companies and so on.

Financial markets provide a forum in which suppliers of funds and demanders of loans/investments can transact business directly.

Financial Markets

Financial markets perform a crucial function in the financial system as facilitating organisations. Unlike financial intermediaries, they are not a source of funds but are a link and provide a forum in which suppliers of funds and demanders of loans/investments can

transact business directly. While the loans and investments of financial intermediaries are made without the direct knowledge of the suppliers of funds (i.e. investors), suppliers in the financial market know where their funds are being lent/invested. The two key financial markets are the money market and the capital market.

Money Market The **money market** is created by a financial relationship between suppliers and demanders of short-term funds which have maturities of one year or less. It exists because investors (i.e. individuals, business entities, government and financial institutions) have temporarily idle funds that they wish to place in some type of liquid asset or short-term interest-earning instrument. At the same time, other entities/organisations find themselves in need of seasonal/temporary financing. The money market brings together these suppliers and demanders of short-term liquid funds. The broad objectives of money market are three-fold:

- An equilibrating mechanism for evening out short-term surplus and deficiencies in the financial system;
- A focal point of intervention by the central bank (e.g. Reserve Bank of India) intervention for influencing liquidity in the economy; and
- A reasonable access to the users of short-term funds to meet their requirements at realistic/reasonable cost and temporary deployment of funds for earning returns to the suppliers of funds.

- **Money market**
- is created by
- a financial
- relationship
- between suppliers
- and demanders of
- short-term funds
- having maturities of
- one year or less.

Capital Market The **capital market** is a financial relationship created by a number of institutions and arrangements that allows suppliers and demanders of long-term funds (i.e. funds with maturities exceeding one year) to make transactions. It is a market for long-term funds. Included among long-term funds are securities issues of business and Government. The backbone of the capital market is formed by the various securities exchanges that provide a forum for equity (equity market) and debt (debt market) transactions. Mechanisms for efficiently offering and trading securities contribute to the functioning of capital markets which is important to the long-term growth of business. Thus, the capital market comprises of (1) stock/security exchanges/markets (secondary markets) and (2) new issue/primary market [initial public offering (IPO) market].

- **Capital market/**
- **securities**
- **market**
- is a financial
- relationship created
- by a number of
- institutions and
- arrangements that
- allows suppliers
- and demanders of
- long-term funds
- with maturities
- exceeding one
- year to make
- transactions.

This Chapter describes the functions, organisation and structure of the capital/securities market. In section 1 we discuss the relationship between the two parts of the securities market, namely, primary market/new issue market (NIM) and secondary markets/stock exchanges. Section 2 describes the functions of the stock exchanges. The functions of the NIM and the issue mechanism/methods of flotation of new issues are outlined in Sections 3. The main points are summarised in the last Section.

LO 21.2 RELATIONSHIP BETWEEN NEW ISSUE MARKET AND STOCK EXCHANGE

The industrial securities market is divided into two parts, namely, NIM and stock market. The relationship between these parts of the market provides an insight into its organisation. One aspect of their relationship is that they differ from each other organisationally as well as in the nature of functions performed by them. They have some similarities also.

Differences

The differences between NIM and stock exchanges pertain to **(i)** Types of securities dealt, **(ii)** Nature of financing and **(iii)** Organisation.

New vs Old Securities The NIM deals with **new** securities, that is, securities which were not previously available and are, therefore, offered to the investing public for the first time. The market, therefore, derives its name from the fact that it makes available a new block of securities for public subscription. The stock market, on the other hand, is a market for **old** securities which may be defined as securities which have been issued already and granted stock exchange quotation. The stock exchanges, therefore, provide a regular and continuous market for buying and selling of securities. The usual procedure is that when an enterprise is in need of funds, it approaches the investing public, both individuals and institutions, to subscribe to its issue of capital. The securities thus floated are subsequently purchased and sold among the individual and institutional investors. There are, in other words, two stages involved in the purchase and sale of securities. In the first stage, the securities are acquired from the issuing companies themselves and these are, in the second stage, purchased and sold continuously among the investors without any involvement of the companies whose securities constitute the stock-in-trade except in the strictly limited sense of registering the transfer of ownership of the securities. The section of the industrial securities market dealing with the first stage is referred to as the NIM, while secondary market covers the second stage of the dealings in securities.

New securities are offered to the investing public for the first time.

Old securities are securities which have been issued already and listed on a stock exchange.

Nature of Financing Another aspect related to the separate functions of these two parts of the securities market is the nature of their contribution to industrial financing. Since the primary market is concerned with new securities, it provides additional funds to the issuing companies either for starting a new enterprise or for the expansion or diversification of the existing one and, therefore, its contribution to company financing is **direct**. In contrast, the secondary markets can in no circumstance supply additional funds since the company is not involved in the transaction. This, however, does not mean that the stock markets have no relevance in the process of transfer of resources from savers to investors. Their role regarding the supply of capital is **indirect**. The usual course in the development of industrial enterprise seems to be that those who bear the initial burden of financing a new enterprise pass it on to others when the enterprise becomes well-established. The existence of secondary markets which provide institutional facilities for the continuous purchase and sale of securities and, to that extent, lend liquidity and marketability, play an important part in the process.

Organisational Differences The two parts of the market have organisational differences also. The stock exchanges have, organisationally speaking, physical existence and are located in a particular geographical area. The NIM is not rooted in any particular spot and has no geographical existence. The NIM has neither any tangible form any administrative organisational set up like that of stock exchanges, nor is it subjected to any centralised control and administration for the consummation of its business. It is recognised only by the services that it renders to the lenders and borrowers of capital funds at the time of any particular operation. The precise nature of the specialised institutional facilities provided by the NIM is described in a subsequent section.

Similarities

Nevertheless, in spite of organisational and functional differences, the NIM and the stock exchanges are inseparably connected.

Stock Exchange Listing One aspect of this inseparable connection between them is that the securities issued in the NIM are invariably **listed** on a recognised stock exchange for dealings in them. In India, for instance, one of the conditions to which a prospectus is to conform is that it should contain a stipulation that the application has been made, or will be made in due course for admitting the securities to dealings on the stock exchange. The practice of **listing** of new issues on the stock market is of immense utility to the potential investors who can be sure that should they receive an allotment of new issues, they will subsequently be able to dispose them off any time. The absence of such facilities would act as some sort of psychological barrier to investments in new securities. The facilities provided by the secondary markets, therefore, encourage holdings of new securities and, thus, widen the initial/primary market for them.

- Listing
- enables dealings
- in securities on a
- stock exchange.

Control The stock exchanges exercise considerable control over the organisation of new issues. In terms of regulatory framework related to dealings in securities, the new issues of securities which seek stock quotation/listing have to comply with statutory rules as well as regulations framed by the stock exchanges with the object of ensuring fair dealings in them. If the new issues do not conform to the prescribed stipulations, the stock exchanges would refuse listing facilities to them. This requirement obviously enables the stock exchange to exercise considerable control over the new issues market and is indicative of close relationship between the two.

Economic Interdependence The markets for new and old securities are, economically, an integral part of a single market—the industrial securities market. Their mutual interdependence from the economic point of view has two dimensions. One, the behaviour of the stock exchanges has a significant bearing on the level of activity in the NIM and, therefore, its responses to capital issues: **Activity in the new issues market and the movement in the prices of stock exchange securities are broadly related: new issues increase when share values are rising and vice versa.**¹ This is because the two parts of the industrial securities market are susceptible to common influences and they act and react upon each other. The stock exchanges are usually the first to feel a change in the economic outlook and the effect is quickly transmitted to the new issue section of the market.

The second dimension of the mutual interdependence of the two parts of the market is that the prices of new issues are influenced by the price movements on the stock market. The securities market represents an important case where the **stock-demand-and-supply curves**, as distinguished from **flow-demand-and-supply curves**, exert a dominant influence on price determination.² The quantitative predominance of old securities in the market usually ensures that it is these which set the tone of the market as a whole and govern the prices and acceptability of the new issues.³ Thus, the flow of new savings into new securities is profoundly influenced by the conditions prevailing in the old securities market—the stock exchange.

LO 21.3 FUNCTIONS OF STOCK/SECONDARY MARKETS/ EXCHANGES

Stock exchanges discharge three vital functions in the orderly growth of capital formation: **(i)** Nexus between savings and investments, **(ii)** Market place and **(iii)** Continuous price formation.

Nexus between Savings and Investment

First and foremost, they are the nexus between the savings and the investments of the community. The savings of the community are mobilised and channelled by stock exchanges for investment into those sectors and units which are favoured by the community at large, on the basis of such criteria as good return, appreciation of capital, and so on. It is the preference of investors for individual units as well as industry groups, which is reflected in the share price, that decides the mode of investment. Stock exchanges render this service by arranging for the preliminary distribution of new issues of capital, offered through prospectus, as also offers for sale of existing securities, in an orderly and systematic manner. They themselves administer the same, by ensuring that the various requisites of listing (such as offering at least the prescribed minimum percentage of capital to the public, keeping the subscription list open for a minimum period of days, making provision for receiving applications at least at the prescribed centres, allotting the shares against applications on a fair and unconditional basis) are duly complied with. Members of stock exchanges also assist in the flotation of new issues by acting **(i)** as brokers, in which capacity they, *inter alia*, try to procure subscription from investors spread all over the country, and **(ii)** as underwriters. This quite often results in their being required to nurse new issues till a time when the new ventures start making profits and reward their shareholders by declaring reasonable dividends when their shares command premiums in the market. Stock companies also provide a forum for trading in rights shares of companies already listed, thereby enabling a new class of investors to take up a part of the rights in the place of existing shareholders who renounce their rights for monetary considerations.

Market Place

The second important function discharged by stock markets/exchanges is that they provide a market place for the purchase and sale of securities, thereby enabling their free transferability through several successive stages from the original subscriber to the neverending stream of buyers, who may be buying them today to sell them at a later date for a variety of considerations like meeting their own needs of liquidity, shuffling their investment portfolios to gear up for the everchanging market situations, and so on. Since the point of aggregate sale and purchase is centralised, with a multiplicity of buyers and sellers at any point of time, by and large, a seller has a ready purchaser and a purchaser has a ready seller at a price which can be said to be competitive. This guarantees saleability to one who has already invested and surety of purchase to the other who desires to invest.

Continuous Price Formation

The third major function, closely related to the second, discharged by the stock exchanges is the process of continuous price formation. The collective judgement of many people operating simultaneously in the market, resulting in the emergence of a large number of buyers and sellers at any point of time, has the effect of bringing about changes in the levels of security prices in small graduations, thereby evening out wide swings in prices. The everchanging demand and supply conditions result in a continuous revaluation of assets, with today's prices being yesterday's prices, altered, corrected, and adjusted, and tomorrow's values being again today's values altered, corrected and adjusted. The process is an unending one. Stock exchanges thus act as a barometer of the state

of health of the nations economy, by constantly measuring its progress or otherwise. An investor can always have his eyes turned towards the stock exchanges to know, at any point of time, the value of the investments and plan his personal needs accordingly.

LO 21.4 FUNCTIONS OF NEW ISSUES/PRIMARY MARKET

The main function of NIM is to facilitate the transfer of resources from savers to entrepreneurs seeking to establish new enterprise or to expand/diversify existing ones. Such facilities are of crucial importance in the context of the dichotomy of funds available for capital uses from those in whose hands they accumulate, and those by whom they are applied to productive uses. Conceptually, the NIM should not, however, be conceived as exclusively serving the purpose of raising finance for new capital expenditure. In fact, the organisation and facilities of the market are also utilised for selling concerns to the public as going concerns through the conversion of existing proprietary enterprises or private companies into public companies. The NIM is a complex of institutions through which funds can be obtained directly or indirectly by those who require them from investors who have savings.

New issues can be classified in various ways. The first category of new issues are by new companies and old companies. This classification was first suggested by R.F. Henderson.⁴ The distinction between *new* also called *initial* and *old* also known as *further*, does not bear any relation to the age of the company. The securities issued by companies for the first time either after the incorporation or conversion from private to public companies are designated as initial issues, while those issued by companies which already have stock exchange quotation, either by public issue or by *rights* to existing shareholders, are referred to as further or old.

The new issues by corporate enterprise can also be classified on the basis of companies seeking quotation, namely, new money issues and no *new money issues*. The term **new money issues** refers to the issues of capital involving newly created shares; **no new money issues** represent the sale of securities already in existence and sold by their holders. The *new money issues* provide funds to enterprises for additional capital investment. According to Merrett and others,⁵ *new money* refers to the sum of money equivalent to the number of newly created shares multiplied by the price per share minus all the administrative cost associated with the issue. This money may not be used for additional capital investment; it may be used wholly or partly to repay debt. Henderson⁶ uses the term in a rather limited sense so that it is the net of repayment of long-term debt and sums paid to vendors of existing securities. The differences in the approaches by Merrett and others, on the one hand, and Henderson, on the other, arise because of the fact that while the concern of the former is with both flow of funds into the market as well as flow of money money, Henderson was interested only in the latter.

However, two types of issues are excluded from the category of new issues. First, *bonus/capitalisation* issues which represent only book-keeping entries, and, second, *exchange* issues by which shares in one company are exchanged for securities of another.

The general function of the NIM, namely, the channelling of investible funds into industrial enterprises, can be split from the operational stand-point, into three services:⁷ **(i) Origination**, **(ii) Underwriting**, and **(iii) Distribution**. The institutional set-up dealing with these can be said to constitute the NIM organisation. In other words, the NIM facilitates the transfer of resources by providing specialist institutional facilities to perform the **triple-service function**.

Origination

The term **origination** refers to the work of investigation and analysis and processing of new proposals. These two functions⁸ are performed by the specialist agencies which act as the sponsors of issues. One aspect is the preliminary investigation which entails a careful study of technical, economic, financial, and legal aspects of the issuing companies. This is to ensure that it warrants the backing of the issue houses in the sense of lending their name to the company and, thus, give the issue the stamp of respectability, to satisfy themselves that the company is strongly-based, has good market prospects, is well-managed and is worthy of stock exchange quotation. In the process of origination the sponsoring institutions render, as a second function, some services of an advisory nature which go to improve the quality of capital issues. These services include advice on such aspects of capital issues as: **(i)** determination of the class of security to be issued and price of the issues in the light of market conditions, **(ii)** the timing and magnitude of issues, **(iii)** methods of flotation, and **(iv)** technique of selling, and so on. The importance of the specialised services provided by the NIM organisation in this respect can hardly be overstressed in view of its pivotal position in the process of flotation of capital in the NIM. On the thoroughness of investigation and soundness of judgement of the sponsoring institutions depends, to a large extent, the allocative efficiency of the market.

Origination is the work of investigation and analysis and processing of new issue proposals.

Underwriting

Underwriting is a form of guarantee that the new issues would be sold by eliminating the risk arising from uncertainty of public response.

The origination howsoever thoroughly done, will not, by itself, guarantee the success of an issue. To ensure success of an issue, therefore, the second specialist service—**underwriting**—provided by the institutional setup of the NIM takes the form of a guarantee that the issues would be sold by eliminating the risk arising from uncertainty of public response. That adequate institutional arrangement for the provision of underwriting is of crucial significance both to the issuing companies as well as the investing public cannot be overstressed.⁹

Distribution

Underwriting, however, is only a stop-gap arrangement to guarantee the success of an issue. The success of an issue, in the ultimate analysis, depends on the issues being acquired by the investing public. The sale of securities to the ultimate investors is referred to as **distribution**. It is a specialist job which can best be performed by brokers and dealers in securities, who maintain regular and direct contact with the ultimate investors.

Distribution is the sale of securities to the ultimate investors.

Thus, the NIM is a complex of institutions through which funds can be obtained by those who require them from investors who have savings. The ability of the NIM to cope with the growing requirements of the expanding corporate sector would depend on the presence of specialist agencies to perform the *triple-service-function* of origination, underwriting and distribution. While the nature of the services provided by an organised NIM is the same in all developed countries,¹⁰ the degree of development and specialisation of market organisation, the type of institutions found and the actual procedures followed differ from country to country, as they are determined partly by history and partly by the particular legal, social, political, and economic environment.

Issue Mechanism

The success of an issue depends, partly, on the issue mechanism. The methods by which new issues are made are: **(i)** Public issue through prospectus, **(ii)** Tender/Book building, **(iii)** Offer for sale **(iv)** Placement and **(v)** Rights issue.

Public Issue through Prospectus A common method followed by corporate enterprises to raise capital through the issue of securities is by means of a prospectus inviting subscription from the investing public. Under this method, the issuing companies themselves offer directly to the general public a fixed number of shares at a stated price, which in the case of new companies is invariably the face value of the securities, and in the case of existing companies, it may sometimes include a premium amount, if any. Another feature of **public issue** method is that generally the issues are underwritten to ensure success arising out of unsatisfactory public response.

- **Public issue**
- are securities that
- are offered to the
- general public
- directly at a stated
- price.

The foundation of the public issue method is a prospectus, the minimum contents of which are prescribed by the Companies Act, 1956. It also provides both civil and criminal liability for any misstatement in the prospectus. Additional disclosure requirements are also mandated by the SEBI. The contents of the prospectus, *inter alia*, include: **(i)** Name and registered office of the issuing company; **(ii)** Existing and proposed activities; **(iii)** Board of directors; **(iv)** Location of the industry; **(v)** Authorised, subscribed and proposed issue of capital to public; **(vi)** Dates of opening and closing of subscription list; **(vii)** Name of broker, underwriters, and others, from whom application forms along with copies of prospectus can be obtained; **(viii)** Minimum subscription; **(ix)** Names of underwriters, if any, along with a statement that in the opinion of the directors, the resources of the underwriters are sufficient to meet the underwriting obligations; and **(x)** A statement that the company will make an application to stock exchange(s) for the permission to deal in or for a quotation of its shares and so on. A detailed account of the regulatory framework relating to issues of capital is given in the next chapter.

The public issue method through prospectus has the advantage that the transaction is carried on in the full light of publicity coupled with approach to the entire investing public. Moreover, a fixed quantity of stock has to be allotted among applicants on a non-discriminatory basis. The issues are, thus, widely distributed and the danger of an artificial restriction on the quantity of shares available is avoided. It would ensure that the share ownership is widely-diffused, thereby contributing to the prevention of concentration of wealth and economic power.

A serious drawback of public issue, as a method to raise capital through the sale of securities, is that it is a highly expensive method. The cost of flotation involves underwriting expenses, brokerage, and other administrative expenses. The administrative cost includes printing charges of prospectus, advertisement/publicity charges, accountancy charges, legal charges, bank charges, stamp duty, listing fee, registration charges, travelling expenses, filling of document charges, mortgage deed registration fee and postage and so on.¹¹ In view of the high cost involved in raising capital, the public issue method is suitable for large issues and it cannot be availed of in case of small issues.

Tender/Book Building Method The essence of the **tender/book building** method is that the pricing of the issues is left to the investors. The issuing company incorporates all the details of the issue proposal in the offer document on the lines of the public issue method including the reserve/minimum price. The investors are required to quote the number of securities and the price at which they wish to acquire. **The detailed procedure followed in India is elaborated upon in the next chapter.**

- **Book building**
- is a price
- discovery and
- investors response
- mechanism.

Offer for Sale Another method by which securities can be issued is by means of an **offer for sale**. Under this method, instead of the issuing company itself offering its shares directly to the public, it offers through the intermediary of issue houses/merchant banks/investment banks or firms of stockbrokers. The *modus operandi* of the offer of sale is akin to the public issue method in that the prospectus with strictly prescribed minimum contents which constitutes the foundation for the sale of securities, and a known quantity of shares are distributed to the applicants in a non-discriminatory manner. Moreover, the issues are underwritten to avoid the possibility of the issue being left largely in the hands of the issuing houses. But the mechanism adopted is different. The sale of securities with an offer for sale method is done in two stages.

Offer for sale is the sale of existing shares by promoters to the investing public.

In the first stage, the issuing company sells the securities *enbloc* to the issuing houses or stockbrokers at an agreed fixed price and the securities, thus acquired by the sponsoring institutions, are resold, in the second stage, by the issuing houses to the ultimate investors. The securities are offered to the public at a price higher than the price at which they were acquired from the company. The difference between the sale and the purchase price, technically called as *turn*, represents the remuneration of the issuing houses. In the case of public method, the issuing houses receive a fee based upon the size and the complications involved in supervision as they act as agents of the issuing companies. Although this is theoretically possible, but usually the issuing houses' remuneration in offer for sale is the 'turn' out of which they also meet subsidiary expenses such as underwriting commission, the cost of advertisement and prospectus, and so on, whereas these are borne by the companies themselves in the case of public issue method.

The offer for sale method shares the advantage available to public issue method. One additional advantage of this method is that the issuing company is saved from the cost and trouble of selling the shares to the public. Apart from being expensive, like the public issue method, it suffers from another serious shortcoming. The securities are sold to the investing public usually at a premium. The margin between the amount received by the company and the price paid by the public does not become additional funds, but it is pocketed by the issuing houses or the existing shareholders.

Placement Method Yet another method to float new issues of capital is the placing method defined by London Stock Exchange as "*sale by an issue house or broker to their own clients of securities which have been previously purchased or subscribed*".¹² Under this method, securities are acquired by the issue houses, as in offer for sale method, but instead of being subsequently offered to the public, they are *placed* with the clients of the issue houses, both individual and institutional investors. Each issue house has a list of large private and institutional investors who are always prepared to subscribe to any securities which are issued in this manner. Thus, the flotation of the securities involves two stages: In the first stage, shares are acquired by the issuing houses and in the second stage, they are made available to their investor-clients. The issue houses usually place the securities at a higher price than the price they pay and the difference, that is, the *turn* is their remuneration. Alternatively, though rarely, they may arrange the placing in return for a fee and act merely as an agent and not principal.

Another feature of placing is that the placing letter and the other documents, when taken together, constitute a *prospectus/offer document* and the information concerning the issue has to be published. In this method, no formal underwriting of the issue is required as the placement itself amounts to underwriting since the issue houses agree to place the issue with their clients. They endeavour to ensure the success of the issue by carefully *vetting* the issuing company concerned and offering generous subscription terms.

Placing of securities that are unquoted is known as **private placing**. The securities are usually in small companies but these may occasionally be in large companies. When the securities to be placed are newly quoted, the method is officially known as stock exchange placing.¹³

The main advantage of placing, as a method of issuing new securities, is its relative cheapness. This is partly because many of the items of expenses in public issue and offer for sale methods like underwriting commission, expense relating to applications and allotment of shares, and so on are avoided. Moreover, the stock exchange requirements relating to contents of the prospectus and its advertisement are less onerous in the case of placing.¹⁴

Its weakness arises from the point of view of distribution of securities. As the securities are offered only to a select group of investors, it may lead to the concentration of shares into a few hands who may create artificial scarcity of scrips in times of hectic dealings in such shares in the market.

The placement method is advantageous to the issuing companies but it is not favourably received by the investing public. The method is suitable in case of small issues which cannot bear the high expenses entailed in a public issue, and also in such issues which are unlikely to arouse much interest among the general investing public. Thus, with the placement method, new issues can be floated by small companies which suffer from a financial disadvantage in the form of prohibitively high cost of capital in the case of other methods of flotation as well as at times when conditions in the market may not be favourable as it does not depend for its success on public response. This underscores the relevance of this method from the viewpoint of the market.

Rights Issue The methods discussed above can be used both by new companies as well as by established companies. In the case of companies whose shares are already listed and widely-held, shares can be offered to the existing shareholders. This is called **rights issue**. Under this method, the existing shareholders are offered the right to subscribe to new shares in proportion to the number of shares they already hold. This offer is made by circular to 'existing shareholders' only.

In India, Section 81 of the Companies Act, 1956 provides that where a company increases its subscribed capital by the issue of new shares, either after two years of its formation or after one year of first issue of shares whichever is earlier, these have to be first offered to the existing shareholders with a right to renounce them in favour of a nominee. A company can, however, dispense with this requirement by passing a special resolution to the same effect.

Rights issues are not normally underwritten but to ensure full subscription and as a measure of abundant precaution, a few companies have resorted to underwriting of rights shares. The experience of these companies has been that underwriters were not called upon to take up shares in terms of their obligations. It is, therefore, observed that such underwriting serves little economically useful purpose in that "it represents insurance against a risk which is (i) readily avoidable and (ii) of extremely rare occurrence even where no special steps are taken to avoid it."¹⁵ The chief merit of rights issue is that it is an inexpensive method. The usual expenses like underwriting commission, brokerage and other administrative expenses are either non-existent or are very small. Advertising expenses have to be incurred only for sending a letter of rights to shareholders. The management of applications and allotment is less cumbersome because the number is limited. As already mentioned, this method can be used only by existing companies and the general investing

- Placement of securities
- is the sale of unquoted securities.

- Rights issue is the sale of securities to the existing shareholders.

public has no opportunity to participate in the new companies. The pre-emptive right of existing shareholders may conflict with the broader objective of wider diffusion of share-ownership.

The above discussion shows that the available methods of flotation of new issues are suitable in different circumstances and for different types of enterprises. The issue mechanism would vary from market to market.

SUMMARY

The financial system consisting of a variety of financial instruments, financial intermediaries, and financial markets related in a systematic manner provides the principal mechanism by which savings are transformed into investments.

A financial instrument/asset/security represents claims against the future income/wealth of an entity. The financial assets are: (i) direct (e.g. shares and debentures of manufacturing companies), (ii) indirect (e.g. units of mutual funds) and derivatives (e.g. futures and options).

Financial intermediaries act as a link between savers and investors. Their main function is to convert a direct/primary security into an indirect security. In the process of conversion, they offer to the investors the benefits of convenience, low risk, expert management and lower risk. The indirect securities offer to the investors better investment alternative than the direct securities by pooling which they are created.

Financial markets facilitate transfer of funds from savers to investors. They are a market for creation and exchange of financial assets. The two key financial markets are money market and capital/securities market.

The money market is a market for short-term funds having maturities of one year or less. Short-term marketable securities are traded in the money market.

Capital market is the market for long-term funds. The backbone of the market is formed by the securities markets/exchanges comprising the new issue markets and the stock exchanges.

The new issue/primary market and secondary market/stock market/exchange differ from each other organisationally as well as in the nature of functions performed by them. While the primary market deals in new securities, that is, securities which were not previously available and are offered to the investors for the first time, the stock market is a market for old securities defined as those already issued and granted stock exchange quotations/listing. Functionally, they also differ in that the new issue market supplies funds to corporate enterprise directly but the secondary markets play only an indirect role in industrial financing by providing liquidity to investments already made.

The two parts of the securities market have organisational differences as well. The stock exchange has a physical existence and is located in a particular geographical area. The new issue market does not have any organisational set up in any particular place and is recognised only by the specialist institutional services that it renders to the lenders/borrowers of capital funds at the time of any particular operation.

The new issue market and the stock exchanges are inseparably interconnected. The securities issued in the primary market are invariably listed on a recognised stock exchange for dealings in them. Moreover, the stock exchanges exercise considerable control over the organisation of new issues in terms of regulatory framework relating to the listing of securities. Further, economically, the behaviour of the stock exchange as reflected in the prices of listed securities has a significant bearing on the level of activity in the new issue market in terms of its response to issue of capital. Similarly, the price of new issues are greatly influenced by the price movements in the stock market.

LO 21.1

LO 21.2

LO 21.3

The stock markets, as an integral part of the industrial securities market, discharge three vital functions in the orderly growth of capital formation. First and foremost, they are a nexus between the savings and investments of the community. They also provide a market price for purchase/sale of securities. The process of continuous price formation is the third function discharged by the stock exchanges.

The main function of the new issue market, namely, the channelling of investible funds into industrial enterprises, is divided, in operational terms, into three distinct services: (i) Origination, (ii) Underwriting and (iii) Distribution. The new issue market facilitates the transfer of resources of providing specialist institutional facilities to perform this *triple-service function*.

The origination functions cover the work of investigation and analysis and processing of new issue proposals. Apart from a careful study of technical, economic, financial and legal aspects of the issuing companies to ensure that it warrants the backing of the issue houses/merchant banks/originators, it also refers to advices relating to the important aspects of the issue proposal such as class of security to be issued, price of an issue, timing and magnitude of issue, methods of flotation and so on.

LO 21.4

The underwriting service provided by the new issue market organisation is a form of a guarantee that the issue would be sold by eliminating the risk arising out of uncertainty of public response.

The distribution of securities is undertaken by brokers and dealers in securities who maintain regular and direct contact with the investors.

The issue mechanism consists of five methods of flotation of securities: (i) Public issue through prospectus, (ii) Offer for sale, (iii) Placement, (iv) Rights issues and (v) Tender/Book-building. Under the first method, issuing companies offer the securities directly to the general public at a stated price. The cost of raising capital through this method is high. It is suitable for large issues. The offer for sale and placement methods are indirect methods of sale of securities through financial/investment institutions to the investing public. They are suitable for small issues of capital. The rights issue is a method to sell securities to the existing shareholders of a company. The pricing of issues is left to the investors in book building method.

REVIEW QUESTIONS

LOD: Easy

RQ.21.1 Fill in the following blanks by appropriate answers:

[LO 21.1-4]

- (i) Capital markets are a sub-part of the _____ system.
- (ii) _____ intermediaries act as a link between savers and investors.
- (iii) The primary function of financial intermediaries is to convert _____ securities into _____ securities.
- (iv) The two key financial markets are _____.
- (v) Money market is a market for _____ funds having maturity of _____.
- (vi) The capital market consists of _____ and the stock exchanges.
- (vii) While the primary market deals in _____ securities, the stock market is a market for _____ securities.
- (viii) The price of new issues are influenced, to a marked extent, by the price movements in the _____ market.
- (ix) Origination, underwriting and _____ are three services provided by the new issue market.
- (x) _____ is a method to sell securities to the existing shareholders of a company.

CHAPTER

22

Equity/Ordinary Shares

LEARNING OBJECTIVES

LO 22.1	Discuss the general features of equity/ordinary shares, the important aspects of preemptive rights of shareholders and the merits and demerits of ordinary share financing
LO 22.2	Review the procedure relating to equity shares and securities convertible/exchangeable into equity shares in India in terms of common conditions for public/rights issues, provisions as to public issues, rights issues, preferential issues and qualified institutional placement

INTRODUCTION

Equity/ordinary share capital, as a long-term source of finance, represents ownership capital/securities and its owners—equity-holders/ordinary shareholders—share the reward and risk associated with the ownership of corporate enterprises. It is also called ordinary share capital in contrast with preference share capital which carries certain preferences/prior rights in regard to income and redemption. When a company is formed, it first issues equity shares to the promoters. As the need for financing increases, the company may issue ordinary shares to specific and small number privately to promoters' relatives, friends, business associates, employees, financial institutions, mutual funds, venture capital funds and so on. As the company grows further, it raises capital from the public. The first issue of equity shares to the public by an unlisted company is called the **initial public offering (IPO)**. Subsequent offerings are called further issues/offerings. This chapter discusses the ordinary/equity shares. The chapter first describes their fundamentals in terms of (1) types, (2) features/attributes and (3) evaluation. The procedure involved in issuing them to the public is the focus of the subsequent discussion. The main points are summarised by way of recapitulation.

LO 22.1 FUNDAMENTALS OF EQUITY SHARES

This section focuses on the types, features and evaluation of equity/ordinary shares.

Types

Authorised equity/share capital represents the maximum amount which a company can raise from the ordinary share holders and can be changed in the prescribed manner. The portion of the authorised capital offered by the company to the investors is the **Issued** capital. **Subscribed** share capital is that part of the issued capital which has been accepted/subscribed by the investors. The actual amount paid by the shareholders is the *Paid-up capital*. The issued, subscribed and *paid-up* capitals are generally the same.

Authorised share capital is the number of ordinary shares capital that a firm can raise without further shareholder approval.

Ordinary shares have typically a **par/face value** in terms of the price for each share, the most popular denomination being ₹10. The price at which the equity shares are issued is the **Issue** price. The issue price for new companies is generally equal to the face value. It may be higher for existing companies, the difference/excess being *share premium*. The **book value** of ordinary shares refers to the paid-up capital plus reserves and surplus (net worth) divided by the number of outstanding shares. The price at which equity shares are traded in the stock market is their **market value**. However, the market value of unlisted/thinly traded shares is not available.

Subscribed share capital is the number of shares (capital) outstanding.

Features

Par (face) value is a value arbitrarily placed on the shares.

The ordinary shares have some special features in terms of the rights and claims of their holders.

Residual Claim to Income The equity shareholders have a residual claim to the income of the company. They are entitled to the remaining income/profits of the company after all outside claims are met. The earnings/income available to the shareholders (EAS) equals profit after tax (PAT) minus preference dividend; the PAT is equal to operating profits (EBIT) less taxes. However, the residual claim is only a theoretical entitlement as the amount actually received by the shareholders in the form of dividend will depend on the decision of the board of directors. The directors have the right to decide what portion of the EAS will be distributed to the shareholders as cash dividend and what portion will be ploughed back as retained earnings which the shareholders will receive later in the form of capital appreciation/bonus shares. In other words, the payment of dividends depends on the discretion of management and the shareholders have no legal right to receive/the company has no legal obligation to distribute, dividends out of EAS. This is in sharp contrast to the claims of debenture-holders which as a contractual obligation of the company must always be honoured irrespective of its financial position.

Residual Claim on Assets The ordinary shareholders' claim in the assets of the company is also residual in that their claim would rank after the claims of the creditors and preference shareholders in the event of liquidation. If the liquidation value of assets is insufficient, their claims may remain unpaid.

Right to Control As owners of the company, the equity-holders have the right to control the operations of/ participate in the management of, the company. Their control is, however, indirect. The major policies/decisions are approved by the Board of Directors and the Board-appointed management carries out the day-to-day operations. The shareholders have the legal right/power to elect the board of directors as well as vote on every resolution placed in various meetings of the company. Though, in theory, they have indirect right to control/participate in management, in actual practice, it is weak and ineffective partly because of the apathy and indifference of the majority of the shareholders who rarely bother to cast their votes and partly because scattered and by and large unorganised equity-holders are unable to exercise their collective power effectively.

Voting System The ordinary shareholders exercise their right to control through voting in the meetings of the company. According to the most commonly used system of voting in India, namely,

Proportionate voting is the system under which each share is allotted a number of votes equal to the number of directors to be elected and votes can be given to any director.

majority rule voting, each share carries one vote and each director is elected individually. Therefore, a shareholder can cast the total number of shares held by him for the election of each director separately. As a result, shareholders/group holding more than 50 per cent of the outstanding equity shares would be able to elect all the directors of their choice. An alternative is **proportionate rule voting** under which the number of votes held by a shareholder/group equals the number of shares held by him multiplied by/times the number of directors to be elected. The total votes held may be cast/spread in any manner: all just for one candidate or spread over as many candidates as the shareholders wishes to vote

for. The proportionate voting system may enable even minority shareholders some representation on the board while all the members of the board may be elected by the holders of the majority of ordinary shares.

Pre-emptive Right The ordinary shareholders of a company enjoy **pre-emptive** rights in the sense that they have a legal right to be offered by the company the first opportunity to purchase additional issue of equity capital in proportion to/pro rata basis their existing/current holdings/ownership. A shareholder owning 2 per cent of the existing issued capital is entitled/has a pre-emptive right to acquire 2 per cent of additional shares to be issued by the company. The option to the shareholders to purchase a specified number of equity shares at a stated price during a given period is called **rights**. The shareholders can (i) exercise, (ii) sell in the market and (iii) renounce/forfeit their pre-emptive right partially or completely. The shares available as a result of non-exercise of right would be allotted on a *pro rata* basis to shareholders exercising the right. Any balance of shares can be offered to the public for subscription.

While the pre-emptive rights ensure that management cannot issue additional shares to strengthen its control by selling them to persons/groups favourably inclined to it, on one hand, it protects the existing shareholders from **dilution of their financial interest** as a result of new equity issues, on the other.

Assume Avon Industries Ltd (AIL) has currently 30,00,000 shares outstanding. The market price is ₹65 per share. The AIL plans to issue 10,00,000 additional shares at a subscription/issue price of ₹40 per share. The number of rights to buy a new share = 30 lakh/10 lakh = 3. The market price of a share after right issue

=
$$\frac{(30,00,000 \times ₹65) + (10,00,000 \times ₹40)}{(30,00,000 + 10,00,000)} = ₹58.75.$$
 A shareholder can buy one new share for

₹40 plus 3 rights. The total value of 3 rights = ₹58.75 - ₹40 = ₹18.75. The value of each right = ₹18.75/3 = ₹6.25. Thus, the *ex-right* price of a share drops by ₹6.25 from the *cum-right* (rights-on) price of ₹65 to the *ex-rights* price of ₹58.75. The existing shareholders do not gain/lose from rights issue. What he receives in the form of value of a right, he loses in the form of a decline in the share price. His financial interest remains unaffected when he exercises his right or sells his rights. In case he does not exercise his right, there will a dilution of his financial interest.

Majority rule voting is the system where by in the election of directors, each shareholder is entitled to one vote for each share held and he can vote all shares for each director separately.

Pre-emptive right (rights) is a legal right of existing shareholders to be offered by the company in the first opportunity to purchase additional equity shares in proportion to their current holdings.

Dilution of control/financial interest occurs when a new share issue results in each existing shareholder having a claim in a smaller part of the firm's earnings than before.

Assume further, Mr X owns 300 shares of AIL. His total wealth/financial interest is ₹19,500 ($300 \times ₹65$). After the exercise of his right, his holdings will be 400 shares. His total wealth would be ₹23,500 ($400 \times ₹58.75$). But he has spent ₹4,000 ($₹40 \times 100$) to acquire additional shares. So his net financial interest = ₹23,500 – ₹4,000 = ₹19,500, that is, equal to before rights issue.

In case Mr X sells his right @ ₹6.25, his total financial position in AIL would be ₹19,500 [$(₹58.75 \times 300) + (₹6.25 \times 300)$]: the same as before the rights issue.

If he does not exercise his right to buy/sell, his financial interest will suffer a dilution as his total wealth = ₹17,625 ($₹58.75 \times 300$), that is, a dilution of ₹1,875 ($₹19,500 - ₹17,625$).

In brief, **an investor suffers dilution of financial interest when he does not exercise his pre-emptive rights.**

Limited Liability Although the equity holders share the ownership risk, their liability is limited to the extent of their investment in the share capital of the company.

Evaluation

As the single most important source of long term funds, equity capital has merits as well demerits from the viewpoint of the company as well as the shareholders.

Merits The advantages of equity capital to a company are: first, it is a permanent source of funds without any repayment liability; second, it does not involve obligatory dividend payment and, thirdly, it forms the basis of further long-term financing in the form of borrowing related to the creditworthiness of the firm. The shareholders with limited liability exercise control and share other ownership rights in the income/assets of the firm.

Demerits The disadvantages of equity capital from the viewpoint of a company are: **(i)** High cost of funds reflecting the high required rate of return of investors as a compensation for higher risk as also the fact that equity dividends are not tax-deductible payments. They are paid out of post-tax profits; **(ii)** High flotation cost in terms of underwriting, brokerage and other issue expenses compared to other securities; **(iii)** Dilution of control of existing shareholders on sale of new shares to outsiders/public. The disadvantages associated with equity capital for the shareholders are: **(i)** The equity capital is in reality risk capital as it ranks the last as a claimant to income as well as the assets of the company. **(ii)** The scattered and unorganised shareholders are unable to exercise effective and real control over the company. **(iii)** The shareholders cannot claim dividend as a matter of right. **(iv)** There is a wide fluctuation in share prices with attendant risk for the investors.

In brief, equity capital is a high risk-high reward permanent source of long-term finance for corporate enterprises. The shareholders who desire to share the risk, return and control associated with ownership of companies would invest in corporate equity. **As a source of long-term fund, it has high cost, low/nil risk, does not dilute control and puts no restraint on managerial freedom.**

LO 22.2 ISSUE PROCEDURES

The procedural aspects of raising of equity shares and securities convertible/exchangeable into equity shares prescribed by the Securities and Exchange Board of India (SEBI) in terms of the following: **(i)** common conditions for public and rights issues, **(ii)** provisions as to public issues, **(iii)** rights issues, **(iv)** preferential issues, and **(v)** qualified institutional placement are discussed below.

Common Conditions for Public/Rights Issues

While public issue means an initial public offer (IPO) or a further public offer (FPO), a rights issue means an offer of equity shares and convertible securities by a listed issuer to its shareholders as on the record date. An **IPO** is an offer of shares/convertible securities by an unlisted issuer to the public for subscription including an offer for sale by existing holders in an unlisted issuer. A **FPO** is an offer of shares/convertible securities by a listed issuer including an offer for sale in a listed issuer. The common conditions for public/rights issues are: general conditions, appointment of intermediaries, filing of offer document, documents submitted before issue opening, draft offer documents made public, issue pricing, fast track issues, issue opening, despatch of material, underwriting, minimum subscription, oversubscription, monitoring agency, manner of calls, allotment/refund, restrictions on further issues, additional requirements for issue of convertible debt instruments (CDIs), rollover, conversion, issue of CDIs for financing and alteration of rights of holders of securities.

The general conditions to be satisfied by an issuer at the time of filing/registering the draft/final offer documents (in case of public issue) and letter of offer (in case of rights issue) with the SEBI/Register of Companies (RoCs)/Designated Stock Exchange (DSE) are: **(i)** The issuer/its promoters/promoter group/person(s) in control are not debarred from accessing the capital market, **(ii)** The issuer of CDIs is not in the list of RBI's willful defaulters/in default for more than six months, has made an application for listing on a RSE (recognised stock exchange) and has entered into an agreement with a depository for demat of securities **(iii)** All existing partly paid-up shares are fully paid up/forfeited, **(iv)** Firm arrangements for 75 per cent of the stated means of finance excluding the amount from the proposed issue/internal accruals have been made.

The issuer should appoint (lead) merchant banker(s)/intermediaries to carry out the issue-related obligations. It should also appoint syndicate members in book-built issues, bankers to an issue at all mandatory collection centres and registrars to an issue who have connectivity with all the depositories. Book building is the process to elicit demand/assess the price to determine quantum/value of securities/IDRs.

An offer document together with the specified fee should be filed with the SEBI not less than 30 days before registering the prospectus/red herring prospectus/shelf prospectus with the ROCs or letter of offer with the DSE. Any changes/observations by the SEBI should be complied with before filing them with the ROCs/DSE/SEBI.

Issuers must obtain in-principle approval for listing of the securities from the concerned RSEs having nation-wide trading terminals.

The lead merchant banker should submit to the SEBI along with the offer document **(i)** copy of the agreement with the issuer **(ii)** *inter se* allocation of responsibilities of each merchant banker **(iii)** due diligence certificates from the concerned lead merchant banker/debenture trustees **(iv)** statements certifying all changes/observations by SEBI have been incorporated in the offer document/ certificate from a Chartered Accountant in respect of promoters contribution and Board of Directors resolution for allotment of securities to promoters. The issuer should submit PAN/bank account/ passport number of its promoters.

The offer document should be hosted on the website of the SEBI/concerned RSEs/merchant bankers for public comment for not less than 21 days.

The above requirements relating to filing of offer documents, in-principle approval for listing and submission of documents before issue opening would not apply if the **(i)** issuers (fast track

- **IPO**
- is an offer of
- shares/convertible
- securities by an
- unlisted issuer
- to the public
- for subscription
- including an offer
- for sale by existing
- holders in an
- unlisted issuer.

- **FPO**
- is an offer of
- shares/convertible
- securities by
- a listed issuer
- including an offer
- for sale in a listed
- issuer.

issue) shares have been listed for at least three years **(ii)** the average market capitalisation of its public shareholding is at least ₹10,000 crore **(iii)** the annualised turnover of its shares has been at least two per cent of weighted average number of shares listed during the last six months **(iv)** it has redressed at least 95 per cent of its investors grievances/complied with the equity listing agreement for at least three years **(v)** the impact of the auditor's qualification on its accounts does not exceed five per cent of its net profits/loss after tax, **(vi)** no show-cause notice has been issued/proceedings initiated by the SEBI pending against it/promoters/whole time directors and **(vii)** the entire promoters holding is in demat form.

An issue should open within **(a)** 12 months from the date of the SEBI's observations on the offer document **(b)** three months after 30 days in case of no observation from the SEBI.

The offer document/other issue material should be despatched to the DSE/syndicate members/underwriters/banker to an issue/investors association/SCSBs (Self-Certified Syndicate Banks) in case of ASBA (Application Supported by Blocked Amount) in advance.

Issues can be underwritten only by SEBI-registered underwriters/book runners (syndicate members). But securities compulsorily allotted to QIBs (Qualified Institutional Buyers) cannot be underwritten. The lead merchant banker/book runner must undertake a minimum underwriting of the lower of the five per cent of the total commitment or ₹25 lakh.

The minimum subscription in an issue should be 90 per cent of the offer. In case of its non-receipt the entire application money received should be refunded within 15 days and seven days from the date of closure of the issue in non-underwritten and underwritten issues respectively.

For issue size exceeding ₹500 crore, a PFI (Public Financial Institution)/bank should be appointed to monitor the use of the issue proceeds. Where a monitoring agency is not appointed, the outstanding subscription must be called within 12 months of allotment. Shares with calls in arrear should be forfeited. Within 15 days of the failure of an issue, the application money must be refunded failing which the specified interest would have to be paid.

In addition to the other requirements, an issuer of CDIs should comply with the following conditions: **(i)** obtain credit rating **(ii)** appoint debenture trustees **(iii)** create debenture redemption fund **(iv)** assets on which charge is proposed are sufficient to discharge the liability and free from encumbrances. They should be redeemed in terms of the offer document.

The non-convertible portion of the partly CDIs can be rolled over without change in the interest rate if 75 per cent of the holders approve it, an auditor's certificate on its liquidity position has been sent to them, the holding of all holders who have not agreed would be redeemed, credit rating has been obtained and communicated to them before rollover.

Positive consent of the holders would be necessary for the optional conversion or CDIs into shares. The holders should be given the option not to convert them if the conversion price was not determined/disclosed to the investors at the time of the issue.

The terms of issue of securities adversely affecting the investors can be altered with the consent/sanction in writing of at least 75 per cent/special resolution of the holders.

Public Issues

The provisions as to public issues are: eligibility requirements, pricing, promoters contribution, lock-in and minimum offer to public/reservations.

The eligibility conditions relate to IPOs and FPOs. An IPO can be made by an issuer who has **(i)** net tangible assets of at least ₹3 crore in the preceding three years not more than 50 per cent of which should be monetary assets, **(ii)** a track record of distributable profits for at least three out of immediately preceding five years; in case of a partnership converted into a company/company

formed out of a diversion, their track record would be considered only if their financial statements of the respective years are revised to conform to the format prescribed by the Companies Act and certified by a chartered accountant to that effect, (iii) net worth of at least ₹1 crore in the preceding three years, (iv) the aggregate of all issues in one financial year does not exceed five times of its pre-issue net worth and (v) at least 50 per cent of the revenue of the preceding year has been earned from the activity indicated by the new name in case of change of its name within the last one year.

An issuer who does not satisfy any of the above five conditions can make an IPO if it alternatively satisfies the following two conditions: (a) it is through book building with at least 50 per cent of the net offer to the public allotted to QIBs or at least 15 per cent of the project cost is contributed by PFIs/banks of which a minimum 10 per cent is from appraisers and 10 per cent of the net offer to the public is allotted to QIBs, (b) its minimum post-issue face value of capital is ₹10 crore or there would be compulsorily market making for at least two years from the date of listing of the securities provided the minimum depth of securities for buy and sell quotes is 300, the bid-ask spread never exceeds 10 per cent and the inventory of the market is not less than five per cent of the issue.

An IPO of CDIs can be made without a prior issue/listing of shares. The minimum number of allottees in a public issue is 1,000. An IPO cannot be made if on the date of registration of the prospectus with the ROCs there are outstanding convertible securities/rights entitling a person the option to receive shares after the IPO. Shares held for at least one year prior to the filing of the draft offer document with the SEBI may be offered for sale. An IPO grading from a SEBI-registered rating agency is mandatory.

A FPO can be made if the issuer satisfies the two requirements of an IPO, namely, the aggregate of the issue size in one year (i.e. 5 times its pre-issue net worth) and the minimum revenue (i.e. 50 per cent) from the activity indicated by the new name in case of change within the last one year. If these two conditions are not satisfied, a FPO can be made in a manner similar to an IPO when the issuer does not satisfy the five conditions.

The price of specified securities/coupon rate/conversion price of CDIs should be determined by the issuer in consultation with the merchant banker(s) or through the book building process.

Book Building There are two alternative methods of book built issues. According to the **first method**, the lead merchant banker would act as the lead book runner and be primarily responsible for book building. Other merchant banker would act as co-book runners/syndicate members. The issue should be compulsorily underwritten by the book runner(s) and sub-underwritten by the syndicate members. The book runners/syndicate members should appoint SEBI-registered brokers and the self certified syndicate banks in case of ASBA would act as bidding/collection centres.

- **Book building**
- is a process to
- elicit demand for
- securities and
- assess price for
- them.

If the issue size is disclosed, the red-herring prospectus may not contain the price/number of securities, but the floor price/price band may be mentioned. In case of its non-disclosure, the price should be disclosed at least one/two working days before the bid opening in an IPO and FPO respectively. In case of opting price band by the issuer, the cap should not be more than 120 per cent of the floor. In case of revision of price, the bidding period should be extended by three days.

The minimum application value of an anchor investor should be ₹10 crore in a public issue. Upto 30 per cent available to QIBs may be allocated to them, one-third of which to mutual funds. The bidding for them should open one day before the issue opening date and they should pay

at least 25 per cent margin on application and the balance within two days of the closure of the issue. The margin money from non-Q1B category should be uniform for each category.

The bidding should be through an electronically-linked transparent facility of a RSE. All non-ASBA investors can revise their bids and the QIBs cannot withdraw their bids after the closure of the bidding.

The issue price should be fixed on the basis of the bids received and the number of securities to be offered. All the successful bidders whose bids are above the final/cut-off price would be entitled for allotment. The retail individual investor may bid at the cut-off rate.

The allotments to categories except anchor investors should be made proportionately and the unsubscribed portion in any category should be allocated as per the disclosures in the red-herring prospectus.

The **alternative method of book-building** issue, available only in case of further public offer, differs from the first in respect of determination of prices and allocation to non-anchor-investors on proportionate basis.

A floor price should be disclosed in the red-herring prospectus or announced at least one day before bid opening. The QIBs should bid above the floor price. Allotment of shares should be on price priority basis to the QIBs and on proportionate basis to the RIIs (retail individual investors)/non-institutional investors and employees at the floor price. The issuer may place **(a)** cap in terms of **(i)** number of securities **(ii)** percentage of its issued capital that may be allotted to a single bidder and **(b)** decide whether a bidder be allowed **(i)** to revise the bid upwards/downwards in terms of price/quantity **(ii)** single/ multiple bids.

The securities may be offered at differential prices **(i)** to retail individual investors/shareholders or employees and **(ii)** in a composite issue on public-cum-rights basis. A price/price band (in draft prospectus) and floor price/price band (in red-herring prospectus) may be mentioned and the (one) price/specific coupon rate on CDIs may be determined at a later stage. The cap on the price band/coupon rate can be upto 120 per cent of the floor price/rate. The floor/final price should not be less than the face value. The face value of shares should be between ₹10 and 1 and ₹10 per share in case of issue prices being ₹500 and above and below ₹500 respectively.

The minimum promoters contribution in a public issue should be at least 20 per cent of the post-issue capital (in IPO)/proposed issue size/post issue capital (in FPO) and composite issue excluding the rights component. It should be by way of shares/subscription to convertible securities. In case of an IPO of CDIs without a prior public issue, it should be 20 per cent of the project cost in the form of shares and at least 20 per cent of the issue size should be from their own funds. Any excess contribution should be at the higher of the price applicable to preferential issues (**discussed later**) and the issue price. The contribution should be brought in at least one day before the issue opening date.

The specified securities held by promoters and others are not transferable. The lock-in of securities held by promoters in a public issue would be three years from the date of commencement of commercial production and allotment in public issue whichever is earlier, in respect of minimum contribution and one year in case of excess contribution. In case of an IPO, the entire pre-issue capital held by other investors would be locked-in for one year. Securities lent to a stabilising agent under green shoe option would be subject to lock-in for the remaining period from the date of their return to the lender. The lock-in securities may be pledged by the promoters with a bank/PFI for loan for financing the object(s) of the issue. Promoters as well non-promoter holders of lock-in securities can transfer them respectively to another promoter/person. The lock-in will continue till the remaining period with the transferee till its expiry.

The minimum/net offer to public should be 10 and 25 per cent of the post-issue capital (in an IPO) and issue size (in FPO). Reservations on competitive/proportionate basis out of the issue size (excluding promoters contribution and net offer to public) can be made: **(a)** in a book-built issue, to employees, shareholders and persons associated with the issuer as depositors/bondholders/subscribers to its services upto five per cent of the issue size, **(b)** in a non-book-built issue to employees and shareholders and **(c)** in case of FPO (other than a composite issue) to retail individual shareholders. The unsubscribed portion in a reserved category may be added to the other and the unsubscribed portion after the *inter se* adjustment should be added to the net offer to the public category. The allocation to the net offer to the public would be: **(a)** in a book-built issue **(i)** retail individual investors, at least 35 per cent, **(ii)** non-institutional investors, at least 15 per cent, **(iii)** QIBs, not more than 50 per cent of which five per cent to mutual funds who would also be eligible for allocation under the balance available for QIBs; upto 35 per cent of the QIB share to an anchor investor making an application for at least ₹10 crore, **(iv)** issuer who does not satisfy the five eligibility conditions, at least 50 per cent to QIBs, **(v)** where the issuer is required to allocate 60 per cent to the QIBs, to retail individual investors, 30 per cent and non-institutional investors, 10 per cent; **(b)** in a non-book built issue, at least 50 per cent to retail individual investors, the balance to other individual/institutional investors. An issuer may provide a safety net to purchase upto a maximum of 1,000 securities at the issue price per allottee within six months from the date of dispatch of security certificates/credit of demat amount.

An issuer may provide **green shoe option** for stabilisation of the post-listing price of its securities by allotting excess shares. Upto 15 per cent of the issue size may be borrowed by the stabilising agent from the promoters/pre-issue shareholders holding more than 5 per cent of the securities. The stabilisation would be available upto 30 days from the date on which permission for trading is given by the RSE. The securities should be returned within two working days after the stabilisation period. If the stabilising agent is unable to buy the securities from the market to the extent of the overallotment, the issuer would allot securities at the issue price to the extent of the shortfall within five days of the stabilisation period. These would be returned to the promoters/pre-issue shareholders in lieu of those borrowed from them.

- **Green shoe option**
- is the option for stabilisation of the post-listing price of securities in a public issue by allotting excess shares.

Unless otherwise provided, a public issue should be open for a minimum of three and a maximum of 10 days. The pre-issue advertisement should be made in one English/Hindi national daily and one regional language newspaper. The minimum application value is in the range of ₹5,000 — ₹7,500. Applicants should be invited in multiples of this value. The minimum application should be 25 per cent of the issue price. The entire issue price in an offer for sale should be brought in as application money. The allotment of securities to non-anchor investors should be on proportionate basis within the specified categories.

Rights Issues

The main elements of the framework of rights issues are record date, restrictions, letter/abridged letter of offer, pricing and subscription period, pre-issue advertisement and utilisation of funds.

To determine the eligibility of the shareholders, a record date should be announced after which a rights issue cannot be withdrawn. Rights issue can be made only after reserving shares of the same class in favour of holders of outstanding fully/partly CDIs in proportion to the convertible part. The abridged letter of offer together with the application form should be sent to all the existing shareholders at least three days before the opening of the issue. Applications can also be made on plain paper. Such applicants cannot renounce their rights. Applications by shareholders on

application form as well as on plain paper would be rejected. The issue price should be determined before the record date and the issue should be open for a minimum of 15 days and a maximum of 30 days. The pre-issue advertisement in one English/Hindi/regional newspaper should be made at least three days before the date of opening of the issue. The funds collected can be utilised after the finalisation of the basis of allotment.

Preferential Issues

Preferential issue is an issue of specified securities by a listed issuer to any select group/group of persons on a private placement basis. The main elements of such issues are: conditions, disclosures, allotments, tenure of convertible securities, pricing of shares payment of consideration, lock-in and transferability of lock-in securities/warrants.

The conditions for preferential issues are a special resolution by the shareholders, all shares held by the proposed allottees are in demat form and the issuer **(i)** is in compliance with the conditions for continuous listing and **(ii)** has obtained the PAN of the allottees.

In the explanatory statement to the notice for the special resolution the issuer should disclose **(i)** objects of the issue, **(ii)** shareholding pattern before/after issue, **(iii)** the time-frame for the issue, **(iv)** identity of the proposed allottees, and **(v)** undertaking relating to recomputation of prices of the securities and lock-in till the payment of the recomputed prices by the allottees. The resolution should specify the relevant date to calculate the share prices. A copy of the certificate of the statutory auditors should also be placed before the general body meeting. The valuation of the assets other than cash in consideration for which shares are being issued should be done by an independent qualified valuer.

The allotment should be completed within 15 days from the date of passing the resolution failing which a fresh special resolution would be necessary.

The tenure of convertible securities should not exceed 18 months from the date of their allotment.

If shares have been listed for six months and more, they should be allotted at a price higher of the average of the weekly high and low of the quoted closing prices of the related shares during the **(i)** six months, **(ii)** two weeks preceding the relevant date. If listed for less than six months, the shares should be allotted at a price higher than **(a)** the average of the weekly high and low of the closing prices during **(i)** the shares have been listed and **(ii)** two weeks preceding the relevant date and **(b)** the price at which they were issued in the IPO. On completion of the six months, the price should be recomputed with reference to the average of the weekly high and low of the closing prices during those months and the allottees would have to pay the difference between the recomputed price and the allotment price. Preferential issues to the QIBs should be made not below the average of the weekly high and low of the closing prices of the related shares during the two weeks preceding the relevant date.

Full price of the securities other than warrants should be paid by the allottees at the time of allotment. At least 25 per cent of the price should be paid against each warrant on the date of their allotment and the balance 75 per cent on allotment of shares pursuant to the exercise of option.

The allotted securities to promoters and others should be locked-in for three and one year(s) respectively. Partly-paid shares would be locked-in for one year of becoming fully paid-up. The entire pre-preferential allotment shareholding of allottees would be lock-in from the relevant date upto six months from the date of such allotment.

The lock-in securities held by promoters may be transferred among them or new promoters/promoters in control of the issuer. The lock-in would continue for the remaining period with the transferee.

Qualified Institutional Placement

The **qualified institutional placement (QIP)** is the allotment of shares/CDIs/warrants and other convertible securities by a listed issuer to QIBs on private placement basis. The main elements of QIP are: conditions, placement document, pricing, allotment restrictions, minimum number of allottees, validity of the special resolution, tenure and transferability.

The QIP should satisfy the following conditions: **(i)** a special shareholders' resolution, **(ii)** listing of shares of the same class on a stock exchange for at least one year and **(iii)** is in compliance with the requirement of minimum public shareholding. It should be made on the basis of a placement document containing all the specified material information.

The QIP should be made at a price not below the average of the quoted weekly high and low of the closing prices of shares of the same class during the two weeks preceding the relevant date. Partly paid-up eligible securities should not be allotted. Equity shares allotted on exercise of option attached to a warrant should be fully paid-up.

A minimum of 10 per cent of the eligible securities should be allotted to mutual funds. Direct/indirect allotment cannot be made to a promoter-QIB/a person related to the promoter. Bids by applicants cannot be withdrawn after the closure of the issue.

The minimum number of allottees for each placement should be at least two for issue size upto ₹250 crore and five for more than ₹250 crore. No single allottee can be allotted more than 50 per cent of the issue size.

The allotment of securities should be completed within 12 months from the date of the resolution. There should be a gap of at least six months between each placement in case of multiple placements. The aggregate of the QIP together with all the QIPs in one financial year should not exceed five times the networth of the issuer. The maximum tenure of convertible/exchangeable securities would be five years. The allottees can sell the securities for one year only on a recognised stock exchange.

- **QIP**
- is the allotment
- of shares/ CDIs/
- warrants and
- other convertible
- securities by a
- listed issuer to
- QIBs on private
- placement basis.

SUMMARY

Equity/ordinary share capital represents ownership capital and its owners—equity-holders/ordinary shareholders—share the reward and risk associated with the ownership of corporate enterprises.

The ordinary shares have some special features in terms of the rights and claims of their holders: (i) residual claim to income, (ii) residual claim on assets, (iii) right to control, (iv) pre-emptive rights and (v) limited liability.

A shareholder can (1) exercise (2) sell in the market and (3) renounce/forfeit his pre-emptive right partially/completely. He does not gain/lose from rights issues. However, he would suffer dilution of financial interest if he does not exercise his pre-emptive right.

Ordinary share capital is a high-risk-reward source of finance for corporates. The shareholders share the risk, return and control associated with ownership of companies.

The common conditions for public/rights issues are: general conditions, appointment of intermediaries, filing of offer document, documents submitted before issue opening, draft offer documents made public, issue pricing, fast track issues, issue opening, despatch of material, underwriting, minimum subscription, oversubscription, monitoring agency, manner of calls, allotment/refund, restrictions on further issues, additional requirements for issue of convertible debt instruments (CDIs), rollover, conversion, issue of CDIs for financing and alteration of rights of holders of securities.

The provisions as to public issues are: eligibility requirements, pricing, promoters contribution, lock-in and minimum offer to public/reservations.

The main elements of the framework of rights issues are record date, restrictions, letter/abridged letter of offer, pricing and subscription period, pre-issue advertisement and utilisation of funds.

Preferential issue is an issue of specified securities by a listed issuer to any select group/group of persons on a private placement basis. The main elements of such issues are: conditions, disclosures, allotments, tenure of convertible securities, pricing of shares payment of consideration, lock-in and transferability of lock-in securities/warrants.

The qualified institutional placement (QIP) is the allotment of shares/CDIs/warrants and other convertible securities by a listed issuer to QIBs on private placement basis. The main elements of QIP are: conditions, placement document, pricing, allotment restrictions, minimum number of allottees, validity of the special resolution, tenure and transferability.

SOLVED PROBLEMS

P.22.1 Delhi Manufacturers (DMs) intend to raise ₹40,00,000 of equity capital through a rights offering. It currently has 10,00,000 shares outstanding which have been most recently selling/trading for ₹50 and ₹56 per share. In consultation with the SEBI Caps, the DM has set the subscription price for the rights at ₹50 per share.

LO 22.1 LOO M

Required

1. Determine the number of new shares DM should sell to raise the desired amount of capital.
2. Ascertain the number of shares each right would entitle a holder of one share to purchase. How many additional shares can an investor who holds 10,000 shares of DM purchase?
3. Compute the theoretical value of a right if the current market price is ₹54 **with rights** and the subscription price is ₹50 for both shares selling **with rights** and shares selling **ex-rights** (i.e. the value of the right is not included in the market price of shares).

Solution

$$1. \text{ Number of new shares} = \frac{\text{₹40,00,000 (to be raised)}}{\text{₹50 (subscription price)}} = 80,000 \text{ shares}$$

$$2. \text{ Number of shares per right} = \frac{80,000 \text{ (new shares)}}{10,00,000 \text{ (shares outstanding)}} = 0.08 \text{ share}$$

$$\text{Additional shares} = 0.08 \text{ shares/right} \times 1 \text{ right/share} \times 10,000 \text{ shares} = 800 \text{ shares}$$

3. Theoretical value of right with rights, R_w :

$$R_w = \frac{M_w - S}{N + 1}$$

Where

R_w = theoretical value of a right when the share is selling with rights/cum rights

M_w = market value of the stock with rights/cum-rights

S = subscription price of the shares

N = number of rights needed to purchase one share

Substituting the values,

$$R_w = \frac{\text{₹54} - \text{₹50}}{12.5^{\text{a}} + 1} = \frac{\text{₹4}}{13.5} = \text{₹0.296}$$

$$\text{a} N = \frac{1}{0.08} = 12.5 \text{ rights need to purchase one new share.}$$

Theoretical value of right ex-right,

$$R_e = \frac{M_e - S}{N}$$

Where

R_e = theoretical value of a right when the share is trading **ex-right**

M_e = market value of shares trading ex-right.

Substituting the values,

$$\frac{₹53.704^{**} - ₹50}{12.5} = \frac{₹3.704}{12.5} = ₹0.296$$

$$^{**}M_w - R_w = ₹54 - ₹0.296 = ₹53.704$$

The investor would receive at least the theoretical value of ₹0.296 per right \times 10,000 shares = ₹2,960. If he expects the price of DMs shares to increase during the period the rights are exercisable, the market value of the rights would be more than their theoretical value.

P.22.2 The Standard Company (SC) wishes to raise ₹30,00,000 through a rights offering. It has currently 2,40,000 shares outstanding which have been most recently trading between ₹106 and ₹116 per share. On the advice of the SBI Caps, the SC has set the subscription price for the rights at ₹100 per share on the assumption that they will be fully subscribed.

LO 22.1 100
M

Required

- How many new shares should SC sell to raise the desired amount?
- How many shares will each right entitle a holder of one share to purchase?
- What is the theoretical value of a right if the current market price is ₹109 with rights and the subscription price is ₹100? Answer for both shares selling with rights and shares selling ex-rights?

Solution

$$(a) \text{ Number of new shares} = \frac{₹30,00,000}{₹100} = 30,000 \text{ shares}$$

$$(b) \text{ Number of shares per right} = \frac{2,40,000}{30,000} = 8, \text{ that is, 8 shares rights are needed to purchase a new share at ₹100. Each right entitles its holder to purchase one- right of a share.}$$

(c) Value of a right, with rights

$$= \frac{₹109 - ₹100}{8 + 1} = ₹1$$

Value of a right, ex-right

$$= \frac{₹108^{*} - ₹100}{8} = ₹1$$

* ₹109 - ₹1

Thus, the theoretical value of the right when the share is selling with rights or ex-rights is the same.

REVIEW QUESTIONS

LOD: Easy

RQ.22.1 Fill in the following blanks with appropriate answers:

[LO 22.1, 2]

- An equity shareholder can renounce his _____ to subscribe to the additional issue partially/completely.

- (ii) Ordinary share capital is a high-risk _____ source of finance for investors.
- (iii) Companies can freely _____ their share issues.
- (iv) _____ is a process to elicit demand for, and price of, securities.
- (v) The entire net offer should be compulsorily _____ by the syndicate members/book runners(s).
- (vi) The book runner(s) and the issuing company would determine the _____ price on the _____ received through the syndicate members.
- (vii) A company making an IPO can avail of the _____ option.
- (viii) Under the green shoe option the amount of the shares to be over-allotted can be _____ of the issue size out of the shares borrowed from the promoters.
- (ix) A listed company can raise funds upto _____ times of its networth through qualified institutional placement.
- (x) A maximum of _____ per cent of the issue size can be allotted to one single QIB/allottee.

[Answers: (i) pre-emptive right (ii) high-reward (iii) price (iv) Book-building (v) underwritten (vi) issue, bid (vii) green shoe (viii) upto 15 per cent (ix) five and (x) 50]

RQ.22.2 What are the different types of equity/ordinary share capital? [LO 22.1]

RQ.22.3 Explain briefly preferential issues of securities. [LO 22.2]

LOD: Medium

RQ.22.4 Discuss briefly the features of equity shares as sources of long-term finance. [LO 22.1]

RQ.22.5 Discuss the merits and demerits of equity shares. [LO 22.1]

RQ.22.6 Give a brief account of eligibility norms for (i) IPOs/offer for sale by unlisted companies and (ii) public issues by listed companies. [LO 22.2]

RQ.22.7 What are the requirements relating to (i) promoters' contribution and (ii) lock-in in public issues? [LO 22.2]

RQ.22.8 Explain the main features of the 75 per cent book-building process. [LO 22.2]

RQ.22.9 Discuss the offer to public through book-building process. [LO 22.2]

RQ.22.10 Explain the allocation/allotment in book-building mechanism. [LO 22.2]

RQ.22.11 Explain and illustrate green shoe option. [LO 22.2]

RQ.22.12 What is rights? Compare the value of rights when a share is selling with/cum-rights with its ex-rights value. [LO 22.1]

RQ.22.13 Hypothetical Ltd (HL) is interested in raising ₹18,00,000 of new equity capital through a rights issue/offering. Its current capital consists of 9,00,000 shares. It would set the subscription price at ₹50 and anticipates that the shares would sell for ₹58 with rights. [LO 22.1]

Required

1. Number of shares the HM should sell to raise the desired amount of funds.
2. Number of rights needed to purchase one share at the subscription price.
3. Additional shares an investor holding 96,000 shares of HL can purchase on exercising his rights.
4. Theoretical value of a right when the share sells (i) with/cum-rights and (ii) ex-rights.
5. Amount the investor holding 96,000 shares of HL would get for his rights immediately after the share goes ex-rights.

LOD: Difficult

RQ.22.14 Explain the pre-emptive rights of the ordinary shareholders. How is their financial interest affected by the issue of rights shares? [LO 22.1]

RQ.22.15 How can issues of securities be priced by the issuing companies? [LO 22.2]

Term Loans, Debentures/Bonds and Securitisation

LEARNING OBJECTIVES

LO 23.1	Understand the characteristics of term-loans, positive and negative covenants in a loan agreement, loan amortisation and the procedure associated with a term-loan
LO 23.2	Describe the basic characteristics of corporate debentures/bonds/notes, general features of a debenture issue, bond refunding options, innovative debt instrument, the procedure of issuing debt instruments and rating of debt instruments
LO 23.3	Define securitisation, describe the general features of securitisation process, credit enhancement, parties to a securitisation transaction, asset characteristics and types of securitised assets

INTRODUCTION

Apart from owners share capital, corporate enterprises raise long-term funds from creditors in the form of term loans, debentures, bonds and so on. The bulk of term loans raised by the corporates was provided earlier by the financial institutions such as IDBI, ICICI and IFCI. Banks have entered term-lending business in the last few years, particularly in the infrastructure/core sector. Bonds/debentures have emerged as substantial source of debt finance to corporates in India in the context of **(i)** absence of term loan support by financial institutions, **(ii)** freedom to corporates to design debt instruments, **(iii)** withdrawal of interest ceilings on debt instruments, **(iv)** credit rating of debt instruments, and **(v)** setting up of the wholesale debt market (WDM) segment by the NSE. Securitisation of loan portfolios is also emerging as a popular instrument in the corporate debt market in India. This Chapter focuses on term loans, debentures/bonds and securitisation. The main points are summarised by way of recapitulation.

LO 23.1 TERM LOANS

Term loans are also known as term/**project finance**. The primary source of such loans are financial institutions. Commercial banks also provide term finance in a limited way. The financial institutions

Term (long-term) loan is a loan made by a bank/financial institution to a business having an initial maturity of more than 1 year.

provide project finance for new projects as also for expansion/diversification and modernisation whereas the bulk of term loans extended by banks is in the form of working capital term loan to finance the working capital gap. Though they are permitted to finance infrastructure projects on a long-term basis, the quantum of such financing is marginal.

Features of Term Loans

Secured loan is a loan that has specific assets pledged as collateral.

Maturity The maturity period of term loans is typically longer in case of sanctions by financial institutions in the range of 6-10 years in comparison to 3-5 years of bank advances. However, they are rescheduled to enable corporates/borrowers tide over temporary financial exigencies.

Collateral (secondary) involves the items used by a borrower to back up a loan; any asset against which a lender has a legal claim if the borrower defaults on some provisions of the loan agreement.

Negotiated The term loans are negotiated loans between the borrowers and the are akin to private placement of debentures in contrast to their public offering to

term loans are **secured**. While the assets financed by term loans serve as primary security, all the other present and future assets of the company provide **collateral/secondary** security for the term loan. Generally, all the present as well as the future immovable properties of the borrower constitute a general mortgage/ first equitable mortgage/floating charges for the entire institutional loan including commitment charges, interest, liquidated damages and so on. They are additionally secured by hypothecation of all movable properties subject to prior charge in favour of banks in respect of working capital finance/advance.

Restrictive covenants are contractual clauses in loan agreements that place certain operating and financial constraints on the borrower.

Covenants

Negative To protect their interest, the financial institutions reinforce the asset security stipulation with a number of restrictive terms and conditions. These are known as **covenants**. They are both positive/affirmative and negative in the sense of what the borrower should and should not do in the conduct of its operations and fall broadly into four sets as respectively related to assets, liabilities, cashflows and control. *Some negative covenants are discussed as under:*

Asset-Related Covenants are intended to ensure the maintenance of a minimum asset base by the borrowers. Included in this set of covenants are:

- Maintenance of working capital position in terms of a minimum current ratio,
- Restriction on creation of further charge on asset,
- Ban on sale of fixed assets without the lenders concurrence/approval.

Liability-Related Covenants may, *inter alia*, include:

- Restrain on the incurrence of additional debt/repayment of existing loan, say, without the concurrence/prior approval of the lender/financial institution,
- Reduction in debt-equity ratio by issue of additional capital, and
- Prohibition on disposal of promoters shareholding.

Cashflow Related Covenants which are intended to restrain cash outflows of the borrowers may include:

- Restriction on new projects/expansion without prior approval of the financial institution,
- Limitation on dividend payment to a certain amount/rate and prior approval of the financial institutions for declaration of higher amount/rate,
- Arrangement to bring additional funds as unsecured loans/deposits to meet overrun/shortfall, and
- Ceiling on managerial salary and perks.

Control Related Covenants aim at ensuring competent management for the borrowers. This set of covenants may include

- Broadbasing of board of directors and finalisation of management set-up in consultation with the financial institution,
- Effective organisational changes and appointment of suitable professional staff, and
- Appointment of nominee directors to represent the financial institutions and safeguard their interests.

Positive In addition to the foregoing negative covenants, certain positive/affirmative covenants stating what the borrowing firm should do during the term of a loan are also included in a loan agreement. They provide, *inter alia*, for **(i)** furnishing of periodical reports/financial statements to the lenders, **(ii)** maintenance of a minimum level of working capital, **(iii)** creation of sinking fund for redemption of debt and **(iv)** maintenance of certain net worth.

Repayment Schedule/Loan Amortisation The term loans have to be amortised according to pre-determined schedule. The payment/repayment has two components: **(i)** interest and **(ii)** repayment of principal.

The interest component of loan amortisation is a legally enforceable contractual obligation. The borrowers have to pay a commitment charge on the unutilised amount. The interest on term loans by the financial institutions, subject to a minimum prime lending/floor rate (PLR), is risk-related and varies with the credit risk of the borrower. In case of default in respect of both the interest and principal components, liquidated damages/penal interest at a specified rate for the period of default on the default amount has to be paid.

Typically, the principal is repayable over 6-10 years period after an initial grace period of 1-2 years. Whereas the mode of repayment of term loans is equal semi-annual instalments in case of institutional borrowings, the term loans from banks are repayable in equal quarterly instalments. With this type of loan amortisation pattern, the total debt servicing burden declines over time, the interest burden declining and principal repayment remaining constant. In other words, the common practice in India to amortise loan is repayment of principal in equal instalments (semi-annual/annual) and payment of interest on the unpaid/outstanding loans. A loan amortisation schedule is illustrated in Table 23.1.

TABLE 23.1 Loan Amortisation Schedule (Equal Principal Repayment)

(₹ thousands)

Year	Beginning loan	Principal repayment	Interest (0.14)	Loan payment	Ending loan
(1)	(2)	(3)	(4)	(5)	(6)
1	60.00	7.50	8.40	15.90	52.50
2	52.50	7.50	7.35	14.85	45.00
3	45.00	7.50	6.30	13.80	37.50
4	37.50	7.50	5.25	12.75	30.00
5	30.00	7.50	4.20	11.70	22.50
6	22.50	7.50	3.15	10.65	15.00
7	15.00	7.50	2.10	9.60	7.50
8	7.60	7.50	1.05	8.55	0.00

The debt servicing/loan amortisation pattern involving equal instalment (interest + repayment of principal) is portrayed in Table 23.2.

TABLE 23.2 Loan Amortisation Schedule (Equal Instalment)

Year	Beginning loan	Payment instalment [®]	Interest (0.14)	Principal repayment [3 - 4]	Ending loan [2 - 5]
(1)	(2)	(3)	(4)	(5)	(6)
1	₹60,000	₹12,934	₹8,400	₹4,535	₹55,466
2	55,466	12,934	7,776	5,168	50,298
3	50,298	12,934	7,042	5,896	44,406
4	44,406	12,934	6,216	6,718	37,688
5	37,688	12,934	5,276	7,658	30,030
6	30,030	12,934	4,204	8,730	21,300
7	21,300	12,934	2,982	9,952	11,348
8	11,348	12,934	1,588	11,346	0

[®] Payment instalment = $(₹60,000/PVIFA\ 8,14) = (₹60,000/4.6389) = ₹12,934$

Evaluation

Term loans have merits as well demerits both for the borrower and the lenders.

From the perspective of borrowers, term loan offer all the advantages and disadvantages associated with debenture financing. An additional demerit is that term loan contracts contain restrictive covenants restricting managerial freedom. The right of lenders to nominate directors on the board of the borrowing company may further restrict managerial discretion.

Similarly, the term loans provide all the advantages and disadvantages of debenture financing to the lending institutions together with the additional benefit of restrictive covenants to protect their interests. However, term loans are not represented by negotiable securities. Debt securitisation would go a long way in removing this limitation of term loans *vis-a-vis* debentures.

To conclude, *term loans carry low cost and involve high risk. There is no adverse effect on control but there is moderate restraint on managerial freedom.*

Obtaining a Term Loan

Term Loan Procedure The procedure associated with a term loan involves the following principal steps:

The borrower submits an application form which seeks comprehensive information about the project. The application form covers the following aspects: **(i)** promoters' background, **(ii)** particulars of the industrial concern, **(iii)** particulars of the project (capacity, process, technical arrangements, management, location, land and buildings, plant and machinery, raw materials, effluents, labour, housing, and schedule of implementation), **(iv)** cost of project, **(v)** means of financing, **(vi)** marketing and selling arrangements, **(vii)** profitability and cash flow, **(viii)** economic considerations, and **(ix)** Government consents.

When the application is received, an officer of the financial institution reviews it to ascertain whether it is complete for processing. If it is incomplete, the borrower is asked to provide the required additional information. When the application is considered complete, the financial institution prepares a 'Flash Report' which is essentially a summarisation of the loan application. On the basis of the 'Flash Report', it is decided whether the project justifies a detailed appraisal or not.

The detailed appraisal of the project covers the marketing, technical, financial, managerial, and economic aspects (discussed in detail later). The appraisal memorandum is normally prepared within two months after site inspection. Based on that, a decision is taken whether the project will be accepted or not.

If the project is accepted, a financial letter of sanction is issued to the borrower communicating the assistance sanctioned and the terms and conditions relating thereto.

On receiving the letter of sanction from the financial institution, the borrowing unit convenes its board meeting at which the terms and conditions associated with the letter of sanction are accepted and an appropriate resolution is passed to that effect. The acceptance of the terms and conditions has to be conveyed to the financial institution within a stipulated period.

The financial institution, after receiving the letter of acceptance from the borrower, sends the draft of the agreement to the borrower to be executed by authorised persons and properly stamped as per the Indian Stamp Act, 1899. The agreement, properly executed and stamped, along with other documents as required by the financial institution, must be returned to it. Once the financial institution also signs the agreement, it becomes ineffective.

Periodically, the borrower is required to submit information on the physical progress of the projects, financial status of the project, arrangements made for financing the project, contribution made by the promoters, projected funds flow statement, compliance with the various statutory requirements, and fulfilment of the pre-disbursement conditions. Based on the information provided by the borrower, the financial institution will determine the amount of term loan to be disbursed from time to time. Before the entire term loan is disbursed, the borrower must fully comply with all terms and conditions of the loan agreement.

The term loans are secured through the first mortgage, by way of deposit of title deeds, of immovable properties and hypothecation of movable properties. As the creation of mortgage, particularly in the case of land, tends to be a time consuming process, the institutions permit interim disbursements against alternate security (in the form of guarantees by the promoters). The mortgage, however, has to be created within a year from the date of the first disbursement. Otherwise, the borrower has to pay an additional charge of 1 per cent interest.

Monitoring of the project is done at the implementation stage as well as the operational stage. During the implementation stage, the project is monitored through: **(i)** regular reports, furnished by the promoters, which provide information about placement of orders, construction of buildings, procurement of plant, installation of plant and machinery, trial production, and so on, **(ii)** periodic site visits, **(iii)** discussion with promoters, bankers, suppliers, creditors, and other connected with the project, **(iv)** progress reports submitted by the nominee directors, and **(v)** audited accounts of the company.

Year	1917	1918	1919	1920	1921
...

...

1917

Year	1917	1918	1919	1920	1921
...

...

...

...

...

...

During the operational stage, the project is monitored with the help of (i) quarterly progress report on the project, (ii) site inspection, (iii) reports of nominee directors, and (iv) comparison of performance with promise.

The most important aspect of monitoring, of course, is the recovery of dues represented by interest and principal repayment.

Project Appraisal Financial institutions appraise a project from the marketing, technical, financial, economic, and managerial angles. The principal issues considered and the criteria employed in such appraisal are discussed below.

Market Appraisal The importance of the potential market and the need to develop a suitable marketing strategy cannot be over-emphasised. Hence, efforts are made to (i) examine the reasonableness of the demand projections, (ii) assess the adequacy of the marketing infrastructure in terms of promotional effort, distribution network, transport facilities, stock levels and so on, and (iii) judge the knowledge, experience, and competence of the key marketing personnel.

Technical Appraisal The technical review done by the financial institutions focuses mainly on the following aspects: (i) product mix, (ii) capacity, (iii) process of manufacture, (iv) engineering know-how and technical collaboration, (v) raw materials and consumables, (vi) location and site, (vii) building, (viii) plant and equipment, (ix) manpower requirements, and (x) break-even point.

Financial Appraisal The financial appraisal seeks to assess the following:

Reasonableness of the Estimate of Capital Cost While assessing the capital cost estimates, efforts are made to ensure that (i) padding or under-estimation of costs is avoided, (ii) specification of machinery is proper, (iii) proper quotation are obtained from potential suppliers, (iv) contingencies are provided, and (v) inflation factors are considered.

Reasonableness of the Estimate of Working Results The estimate of working results is sought to be based on (i) a realistic market demand forecast, (ii) price computations for inputs and outputs that are based on current quotations and inflationary factors, (iii) an approximate time schedule for capacity utilisation, and (iv) cost projections that distinguish between fixed and variable costs.

Adequacy of Rate of Return The general norms for financial desirability are as follows: (i) internal rate of return, 15 per cent, (ii) return on investment, 20-25 per cent after tax, (iii) debt-service coverage ratio, 1.5 to 2. In applying these norms, however, a certain degree of flexibility is shown on the basis of the nature of the project, the risks inherent in the project, and the status of the promoter.

Appropriateness of the Financing Pattern The institutions consider the following in assessing the financial pattern: (i) a general debt-equity ratio norm of 1.5:1, (ii) a requirement that promoters should contribute a certain percentage of the project cost, (iii) stock exchange listing requirements, and (iv) the means of the promoter and his capacity to contribute a reasonable share of the project finance.

Managerial Appraisal In order to judge the managerial capability of the promoters, the following aspects are considered:

Resourcefulness This is judged in terms of the prior experience of the promoters, the progress achieved in organising various aspects of the project, and the skill with which the project is presented.

Understanding This is assessed in terms of the credibility of the project plan (including, *inter alia*, the organisation structure, the staffing plan, the estimated costs, the financing pattern, the assessment of various inputs, and the marketing programme) and the details furnished to the financial institutions.

Commitment This is gauged by the resources (financial, managerial, material, and other) applied to the project and the zeal with which the objectives of the project, short-term as well as long-term, are pursued. Managerial review also involves an assessment of the calibre of the key technical and managerial personnel working on the projects, the schedule for training them, and the remuneration structure for rewarding and motivating them.

LO 23.2 DEBENTURES/BONDS/NOTES

Akin to a promissory note, **debentures/bonds** represent creditorship securities and debenture-holders are long-term creditors of the company. As a secured instrument, it is a promise to pay interest and repay principal at stipulated times. In contrast to equity capital which is a variable income (dividend) security, the debentures/notes are fixed income (interest) security.

Attributes

As a long-term source of borrowing, debentures have some contrasting features compared to equities.

Trust Indenture When a debenture is sold to investing public, a trustee is appointed through an **indenture/trust deed**. It is a legal agreement between the issuing company and the trustee who is usually a financial institution/bank/ insurance company/firm of attorneys. The trust deed provides the specific terms of agreement such as description of debentures, rights of debenture-holders, rights of the issuing company and responsibilities of the **trustee**. The trustee is responsible to ensure that the borrower/company fulfills all its contractual obligations.

Interest The debentures carry a fixed (coupon) rate of interest, the payment of which is legally binding/enforceable. The debenture interest is tax-deductible and is payable annually/semi-annually/quarterly. Some public sector undertakings issue tax-free bonds the income from which is exempted from tax in the hands of the investors. A company is free to choose the coupon rate which may be fixed or floated, being determined in relation to some benchmark rate. It is also related to the credit rating of the debenture as an instrument.

Debenture redemption reserve is a requirement in a debenture indenture providing for the systematic retirement of debentures/bonds prior to their maturity.

Maturity It indicates the length of time for redemption of par value. A company can choose the maturity period, though the redemption period for non-convertible debentures is typically 7-10 years. The redemption of debentures can be accomplished in either of two ways: (i) debentures redemption reserve (sinking fund) and (ii) call and put (buy-back) provision.

Debenture Redemption Reserve (DRR) A DRR has to be created for the redemption of all debentures with a maturity period exceeding

- **Debenture/bond**
- is a debt instrument
- indicating that
- a company has
- borrowed certain
- sum of money and
- promises to repay
- it in future under
- clearly defined
- terms.

- **Trust (bond) indenture**
- is a complex
- and lengthy legal
- document stating
- the conditions
- under which a bond
- has been issued.

- **Trustee**
- is a bank/financial
- institution/

18 months equivalent to at least 50 per cent of the amount of issue/redemption before commencement of redemption.

Call and Put Provision The call/buy-back provision provides an option to the issuing company to redeem the debentures at a specified price before maturity. The **call price** may be more than the par/face value by usually 5 per cent, the difference being **call premium**. The put option is a right to the debenture-holder to seek redemption at specified time at predetermined prices.

Call price is the stated price at which a bond may be repurchased by use of a call feature prior to maturity.

Security Debentures are generally secured by a charge on the present and future immovable assets of the company by way of an equitable mortgage.

Convertibility Apart from pure non-convertible debentures (NCDs), debentures can also be converted into equity shares at the option of the debenture-holders. The conversion ratio and the period during which conversion can be affected are specified at the time of the issue of the debenture itself. The convertible debentures may be fully convertible (FCDs) or partly convertible (PCDs). The FCDs carry interest rates lower than the normal rate on NCDs; they may even have a zero rate of interest.

Call premium is the amount by which a bonds' call price exceeds its par value.

The PCDs have two parts: (a) convertible part, (b) non-convertible part. Typically, the convertible portion is converted into equity share at a specified premium after a specified date from the date of allotment, while the non-convertible portion is payable/redeemable in specified equal instalments on the expiry of specified years from the date of allotment.

Credit Rating To ensure timely payment of interest and redemption of principal by a borrower, all debentures must be compulsorily rated by one or more of the four credit rating agencies, namely, Crisil, Ica, Care and FITCH India.

Claim on Income and Assets The payment of interest and repayment of principal is a contractual obligation enforceable by law. Failure/default would lead to bankruptcy of the company. The claim of debenture-holders on income and assets ranks *pari passu* with other secured debt and higher than that of shareholders—preference as well as equity.

Evaluation

The merits and demerits of debentures as a source of long-term funds from the point of view of the company and investors/debenture-holders are as follows:

Advantages The advantages for company are (i) lower cost due to lower risk and tax-deductibility of interest payments, (ii) no dilution of control as debentures do not carry voting rights. For the investors, debentures offer stable return, have a fixed maturity, are protected by the debenture trust deed and enjoy preferential claim on the assets in relation to shareholders.

Disadvantages The disadvantages for the company are the restrictive covenants in the trust deed, legally enforceable contractual obligations in respect of interest payments and repayments, increased financial risk and the associated high cost of equity. The debenture-holders have no voting rights and debenture prices are vulnerable to change in interest rates.

To summarise, *debentures, as long-term source of funds, have low cost, do not dilute control, involve high risk and put some restraint on managerial freedom.*

Innovative Debt Instruments

In order to improve the attractiveness of bonds/debentures, some new features are added. As a result, a wide range of innovative debt instruments have emerged in India in recent years. Some of the important ones among these are discussed below.

Zero Interest Bonds/Debentures (ZIB/D) Also known as zero coupon bonds/debentures, ZIBs do not carry any explicit/coupon rate of interest. They are sold at a discount from their maturity value. The difference between the face value of the bond and the acquisition cost is the gain/return to the investors. The implicit rate of return/interest on such bonds can be computed by Equation 23.1.

$$\text{Acquisition price} = \text{Maturity (face) value}/(1 + i)^n \quad (23.1)$$

Where i = rate of interest, and n = maturity period (years)

Deep Discount Bond (DDB) A deep discount bond is a form of ZIB. It is issued at a deep/steep discount over its face value. It implies that the interest (coupon) rate is far less than the yield to maturity. The DDB appreciates to its face value over the maturity period.

The DDBs are being issued by the public financial institutions in India, namely, IDBI, SIDBI and so on. For instance, IBDI sold in 1992 a DDB of face value of ₹1 lakh at a deep discount price of ₹2,700 with a maturity period of 25 years. If the investor could hold the DDB for 25 years, the annualised rate of return would work out to 15.54 per cent. The investor had the option to withdraw (put option) at the end of every five years with a specified maturity/deemed face value ranging between ₹5,700 (after 5 years) and ₹50,000 (after 20 years), the implicit annual rate of interest being 16.12 and 15.71 per cent respectively. The investors could also sell the DDBs in the market. The IBDI had also the option to redeem them (call option) at the end of every 5 years presumably to take advantage of prevailing interest rates. A second series of DDBs was issued by the IDBI in 1996 with a face value of ₹2 lakh and a maturity period of 25 years, the deep discount issue price being ₹5,300.

The merit of DDBs/ZIBs is that they enable the issuing companies to conserve cash during their maturity. They protect the investors against the reinvestment risk to the extent the implicit interest on such bonds is automatically reinvested at a rate equal to its yield to maturity. However, they are exposed to high repayment risk as they entail a balloon payment on maturity.

Secured Premium Notes (SPNs) The SPN is a secured debenture redeemable at a premium over the face value/purchase price. It resembles a ZIB. There is a lock-in period for SPN during which no interest is paid. The holder has the option to sell back the SPN to the issuing company at par after the lock-in-period. The redemption is made in instalments. The SPN is a tradeable instrument. A typical example is the SPN issued by TISCO in 1992. Its salient features were:

- Each SPN had a face value of ₹300. No interest would accrue during the first year after allotment.
- During years 4-7, principal will be repaid in annual instalment of ₹75. In addition, ₹75 will be paid each year as interest and redemption premium. The investor could choose a mix of low interest/high premium or high interest/low premium from three options: (i) interest, ₹37.5, premium, ₹37.50; (ii) interest, ₹25 and premium, ₹50 and (iii) interest, ₹50 and premium, ₹25.
- A warrant was attached to the SPN entitling the holder to acquire one equity share for cash by payment of ₹100. The option could be exercised between first year and one-and-a-half year after allotment by which time the SPN will be fully paid up.
- The holder was given an option to sell back the SPN at the par value of ₹300.

Although the SPN is akin to a ZIB to the extent it has no coupon rate of interest, the interest payment and principal repayment are spread over a period of 4 years whereas in case of ZIBs the entire payment is made in lump sum on maturity.

The before tax rate of return on the SPN = 13.65 per cent, that is,

$$300 = \frac{0}{(1+r)} + \frac{0}{(1+r)^2} + \frac{0}{(1+r)^3} + \frac{150}{(1+r)^4} + \frac{150}{(1+r)^5} + \frac{150}{(1+r)^6} + \frac{150}{(1+r)^6}$$

Floating Rate Bonds (FRBs) The interest on such bonds is not fixed. It is floating and is linked to a benchmark rate such as interest on treasury bills, bank rate, maximum rate on term deposits. It is typically a certain percentage point higher than the benchmark rate. The prices of FRBs tend to be fairly stable and close to par value in comparison with fixed interest bonds. They provide a protection against inflation risk to investors, particularly banks and financial institutions.

Call provision is a provision/feature that gives the issuers the opportunity to repurchase bonds at a stated price prior to maturity.

Callable/Puttable Bonds/Debentures/Bond Refunding Beginning from 1992 when the Industrial Development Bank of India issued bonds with **call features**, several callable/puttable bonds have emerged in the country in recent years. The call provisions provide flexibility to the company to redeem them prematurely. Generally, firms issue bonds presumably at lower rate of interest when market conditions are favourable to redeem such bonds. In other words, the firm refunds its debt.

Evaluation The bond refunding decision can be analysed as a capital budgeting decision. **If the present value of the stream of net cash savings exceeds the initial cash outlay, the debt should be refunded.**

Example 23.1

The 22 per cent outstanding bonds of the Bharat Industries Ltd (BIL) amount to ₹50 crores, with a remaining maturity of 5 years. It can now issue fresh bonds of 5 year maturity at a coupon rate of 20 per cent. The existing bonds can be refunded at a premium (call premium) of 5 per cent. The flotation costs (issue expenses + discount) on new bonds are expected to be 5 per cent. The unamortised portion of the issue expenses on existing bonds is 1.5 crore. They would be written off as soon as the existing bonds are called/refunded.

If the BIL is in 35 per cent tax bracket, would you advise it to call the bond?

Solution

	(Amount in ₹ crore)
Annual net cash savings (Working note 2)	0.71
PVIFA (10,13) (Working note 3)	3.517
Present value of annual net cash savings	2.497
Less: Initial outlay ((Working note 1)	3.600
NPV (bond refunding)	(1.103)

It is not advisable to call the bond as the NPV is negative.

Working Notes

(1) (a) Cost of calling/refunding existing bonds

Face value	50.0	
Plus: Call premium (5 per cent)	2.5	52.5
(b) Net proceeds of new bonds		
Gross proceeds	50.0	
Less: Flotation costs	2.5	47.5
(c) Tax savings on expenses		
Call premium	2.5	
Plus: Unamortised issue costs	1.5	
	4.0 × (0.35 tax)	1.40
Initial outlay [(1a) – (1b) – (1c)]		3.60

(2) (a) Annual net cash outflow on existing bonds		
Interest expenses	11.00	
<i>Less: Tax savings on interest expenses and amortisation of issue costs : 0.35 [11.0 + (1.5/5)]</i>	3.96	7.04
	<hr/>	<hr/>
(b) Annual net cash outflow on new bonds		
Interest expenses	10.00	
<i>Less: Tax savings on interest expenses and amortisation of issue costs : 0.35 [11.0 + (2.5/5)]</i>	3.67	6.33
Annual net cash savings [(2a) – (2b)]		0.71
	<hr/>	<hr/>
(3) Present value interest factor of 5 year annuity, using a 13 per cent after tax [0.20 (1 – 0.35)] cost of new bonds = 3.517		

Rating of Debt Instruments

Credit rating is, essentially, the symbolic indicator of the current opinion of the rating agency on the relative ability and willingness of the issuer of a debt instrument to meet the debt service obligations as and when they arise. It provides a relative ranking of the credit quality of debt instruments or their grading according to investment qualities. In other words, credit rating provides a simple system of gradation by which the relative capacities of companies (borrowers) to make timely payment of interest and repayment of principal on a particular type of debt instrument can be noted.

- **Credit rating**
- is a symbolic
- indicator of the
- relative ability of
- the issuer of the
- debt instruments
- to meet obligations
- when due.

Credit rating, however, is neither a general purpose evaluation of a corporate entity nor an overall assessment of the credit risk likely to be involved in all the debts instruments contracted or to be contracted by such issues. A rating is specific to a debt instrument and is intended to grade different and specific instruments in terms of the credit risk associated with the particular instruments. Although it is an opinion expressed by an independent professional organisation, on the basis of a detailed study of all the relevant factors, the rating does not amount to any recommendation to buy, hold or sell an instrument as it does not take into consideration factors such as market prices, personal risk preferences of an investor and such other considerations, which may influence an investment decision.

As a fee-based financial advisory service, credit rating is, obviously, extremely useful to investors, corporates (borrowers), banks, and financial institutions. For the investors, it is an indicator expressing the underlying credit quality of a (debt) issue programme. The investor is fully informed about the company as any effect of changes in business/economic conditions on the company is evaluated and published regularly by the rating agencies.

The corporate borrower can raise funds at a cheaper rate with a good rating. It minimises the role of 'name recognition' and lesser-known companies can also approach the market on the basis of their rating. The fund ratings are useful to the banks and other financial institutions when they decide on lending and investment strategies.

Although credit rating has been a long-established part of the financial mechanism abroad, it is of relatively recent origin in the country. The first rating agency, Credit Rating Information Services of India Ltd (CRISIL), was started in 1988. Initially, it played a rather subdued role presumably because the institutional investors did not require the wisdom of a rating agency. In a changed scenario where corporates are increasingly dependent on the public, the removal of restrictions on interest rates and the stipulation of a mandatory credit rating of a number of instruments since 1991 by the Government/SEBI, credit rating has emerged as a critical element in the functioning of the Indian debt/financial markets. In response to the ever-increasing role of credit rating, two more agencies were set up in 1990 (Information and Credit Rating Services (ICRA) Ltd and 1993 Credit Analysis and Research (CARE) Ltd respectively.

The first private sector credit rating institution was set up as a joint venture between the JM Financials, Alliance Group and the international rating agency Duffs and Phelps in 1995, known as Phelps Credit Rating India Ltd (DCR). It is now known as FITCH India Ltd.

Rating Methodology The rating methodology involves an analysis of the industry risk, the issuer's business and financial risks. A rating is assigned after assessing all the factors that could affect the credit worthiness of the entity. Typically, the industry risk assessment sets the stage for analysing more specific company risk factors and establishing the priority of these factors in the overall evaluation. For instance, if the industry is highly competitive, careful assessment of the issuer's market position is stressed. If the company has large capital requirements, the examination of cash flow adequacy assumes importance. The ratings are based on the current information provided by the issuer or facts obtained from reliable sources. Both qualitative and quantitative criteria are employed in evaluating and monitoring the ratings.

The main elements of the rating methodology for manufacturing companies are outlined below.

Business Risk Analysis The rating analysis begins with an assessment of the company's environment focusing on the strength of the industry prospects, pattern of business cycles as well as the competitive factors affecting the industry. The vulnerability of the industry to Government controls/regulations is assessed.

The nature of competition is different for different industries based on price, product quality, distribution capabilities, image, product differentiation, service and so on. The industries characterised by a steady growth in demand, ability to maintain margins without impairing future prospects, flexibility in the timing of capital outlays, and moderate capital intensity are in a stronger position.

When a company participates in more than one business, each segment is analysed separately. A truly diversified company does not have a single business segment that is dominant, and the company's ability to manage diverse operations is a significant factor. As part of the industry analysis, key rating factors are identified into keys to success and areas of vulnerability. The main industry and business factors assessed include:

Industry Risk Nature and basis of competition, key success factors, demand and supply position, structure of industry, cyclical/seasonal factors, government policies and so on.

Market Position of the Issuing Entity Within the Industry Market share, competitive advantages, selling and distribution arrangements, product and customer diversity and so on.

Operating Efficiency of the Borrowing Entity Locational advantages, labour relationships, cost structure, technological advantages and manufacturing efficiency as compared to competitors and so on.

Legal Position Terms of the issue document/prospectus, trustees and their responsibilities, systems for timely payment and for protection against fraud/forgery and so on.

While the CRAs do not have a minimum size criterion for any given rating level, the size of the company is a critical factor in the rating decision as smaller companies are more vulnerable to business cycle swings as compared to larger companies. In general, small companies are more concentrated in terms of product, number of customers and geography and, consequently, lack the benefits of diversification that can benefit larger firms.

If the company being rated is a subsidiary or an affiliate, that is controlled by/has strong links with a dominant parent company, then the rating also includes an analysis of the parent company's credit quality. The parent company's credit quality could have an impact on the issuer's own credit quality.

Financial Risk Analysis After evaluating the issuer's competitive position and operating environment, the analysts proceed to analyse the financial strength of the issuer. Financial risk is analysed largely through quantitative means, particularly by using financial ratios. While the past financial performance of the issuer is important, emphasis is placed on the ability of the issuer to maintain/improve its future financial performance.

As ratings rely on audited data (the rating process does not entail auditing a company's financial records), the analysis of the audited financial results begin with a review of accounting quality. The purpose is to determine whether ratios and statistics derived from financial statements can be used to accurately measure a company's performance and its position, relative to both its peer group and the larger universe of companies.

The profitability of a company is an important determinant of its ability to withstand business adversity as well as generate capital internally. The main measures of profitability studied include operating and net margins and return on capital employed. The absolute levels of these ratios, trends in movement of the ratios as well as comparison of the ratios with other competitors, is analysed. As a rating exercise is a forward-looking exercise, greater emphasis is laid on the future, rather than the past earning capability of the issuer.

Emphasis is also laid on an analysis of cash flow patterns, as it provides a better indicator of the issuer's debt servicing capability compared to reported earnings. A cash flow analysis reveals the usage of cash for different purposes, and, consequently, the extent of cash available for debt service.

The future debt claims on the issuer's as well as the issuer's ability to raise capital is also assessed in order to arrive at the level of the issuer's financial flexibility. The areas considered in financial analysis include:

Accounting Quality Overstatement/understatement of profits, auditors qualifications, method of income recognition, inventory valuation and depreciation policies, off Balance sheet liabilities and so on.

Earnings Protection Sources of future earnings growth, profitability ratios, earnings in relation to fixed income charges and so on.

Adequacy of Cash Flows In relation to debt and working capital needs, stability of cash flows, capital spending flexibility, working capital management and so on.

Financial Flexibility Alternative financing plans in times of stress, ability to raise funds, asset deployment potential and so on.

Interest and Tax Sensitivity Exposure to interest rate changes, tax law changes and hedging against interest rates and so on.

Management Risk A proper assessment of debt protection levels requires an evaluation of the management philosophies and its strategies. The analyst compares the company's business strategies and financial plans (over a period of time) to provide insights into a management's abilities with respect to forecasting and implementing of plans. Specific areas reviewed include:

(i) Track record of the management: planning and control systems, depth of managerial

[Illegible text]

talent, succession plans; **(ii)** Evaluation of capacity to overcome adverse situations; and **(iii)** Goals, philosophy and strategies.

Rating Symbols The **rating symbols** are symbolic expression of opinion/assessment of the credit rating agency/(agencies) (CRAs) regarding the investment/credit quality/grade of the debt/obligations/instrument. They group together similar, though not necessarily identical, entities in terms of their relative capacity of timely servicing of the obligations as per the terms of the contract.

Rating symbol is a symbolic expression of opinion of the rating agency regarding the investment/credit quality/grade of the debt instrument/obligation.

The SEBI-registered CRAs have been using different rating symbols and definitions. There is need to have common rating symbols and definitions **(i)** for their easy understanding and meanings by the investors, and **(ii)** to achieve high standards of integrity and fairness in ratings. The standardised symbols and their definitions for **(a)** Long-term debt instruments; **(b)** Short-term debt instruments are listed in the annexure below

Annexure: Standardised Rating Symbols/Definitions

I. Rating Symbols and Definitions for Long-term Debt Instruments: *The instruments with original maturity exceeding one year. The rating symbols should have CRA's first name as prefix*

AAA Instruments with this rating are considered to have the highest degree of safety regarding timely servicing of financial obligations and carry lowest credit risk.

AA Instruments with this rating are considered to have high degree of safety regarding timely servicing of financial obligations and carry very low credit risk.

A Instruments with this rating are considered to have adequate degree of safety regarding timely servicing of financial obligations and carry low credit risk.

BBB Instruments with this rating are considered to have moderate degree of safety regarding timely servicing of financial obligations and carry moderate credit risk.

BB Instruments with this rating are considered to have moderate risk of default regarding timely servicing of financial obligations.

B Instruments with this rating are considered to have high risk of default regarding timely servicing of financial obligations.

C Instruments with this rating are considered to have very high risk of default regarding timely servicing of financial obligations.

D Instruments with this rating are in default or are expected to be in default soon.

Modifiers ("+" (plus) / "-" (minus)) can be used with the rating symbols for the categories AA to C. The modifiers reflect the comparative standing within the category.

II. Rating Symbols and Definitions for Short Term Debt instruments: *The instruments with original maturity of upto one year. Rating symbols should have CRA's first name as prefix*

AI Instruments with this rating are considered to have very strong degree of safety regarding timely payment of financial obligations and carry lowest credit risk.

A2 Instruments with this rating are considered to have strong degree of safety regarding timely payment of financial obligations and carry low credit risk.

A3 Instruments with this rating are considered to have moderate degree of safety regarding timely payment of financial obligations and carry higher credit risk as compared to instruments rated in the two higher categories.

A4 Instruments with this rating are considered to have minimal degree of safety regarding timely payment of financial obligations and carry very high credit risk and are susceptible to default.

D Instruments with this rating are in default or expected to be in default on maturity.

Modifier {"+" (plus)} can be used with the rating symbols for the categories A1 to A4. The modifier reflects the comparative standing within the category.

Issue Procedure

Debt securities mean non-convertible securities, including bonds/debentures and other securities of a body corporate/any statutory body, which create/acknowledge indebtedness, but excluding bonds issued by Government/other bodies specified by the SEBI, security receipts and securitised debt instruments. **Private placement** is an offer to less than 50 persons, while public issue is an offer/invitation to public to subscribe to debt securities. The main element of the SEBI regulations relating to issue and listing of debt securities are: issue requirements, listing, conditions for continuous listing and trading, obligations of intermediaries/issuers, procedure for action for violation, and powers of the SEBI to issue general order.

Any issuer who has been restrained/prohibited/debarred by the SEBI from accessing the securities market/dealing in securities cannot make public issue of debt securities. To make such an issue the conditions to be satisfied on the date of filing of draft/final offer document are in-principle approval for their listing, credit rating from at least one SEBI-registered rating agency and agreement with a SEBI-registered depository for their dematerialisation. The issuer should appoint merchant bankers/trustees and not issue such securities to provide loan to, acquisition of shares of, any person who is a part of the same group/under the same management. The issuer should advertise in a national daily with wide circulation on/before the issue opening date. Application forms should be accompanied by a copy of the abridged prospectus. The issue could be fixed-price or book-built. The minimum subscription and underwriting arrangement should be disclosed in the offer document and it should not contain any false/misleading statement. A trust deed must be executed and debenture redemption reserve should be created. The creation of security should be disclosed in the offer document.

The listing of debt securities is mandatory. The issuer should comply with the conditions of listing specified in the listing agreement.

The debt securities issued to public or on private placement basis should be traded/cleared/settled in a recognised stock exchange subject to conditions specified by the SEBI including conditions for reporting of all such trades.

The debenture trustees, issuers and merchants bankers should comply with their obligations specified by the SEBI.

In case of violation of any regulation(s), the SEBI may carry out inspection of books of accounts/records/documents of the issuers/intermediaries. It can issue such directions as it may deem fit. An aggrieved party may prefer an appeal with the SAT.

In addition to the other requirements, an issuer of CDIs (Convertible debt instruments) should comply with the following conditions: **(i)** obtain credit rating, **(ii)** appoint debenture trustees, **(iii)** create debenture redemption fund, **(iv)** assets on which charge is proposed are sufficient to discharge the liability and free from encumbrances. They should be redeemed in terms of the offer document.

The non-convertible portion of the partly CDIs can be rolled over without change in the interest rate if 75 per cent of the holders approve it; an auditors certificate on its liquidity position has been sent to them; the holding of all holders who have not agreed would be redeemed; credit rating has been obtained and communicated to them before rollover.

Positive consent of the holders would be necessary for conversion of optionally CDIs into shares. The holders should be given the option not to convert them if the conversion price was not determined/disclosed to the investors at the time of the issue.

The terms of issue of securities adversely affecting the investors can be altered with the consent/sanction in writing of at least 75 per cent/special resolution of the holders.

LO 23.3 SECURITISATION

Concept

Securitisation is the process of pooling and repackaging of homogeneous illiquid financial assets into marketable securities that can be sold to investors. The process leads to the creation of financial instruments that represent ownership interest in, or are secured by a segregated income producing asset or pool, of assets. The pool of assets collateralises securities. These assets are generally secured by personal or real property such as automobiles, real estate, or equipment loans but in some cases are unsecured, for example, credit card debt and consumer loans.

Securitisation Process

Securitisation is the process of pooling and repackaging of homogeneous illiquid financial assets, such as residential mortgage, into marketable securities that can be sold to investors.

1. Asset are originated through receivables, leases, housing loans or any other form of debt by a company and funded on its balance sheet. The company is normally referred to as the "originator".
2. Once a suitably large portfolio of assets has been originated, the assets are analysed as a portfolio and then sold or assigned to a third party, which is normally a special purpose vehicle company ('SPV') formed for the specific purpose of funding the assets. It issues debt and purchases receivables from the originator. The SPV is owned by a trust/the originator.
3. The administration of the asset is then subcontracted back to the originator by the SPV. It is responsible for collecting interest and principal payments on the loans in the underlying pool of assets and transfer to the SPV.
4. The SPV issues tradable securities to fund the purchase of assets. The performance of these securities is directly linked to the performance of the assets and there is no recourse (other than in the event of breach of contract) back to the originator.
5. The investors purchase the securities because they are satisfied that the securities would be paid in full and on time from the cash flows available in the asset pool. The proceeds from the sale of securities are used to pay the originator.

6. The SPV agrees to pay any surpluses which, may arise during its funding of the assets, back to the originator. Thus, the originator, for all practical purposes, retains its existing relationship with the borrowers and all of the economies of funding the assets.
7. As cash flow arise on the assets, these are used by the SPV to repay funds to the investors in the securities.

Credit Enhancement

Investors in securitised instruments take a direct exposure on the performance of the underlying collateral and have limited or no recourse to the originator. Hence, they seek additional comfort in the form of **credit enhancement**. It refers to the various means that attempt to buffer investors against losses on the asset collateralising their investment. These losses may vary in frequency, severity and timing, and depend on the asset characteristics, how they are originated and how they are administered. The credit enhancements are often essential to secure a high level of credit rating and for low cost funding. By shifting the credit risk from a less-known borrower to a well-known, strong, and larger credit enhancer, credit enhancements correct the imbalance of information between the lender(s) and the borrowers. They are either external (third party) or internal (structural or cash-flow-driven).

- **Credit enhancement**
- are the various
- means that attempt
- to buffer investors
- against losses
- on the asset
- collateralising their
- investment.

External Credit Enhancements They include insurance, third party guarantee and letter of credit.

Insurance Full insurance is provided against losses on the assets. This tantamounts to a 100 per cent guarantee of a transaction's principal and interest payments. The issuer of the insurance looks to an initial premium or other support to cover credit losses.

Third-Party Guarantee This method involves a limited/full guarantee by a third party to cover losses that may arise on the non-performance of the collateral.

Letter of Credit For structures with credit ratings below the level sought for the issue, a third party provides a letter of credit for a nominal amount. This may provide either full or partial cover of the issuer's obligation.

Internal Credit Enhancements Such form of credit enhancement comprise the following:

Credit Tranching (Senior/Subordinate Structure) The SPV issues two (or more) tranches of securities and establishes a predetermined priority in their servicing, whereby first losses are borne by the holders of the subordinate tranches (at times the originator itself). Apart from providing comfort to holders of senior debt, credit tranching also permits targeting investors with specific risk-return preferences.

Over-collateralisation The originator sets aside assets in excess of the collateral required to be assigned to the SPV. The cash flows from these assets must first meet any overdue payments in the main pool, before they can be routed back to the originator.

Cash Collateral This works in much the same way as the over-collateralisation. But since the quality of cash is self-evidently higher and more stable than the quality of assets yet to be turned into cash, the quantum of cash required to meet the desired rating would be lower than asset over-collateral to that extent.

Spread Account The difference between the yield on the assets and the yield to the investors from the securities is called **excess spread**. In its simplest form, a spread account traps the excess spread

The first part of the history of the world is the history of the human race. It is a story of progress and struggle, of triumph and defeat, of hope and despair. It is a story that has shaped the course of human civilization and that continues to shape it today.

The second part of the history of the world is the history of the nations. It is a story of the rise and fall of empires, of the growth and decline of nations, of the search for power and the quest for justice. It is a story that has shaped the course of human history and that continues to shape it today.

THE HISTORY OF THE WORLD

The third part of the history of the world is the history of the human mind. It is a story of the development of thought, of the discovery of truth, of the search for meaning and the quest for wisdom. It is a story that has shaped the course of human culture and that continues to shape it today.

THE HISTORY OF THE WORLD

The fourth part of the history of the world is the history of the human spirit. It is a story of the triumph of the human will, of the courage to face adversity, of the search for purpose and the quest for fulfillment. It is a story that has shaped the course of human destiny and that continues to shape it today.

The fifth part of the history of the world is the history of the human future. It is a story of the challenges we face, of the opportunities we have, of the choices we make and the consequences we bear. It is a story that will shape the course of human history and that will continue to shape it today.

The sixth part of the history of the world is the history of the human present. It is a story of the world we live in, of the people we meet, of the things we do and the dreams we have. It is a story that is shaping the course of human history and that will continue to shape it today.

THE HISTORY OF THE WORLD

The seventh part of the history of the world is the history of the human past. It is a story of the lives of the people who lived before us, of the cultures they created and the legacies they left behind. It is a story that has shaped the course of human history and that continues to shape it today.

The eighth part of the history of the world is the history of the human future. It is a story of the challenges we face, of the opportunities we have, of the choices we make and the consequences we bear. It is a story that will shape the course of human history and that will continue to shape it today.

The ninth part of the history of the world is the history of the human present. It is a story of the world we live in, of the people we meet, of the things we do and the dreams we have. It is a story that is shaping the course of human history and that will continue to shape it today.

The tenth part of the history of the world is the history of the human future. It is a story of the challenges we face, of the opportunities we have, of the choices we make and the consequences we bear. It is a story that will shape the course of human history and that will continue to shape it today.

The eleventh part of the history of the world is the history of the human present. It is a story of the world we live in, of the people we meet, of the things we do and the dreams we have. It is a story that is shaping the course of human history and that will continue to shape it today.

The twelfth part of the history of the world is the history of the human future. It is a story of the challenges we face, of the opportunities we have, of the choices we make and the consequences we bear. It is a story that will shape the course of human history and that will continue to shape it today.

(net of all running costs of securitisation) within the SPV up to a specified amount sufficient to satisfy a given rating or credit equity requirement. Only realisations in excess of this specified amount are routed back to the originator. This amount is returned to the originator after the payment of principal and interest to the investors.

Triggered Amortisation This works only in structures that permit substitution (for example, rapidly revolving assets such as credit cards). When certain preset levels of collateral performance are breached, all further collections are applied to repay the funding. Once amortisation is triggered, substitution is stopped and the early repayment becomes an irreversible process. The triggered amortisation is typically applied in future flow securitisation.

Parties to a Securitisation Transaction

The parties to securitisation deal are **(i)** primary and **(ii)** others. There are three primary parties to a securitisation deal, namely, originators, special purpose vehicle (SPV) and investors. The other parties involved are obligors, rating agency, administrator/servicer, agent and trustee, and structurer.

Originator is the entity on whose books the assets to be securitised exist.

Originator This is the entity on whose books the assets to be securitised exist. It is the prime mover of the deal, that is, it sets up the necessary structures to execute the deal. It sells the assets on its books and receives the funds generated from such sale. In a true sale, the **originator** transfers both the legal and the beneficial interest in the assets to the SPV.

SPV (special purpose vehicle) is the entity which would typically buy the assets to be securitised from the originator.

SPV An issuer, also known as the **SPV**, is the entity, which would typically buy the assets to be securitised from the originator. An SPV is typically a low-capitalised entity with narrowly defined purposes and activities, and usually has independent trustees/Directors. As one of the main objectives of securitisation is to remove the assets from the balance sheet of the originator, the SPV plays a very important role in as much as it holds the assets in its books and makes the upfront payment for them to the originator.

Investors The investors may be in the form of individuals or institutional investors like FIs, mutual funds, provident funds, pension funds, insurance companies and so on. They buy a participating interest in the total pool of receivables and receive their payment in the form of interest and principal as per agreed pattern.

Obligors are the borrowers of the original loan.

Obligor(s) The **obligors** are the originator debtors (borrowers of the original loan). The amount outstanding from an obligor is the asset that is transferred to an SPV. The credit standing of an obligor(s) is of paramount importance in a securitisation transaction.

Rating Agency Since the investors take on the risk of the asset pool rather than the originator, an external credit rating plays an important role. The rating process would assess the strength of the cash flow and the mechanism designed to ensure full and timely payment by the process of selection of loans of appropriate credit quality, the extent of credit and liquidity support provided and the strength of the legal framework.

Receiving and paying agent is one who collects the payment due from the obligors and passes it on to the SPV.

Administrator or Servicer It collects the payment due from the obligor(s) and passes it to the SPV, follows up with delinquent borrowers and pursues legal remedies available against the defaulting borrowers. Since it receives the instalments and pays it to the SPV, it is also called the **Receiving and Paying Agent (RPA)**.

Agent and Trustee It accepts the responsibility for overseeing that all the parties to the securitisation deal perform in accordance with the securitisation trust agreement. Basically, it is appointed to look after the interest of the investors.

Structurer Normally, an investment banker is responsible as structurer for bringing together the originator, the credit enhancer(s), the investors and other partners to a securitisation deal. It also works with the originator and helps in structuring deals.

The different parties to a securitisation deal have very different roles to play. In fact, firms specialise in those areas in which they enjoy competitive advantage. The entire process is broken up into separate parts with different parties specialising in origination of loans, raising funds from the capital markets, servicing of loans and so on. It is this kind of segmentation of market roles that introduces several efficiencies securitisation is so often credited with.

The securitisation process is depicted in Figure 23.1.

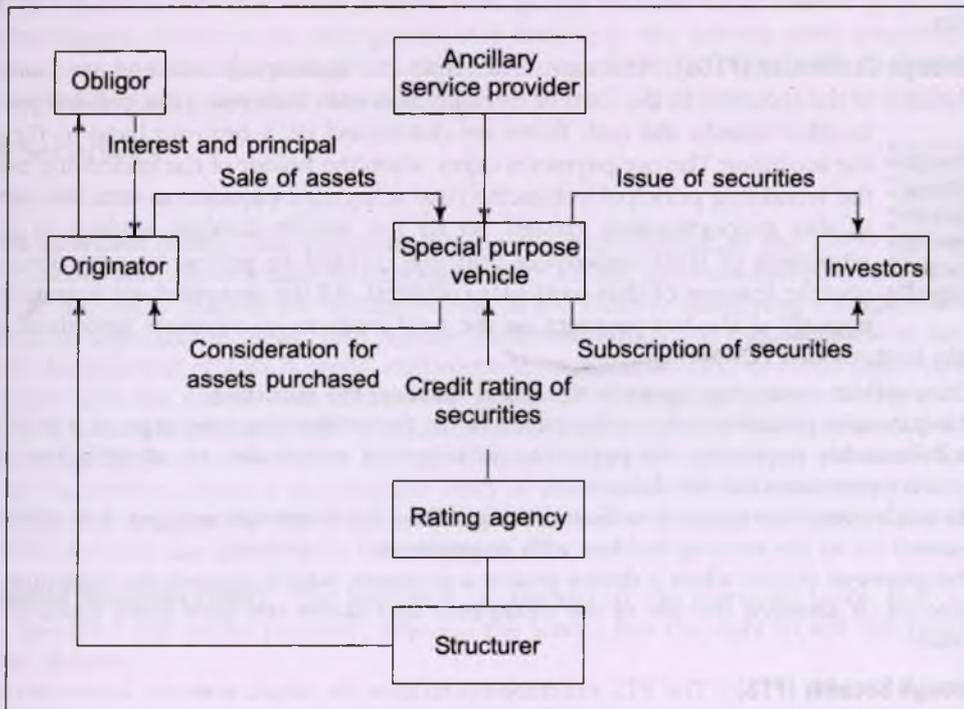

FIGURE 23.1 Securitisation Process

Asset Characteristics

The assets to be securities should have the following characteristics.

Cash Flow A principal part of the assets should be the right to receive from the debtor(s) on certain dates, that is, the asset can be analysed as a series of cash flows.

Security If the security available to collateralise the cash flows is valuable, then this security can be realised by a SPV.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice to ensure transparency and accountability.

Furthermore, it is noted that regular audits are essential to identify any discrepancies or errors in the accounting process. This helps in maintaining the integrity of the financial data and ensures compliance with relevant regulations.

Accounting Principles

The document outlines the fundamental principles of accounting, including the double-entry system. It explains how every transaction affects at least two accounts, ensuring that the total debits always equal the total credits.

It also discusses the importance of the accounting cycle, which consists of a series of steps from recording transactions to preparing financial statements. This systematic approach helps in organizing and summarizing financial information.

The document further elaborates on the classification of accounts into assets, liabilities, and equity. It provides examples of each type and explains how they are recorded in the accounting system.

Additionally, it covers the concept of depreciation, which is used to allocate the cost of tangible assets over their useful life. This method ensures that the expense is recognized in a way that matches the asset's usage.

The document also touches upon the importance of accurate pricing and cost accounting. It explains how these factors are crucial for determining the profitability of different products or services.

Finally, it discusses the role of accounting in decision-making. By providing clear and concise financial information, it enables management to make informed choices about the future of the organization.

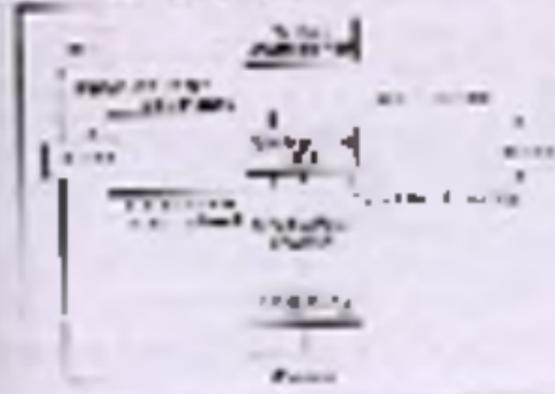

The document concludes by emphasizing the need for continuous learning and staying updated with the latest accounting practices and technologies. This ensures that the organization remains competitive and compliant in a dynamic business environment.

In summary, this document provides a comprehensive overview of accounting principles and practices. It serves as a valuable resource for anyone looking to understand the fundamentals of financial management and reporting.

The second part of the document focuses on the practical application of accounting principles. It provides detailed instructions on how to record various types of transactions, such as sales, purchases, and expenses.

It also includes examples of journal entries and T-accounts to illustrate the correct way to record and balance accounts. This helps in understanding the flow of data between different parts of the accounting system.

Furthermore, the document discusses the importance of maintaining a clear and organized chart of accounts. This is essential for tracking all financial activities and ensuring that every transaction is properly categorized.

Accounting Cycle

The accounting cycle is a systematic process used to record, summarize, and report on the financial activities of an organization. It consists of eight distinct steps that ensure the accuracy and completeness of the accounting records.

Step 1 involves identifying and recording all business transactions. This is done by analyzing source documents and creating journal entries. Step 2 is posting these entries to the appropriate T-accounts in the ledger.

Step 3 is the preparation of a trial balance to verify that the debits equal the credits. This is a crucial check to ensure that the accounting records are mathematically correct before proceeding to the next steps.

Distributed Risk Assets either have to have a distributed risk characteristic or be backed by suitably-rated credit support.

Homogeneity Assets have to be relatively homogenous, that is, there should not be wide variations in documentation, product type or origination methodology.

No Executory Clauses The contracts to be securitised must work even if the originator goes bankrupt.

Independence From the Originator The ongoing performance of the assets must be independent of the existence of the originator.

Instruments of Securitisation

Securitisation can be implemented by three kinds of instruments differing mainly in their maturity characteristics. They are: **(i)** Pass through certificates, **(ii)** Pay through securities, **(iii)** Stripped securities.

Pass Through Certificates (PTCs) The cash flows from the underlying collateral are passed through to the holders of the securities in the form of monthly payment of interest, principal and pre-payments.

Pass through certificate is a conduit for sale of ownership in receivables (mortgages).

In other words, the cash flows are distributed on a *pro-rata* basis to the holders of the securities. The pre-payments occur when the holder of the underlying asset prepays the remaining principal before the final scheduled payment month. Any pre-payment is also proportionately passed on to the security-holders leading to the quicker retirement of their underlying principal. Critical to pricing of pass through are the specific features of that particular collateral. All the securities are terminated simultaneously as the last payment on the pool leads to its complete amortisation. Some of

the main features of PTCs are:

- They reflect ownership rights in the assets backing the securities.
- Pre-payment precisely reflects the payment on the underlying mortgage. If it is a home loan with monthly payments, the payments on securities would also be monthly but at a slightly less coupon rate than the loan.
- As underlying mortgage is self-amortising. Thus, by whatever amount it is amortised, it is passed on to the security-holders with re-payment.
- Pre-payment occurs when a debtor makes a payment, which exceeds the minimum scheduled amount. It shortens the life of the instrument and skews the cash flows towards the earlier years.

Pay Through Security (PTS) The PTS structure overcomes the single maturity limitations of the pass through certificates. Its structure permits the issuer to restructure receivables flow to offer a range of investment maturities to the investors associated with different yields and risks. The issuer of assets-backed debt are thus freed from the limitations imposed by the pass through structure which simply provides a conduit for sale of ownership interest in the receivables. By contrast, in a PTS structure, the issuer typically owns the receivables and simply sells the debt that is backed by the assets. As a result, the issuer of debt is free to restructure the cash flow from the receivable into payments on several debt tranches with varying maturities.

A key difference between PTC and PTS is the mechanics of principal repayment process. In PTC, each investor receives a pro-rata distribution of any principal and interest payment made by the borrower. Because these assets are self-amortising assets, a pass through, however, does not occur until the final asset in the pool is retired. This results in large difference between average life and final maturity as well as a great deal of uncertainty with regard to the timing of the return of the

principal. The PTS structure, on the other hand, substitutes a sequential retirement of bonds for the pro-rata principal return process found in pass through. Cash flows generated by the underlying collateral is used to retire bonds. Only one class of bonds at a time receives principal. All principal payments go first to the fastest pay tranche in the sequence then becomes the exclusive recipients of principal. This sequence continues till the last tranches of bonds is retired.

Stripped Securities Under this instrument, securities are classified as Interest only (IO) or Principally only (PO) securities. The IO holders are paid back out of the interest income only while the PO holders are paid out of principal repayments only. However, these securities are highly volatile by nature and are least preferred by the investors. Normally, PO securities increase in value when interest rates go down because it becomes lucrative to prepay existing mortgagor and undertake fresh loans at lower interest rates. As a result of prepayment of mortgages, the maturity period of these securities goes down and investors are returned the money earlier than they anticipated. In contrast, IOs increase in value when interest rates go up because more interest is collected on underlying mortgages. However, in anticipation of a decline in the interest rates, prepayments of mortgages declines and maturities lengthen. These are normally traded by speculators who make money by speculating about interest rate changes.

Types of Securities

The securities fall into two groups:

Asset Backed Securities (ABS) The investors rely on the performance of the assets that collateralise the securities. They do not take an exposure either on the previous owner of the assets (the originator), or the entity issuing the securities (the SPV). Clearly, classifying securities as 'asset-backed' seeks to differentiate them from regular securities, which are the liabilities of the entity issuing them. An example of ABS is credit card receivables. Securitisation of credit card receivables is an innovation that has found wide acceptance. Although the average tenure of credit available to a credit card holder is generally very short, it is revolving by nature. The lacuna of short tenor of the receivables is, hence, overcome by 'substitution', whereby collections are used for fresh purchases of receivables. Thus, a securitisable asset of marketable tenure comes into being. The structure in the case is generally 'Pay Through', since it is impossible to match the payment made by the card-holder with the payment to the investor.

Mortgage Backed Securities (MBS) The securities are backed by the mortgage loans, that is, loans secured by specified real estate property, wherein the lender has the right to sell the property, if the borrower defaults.

Issue Procedure

The main elements of the SEBI regulations relating to public offers of securitised debt instruments (**SDIs**) and listing on a recognised stock exchange are: registration of trustees, constitution/management of special purpose distinct entities (SPDEs), schemes of SPDEs, public offer of SDIs, rights of investors, listing of SDIs, inspection and disciplinary proceedings, and action in case of default.

Public offer and listing of SDIs can be made only by SPDEs if their trustees are registered with the SEBI and it complies with all the applicable provisions of these regulations and the Securities Contracts (Regulation) Act. However, SEBI-registered debenture trustees, RBI-registered securitisation/asset reconstruction companies, NHB and NABARD would not require registration to act as trustees. A **SDI** means any certificate/instrument issued to an investor by SPDE which possesses any debt/

- **SDI**
- means any
- certificate/
- instrument issued
- to an investor
- by SPDE which
- possesses any
- debt/receivables
- including mortgage
- debt assigned to it
- and acknowledging
- beneficial interest
- of such investors.

receivables including mortgage debt assigned to it and acknowledging beneficial interest of such investors.

While considering registration, the SEBI would have regard to all relevant factors, including: **(i)** track record, professional competence and general reputation of the applicant, **(ii)** objectives of a body corporate applicant, **(iii)** adequacy of its infrastructure, **(iv)** compliance with the provisions of these regulations, **(v)** rejection by the SEBI of any previous application and **(vi)** the applicant/promoters/directors are fit and proper person.

The registration of the trustees would be subject to the following conditions: **(i)** prior approval of the SEBI to change its management/control, **(ii)** adequate steps for redressal of investors grievances, **(iii)** abide by the provisions of these regulations/Securities Contracts (Regulation) Act, **(iv)** forthwith inform the SEBI **(a)** if information/particulars previously submitted is false/misleading **(b)** of any material change in the information submitted and **(v)** abide by the specified code of conduct.

The SPDE should be constituted as a trust entitled to issue SDIs. The trust deed should contain the specified clauses.

A SPDE may raise funds by offering SDIs through a scheme. The scheme should consist of the following elements: **(i)** obligation to redeem the SDIs, **(ii)** credit enhancement and liquidity facilities, **(iii)** servicers, **(iv)** accounts, **(v)** audit, **(vi)** maintenance of records, **(vii)** holding of originator and **(viii)** winding up.

The stipulations relating to the public offer of the SDIs are: **(i)** offer to the public, **(ii)** submission of draft offer document and filing of final offer document, **(iii)** arrangement for dematerialisation, **(iv)** mandatory listing, **(v)** credit rating, **(vi)** contents of the offer document, **(vii)** prohibition on misstatements in the offer document, **(viii)** underwriting of the issue, **(ix)** offer period, **(x)** minimum subscription, **(xi)** allotment and other obligations and **(xii)** post-issue obligations.

The rights of investors are two-folds: free transferability of the SDIs and their rights in the securities issued by the SPDE.

The provisions relating to the listing of the SDIs include: **(a)** application for listing, **(b)** minimum public offering for listing, **(c)** continuous listing conditions and **(d)** trading.

As regards inspection and disciplinary proceedings, the provisions relate to **(1)** power of the SEBI to call for information, **(2)** right of inspection by the SEBI, **(3)** obligations of the SPDE on inspection, **(4)** appointment of auditor/valuer and **(5)** submission of report to the SEBI.

Action in case of default would result in suspension/cancellation of registration of the SPDE. The SEBI may also issue the specified directions to the SPDE/trustees. An aggrieved party may prefer an appeal to the SAT.

SUMMARY

LO 23.1

Term loans/term/project finance are negotiated loans between the borrower and the lenders with a maturity of up to 10 years. They are employed to finance acquisition of fixed assets and working capital margin. All term loans are secured. The asset security stipulations are reinforced by a number of positive/affirmative and negative covenants. While negative covenants are (i) asset-related, (ii) liability-related, (iii) cashflow-related and (iv) control-related, the positive covenants relate to maintenance of (i) network, (ii) level of working capital, (iii) creation of redemption funds and so on. The term loans have to be amortised according to the predetermined schedule. They carry low cost and involve high risk. They have no adverse effect on control but there is a moderate restraint on managerial freedom. Term loans are sanctioned and disbursed by the financial institutions banks/according to the prescribed procedure. Financial institutions appraise a term loan proposal/project from the marketing, technical, financial and managerial angles.

LO 23.2

Debentures represent creditorship securities and debenture-holders are long-term creditors of the company. As long-term source of finance, debentures have some contrasting features compared to equity shares. When they are sold to public, a trustee is appointed through a trust deed/indenture to ensure that the borrower fulfills all contractual obligations. The coupon rate of interest is legally enforceable as well as tax-deductible. A typical non-convertible debenture (NCD) has a maturity of 7-10 years. The redemption of debentures can be accomplished in either of the two ways: (i) debenture redemption reserves (sinking fund) and (ii) call and put (buy-back) provision. They are generally secured by way of an equitable mortgage. The convertible debentures can be partly/fully converted into equity shares. All debentures must be rated by a rating agency. As long-term source of funds, debentures (i) have low cost, (ii) do not dilute control, (iii) involve high risk and (iv) put some restraint on managerial freedom. To improve the attractiveness of debentures, a wide range of innovative instruments have emerged such as deep discount bonds, secured premium notes and floating rate bonds.

A company offering convertible/non-convertible debt instruments has to comply with the requirements prescribed by the SEBI. These relate to (1) credit rating, (2) debenture trustees, (3) debenture redemption reserve, (4) distribution of dividends, (5) creation of charge, (6) letter of option, (7) rollover and so on.

Credit rating of debentures by a rating agency is mandatory. It provides a simple system of gradation by which relative capacities of borrowers to make timely payment of payment and repayment of principal on a particular type of debt instrument can be noted. The main elements of the rating methodology are (1) business risk analysis in terms of industry risk, market position of the issuing entity within the industry, its operating efficiency, and legal position, (2) financial risk analysis as reflected in accounting quality, earnings protection, adequacy of cash flows, financial flexibility and interest and tax sensitivity and (3) management risk. The rating agencies in India are CRISIL, ICRA, CARE and Fitch India. The CRAs have to use the SEBI-prescribed standardised rating symbols for long/short-term debt instruments.

LO 23.3

Securitisation is the process of pooling and repackaging of homogeneous illiquid financial assets/loans into marketable securities that can be sold to investors. The parties to a securitisation transaction are (1) originator, (2) SPV, (3) investors, (4) obligor, (5) rating agency, (6) administrator/servicer, (7) agent/trustee and (8) structurer. Securitisation can be implemented by three kinds of instruments differing mainly in their maturity characteristics, namely, (i) PTCs, (ii) PTS and (iii) stripped securities. These securities fall into two groups: (a) ABS and (b) MBS.

SOLVED PROBLEMS

P.23.1 Hindustan Copper Industries (HCI) manufactures copper pipe. It is contemplating calling ₹3 crore of 30-year, ₹1,000 bonds (30,000 bonds) issued 5 years ago with a coupon interest rate of 14 per cent. The bonds have a call price of ₹1,140 and had initially collected proceeds of ₹2.91 crore due to a discount of ₹30 per bond. The initial flotation cost was ₹3,60,000. The HCI intends to sell ₹3 crore of 12 per cent coupon interest rate, 25-year bonds to raise funds for retiring the old bonds. It intends to sell the new bonds at their par value of ₹1,000. The estimated flotation costs are ₹4,40,000. The HCI is in 35 per cent tax bracket and its after cost of debt is 8 per cent. As the new bonds must first be sold and their proceeds then used to retire the old bonds, the HCI expects a 2-month period of overlapping interest during which interest must be paid on both the old and the new bonds. Analyse the feasibility of the bond refunding by the HCI.

LO 23.2

LOD
M

The first part of the paper discusses the importance of the study and the objectives of the research. It highlights the need for a comprehensive understanding of the subject matter and the role of the researcher in this process. The author emphasizes the significance of the data collected and the methods used to analyze it.

The second part of the paper focuses on the methodology employed in the study. It details the various techniques and tools used to gather and process the data. The author provides a clear and concise explanation of the experimental design and the steps taken to ensure the accuracy and reliability of the results.

The final part of the paper presents the findings of the study and discusses their implications. The author compares the results with existing literature and offers insights into the broader context of the field. The paper concludes with a summary of the key points and a call for further research in this area.

CONCLUSION

The study has shown that the proposed method is effective in solving the problem at hand. The results are consistent with the theoretical predictions and provide a solid foundation for future work. The author believes that the findings of this study will be valuable to researchers and practitioners alike.

The second part of the paper discusses the methodology employed in the study. It details the various techniques and tools used to gather and process the data. The author provides a clear and concise explanation of the experimental design and the steps taken to ensure the accuracy and reliability of the results.

The final part of the paper presents the findings of the study and discusses their implications. The author compares the results with existing literature and offers insights into the broader context of the field. The paper concludes with a summary of the key points and a call for further research in this area.

Solution

Decision analysis for bond refunding decision

Present value of annual cashflow savings (Refer working note 2):	
₹3,81,460 × 10.675 (PVIF _{8,25})	₹40,72,086
Less: Initial investment (Refer working note 1)	32,57,500
NPV	<u>8,14,586</u>

Decision The proposed refunding is recommended as it has a positive NPV.

Working Notes**1. Initial investment:**

(a) Call premium:

Before tax [(₹1,140 – ₹1,000) × 30,000 bonds]	₹42,00,000	
Less: Tax (0.35 × ₹42,00,000)	14,70,000	
After tax cost of call premium		<u>₹27,30,000</u>

(b) Flotation cost of new bond

4,40,000

(c) Overlapping interest:

Before tax (0.14 × 2/12/ × ₹3 crore)	7,00,000	
Less: Tax (0.35 × 7,00,000)	2,45,000	
		<u>4,55,000</u>

(d) Tax savings from unamortised discount on old bond
[25/30 × (₹3 crore – 2.91 crore) × 0.35]

(2,62,500)

(e) Tax savings from unamortised flotation cost of old
bond (25/30 × ₹3,60,000 × 0.35)

(10,5,000)

32,57,500**2. Annual cash flow savings**

(a) Old bond

(i) Interest cost:

Before tax (0.14 × 3 crore)	₹42,00,000	
Less: Tax (0.35 × ₹42,00,000)	14,70,000	
		27,30,000

(ii) Tax savings from amortisation of
discount [(₹9,00,000[®] × 30) × 0.35]

(10,500)

(iii) Tax savings from amortisation of
flotation cost [(₹3,60,000 × 30) × 0.40]

(4,200)

Annual after tax debt payment (a)

27,15,300

(b) New bond

(i) Interest cost:

Before tax (0.12 × 3 crore)	36,00,000	
Less: Taxes (0.35 × ₹36,00,000)	12,60,000	
After tax interest cost		<u>23,40,000</u>

(ii) Tax savings from amortisation of
flotation cost [₹4,40,000 × 25) × 0.35]

(6,160)

Annual after-tax debt payment (b)

23,33,840

Annual cash flow savings [(a) – (b)]

3,81,460

[®]Par value – net proceeds for sale.

P.23.2 Dua Manufacturing (DM) has under consideration refunding of ₹2 crore outstanding bonds at ₹1,000 par value as a result of recent decline in long-term interest rates. The bond-refunding plan involves issue of ₹2 crore of new bonds at the lower interest and the proceeds to call and retire the ₹2 crore outstanding bonds. The DM is in 35 per cent tax bracket.

LO 23.2

The details of the new bonds are: (i) sale at par value of ₹1,000 each, (ii) 11 per cent coupon rate, (iii) 20-year maturity, (iv) flotation costs, ₹4,00,000, and (v) a 3-month period of overlapping interest.

DMs outstanding bonds were initially issued 10 years ago with a 30-year maturity and 13 per cent coupon rate of interest. They were sold at ₹12 par bond discount from par value with flotation costs amounting to ₹1,50,000 and their call at ₹1,130.

Assuming 7 per cent after-tax cost of debt, analyse the bond-refunding proposal. Would you recommend it? Why?

Solution

Decision analysis for bond refunding decision

Present value of annual cashflow savings (<i>Refer working note 2</i>):	
₹2,62,450 × 10.594 (PVIF _{7,20})	₹27,80,395
Less: Initial investment (<i>Refer working note 1</i>)	24,21,500
Net present value of refunding	3,58,895

Decision As the NPV is positive, the proposed bond-refunding is recommended.

Working Notes**1. Initial investment:**

(a) Call premium:

Before tax [(₹1,130 – ₹1,000) × 20,000 bonds]	₹26,00,000	
Less: Tax (0.35 × ₹26,00,000)	9,10,000	
After-tax cost of call premium		₹16,90,000

(b) Flotation cost of new bond 4,00,000

(c) Overlapping interest:

Before tax (0.13 × 3/12 [ⓐ] × ₹2 crore)	6,50,000	
Less: Tax (0.35 × 6,50,000)	2,27,500	
After-tax cost of overlapping interest		4,22,500

(d) Tax savings from unamortised discount on old bond
[25/30[ⓑ] × (20,000 bonds × ₹12/bond discount) × 0.35] (56,000)

(e) Tax savings from unamortised flotation cost of old
bond (20/30[ⓑ] × ₹1,50,000 × 0.35) (35,000)

24,21,500

[ⓐ]3 months × 12 months

[ⓑ]20 years maturity × 30 years maturity

2. Annual cash flow savings

(a) Old bond

(i) Interest cost:

Before tax (0.13 × ₹2 crore)	₹26,00,000	
Less: Tax (0.35 × ₹26,00,000)	9,10,000	
After tax interest cost		16,90,000

(ii) Tax savings from amortisation of
discount [(₹2,40,000[ⓐ] × 30) × 0.35] (2,800)

(iii) Tax savings from amortisation of

flotation cost [$(₹1,50,000 + 30) \times 0.35$]	(1,750)	
Annual after-tax debt payment (a)		16,85,450
(b) New bond		
(i) Interest cost:		
Before tax ($0.11 \times 2,00,00,000$)	22,00,000	
Less: Taxes ($0.35 \times ₹22,00,000$)	<u>7,70,000</u>	
After tax interest cost		14,30,000
(ii) Tax savings from amortisation of flotation cost [$₹4,00,000 \div 20 \times 0.35$]	<u>(7,000)</u>	
Annual after tax debt payment (b)		<u>14,23,000</u>
*20,000 bonds $\times ₹12$ per bond		<u>2,62,450</u>
Annual cash flow savings [(a) - (b)]		<u>2,62,450</u>

REVIEW QUESTIONS

LOD: Easy

RQ.23.1 Give appropriate answers for the following:

[LO 23.1,2,3]

- (i) Term loans are akin to _____ of debentures in contrast to their public offering to investors.
- (ii) Term loans are secured while debentures are non-secured instruments. (True/False)
- (iii) The creation of the Debenture Redemption is non-obligatory and depends on the discretion of the management for all debenture issues. (True/False)
- (iv) Credit rating of all debenture issues is compulsory in India. (True/ False)
- (v) _____ is a secured debenture redeemable at a premium over the face value/purchase price.
- (vi) Companies which have defaulted on the payment of interest to the debenture holders cannot distribute dividends without the permission of the debenture trustees and the lead institution, if any. (True/False)
- (vii) A "AAA" rating given by CRISIL to a company guarantees timely payment of the interest and repayment of the principal by the issuing company. (True/False)
- (viii) Only those assets which are secured by a collateral can be securitized. (True/False)
- (ix) _____ refers to the various means that attempt to buffer investors against losses on the asset collateralizing their investment.
- (x) The sale of the securities by the SPV after the securitization of the assets is open to retail investors. (True/False)
- (xi) _____ are backed by loans secured by specified real estate property.

[Answers: (i) private placement (ii) False (iii) False (iv) True (v) Secured premium note (vi) True (vii) False (viii) False (ix) Credit enhancement (x) False, and (xi) Mortgage backed security]

- RQ.23.15** Explain briefly (i) instruments of securitisation and (ii) types of securitisation. [LO 23.3]
- RQ.23.16** New Delhi Company (NDC) has under consideration offering a new ₹4 crore bond issue to replace outstanding ₹4 crore bond issue to take advantage of the decline in interest rate. The NDC is in 35 per cent tax bracket. The details of the old bond and new bond are as follows. [LO 23.2]
- Old Bonds** The outstanding have a ₹1,000 par value and 15 per cent coupon interest rate. They were issued 5 years ago with a 25-year maturity. They were initially sold at par value and the flotation costs were ₹3,30,000. They are callable at ₹1,140.
- New Bonds** They would have par value of ₹1,000 and 13 per cent coupon rate of interest. With a maturity of 20 years, they could be sold at par. The flotation costs would be ₹5,30,000. The NDC does not expect any overlapping interest.
- Assuming 7 per cent after-tax cost of debt, analyse the bond refunding proposal. Would you recommend it?

LOD: Difficult

- RQ.23.17** Discuss the symbols and their implications used by (i) CRISIL, (ii) ICRA, (iii) CARE and (iv) FITCH India for rating debentures. [LO 23.2]
- RQ.23.18** Dua Company (DC) is contemplating replacing an outstanding ₹2 crore bond issue by a new ₹2 crore bond issue to take advantage of decline in interest rates that has occurred since the original issue. Assuming 35 per cent tax, 8 per cent after-tax cost of debt to evaluate low-risk decisions and the undermentioned details, find the NPV of the bond refunding decision. Is the bond-refunding worthwhile?
- The new bonds would have (1) 15-year maturity, (2) a par value of ₹1,000 and (3) 12 per cent coupon rate. They can be sold at par at a flotation cost of ₹4,00,000. The DC expects a 2-month period of overlapping interest while it retires the old bonds.
- The outstanding bonds have (1) ₹1,000 par value, and (2) 16 per cent coupon rate interest rate. They were issued 5 years ago with a maturity of 20 years. They were initially sold at ₹20 per-bond discount and ₹2,40,000 flotation cost was incurred. They are callable at ₹1,170.

ANSWERS

- 23.16** Yes, as NPV of refunding is positive at ₹14,80,595
- 23.18** NPV = ₹17,33,218. The bond refunding is worthwhile

Hybrid Financing/Instruments

LEARNING OBJECTIVES

LO 24.1	Understand the basic rights of preference shareholders, the features of preference shares and the advantages and disadvantages of preference share financing
LO 24.2	Describe the general features of convertible debentures and illustrate the procedure for determining the value of both optionally convertible debentures and compulsorily convertible debentures
LO 24.3	Explain the basic characteristics of warrants, the implied price of a warrant and the value of a warrant—theoretical, market and warrant premium
LO 24.4	Define option and explain call and put option

INTRODUCTION

As hybrid source of financing has characteristics of both straight debt and straight equity falling somewhere in between. The important hybrid instruments/sources of financing are: **(i)** preference shares/capital, **(ii)** convertible/exchangeable debentures/bonds, **(iii)** warrants and **(iv)** options. The focus in this chapter is on their features and valuation. The procedural aspects of raising hybrid securities is similar to raising equity capital (discussed in Chapter 22). The main points are summarised by way of recapitulation.

LO 24.1 PREFERENCE SHARE CAPITAL

Preference capital is a unique type of long-term financing in that it combines some of the features of equity as well as debentures. As a *hybrid* security/form of financing, it is similar to debenture insofar as: **(i)** it carries a fixed/stated rate of dividend, **(ii)** it ranks higher than equity as a claimant to the income/assets, **(iii)** it normally does not have voting rights and **(iv)** it does not have a share in residual earnings/assets. It also partakes some of the attributes of equity capital, namely, **(i)** dividend on preference capital is paid out of divisible/after tax profit, that is, it is not tax-deductible, **(ii)** payment of preference dividend depends on the discretion of management, that is, it is not an obligatory payment and non-payment does not force insolvency/liquidation and **(iii)** irredeemable type of preference shares have no fixed maturity date.

Features/Attributes

The main attributes of preference shares/capital are discussed below.

Cumulative (dividend) preference shares are preference shares for which all unpaid dividends in arrears must be paid along with the current dividend prior to the payment of dividends to ordinary shareholders.

Prior Claim on Income/Assets Preference capital has a prior claim/preference over equity capital both on the income and assets of the company. In other words, preference dividend must be paid in full before payment of any dividend on the equity capital and in the event of liquidation, the whole of preference capital must be paid before anything is paid to the equity capital. Thus, preference capital stands midway between debentures and equity as regards claim on income and assets of the company. It is also referred to as a *senior security*. Stated in terms of risk perspective, preference capital is less risky than ordinary shares but more risky than debentures.

Cumulative Dividends Preference capital is cumulative in the sense that all unpaid dividends are carried forward and payable before any ordinary dividend is paid.

Redeemability Preference capital has a limited life/specified/fixed maturity after which it must be retired. However, there are no serious penalties for breach of redemption stipulation.

Straight preference shares value/price is the price at which a preference share would sell without the redemption/call feature.

The preference shares have a stated call price which is above the original issue price and decreases over time. Like the call feature on bonds, the call feature on preference shares provides flexibility to the issuer company. Since the market price of **straight preference shares** tends to fluctuate with changes in interest rate, the value of the preference share call feature is determined by the same considerations as is the call feature for bonds (discussed in Chapter 23). The refund of preference share is illustrated in Example 24.1.

Example 24.1

Delhi Manufacturing Company (DMC) is considering refunding its preference shares. They have a par value of ₹100 and a stated dividend of 12 per cent. The call price is ₹104 per share and 5,00,000 shares are outstanding. The DMC can issue new preference shares at 11 per cent. The new issue can be sold at par, the total par value being ₹5 crore. Flotation costs would be ₹13,60,000. Marginal tax rate is 35 per cent. A 90-day period of overlap is expected between the time the new preferences share are issued and the time the existing preference shares are retired. Should the DMC refund its preference shares?

Solution

Analysis of Preference Shares Refund Using Capital Budgeting Analysis

Net Cash Outflow:

1	Cost of calling old preference shares (5,00,000 × ₹104)	₹5,20,00,000
2	Net proceeds of new issues (₹5 crore – ₹13,60,000)	4,86,40,000
3	Difference (1 – 2)	33,60,000
4	Preference share dividend on old preference shares during overlap (5,00,000 × ₹104 × 3/12)	15,60,000
5	Net cash outlay (3 + 4)	49,20,000
6	Annual net cash outflow on old preference shares: Preference share dividend	60,00,000
7	Annual net cash outflow on new preference share: Preference share dividend	55,00,000

(Contd.)

(Contd.)

8	Difference (6 - 7)	5,00,000
9	Present value ($\text{₹}5,00,000 + 0.11^{\circ}$)	45,45,454
10	Net benefit ($\text{₹}45,45,454 - \text{₹}49,20,000$)	(3,74,454)

^oDiscounted at 11 per cent for a perpetuity.

Decision The preference share issue should not be refunded as the benefit is negative.

Fixed Dividend Preference dividend is fixed and is expressed as a percentage of par value. Yet, it is not a legal obligation and failure to pay will not force bankruptcy. Preference capital is also called a *fixed income* security.

Convertibility Preference share capital may sometimes be convertible partly/fully into equity shares/debentures at a certain ratio during a specified period. A variant in India is cumulative convertible preference shares which combine the cumulative and convertibility features. It has, however, been a non-starter so far.

Voting Rights Preference capital ordinarily does not carry voting rights. It is, however, entitled to vote on every resolution if (i) the preference dividend is in arrears for two years in respect of cumulative preference shares or (ii) the preference dividend has not been paid for a period of two/more consecutive preceding years or for an aggregate period of three/more years in the preceding six years ending with the expiry of the immediately preceding financial year.

Participation Features Preference capital may be participating, entitling **participation** in surplus profits, if any, that is, profits after payment of preference dividend and equity dividend at a certain specified rate. Similarly, it may be entitled to participate in the residual assets after the payment of their normal claim according to a specific formula in the event of liquidation of the company.

- **Conversion feature (convertibility)**
- is a feature that
- allows preference shareholders to
- change each share
- in a stated number
- of ordinary shares.

- **Participation**
- is a feature that
- provides for
- dividend payments
- based on certain
- formula allowing
- preference shareholders
- to participate
- with ordinary
- shareholders in the
- receipt of dividends
- beyond a specified
- amount.

Evaluation

Preference capital, as a source of long-term financing, has merits and demerits from the point of view of the investors/ shareholders as well as the company.

Merits The advantages for the investors are: **(i)** stable dividend, **(ii)** the exemption to corporate investors on preference income to the extent of dividend paid out. The issuing companies enjoy several advantages, namely, **(i)** no legal obligation to pay preference dividend and skipping of dividend without facing legal action/bankruptcy, **(ii)** redemption can be delayed without significant penalties, **(iii)** as a part of net worth, it improves the credit-worthiness/ borrowing capacity and, **(iv)** no dilution of control.

Demerits The shareholders suffer serious disadvantages such as (a) vulnerability to arbitrary managerial action as they cannot enforce their right to dividend/right to payment in case of redemption, and (b) modest dividend in the context of the associated risk. For the company, the preference capital is an expensive source of finance due to non-tax deductibility of preference dividend.

In brief, preference capital (i) involves high cost; (ii) does not dilute control, (iii) has negligible risk and (iv), puts no restraint on managerial freedom. The shareholders receive modest returns and are vulnerable to arbitrary managerial actions. It is not a popular source of long-term finance in India.

have not agreed to the resolution and **(iv)** credit rating from at least one SEBI-registered rating agency has been obtained and communicated to them before the rollover. If the existing trust deed/security document(s) provide for the continuance of the security till redemption, the creation of fresh security/execution of fresh trust deed would not be mandatory.

Positive consent of the holders would be necessary for conversion of such CDIs into equity shares and non-receipt of reply to any notice by the issuer for this purpose would not be construed as consent for conversion. The holders of CDIs, where the value of the convertible portion of CDIs by a listed company exceeds ₹50 lakh and the conversion price has not been determined, should have the option not to convert them into shares. Such an option may not be given in case the upper limit on their price together with the justification was determined/disclosed to the investors at the time of the issue. If some holders who have been given the option do not exercise it, the issuer should redeem the concerned instruments within one month from the last date for exercise of option at a price not below its face value. This condition would not be applicable if redemption is in terms of the disclosures in the offer document.

Issue of CDIs for **(i)** financing replenishment of funds, **(ii)** providing loan to or for acquiring shares of any person in the same group [in terms of Section 2(e) or 2(g) of the Monopolies and Restrictive Trade Practice Act] or under the same management [in terms of Section 370 (1-B) of the Companies Act] are prohibited. However, fully CDIs may be issued for these purposes with a conversion period of less than 18 months from the date of their issue.

Valuation

The convertible debentures presently in India can be of three types: **(i)** compulsorily convertible within 18 months, **(ii)** optionally convertible within 36 months and **(iii)** convertible after 36 months with *call* and *put* features. However, only the first two types are popular.

Compulsory Partly/Fully Convertible Debentures

Value The holders of PCDs receive interest at a specified rate over the term of the debenture plus equity share(s) on part conversion and repayment of unconverted part of principal. Symbolically,

$$V_0 = \sum_{t=1}^n \frac{I_t}{(1+k_d)^t} + \frac{aP_t}{(1+k_e)^t} + \sum_{j=m}^n \frac{F_j}{(1+k_d)^j} \quad (24.1)$$

where V_0 = Value of the convertible debenture at the time of issue,

I_t = Interest receivable at the end of period, t ,

n = Term of debentures,

a = Equity shares on part conversion at the end of period, i ,

P_t = Expected pre-equity share price at the end of period, i ,

F_j = Instalment of principal payment at the end of period, j ,

k_d = Required rate of return on debt, and

k_e = Required rate of return on equity.

Example 24.2

The Tata Iron & Steel Ltd (TISCO) had offered in June 1989, ₹30 lakh partly convertible debentures of ₹1,200 each at par. The conversion terms were: (i) compulsory conversion of ₹600 par value into an equity share of ₹100 at a premium of ₹500 within six months of the date of allotment, that is, on February 1, 1990. (ii) 12 per cent per annum interest payable half-yearly and (iii) redemption of non-convertible portion of the debentures at the end of 8 years.

It had also simultaneously issued 32, 54, 167, 12 per cent FCDs of ₹600 each at par on rights basis to the existing shareholders. Each debenture was fully convertible into one share of ₹600, that is, ₹100 par plus a premium of ₹500 within six months from the date of allotment of debentures.

Assuming 8 and 10 per cent as the half-yearly required rate of return on debt and equity respectively, find the value of a TISCO convertible debenture at the time of issue.

Solution

$$\begin{aligned} \text{Value of the PCD} &= \left[\frac{₹72}{1.08} \right] + \sum_{t=2}^{16} \left[\frac{36}{(1.08)^t} \right] + \left[\frac{1 \times ₹1,200}{(1.10)^1} \right] + \left[\frac{₹600}{(1.08)^{16}} \right] \\ &= ₹352.03 + ₹1,090.91 + ₹175.20 = ₹1,618.14 \end{aligned}$$

Cost The cost of partly convertible debenture (k_c) is given by Equation 24.2.

$$S_0 = \sum_{t=1}^n \frac{I_t(1-T)}{(1+k_c)^t} + \frac{aP_i b}{(1+k_c)^t} + \sum_{j=m}^n \frac{F_j}{(1+k_c)^j} \quad (24.2)$$

S_0 = net subscription price of debentures at the time of issue,

I_t = interest payable at the end of period, t ,

T = tax rate,

a = number of equity shares offered on the occurrence of conversion at the end of period, i ,

P_i = per equity share price at the end of period i ,

b = proportion of net realisable proportion of P_i on the equity share issues to the public,

F_j = principal repayment instalment at the end of period, j , and

k_c = cost of capital/discount rate.

For the TISCO convertible issue as detailed in Example 24.1, assuming further issue expenses, ₹80, 35 per cent tax rate and 75 per cent as the net realisable proportion of equity shares issued to public, the cost of capital (convertible debenture) on a semi-annual basis is the discount rate by solving the following equation:

$$1,120 = \frac{72(1-0.35)}{(1+k_c)} + \sum_{t=2}^{16} \frac{36(1-0.35)}{(1+k_c)^t} + \frac{1 \times 1,200 \times 0.75}{(1+k_c)} + \frac{600}{(1+k_c)^{16}} \quad \text{or } k_c = 11.5 \text{ per cent}$$

Optionally Convertible Debentures The value of a debenture depends upon three factors:

(i) straight debenture value, (ii) conversion value and (iii) option value.

Straight debenture value is the price at which a convertible bond would sell in the market without the conversion feature.

Straight Debenture Value (SDV) equals the discounted value of the receivable interest and principal repayment, if retained as a straight debt instrument. The discount factor would depend upon the credit rating of the debenture.

$$\text{Symbolically SDV} = \sum_{t=1}^n \frac{I}{(1+k_d)^t} + \frac{P}{(1+k_d)^n} = \sum_{t=1}^8 \frac{12}{(1.16)^t} + \frac{100}{(1.16)^8} \quad (24.3)$$

where,

Maturity period = 8 years, Discount factor = 0.16, Interest = 0.12 payable annually and Face value of debenture = ₹100.

Conversion Value (CV) if the holders opt for conversion, is equal to the share price multiplied by the conversion ratio, that is, the number of equity share offered for each debenture.

If the price of share is, ₹50 and one debenture is convertible into 5 shares (conversion ratio = 5), the CV = ₹250 (₹50 × 5).

The value of a convertible debenture cannot be less than the SDV and CV which, in a sense, represent its two floor values. In other words, the value of convertible debenture would be the higher of the SDV and CV.

Option Value (OV) The investors have an option, that is, they may not exercise the right/exercise the right at a time of their choosing and select the most profitable alternative. Thus, the option has value in the sense that the value of debenture will be higher than the floor values. Therefore, the value of the convertible debentures = Max [SDV, CV] + OV.

- **Conversion value**
- is the value of a convertible debenture
- measured in terms of the market price of shares into which it can be converted.

Evaluation

Convertible debentures/bonds have emerged as fairly popular instruments of long-term finance in India in recent years. In the first place, they improve *cash flow matching* of firms. With the invariably lower initial interest burden, a growing/expanding firm would be in a better position to service the debt/debenture. Subsequently, when it would do well, it can afford the servicing of the financing instrument after conversion.

Secondly, they generate *financial synergy*. The assessment of risk characteristics of a new firm is costly and difficult. Convertible debentures provide a measure of protection against error of risk assessment. They have two components: straight debentures and call option. In case the firm turns out risky, the former will have a low value while the latter will have a high value and *vice versa* if the firm turns out to be relatively risk free. As a result, the required yield will not be very sensitive to default risk. In other words, firms with widely varying risks can issue convertible debentures on similar terms whereas the cost for straight debentures would be substantially different. Thus, convertible debentures offer a combination/financial synergy/risk synergy to companies to obtain capital on more favourable terms.

Finally, convertible debentures can mitigate agency problems associated with financing arising out of conflicting demand of equity-holders and debenture-holders/lenders. The focus of the latter is on minimising default risk whereas the former would like the firm to undertake high risk projects. This conflict can be resolved by the issue of convertible debentures/bonds. The debenture-holders would not impose highly restrictive covenants to protect the interest and firms can undertake profitable investment opportunities.

LO 24.3 WARRANTS

A **warrant** entitles its holders to subscribe to the equity capital of a company during a specified period at a stated/particular/certain price. The holder acquires only the right (option) but he has no obligation to acquire the equity shares. Warrants are generally issued in conjunction with/tied to other instruments, for example, attached to (i) secured premium notes of TISCO in 1992, (ii) debentures of Deepak Fertilisers & Petrochemical Corporation Ltd in 1987, Ranbaxy and Reliance in 1995. They can be/are issued independently also.

- **Warrant**
- is an instrument that gives its holder the right to purchase a certain number of shares at a specified price over a certain period of time.

Difference with Convertible Debentures

Warrants are akin to convertible debentures to the extent that both give the holder the option/right to buy ordinary shares but there are differences between the two. While the debenture and conversion option are inseparable, a warrant can be detached. Similarly, conversion option is tied to the debenture but warrants can be offered independently also. Warrant are typically exercisable for cash.

Features

The important features of warrants are as follows:

- Exercise price** is the price at which holders of warrant can purchase a specified number of shares.
 - Exercise Price** It is the price at which the holder of a warrant is entitled to acquire the ordinary shares of the firm. Generally, it is set higher than the market price of the shares at the time of the issue.
 - Exercise Ratio** It reflects the number of shares that can be acquired per warrant. Typically, the ratio is 1:1 which implies that one equity share can be purchased for each warrant.

Expiry Date It means the date after which the option to buy shares expires, that is, the life of the warrant. Usually, the life of warrants is 5-10 years although theoretically perpetual warrants can also be issued.

Types Warrants can be (i) detachable, and (ii) non-detachable. A detachable warrant can be sold separately in the sense that the holder can continue to retain the instrument to which the warrant was tied and at the same time sell it to take advantage of price increases. Separate sale independent of the instrument is not possible in case of non-detachable warrants. The detachable warrants are listed independently for stock exchange trading but non-detachable warrants are not.

Implied Price of an Attached Warrant

The **implied price of a warrant** is the price effectively paid for each warrant attached to a bond. It can be computed using Equation 24.4

Implied price of a warrant is the price effectively paid for each warrant attached to a bond.

$$\text{Implied price of all warrants} = \text{Price of bond with warrants attached} - \text{Straight bond/debenture value} \quad (24.4)$$

The straight debenture value can be computed using the method to value convertible debentures.

$$\text{The implied price of each warrant} = \frac{\text{Implied price of all warrants}}{\text{Number of warrants attached to each bond}}$$

The procedure is illustrated in Example 24.3.

Example 24.3

Delhi Traders (TD) has issued 10 per cent, ₹1,000 at par, 10-year bond paying annual interest and having 15 warrants attached for the purchase of its shares. The bonds were initially sold for their par value. Similar-risk straight bonds were selling to yield 12 per cent rate of return. Determine the implied price of an attached warrant.

Solution**Computation of Straight Bond Value**

Years	Payments (1)	PVIF (0.12) (2)	Total present value (3) [(1) × (2)]
1 – 10	₹100	5.650	₹565
20	1,000	0.322	322
Straight bond value			887

Implied price of all warrants = ₹1,000 – ₹887 = ₹113

Implied price of each warrant = ₹113 ÷ 15 = ₹7.53

The implication is that an investor is effectively paying ₹7.53 each warrant while purchasing bonds with attached warrants for ₹1,000.

The implied price of each warrant would be useful to estimate the true market value of each warrant if compared with the specific features of each warrant such as (i) number of shares that can be purchased and (ii) the specified exercise price. If the implied price is more than the estimated market value, the price of the bond with attached warrants may be too high. The bond may be quite attractive in case estimated market value exceeds the implied price.

Value of Warrants

Like convertible bonds, a warrant has a (i) market value and (ii) a theoretical value. The difference between them is known as the warrant premium.

Theoretical Value of Warrant (TVW) The theoretical value of a warrant is the amount for which the warrant can be expected to be sold in the market. Symbolically, theoretical value of a warrant (TVW)

$$= (P_0 - E) \times N \quad (24.5)$$

Where, P_0 = current market of a share, E = exercise price of the warrant, and N = number of shares obtainable with one warrant.

Example 24.4

Avon Manufacturers (AM) has outstanding warrants that are exercisable at ₹100 per share. They entitle the holders to purchase 2 shares. The shares of AM are currently selling for ₹112.50 per share. What is the theoretical value of the warrants of AM?

Solution

$$\begin{aligned} \text{Theoretical value of warrants} &= (P_0 - E) \times N \\ &= [(\text{₹}112.50 - \text{₹}100) \times 2] = \text{₹}25 \end{aligned}$$

The warrants should sell for ₹25 in the market.

Market Value of Warrant (MVW) The MVW is generally more than the TVW. The two values are close only when (i) the TVW is very high or (ii) the warrant is near its expiration date. The maximum excess of MVW over the TVW generally is when the market price of shares is close to the exercise price of the warrant per share. The amount of time until expiration also effects the MVW. In general, the closer the warrant is to its expiration date, the more likely the MVW would equal the TVW.

Warrant Premium The warrant premium is the amount by which MVW exceeds the TVW. It results from a combination of (i) positive investor expectations and (ii) the ability of the investor to obtain

• **Warrant premium**
• is the difference
• between the actual
• market value and
• theoretical value of
• a warrant.

THEORY OF THE STATE

The theory of the state is a branch of political science which deals with the nature, origin, and development of the state. It is a study of the political organization of society and the relationship between the state and its citizens.

The state is defined as a political entity that has a permanent population, a defined territory, and a government that exercises authority over its subjects. The state is the primary actor in international relations and is responsible for the welfare of its citizens.

The theory of the state is concerned with the question of how the state should be organized and how it should exercise its authority. It is a study of the political system and the relationship between the state and its citizens.

larger potential return/risk by trading in warrants instead of the underlying shares (i.e. leverage opportunities). Consider Example 24.5.

Example 24.5

An investor has ₹24,300 to invest in Avon Manufacturers (AM). Its shares are currently selling for ₹112.50 per share. The MVW is ₹45 per warrant. Each warrant entitles the holder to purchase 2 shares of AM at ₹100 per share. Compute the warrant premium for the investor.

Solution

The investor could invest his ₹24,300 in either of two ways. Assuming no transaction costs, he could purchase (i) 216 shares of AM at ₹112.50 per share or (ii) 540 warrants at ₹45 per warrant. Assuming the market price of shares of AM increase by ₹7.50 to ₹120. If the investor sells his shares, his gain ($₹7.50 \times 216$) = ₹1,620. His total gain on the sale of warrants = ₹8,100 ($₹7.50 \times 2 \text{ shares}$) \times 540 warrants. Thus, warrant premium = ₹6,480 ($₹8,100 - ₹1,620$).

If the market price of shares decline by ₹7.50 per share, the loss to the investor would be: (i) on sale of shares, ($₹7.50 \times 216$) = ₹1,620; (ii) on sale of warrants [$(₹7.50 \times 2) \times 540$] = ₹8,100. Thus, the use of warrants by the investor is more risky than trading the underlying shares of AM.

LO 24.4 OPTIONS

Option is an instrument that provides its holders with an opportunity to purchase/sell a specified asset at a stated price on or before a set expiration date.

Option is a **derivative security** and derives its value from an underlying security/asset. An option is an instrument that provides to its holders an opportunity to purchase/sell a specified security/asset at a stated price on/before a specified expiration date. The focus in options is on options related to shares. They are traded in India on the NSE and the BSE as securities. There are three basic forms of options: (i) rights, (ii) warrants, and (iii) calls and puts. While rights are discussed in Chapter 18, warrants are described and illustrated in the preceding section. This section explains the call and put option As an investment vehicle, however, they are not a source of financing. The options are issued by investors and not by firms. They are used to earn a return or to protect/lock-in returns already earned on securities by fund managers. But they do stabilise market prices of shares by increasing trading activity in them. Unlike shareholders, buyers of option have no voting rights. The finance managers do not deal with them as a part of fund-raising activities.

Derivative security is a security that derives its value from an underlying asset that is often another security for example, equity shares.

Striking price is the price at which the holder of a call option can buy (or the holder of a put option can sell) a specified amount of shares at any time prior to the expiration date.

Calls and Puts Option

Call option is an option to purchase a specified number of shares on or before a specified future date at a stated price.

A **call option** is an option to purchase a specified number of shares on/before a specified future date at stated/strike price. The **striking price** is the price at which the holder of the option can buy the shares at any time prior to the expiration date of the option. It is set at/near the prevailing market price of the shares at the time the option is issued.

A **put option** is an option to sell a given number of shares on/before a specified future date at a stated striking price. Like the call option, the striking price of the put is also set close to the market price of the underlying stock at the time of the deal.

Put option is an option to sell a given number of shares on or before a specified future date at a stated price.

Options transactions are done on futures and options (F&O) segment of the NSE/BSE. The call and put option contracts have one month, two months and three months expiry cycles. All contracts expire on the last Thursday of every month. Thus, a January expiration contract would expire on

the last Thursday of January. On the Friday following the last Thursday, a new contract having a 3-month expiry would be introduced for trading. Thus, at any point of time, three contracts would be available for trading with the first contract expiring on the last Thursday of that month. The contract size is 100 or multiples thereof, minimum value being ₹2,00,000. The minimum tick size for a contract is ₹0.05. A single move in option trading would imply a resultant gain/loss of ₹10 (i.e. ₹0.05 × 200 units) on an open position of 200 units.

Call options are purchased in the expectation that the market price of the underlying shares will rise while put options are purchased in the expectation that the share price would decline over the life of the option. The logic underlying the purchase of a put is exactly the opposite of that underlying the use of call options.

Example 24.6

Assume an investor pays ₹2,500 for a 3-month call option on Reliance Industries (RI) at a striking price of ₹500. By paying ₹2,500, the investor is entitled to purchase 100 shares of RI at ₹500 per share at any time during the next 3 months. It implies that the share price must rise to ₹525, that is, ₹5 per share (₹500 + 100 shares) to cover the cost of option (₹2,500), assuming no transaction costs. Suppose the share prices of RI increase to ₹600 during the 3-month period, the net profit to the investor would be ₹7,500 [(100 shares × ₹600) – (₹500 × 100 shares) – ₹2,500]. Thus, option offers a very high return on investment of ₹2,500. However, if the share prices do not rise above ₹500 per share, the investor would lose ₹2,500 as he would not exercise the option. If the share prices increase between ₹500 and ₹525, he would exercise the option to reduce loss to below ₹2,500.

Example 24.7

Assume an investor pays ₹3,250 for a 3-month put option on Reliance Industries (RI) at a striking price of ₹400. The investor is sure that he can sell 100 shares at ₹400 at any time during the next 3 months by paying option money of ₹3,250. Assuming no transaction cost, the price of shares of RI must decline by (₹3,250 ÷ 100 shares) ₹32.5 to ₹367.5 per share to cover the cost of option (₹3,250) of the investor. In case the share prices drop to ₹300 during the 3-month period, the net profit to the investor would be [(100 shares × ₹400) – (100 shares × ₹300) – ₹3,250] ₹6,750. Thus, on an investment of ₹3,250, option offer a very high potential profit (₹6,750) to the investor. If the share price fall to between ₹367.5 and ₹400 per share, the investor should exercise the option to reduce his loss below ₹3,250. However, if the prices rise above ₹400, the investor would not exercise his option and lose ₹3,250.

SUMMARY

A hybrid source of financing partakes some features of equity shares and some features of debt instruments. The important hybrid instruments are: preference shares, convertible debentures/bonds, warrants and options. The issue procedure for these instruments is similar to the raising of equity shares.

The main attributes of preference shares (i) prior claim on income/assets, (ii) cumulative dividends, (iii) redeemability, (iv) voting rights when preference dividend is in arrears, (v) participation in surplus profits/excess assets and so on.

Preference capital involves high cost, does not dilute owners control of the company, has negligible risk and puts no restraint on managerial freedom. The shareholders receive modest return and are vulnerable to arbitrary managerial actions. It is not a popular source of long-term finance in India.

Convertible debentures (CDs) confer on their holders the right/option to convert them partly (PCDs)/fully (FCDs) into equity at a later date on specified terms/conditions.

Their operational features, namely, conversion ratio, conversion premium and conversion timing are specified in advance. The call option gives the issuer the right to redeem to redeem the debentures prematurely. The investor has also the right to prematurely sell them back.

... ..

... ..

SECTION 2

... ..

... ..

... ..

... ..

... ..

... ..

... ..

LO 24.2	The value of a compulsorily/fully/partly CDs, $V_0 = \sum_{t=1}^n \frac{I_t}{(1+K_d)^t} + \frac{aP_i}{(1+K_e)^t} + \sum_{j=m}^n \frac{F_j}{(1+K_d)^j}$
	The cost of a PCDs, $K_c = S_0 = \sum_{t=1}^n \frac{I_t(1-T)}{(1+K_c)^t} + \frac{aP_i b}{(1+K_c)^t} + \sum_{j=m}^n \frac{F_j}{(1+K_c)^j}$
	The value of optionally CDs depends upon three factors: (i) straight debenture value, (ii) conversion value and (iii) option value. The reasons for the popularity of CDs are (1) cashflow matching of firms, (2) financial synergy and (3) mitigation of agency problem.
LO 24.3	A warrant entitles its holders to subscribe to the equity capital of a company during a specified period at a stated/particular/striking price. It differs from a CD in that while debenture and conversion option are irreparable a warrant can be detached. Unlike CDs, warrants can be offered independently also. The important features of warrants are (1) exercise, price, (2) exercise ratio and (3) expiry date.
	The implied price of an attached warrant is the price effectively paid for each warrant. It is equal to price of bond with attached warrants less straight debenture/warrant value. A warrant has a market value and a theoretical value. The difference between them is the warrant premium. The theoretical value of a warrant = $(P_0 - E) \times N$.
	A warrant premium results from a combination of (1) positive investor expectation and (ii) the ability of the investor to obtain larger potential return by trading in warrants instead of under-lying shares.
LO 24.4	Options are not a source of financing like shares, debentures, CDs and warrants. But they do stabilise prices of shares by increasing trading activity in them. An option is an instrument that provides to its holders an opportunity to purchase (call option)/sell (put option) specified security/asset at a stated striking price on/before a specified expiration date.

SOLVED PROBLEMS

P.24.1 Allied Manufacturers (AM) has an outstanding issue of convertible debentures with a ₹1,000 par value. They are convertible into 100 ordinary shares. They have 10 per cent annual coupon rate and 10-year maturity. The interest rate on straight bond of similar risk is 12 per cent.

LO 24.2 LOD
M

Required

- Calculate the (i) straight debenture value of the debentures, (ii) conversion (or share) values of the debenture when the market price of the ordinary shares is ₹20, 25, 28, 35 and 50 per share.
- For each of the price given in (a) (ii), at what price would you expect the debenture to sell?
- What is the lowest price you would expect the debentures to sell for irrespective of the behaviour of the price of the ordinary shares?

Solution

- (a) (i) Computation of straight debenture value

Years	Payments (1)	PVIFA (0.12) (2)	Present value (3) [(1) × (2)]
1 – 10	₹100*	5.650	₹565
10	1,000	0.322	322
			887

* (₹1,000 × 0.10)

(ii) Computation of conversion value of debentures

Market price of shares (1)	Conversion ratio (2)	Conversion value (3) [(1) × (2)]
₹8.0	100	₹800
10.0 (conversion price)	100	1,000 (par value)
11.2	100	1,120
14.0	100	1,400
20.0	100	2,000

- (b) The debenture would be expected to sell at the higher of the conversion value and straight value. In no case it would sell for less than the straight value (i.e. ₹887). At a price of ₹8, the debenture would sell for its straight value of ₹887. At other prices, it would be expected to sell at the associated conversion values respectively [as calculated in (a) (ii)].
- (c) The lowest price would be the straight debenture value (i.e. ₹887).

P.24.2 Delhi Manufacturing Company (DMC) is planning to issue ₹10 crore in 10 per cent convertible debentures. Currently, the market price of its shares is ₹40 per share. The DMC expects to obtain a conversion premium, that is, excess of issue price over conversion value, of 10 per cent. The call price of the debentures in the first 5 years is ₹1,050 per debenture, after which it drops to ₹1,020 in the next 5 years and to ₹1,000 in the last 5 years. To allow for fluctuation in market price of shares, DMC does not want to call the debentures until their conversion value is at least 12 per cent higher than the call price. Earnings per share are expected to grow at 6 per cent compound annual rate and DMC does not envisage any change in its P/E ratio.

LO 24.2 LOD D

Required

Determine the length of time when DMC would be in a position to force conversion.

Solution Expected length of time to force conversion

$$\text{Conversion price} = ₹40 \times 1.10 = ₹44$$

$$\text{Call price per share in the first 5 years} = ₹44 \times 1.05 = ₹46.2$$

$$\text{Price to which the shares must increase when the DMC would be in a position to force conversion} = ₹46.2 \times 1.12 = ₹51.74.$$

$$\text{Increase from present price} = ₹51.74 \div ₹40 = 1.294.$$

At 6 per cent compound growth rate, EPS would grow to 1.262 in 4 years and 1.338 in 5 years (Table A-1). If the P/E ratio remains the same, it would take 4-5 years before the DMC can force conversion.

P.24.3 New Delhi Manufacturers has current earnings of ₹6 per shares with 5,00,000 shares outstanding. It is planning to issue 40,000 shares of 9 per cent, ₹100 par value convertible preference shares at par. The preference share is convertible into 2 ordinary shares for each preference share held. The current market price of ordinary shares is ₹42 per share.

LO 24.1 LOD M

Required

- (a) Compute the conversion value of preference shares.
- (b) Compute the conversion premium.
- (c) Assuming total earnings remain the same, determine the effect of issue on basic earnings per share (i) before conversion (ii) on a fully diluted basis.
- (d) If profits after taxes increases by ₹10 lakh, determine the basic earnings per share (i) before conversion and (ii) on a fully diluted basis.

Solution

(a) Conversion value = Conversion ratio × market price per share = 2 × ₹42 = ₹84.

(b) Conversion premium = $(₹100 \div ₹84) - 1 = 19.05$ per cent.

The first part of the report is devoted to a description of the work done during the year. It is divided into two main sections, the first of which deals with the general work of the office and the second with the work of the various divisions. The first section is headed "General Work" and the second "Work of the Divisions".

General Work
 The general work of the office during the year has been devoted to the preparation of the annual report and the various reports required by the various departments. The work has been carried out in a systematic and efficient manner and has resulted in the completion of all the reports in time for their submission to the various departments.

Work of the Divisions
 The work of the various divisions has also been carried out in a systematic and efficient manner. The work of the various divisions has been as follows:

THE YEAR

The work of the various divisions has been as follows:

Division 1	100
Division 2	200
Division 3	300
Division 4	400
Division 5	500
Division 6	600
Division 7	700
Division 8	800
Division 9	900
Division 10	1000

The work of the various divisions has been as follows:

The work of the various divisions has been as follows:

Division 1	100
Division 2	200
Division 3	300
Division 4	400
Division 5	500
Division 6	600
Division 7	700
Division 8	800
Division 9	900
Division 10	1000

(c) Earnings per share effect

(i) Total after-tax earnings ($\text{₹}6 \times 5,00,000$ shares)	₹30,00,000
Preference share dividend ($0.09 \times 40,000 \times \text{₹}100$)	3,60,000
Earnings available to ordinary shareholders (NI)	<u>26,40,000</u>
Number of shares (N)	5,00,000
EPS (basic) ($\text{₹}26,40,000 \div 5,00,000$)	5.28
(ii) Total earnings	30,00,000
Number of shares ($5,00,000 + 80,000$)	5,80,000
EPS (diluted) ($\text{₹}30,00,000 \div 5,80,000$)	<u>5.17</u>

(d) Earnings per share effect with increase in profit

(i) Total after-tax earnings	₹40,00,000
Preference dividend	3,60,000
NI	<u>36,40,000</u>
N	5,00,000
EPS (NI + N)	7.28
(ii) Total earnings (NI)	40,00,000
N ($5,00,000 + 80,000$)	5,80,000
EPS (NI + N)	<u>6.90</u>

REVIEW QUESTIONS

LOD: Easy

RQ.24.1 Give appropriate answers for the following:
[LO 24.1-4]

- (i) Payment of preference share dividend is not obligatory and depends on the discretion of the management. (True/False)
- (ii) Preference shares do not entail voting rights under all circumstances. (True/False)
- (iii) Convertible debentures are also akin in nature to _____
 (a) Call options (b) Put options (c) Futures contract
- (iv) Conversion ratio (in debentures) equals _____ divided by the conversion price.
- (v) _____ is the price at which a convertible bond will sell in the market without the conversion feature.
- (vi) Which of the following instruments is similar in nature to call options?
 (a) Warrants (b) Redeemable preference shares (c) Debentures
- (vii) For the same strike price and maturity, which of the following strategies is theoretically safer than the other?
 (a) Selling a call option (b) Selling a put option
- (viii) _____ is an instrument that gives its holder the right to purchase a certain number of shares at a specified price over a certain period of time.
- (ix) _____ is the price at which holders of warrant can purchase a specified number of shares.
- (x) The market value of a warrant is the amount at which the warrant is expected to be sold in the market (True / False).

[Answers: (i) True (ii) False (iii) Call options (iv) Par value of convertible debentures (v) Straight debenture value (vi) Warrants (vii) Selling a put option (viii) Warrant (ix) Exercise price and (x) False]

RQ.24.2 What is preference share? What are the key merits and demerits of preference shares as a source of long-term finance?

[LO 24.1]

RQ.24.3 What is call/redeemable feature in a preference share? [LO 24.1]

RQ.24.4 What is conversion feature? What is conversion ratio? [LO 24.1,2]

LOD: Medium

RQ.24.5 Define straight bond value, conversion value, market value and market premium. [LO 24.2]

RQ.24.6 What is a warrant. How does it differ from convertible securities? [LO 24.3]

RQ.24.7 What is implied price of a warrant? How is it estimated? [LO 24.3]

RQ.24.8 What is an option? Define call and put option. Do they play any role in fund-raising activities of a firm? [LO 24.4]

RQ.24.9 How does option trading take place? [LO 24.4]

RQ24.10 The North Traders has an outstanding issue of convertible debentures with a par value of ₹1,000. They are convertible into 50 shares, have 10 per cent annual coupon rate and 10-year maturity. The interest on a straight bond of a similar risk is currently 11 per cent. [LO 24.2]

Required

1. Calculate the straight value of the debentures.
2. Calculate the conversion values of the debentures when the market price of shares is ₹15, 20, 23, 30 and 45 per share.
3. For each of the stock prices given in (2), at what price can the debentures be expected to sell?
4. What is the minimum price the debenture would be expected to sell at irrespective of the behaviour of share prices.

RQ24.11 The warrants of Dua Manufacturers allow the purchase of its 2 shares at ₹75 per share. The price per share and the market value of the warrants associated with the relevant share prices are given below. [LO 24.3]

Per share price	Market value of warrant
₹63	₹3
69	12
72	13.5
81	27
87	42
93	57
99	72

Required

Compute the theoretical warrant value for each of the share prices.

LOD: Difficult

RQ.24.12 Discuss the method for valuation of compulsorily convertible debentures into shares. [LO 24.2]

RQ.24.13 How is the value of an optionally convertible debenture affected by the straight debenture value, conversion value and option value. [LO 24.2]

RQ.24.14 Explain briefly (1) theoretical value of a warrant, (2) its market value, and (3) warrant premium. [LO 24.3]

RQ24.15 An investor wishes to ascertain if the ₹1,000 price of debentures of Southern Petrochemicals (SP) is fair in the light of the theoretical value of the attached warrants. The debentures (1) have a par value of ₹1,000 (2) pay 12 per cent coupon interest rate annually, (3) have a 10-year maturity and (4) have 10 warrants attached for purchase of shares. The theoretical value of each warrant (TVW) is ₹12.50. The interest on an equal risk straight debenture is 14 per cent. [LO 24.2]

Required

- (a) Compute the straight value of SP's debentures.
- (b) What is the implied price of all warrants attached to SP's debentures?
- (c) What is the implied price of each warrant?
- (d) Compare the implied price computed in (c) to its theoretical value. On the basis of the comparison, is the price of SP's debentures fair? Why?

ANSWERS

- 24.10** 1. ₹940.9
2. ₹750; ₹1,000; ₹1,150; ₹1,500; ₹2,250
3. The debenture would be expected to sell at the higher of conversion value and straight value. In no case, it would sell for less than the straight value (₹940.9). At a market price of ₹15, the debenture would sell for its straight value ₹940.9; at others prices, it would be expected to sell at respective conversion value.
4. Straight value ₹940.9
- 24.11** 0*; 0*; 0*; ₹12; ₹24; ₹36; ₹48 (For price ranges from ₹63–₹99)
* The value of warrant cannot be negative. Its value is, therefore, taken as zero
- 24.15** (a) ₹895.92
(b) ₹104.08
(c) ₹10.41
(d) The implied price (₹10.41) is less than theoretical value (₹12.5).
Yes, price is fair. The debenture has been issued at ₹20.92 which is less than expected market value.

Lease Financing and Hire-purchase Finance

LEARNING OBJECTIVES

LO 25.1	Define leasing, describe its main features and classification of leasing—finance lease, operating lease, sale and lease back, single investor and leveraged lease, domestic and international lease—and the significance and limitations of leasing
LO 25.2	Review and illustrate financial evaluation of leasing both from lessee's perspective and lessor's perspective
LO 25.3	Describe the general features of hire-purchase, comparison of hire-purchase with leasing and instalment payment, and financial evaluation of hire-purchase transaction from the viewpoint of the hirer as well the finance company

INTRODUCTION

This chapter dwells on two sources of long-term finance, namely, lease financing and hire-purchase financing. The main points are also summarised by way of recapitulation.

LO 25.1 LEASE FINANCING

We explain the theoretical framework of leasing in terms of concept and classification of leasing and its significance and limitation.

Concept and Classification

Concept The conceptual aspect of leasing include its meaning and essential elements.

Meaning Conceptually, a **lease** may be defined as a contractual arrangement/transaction in which a party owning an asset/equipment (lessor) provides the asset for use to another/transfer the right to use the equipment to the user (lessee), over a certain/for an agreed period of time, for consideration in form of/in return for periodic payment

- **Leasing**
- is the process by
- which a firm can
- obtain the use
- of a certain fixed
- asset for which it
- must make a series
- of contractual,
- periodic, tax-
- deductible
- payments (lease
- rentals).

(rentals), with or without a further payment (premium). At the end of the period of contract (lease period), the asset/equipment reverts back to the lessor unless there is a provision for the renewal of the contract. Leasing essentially involves the *divorce of ownership from the economic use of an asset/equipment*. It is a device of financing the cost of an asset. It is a contract in which a specific equipment required by the lessee is purchased by the lessor (financier) from a manufacturer/vendor selected by the lessee. The lessee has possession and use of the asset on payment of the specified rentals over a predetermined period of time. Lease financing is, thus, a device of financing/money lending. The position of a lessee is akin to that of a person who owns the same asset with borrowed money. The real function of a lessor is not renting of the asset but lending of funds/finance/credit, and lease financing is, in effect, a contract of lending money. The lessor (financier) is the nominal owner of the asset as the possession and economic use of the equipment vests in the lessee. The lessee is free to choose the asset according to his requirements and the lessor does not take recourse to the equipment as long as the rentals are regularly paid to him.

Essential Elements The essential elements of leasing are the following:

Parties to the Contract There are essentially two parties to a contract of lease financing, namely, the owner and the user, called the **lessor** and the **lessee**, respectively. Lessors as well as lessees,

Lessor
is the owner of
the assets that are
being leased.

Lessee
is the receiver of
the services of the
assets under a
lease contract.

may be individuals, partnerships, joint stock companies, corporations or financial institutions. Sometimes there may be joint lessors or joint lessees, particularly where the properties or the amount of finance involved is enormous. Besides, there may be a lease broker who acts as an intermediary in arranging these deals. Merchant banking divisions of certain foreign banks in India, subsidiaries of some Indian banks and even some private merchant bankers are acting as lease brokers. They charge a certain percentage of fees for their services, ranging between 0.50 to 1 per cent. Besides, a lease contract may involve a *lease financier*, who refinances the lessor, either by providing term loans or by subscribing to equity or lending under a specific refinance scheme.

Assets The assets, property or equipment to be leased is the subject matter of a lease financing contract. The asset may be an automobile, plant and machinery, equipment, land and building, factory, a running business, an aircraft and so on. The asset must, however, be of the lessee's choice, suitable for his business needs.

Ownership Separated from User The essence of a lease financing contract is that during the lease tenure, ownership of the asset vests with the lessor and its use is allowed to the lessee. On the expiry of the lease tenure, the asset reverts to the lessor.

Term of Lease The term of lease is the period for which the agreement of lease remains in operation. Every lease should have a definite period, otherwise it will be legally inoperative. The lease period may sometimes stretch over the entire economic life of the asset (i.e. financial lease) or a period shorter than the useful life of the asset (i.e. operating lease). The lease may be perpetual, that is, with an option at the end of lease period to renew the lease for the further specific period.

Lease Rentals The consideration that the lessee pays to the lessor for the lease transaction is the lease rental. Lease rentals are structured so as to compensate (in the form of depreciation) the lessor for the investment made in the asset, and for expenses like interest on the investment, repairs and servicing charges borne by the lessor over the lease period.

Modes of Terminating the Lease At the end of the lease period, the lease is terminated and various courses are possible, namely,

- (a) The lease is renewed on a perpetual basis or for a definite period, or
- (b) The asset reverts to the lessor, or
- (c) The asset reverts to the lessor and the lessor sells it to a third party or
- (d) The lessor sells the asset to the lessee.

The parties may mutually agree to and choose any of the aforesaid alternatives at the beginning of a lease term.

Classification An equipment lease transaction can differ on the basis of (i) the extent to which the risks and rewards of ownership are transferred, (ii) number of parties to the transactions, (iii) domiciles of the equipment manufacturer, the lessor, the lessee and so on.

Risk, with reference to leasing, refers to the possibility of loss arising on account of under-utilisation or technological obsolescence of the equipment, while **reward** means the incremental net cash flows that are generated from the usage of the equipment over its economic life and the realisation of the anticipated residual value on expiry of the economic life. On the basis of these variations, leasing can be classified into the following types: (a) Finance lease and Operating lease, (b) Sales and lease back and Direct lease, (c) Single investor lease and Leveraged lease and (d) Domestic lease and International lease.

- **Risk**
- is the possibility
- of loss arising
- on account of
- under-utilisation
- or technological
- obsolescence of the
- equipment.

Finance Lease and Operating Lease: Finance Lease According to the International Accounting Standards (IAS-17), in a **finance lease** the lessor transfers, substantially all the risks and rewards incidental to the ownership of the asset to the lessee, whether or not the title is eventually transferred. It involves payment of rentals over an obligatory non-cancellable lease period, sufficient in total to amortise the capital outlay of the lessor and leave some profit. In such leases, the lessor is only a financier and is usually not interested in the assets. It is for this reason that such leases are also called **full payout leases**, as they enable a lessor to recover his investment in the lease and derive a profit. Types of assets included under such leases are ships, aircrafts, railway wagons, lands, buildings, heavy machinery, diesel generating sets and so on.

- **Finance**
- **(capital) leases**
- are for terms
- that approach the
- economic life of
- the asset; the total
- payments over the
- term of the lease
- are greater than the
- lessor's initial cost
- of the leased asset.

The IAS-17 stipulates that a substantial part of the ownership related risks and rewards in leasing are transferred when:

- (i) The ownership of the equipment is transferred to the lessee by the end of the lease term;
- (ii) The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair market value at the date the option becomes exercisable and if at the inception of the lease it is reasonably certain that the option will be exercised; or
- (iii) The lease term is for a major part of the useful life of the asset; the title may not eventually be transferred. The useful life of an asset refers to the minimum of its (i) *physical life* in terms of the period for which it can perform its function, (ii) *technological life* in the sense of the period in which it does not become obsolete and (iii) *product market life* defined as the period during which its product enjoys a satisfactory market. The criterion/cut-off point is that if the lease term exceeds 75 per cent of the useful life of the equipment, it is a finance lease or
- (iv) The present value of the minimum lease payment is greater than, or substantially equal to, the fair market value of the asset at the inception of the lease (cost of equipment). The title may or may not be eventually transferred. The cut-off point is that the present value exceeds 90 per cent of the fair market value of the equipment. The present value should be computed

by using a discount rate equal to the rate implicit in the lease, in the case of the lessor, and the incremental rate in the case of the lessee.

According to the Accounting Standard (AS)-19: Lease issued by the Institute of Chartered Accountants of India (ICAI) in January 2001, the classification of leases is based on the extent to which risks and rewards incidental to ownership of a leased asset lie with the lessor or the lessee. Risks include the possibility of losses from the idle capacity or technological obsolescence and of variation in return due to changing economic conditions. Rewards may be represented by the expectation of profitable operation over the economic life of the asset and of gain from appreciation in the value of the residual value that has been realised.

A lease is classified as a *finance lease* if it transfers substantially all the risk and rewards incidental to ownership. Title may or may not eventually be transferred. A lease is classified as an *operating lease* if it does not transfer substantially all the risks and rewards incidental to ownership. Since the transaction between a lessor and lessee is based on a lease agreement common to both parties, it is appropriate to use consistent definitions. The application of these definitions to the differing circumstances of the two parties may sometimes result in the same lease being classified differently by the lessor and the lessee. Whether a lease is a finance lease or an operating lease depends on the substance of the transaction rather than its form. Examples of situations that would normally lead to a lease being classified as a finance lease are:

- (a) The lease transfers ownership of the asset to the lessee by the end of the lease term;
- (b) The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable such that, at the inception of the lease, it is reasonably certain that the option will be exercised;
- (c) The lease term is for the major part of the economic life of the asset even if title is not transferred;
- (d) At the inception of the lease, the present value of the minimum lease payments amounts to greater than or at least substantially equal to the fair value of the leased asset and
- (e) The leased asset is of a specialised nature such that only the lessee can use it without major modifications being made.

Indicators of situations, that individually or in combination, could also lead to a lease being classified as a finance lease are:

- (a) If the lessee can cancel the lease, the lessor's losses associated with the cancellation are borne by the lessee;
- (b) Gains or losses from the fluctuation in the fair value of the residual fall to the lessee (for example in the form of a rent rebate equalling most of the sales proceeds at the end of the lease) and
- (c) The lessee can continue the lease for a secondary period at a rent that is substantially lower than market rent.

Lease classification is made at the inception of the lease. If at any time, the lessee and the lessor agree to change the provisions of the lease, other than by renewing the lease, in a manner that would have resulted in a different classification of the lease under the criteria outlined above, or had the changed terms been in effect at the inception of the lease, the revised agreement is considered as a new agreement over its revised term. Changes in estimates (for example, changes in estimate of the economic life or of the residual value of the leased asset) or changes in circumstances (for example, default by the lessee), however, do not give rise to a new classification of a lease for accounting purposes. A finance lease is structured to include the following features:

- (i) The lessee (the intending buyer) selects the equipment according to his requirements, from its manufacturer or distributor;

- (ii) The lessee negotiates and settles with the manufacturer or distributor, the price, the delivery schedule, installation, terms of warranties, maintenance and payment and so on;
- (iii) The lessor purchases the equipment either directly from the manufacturer or distributor (under straight forward leasing) or from the lessee, after the equipment is delivered (under sale and lease back);
- (iv) The lessor then leases out the equipment to the lessee. The lessor retains the ownership while lessee is allowed to use the equipment;
- (v) A finance lease may provide a right or option, to the lessee, to purchase the equipment at a future date. However, this practice is rarely found in India;
- (iv) The lease period spreads over the expected economic life of the asset. The lease is originally for a non-cancellable period called the **primary lease period** during which the lessor seeks to recover his investment alongwith some profit. During this period, cancellation of lease is possible only at a very heavy cost. Thereafter, the lease is subject to renewal for the **secondary lease period**, during which rentals are substantially low;
- (vii) The lessee is entitled to exclusive and peaceful use of the equipment during the entire lease period, provided he pays the rentals and complies with the terms of the lease;
- (viii) As the equipment is chosen by the lessee, the responsibility of its suitability, the risk of obsolescence and the liability for repair, maintenance and insurance of the equipment rest with the lessee.

Operating Lease According to the IAS-17 and AS-19, an **operating lease** is one that is not a finance lease. In a operating lease, the lessor does not transfer all the risks and rewards incidental to the ownership of the asset and the cost of the asset is not fully amortised during the primary lease period. The lessor provides services (other than the financing of the purchase price) attached to the leased asset, such as maintenance, repair and technical advice. For this reason, an operating lease is also called a '**service lease**'. The lease rental is an operating lease that includes a cost for the 'services' provided, and the lessor does not depend on a single lessee for recovery of his cost. An operating lease is generally used for computers, office equipment, automobiles, trucks, other equipment, telephones and so on. An operating lease is structured with the following features:

- (i) An operating lease is generally for a period significantly shorter than the economic life of the leased asset. In some cases, it may be even on an hourly, daily, weekly or monthly basis. The lease is cancellable by either party during the lease period.
- (ii) Since the lease periods are shorter than the expected life of the asset, the lease rentals are not sufficient to totally amortise the cost of assets.
- (iii) The lessor does not rely on the single lessee for recovery of his investment. His ultimate interest is in the residual value of the asset. The lessor bears the risk of obsolescence, since the lessee is free to cancel the lease at any time;
- (iv) Operating leases normally include a maintenance clause requiring the lessor to maintain the leased asset and provide services such as insurance, support staff, fuel and so on.

Examples of operating leases are:

- (a) Providing mobile cranes with operators;
- (b) Chartering of aircrafts and ships, including the provision of crew, fuel and support services;
- (c) Hiring of computers with operators;
- (d) Hiring a taxi for a particular travel, which includes service of the driver, provision for maintenance, fuel, immediate repairs and so on.

- **Operating leases**
- are for a time shorter than the economic life of the asset; generally the payments over the term of the lease are less than the lessor's initial cost of the leased asset.

Sale and Lease Back and Direct Lease: Sale and Lease Back In a way, it is an indirect form of leasing. The owner of an equipment/asset sells it to a leasing company (lessor) that leases it back to the

Sale-lease back is a lease under which the lessee sells an asset for cash to a prospective lessor and then leases back the same asset, making fixed periodic payments for its use.

owner (lessee). A classic example of this type of leasing is the sale and lease back of safe deposit vaults by banks. Banks sell the vaults in their custody to a leasing company at a market price substantially higher than the book value and the leasing company in turn offers these lockers on a long-term basis to the bank. The bank sub-leases the lockers to its customers. The *lease back* arrangement in sale and lease back type of leasing can be in the form of a finance lease or an operating lease.

Direct Lease In direct lease, the lessee, and the owner of the equipment are two different entities. A direct lease can be of two types: bipartite and tripartite lease.

Direct lease is a lease under which a lessor owns/acquires the assets that are leased to a given lessee.

Bipartite Lease There are two parties in this lease transaction, namely, **(i)** the equipment supplier-cum-lessor and **(ii)** the lessee. Such a lease is typically structured as an operating lease with inbuilt facilities like upgradation of the equipment (Upgrade lease), addition to the original equipment configuration and so on. The lessor maintains the asset and, if necessary, replaces it with a similar equipment that is in working condition (Swap lease).

Tripartite Lease Such a lease involves three different parties in the lease agreement: **(i)** the equipment supplier, **(ii)** the lessor and **(iii)** the lessee. An innovative variant of the tripartite lease is the sales-aid lease under which the equipment supplier arranges for lease finance in various forms by:

- Providing reference about the customer to the leasing company;
- Negotiating the terms of the lease with the customer and completing all the formalities on behalf of the leasing company;
- Writing the lease on his own account and discounting the lease receivables with the designated leasing company. The effect is that the leasing company owns the equipment and obtains an assignment of the lease rental.

The sales-aid lease is usually with recourse to the supplier in the event of default by the lessee, either in the form of an offer from the supplier to buy back the equipment from the lessor or a guarantee on behalf of the lessee.

Single Investor Lease and Leveraged Lease: Single Investor Lease There are only two parties to this lease transaction: the lessor and the lessee. The leasing company (lessor) funds the entire investment by an appropriate mix of debt and equity funds. The debt raised by the leasing company to finance the asset are without recourse to the lessee, that is, in the case of default in servicing the debt by the leasing company, the lender is not entitled to payment from the lessee.

Leveraged lease is a lease under which the lessor acts as an equity participant supplying a fraction of the total cost of the asset while the lender supplies the major part (balance).

Leveraged Lease There are three parties to the transaction: **(i)** the lessor (equity investor), **(ii)** the lender and **(iii)** the lessee. In such a lease, the leasing company (equity investor) buys the asset through substantial borrowing, with full recourse to the lessee and any recourse to it. The lender (loan participant) obtains an assignment of the lease and the rentals to be paid by the lessee as well as first mortgage assets on the leased asset. The transaction is routed through a trustee who looks after the interests of the lender and lessor. On receipt of the rentals from the lessee, the trustee remits the debt-service component of the rental to the loan participant and the balance to the lessor.

To illustrate, assume the Hypothetical Ltd (HLL) has structured a leveraged lease with an investment cost of ₹50 crore. The investment is to be financed by equity from the company and loan from the Hypothetical Bank Ltd (HBL) in the ratio of 1:5. The interest on loan may be assumed to be 20 per cent per annum, to be repaid in five equated annual instalments. If the required rate of return (gross yield) of the HLL is 24 per cent, calculate (i) the equated annual instalment and (ii) the annual lease rental.

(i) Equated Annual Instalment to HBL:

$$= \frac{\text{Loan amount}}{\text{PVIFA [at 20 per cent, after 5 years (20,5)]}}$$

$$= \frac{\text{₹40 crore (0.8} \times \text{₹50 crore)}}{2.991} = \text{₹13.4 crore}$$

(ii) Annual Lease Rental (X):

$$\text{Annual cash flow to HLL} = (X - \text{₹13.4 crore})$$

Given HLL's required rate of return of 24 per cent, $(X - \text{₹13.4 crore}) \times \text{PVIFA (24,5)} - \text{₹10 crore}$ (equity) or $2.745 X - \text{₹36.783 crore}$ (ie, $2.745 \times \text{₹13.4 crore}$) = ₹10 crore

Or

$$2.745 X = \text{₹46.783 crore}$$

$$X = \text{₹17.04 crore}$$

In terms of the standard quote, the lease rental works out to be ₹340/₹1,000 per annum

$$\left(\text{₹17.04 crore} \times \frac{\text{₹1,000}}{\text{₹50 crore}} \right)$$

Like other lease transactions, leverage lease entitles the lessor to claim tax shields on depreciation and other capital allowances on the entire investment cost, including the non-recourse debt. The return on equity (profit after tax divided by networth) is, therefore, high.

From the lessee's point of view, the effective rate of interest implicit in the lease arrangement is less than on a straight loan as the lessor passes on a portion of the tax benefits, in the form of lower rental payments, to the lessee. Leveraged lease packages are generally structured for leasing investment intensive assets like aircrafts, ships and so on.

Domestic Lease and International Lease: Domestic Lease A lease transaction is classified as domestic if all parties to the agreement, namely, equipment supplier, lessor and the lessee are domiciled in the same country.

- Domestic lease
- is a lease
- transaction if all
- parties to the
- agreement are
- domiciled in the
- same country.

International Lease If the parties to the lease transaction are domiciled in different countries, it is known as an international lease. This type of lease is further sub-classified into (1) the import lease and (2) the cross-border lease.

- International
- lease
- is a lease
- transaction if
- all parties to
- the agreement
- are domiciled in
- different countries.

Import Lease In an import lease, the lessor and the lessee are domiciled in the same country but the equipment supplier is located in a different country. The lessor imports the asset and leases it to the lessee.

Cross-Border Lease When the lessor and the lessee are domiciled in different countries, the lease is classified as cross-border lease. The domicile of the supplier is immaterial.

Operationally, the domestic and international leases are differentiated on the basis of risk. The latter type of lease transaction is affected by two additional risk factors,

that is, country risk and currency risk. The country risk arises from the need to structure the lease transaction in the light of an understanding of the political and economic climate and a knowledge of the tax and regulatory environment governing them in the foreign countries concerned. As the payment to the supplier and the lease rentals are denominated in different currencies, any variation in the exchange rate will involve currency risk.

Significance and Limitations

The advantages and limitations of leasing are summarised below.

Advantage of Leasing: To the Lessee Lease financing has the following advantages to the lessee:

Financing of Capital Goods Lease financing enables the lessee to avail of finance for huge investments in land, building, plant, machinery, heavy equipment, and so on, upto 100 per cent, without requiring any immediate down payment. Thus, the lessee is able to commence his business virtually without making any initial investment (of course, he may have to invest a minimal sum for working capital needs).

Additional Sources of Finance Leasing facilitates the acquisition of equipment, plant and machinery without the necessary capital outlay and, thus, has a competitive advantage of mobilising the scarce financial resources of a business enterprise. It enhances the working capital position and makes available the internal accruals for business operations.

Less Costly Leasing as a method of financing is less costly than other alternatives available.

Ownership Preserved Leasing provides finance without diluting the ownership or control of the promoters. As against it, other modes of long-term finance—for example, equity—normally dilute the ownership of the promoters.

Avoids Conditionalities Lease finance is considered preferable to institutional finance as in the former case there are no strings attached. Lease financing is beneficial since it is free from restrictive covenants and conditionalities, such as representation on the board, conversion of debt into equity, payment of dividend and so on, which usually accompany institutional finance and term loans from banks.

Flexibility in Structuring of Rentals Lease rentals can be structured to accommodate the cash flow situation of the lessee, making the payment of rentals convenient to him. Lease rentals are so tailor-made that the lessee is able to pay the rentals from the funds generated from operations. The lease period is also chosen so as to suit the lessee's capacity to pay rentals and considering the operating life-span of the asset. Some of the ways to structure lease rentals are illustrated below.

The following data relate to the Hypothetical Leasing Ltd:

- (1) Investment outlay/cost, ₹100 lakh
- (2) Pre-tax required rate of return, 20 per cent per annum
- (3) Primary lease period, 5 years
- (4) Residual value (after primary period), Nil
- (5) Assumptions regarding alternative rental structures:
 - (A) Equated/Level
 - (B) Stepped (15 per cent increase per annum),
 - (C) Ballooned (annual rental of ₹10 lakh for years, 1–4),
 - (D) Deferred (deferment period of 2 years)

The annual lease rentals under the above four alternatives are computed below:

(A) Equated Annual Lease Rental (Y):

$$Y = Y \times \text{PVIFA [at 20 per cent for 5 years (20,5)]} = ₹100 \text{ lakh}$$

$$= \frac{₹100 \text{ lakh}}{2.991} = ₹33.43 \text{ lakh}$$

(B) Stepped Lease Rental (assuming 15 per cent increase annually):

$$Y = Y \times \text{PVIF (20,1)} + (1.15)Y \times \text{PVIF (20,2)} + (1.15)^2 Y \times \text{PVIF (20,3)} + (1.15)^3 Y$$

$$\times \text{PVIF (20,4)} + (1.15)^4 Y \times \text{PVIF (20,5)} = ₹100 \text{ lakh}$$

$$= 8.33Y + 0.798Y(0.694 \times 1.15Y) + 0.764Y(0.579 \times 1.32Y) + 0.733Y$$

$$(0.482 \times 1.52Y) + 0.703Y(0.402 \times 1.75Y)$$

$$= (0.482 \times 1.52 Y) + 0.703(0.402 \times 1.75 Y) = 3.833Y = ₹100 \text{ lakh}$$

$$Y = ₹26.10 \text{ lakh, where } Y \text{ denotes the annual rental in year 1.}$$

The lease rentals in different years over the lease term will be: Year 2, ₹30.02 lakh; Year 3, ₹34.52 lakh; Year 4, ₹39.70 lakh; an Year 5, ₹45.65 lakh.

(C) Ballooned Leased Rental (₹10 lakh for years 1-4):

$$Y = [10 \times \text{PVIFA (20,4)} + Y \times \text{PVIF (20,5)}] = ₹100 \text{ lakh}$$

$$Y = ₹100 \text{ lakh} - ₹25.9 \text{ lakh}$$

or $Y = (₹74.10 \text{ lakh} + 0.402) = ₹184.33 \text{ lakh, where } Y \text{ denotes the ballooned payment in year 5.}$

(D) Deferred Lease Rental (deferment of 2 years):

Denoting Y as the equated annual rental to be charged between years 3-5,

$$Y = Y \times \text{PVIF (20,3)} + Y \times \text{PVIF (20,4)} + Y \times \text{PVIF (20,5)} = ₹100 \text{ lakh}$$

$$1.463 Y = ₹100 \text{ lakh}$$

$$Y = ₹68.35 \text{ lakh}$$

This flexibility is not available in the debt servicing pattern of a conventional loan; institutional borrowings, for instance. Such loans have to be typically repaid over a specified number of instalments resulting in heavy debt servicing burden in the earlier years of a project, whereas the project may actually generate substantial cash flows in later years.

Simplicity A lease finance arrangement is simple to negotiate and free from cumbersome procedures with faster and simple documentation. As against it, institutional finance and term loans require compliance of covenants, formalities and a bulk of documentation, causing procedural delays.

Tax Benefits By suitable structuring of lease rentals, a lot of tax advantage can be derived. If the lessee is in a tax paying position, the rental may be increased to lower his taxable income. The cost of the asset is thus amortised more rapidly than in a case where the asset is owned by the lessee, since depreciation is allowable at the prescribed rates. If the lessor is in a tax paying position, the rentals may be lowered to pass on a part of the tax benefit to the lessee. Thus, rentals can be suitably adjusted for postponement of taxes.

Obsolescence Risk is Averted In a lease arrangement, the lessor, being the owner, bears the risk of obsolescence and the lessee is always free to replace the asset with the latest technology.

To the Lessor A lessor has the following advantages:

Full Security The lessor's interest is fully secured since he is always the owner of the leased asset and can take repossession of the asset if the lessee defaults. As against it, realising an asset secured against a loan is more difficult and cumbersome.

Tax Benefit The greatest advantage of the lessor is the tax relief by way of depreciation. If the lessor is in a high tax bracket, he can lease out assets with high depreciation rates and, thus, reduce his tax liability substantially. Besides, the rentals can be suitably structured to pass on some tax benefit to the assessee.

High Profitability The leasing business is highly profitable since the rate of return is more than what the lessor pays on his borrowings. Also, the rate of return is more than in case of lending finance directly.

Trading on Equity The lessor usually carry out his operations with greater financial leverage. That is, he has a very low equity capital and use a substantial amount of borrowed funds and deposits. Thus, the ultimate return on equity is very high.

High Growth Potential The leasing industry has a high growth potential. Lease financing enables the lessees to acquire equipment and machinery even during a period of depression, since they do not have to invest any capital. Leasing, thus, maintains the economic growth even during a recessionary period.

Limitations of Leasing Lease financing suffers from certain limitations too:

Restrictions on Use of Equipment A lease arrangement may impose certain restrictions on use of the equipment, acquiring compulsory insurance and so on. Besides, the lessee is not free to make additions or alterations to the leased asset to suit his requirement.

Limitations of Financial Lease A financial lease may entail a higher payout obligation if the equipment is not found to be useful and the lessee opts for premature termination of the lease agreement. Besides, the lessee is not entitled to the protection of express or implied warranties since he is not the owner of the asset.

Loss of Residual Value The lessee never becomes the owner of the leased asset. Thus, he is deprived of the residual value of the asset and is not even entitled to any improvements done by the lessee or caused by inflation or otherwise, such as appreciation in value of leasehold land.

Consequence of Default If the lessee defaults in complying with any terms and conditions of the lease contract, the lessor may terminate the lease and take over the possession of the leased asset. In case of finance lease, the lessee may be required to pay for damages and accelerated rental payments.

Understatement of Lessee's Asset Since the leased asset does not form part of the lessee's assets, there is an effective understatement of his assets, which may sometimes lead to gross underestimation of the lessee. However, there is now an accounting practice to disclose the leased assets by way of a footnote to the balance sheet.

LO 25.2 FINANCIAL EVALUATION OF LEASING

The process of financial appraisal in a lease transaction generally involves three steps: **(i)** appraisal of the client, in terms of his financial strength and credit worthiness; **(ii)** evaluation of the security/collateral security offered and **(iii)** financial evaluation of the proposal. The most critical part of a leasing transaction, both to the lessor and the lessee, is the financial evaluation of the proposal. The analytical framework/technique to evaluate the financial terms of a leasing proposal is discussed below. The objective of the evaluation is to identify the cheaper source of finance to a lessee and better investment alternative to the lessor.

Lessee's Perspective

Finance lease effectively transfers the risk and rewards associated with the ownership of an equipment from the lessor to the lessee. A lease can be evaluated either as an investment decision or as a financing alternative. Given that an investment decision has already been made, a firm (lessee) has to evaluate whether it will purchase the asset/equipment or acquire it on lease basis. Since lease rental payments are similar to payments of interest on debt, leasing in essence is an alternative to borrowing. The lease evaluation from the lessee's point of view, thus, essentially involves a choice between debt financing versus lease financing. It is in this context that an evaluation of lease financing from the view point of the lessee is presented here. The decision criterion used is the Net Present Value of Leasing [NPV(L)]/Net Advantage of Leasing (NAL). The discount rate used is the marginal cost of capital for all cash flows other than lease payments and the pre-tax cost of debt for lease payments. The value of the interest tax shield is included as a foregone cash flow in the computation of NPV(L)/NAL

Equationally NPV(L)/NAL

= Investment cost

Less: Present value of lease payments (discounted by K_d)

Plus: Present value of tax shield on lease payments (discounted by K_c)

Less: Management fee

Plus: Present value of tax shield on management fee (discounted by K_c)

Minus: Present value of depreciation (tax) shield (discounted by K_c)

Minus: Present value of (tax) shield on interest (discounted by K_c)

Minus: Present value of residual/salvage value (discounted by K_c)

where K_c = Post-tax marginal cost of capital

K_d = Pre-tax cost of long-term debt

If the NAL/NPV(L) is positive, the leasing alternative should be used, otherwise the borrowing alternative would be preferable.

An alternative approach is to compare the leasing and buying/borrowing alternative. Given the fact that investment decision has already been taken, the lessee is to evaluate whether it should purchase an equipment through borrowing or acquire it on lease basis. Why borrowings only? Since lease rentals are similar to the payment of interest on debt, leasing, in essence, is an alternative to borrowing. The lease, as a source of finance, should be logically compared exclusively with debt as an alternative source of finance to purchase the required equipment/plant. The lessee, obviously, would opt for the cheaper source of finance. For the purpose of financial evaluation, the two methods in vogue are: (1) Present-value method and (2) Internal-rate of return method.

Present-Value Method The present value method involves a comparison of present value (PV) of cash outflows after taxes (COAT) under both the alternatives. An alternative with the lower PV would be a preferred choice. The steps involved are summarised below.

- (1) Determine the cash outflows after taxes for each year under the lease alternative. This is arrived at multiplying the lease rental payments (L) by $(1 - \text{tax rate}, t)$.
- (2) Determine the cash outflows after taxes for each year under the buy/borrow alternative. The COAT is equal to the loan instalment (Gross cash outflows, GCO) less (i) tax advantage on interest (I) component of loan instalment ($I \times t$) and (ii) tax shield due to depreciation allowance ($D \times t$).

- (3) Compare the PV of the cash outflows associated with leasing (Step 1) and buy/borrow alternative (Step 2) by employing after-tax cost of debt (k_d) as the discount rate. The focus of analysis, essentially, is to compare the two sources of finance, namely, leasing and debt. Therefore, the relevant required values are after-tax cost of (i) leasing and (ii) debt.
- (4) Select the alternative with the lower PV of cash outflow after taxes.
- (5) Decision criterion is:
- (a) **In favour of buy/borrow alternative if** PV of COAT under lease alternative > PV of COAT under buy/borrow alternative
- (b) **In favour of lease alternative in case** PV of COAT under lease alternative < PV of COAT under buy/borrow alternative.

Note: (A) In Step 2, cash inflows in the terminal year are expected from two more avenues: (i) Salvage value and (ii) Tax shield on short-term capital loss (as machine, more often than not, is sold at a price lower than its book value). In rare cases, when the sale yields profits, the tax due on short-term capital gains should be subtracted from the salvage value.

(B) Normally, taxes and maintenance expenses are borne by the lessee. Since such costs are common costs under both options, they might be ignored. However, if they are to be incurred by the lessor, after tax maintenance costs are incremental costs under buy/borrow alternative and should be taken into account.

Internal Rate Return (IRR) Under the IRR method/alternative, the after-tax cost of leasing is determined and is compared with the after-tax cost of debt. The alternative with the lower cost is selected. Both methods provide identical answers. The virtue of IRR method is that it is devoid of the problem of choosing an appropriate discount rate. The steps required to compute IRR (representing after tax cost of leasing) is summarised below.

- (1) Capital cost of plant and machinery is saved due to lease option. The cost saved is equal to the present value of cash outflows after taxes (for the lease period) associated with lease alternative (determined as per Step 2). The rate which makes the two sides equal is the IRR.
- (2) Cash outflows after taxes (COAT) under the lease alternative are equal to the lease payments (L) minus the tax advantage on the excess amount of lease payments over depreciation allowed on plant and machinery. Symbolically, it is $[L - t(L - D)]$. These net cash outflows are to be determined for each year. Alternatively, $COAT = LRAT + \text{Tax advantage on depreciation allowed on own plant and machinery foregone}$.
- (3) In the terminal year, the salvage value (SV) as well as the tax advantage on short-term capital loss (TASTCL) are to be reckoned as opportunity costs of using the lease alternative. The sum of the two would constitute the cash outflows in terminal (nth) year.
- (4) Symbolically, the IRR representing the cost of leasing would be:

$$\text{Cost of plant and machinery} = \sum_{t=1}^n \frac{COAT(\text{net})_t}{(1+k_l)^t} + \frac{SV_n + TASTCL_n}{(1+k_l)^n}$$

- (5) Decision criterion: If the after tax cost of leasing (k_l) < the after tax cost of debt (k_d), choose the leasing alternative and vice versa.

The mechanics of computation of (i) PV/IRR associated with the two alternatives—leasing and borrowing and (ii) NAL/RIPV(L) is illustrated now.

Example 25.1

XYZ Ltd is in the business of manufacturing steel utensils. The firm is planning to diversify and add a new product line. The firm either can buy the required machinery or get it on lease.

The machine can be purchased for ₹15,00,000. It is expected to have a useful life of 5 years with a salvage value of ₹1,00,000 after the expiry of 5 years. The purchase can be financed by 20 per cent loan repayable in 5 equal annual instalments (inclusive of interest) becoming due at the end of each year. Alternatively, the

machine can be taken on year-end lease rentals of ₹4,50,000 for 5 years. Advise the company on the option it should choose. For your exercise, you may assume the following:

- (i) The machine will constitute a separate block for depreciation purposes. The company follows written down value method of depreciation, the rate of depreciation being 20 per cent.
- (ii) Tax rate is 35 per cent and cost of capital is 20 per cent.
- (iii) Lease rentals are to be paid at the end of the year.
- (iv) Maintenance expenses estimated at ₹30,000 per year are to be borne by the lessee.
- (v) Assume the firm would have sufficient short-term capital gains in year of sale of machine.

Solution

(A) Present Value Approach

PV of Cash Outflows Under Leasing Alternative

Year-end	Lease rent after taxes [R(1 - t)] [₹4,50,000 (1 - 0.35)]	PVIFA at 13% [20% (1 - 0.35)]	Total PV
1-5	₹2,92,500	3.517	₹10,28,723

Borrowing/Buying Option:

Equivalent annual loan instalment = ₹15,00,000/2.991 (PVIFA for 5 years at 20% i.e., 20,5) = ₹5,01,505.

PV of Cash Outflows Under Buying Alternative

Year-end	Loan instalment	Tax advantage on		Net cash outflows col. 2 - (col. 3 + 4)	PVIF at 13%	Total PV
		Interest (I × 0.35)	Depreciation (D × 0.35)			
1	2	3	4	5	6	7
1	₹5,01,505	₹1,05,000	₹1,05,000	₹2,91,505	0.885	₹2,57,982
2	5,01,505	90,895	84,000	3,26,610	0.783	2,55,736
3	5,01,505	73,968	67,200	3,60,337	0.693	2,49,714
4	5,01,505	53,656	53,760	3,94,089	0.613	2,41,577
5	5,01,505	29,114	43,008	4,29,383	0.543	2,33,155
						12,38,164
						54,300
					74,408	
Total						11,09,456

Less: PV of salvage value (₹1,00,000 × 0.543)

Less: PV of tax savings on short-term capital loss

(₹4,91,520 - ₹1,00,000) × 0.35 = (₹1,37,032 × 0.543)

Total

Recommendation

The company is advised to go for leasing as the PV of cash outflows under the leasing option is lower than under the buy/borrowing alternative.

Working Notes

Schedule of Debt Payment

Year-end	Loan instalment	Loan at the beginning of the year	Payments		Loan outstanding at the end of the year (col. 3 - col. 5)
			Interest (col. 3 × 0.20)	Principal repayment	
1	2	3	4	5	6
1	₹5,01,505	₹15,00,000	₹3,00,000	₹2,01,505	₹12,98,495
2	5,01,505	12,98,495	2,59,699	2,41,806	10,56,689
3	5,01,505	10,56,689	2,11,338	2,90,167	7,66,522
4	5,01,505	7,66,522	1,53,304	3,48,201	4,18,321
5	5,01,505	4,18,321	83,184*	4,18,321	—

 The final results in the spreadsheet differ marginally from those of the numerical solution due to approximations.

(B) IRR Approach

Determination of After-tax Cost of Lease Financing (IRR Approach)

Year-end	Cost of machine	Lease payments (L)	Depreciation of machine (D)	Incremental tax shield on leasing $0.35 \times (L - D)$	Net cash outflows under leasing [(3) - (5)]
(1)	(2)	(3)	(4)	(5)	(6)
0	₹15,00,000	—	—	—	₹15,00,000
1		₹4,50,000	₹3,00,000	₹52,500	(3,97,500)
2		4,50,000	2,40,000	73,500	(3,76,500)
3		4,50,000	1,92,000	90,300	(3,59,700)
4		4,50,000	1,53,600	1,03,740	(3,46,260)
5		4,50,000	1,22,880	1,14,492	(3,35,508)
5* Salvage value					(1,00,000)*
5* Tax savings on short-term capital loss					(1,37,032)**

*Machine has been sold after the expiry of five years (that is, at the beginning of year 6). The PV of salvage value and tax savings can be computed with reference to year-end 5.

**Salvage value of machine foregone and short-term capital loss constitute the opportunity cost of lease financing and, therefore, cash outflows of lease financing.

Determination of IRR

Year	Net cash outflows under leasing	PV factor at		Total PV at	
		10%	11%	10%	11%
1	₹3,97,500	0.909	0.901	₹3,61,375	₹3,58,148
2	3,76,500	0.826	0.812	3,10,989	3,05,718
3	3,59,700	0.751	0.731	2,70,135	2,62,941
4	3,46,260	0.683	0.659	2,36,496	2,28,185
5	5,72,540@	0.621	0.593	3,55,547	3,39,516
				15,34,542	14,94,508

@ [₹3,35,508 + ₹1,00,000, salvage value + ₹1,37,032, tax advantage on short-term capital loss]

IRR1 = 11% - (₹5,492/₹40,034 = 0.14) = 10.86 per cent.

Recommendation: The company is advised to go for leasing to take advantage of its lower cost relative to the cost of debt.

CONCLUSIONS

The following conclusions were drawn from the data presented in this report:

1. The first conclusion is that the data shows a clear trend of increasing values over the period studied.

2. The second conclusion is that the rate of increase appears to be accelerating towards the end of the period.

3. The third conclusion is that the data is consistent with the theoretical model proposed in the introduction.

4. The fourth conclusion is that the data suggests a strong correlation between the variables studied.

5. The fifth conclusion is that the data indicates a significant impact of the independent variable on the dependent variable.

6. The sixth conclusion is that the data supports the hypothesis that the system is approaching a state of equilibrium.

7. The seventh conclusion is that the data shows a high degree of variability in the measurements.

8. The eighth conclusion is that the data indicates a need for further investigation into the underlying mechanisms.

The data presented in this report shows a clear trend of increasing values over the period studied. The rate of increase appears to be accelerating towards the end of the period. The data is consistent with the theoretical model proposed in the introduction. The data suggests a strong correlation between the variables studied. The data indicates a significant impact of the independent variable on the dependent variable. The data supports the hypothesis that the system is approaching a state of equilibrium. The data shows a high degree of variability in the measurements. The data indicates a need for further investigation into the underlying mechanisms.

Example 25.2 (Annual Lease Rentals)

The following details relate to an investment proposal of the Hypothetical Industries Ltd (HIL):

- Investment outlay, ₹180 lakh
- Useful life, 3 years
- Net salvage value after 3 years, ₹18 lakh
- Annual tax relevant rate of depreciation, 40 per cent

The HIL has two alternatives to choose from to finance the investment:

Alternative I: Borrow and buy the equipment. The cost of capital of the HIL, 0.12; marginal rate of tax, 0.35; cost of debt, 0.17 per annum.

Alternative II: Lease the equipment from the Hypothetical Leasing Ltd on a three year full payout basis @₹444/₹1,000, payable annually in arrears (year-end). The lease can be renewed for a further period of 3 years at a rental of ₹18/₹1,000, payable annually in arrears.

Which alternative should the HIL choose? Why?

Solution**Decision Analysis**

(₹ lakh)

1. Investment outlay	₹180.00
2. <i>Less:</i> Present value of lease rentals (working note 1)	176.61
3. <i>Plus:</i> present value of tax shield on lease rentals (2)	67.19
4. <i>Minus:</i> present value of tax shield on depreciation (3)	41.01
5. <i>Less:</i> Present value of interest shield on displaced debt (4)	18.29
6. <i>Less:</i> Present value of net salvage value (5)	12.81
NAL/NPV(L)	(1.53)

Since the NAL is negative, the lease is not economically viable. The HIL should opt for the alternative of borrowing and buying.

Working Notes

1. Present value of lease rentals: = ₹(180 lakh × 0.444) × PVIFA (17,3) = ₹79.92 lakh × 2.210 = ₹176.61 lakh
2. Present value of tax shield on lease rentals: = ₹(180 lakh × 0.444 × 0.35) × PVIFA (12,3) = ₹27.972 lakh × 2.402 = ₹67.19 lakh
3. Present value of tax shield on depreciation = [72 × PVIF (12,1) + 43.2 × PVIF (12,2) + 25.92 × PVIF (12,3)] × 0.35 = [(72 × 0.893) + (43.2 × 0.797) + (25.92 × 0.712)] × 0.35 = ₹41.01 lakh
4. Present value of interest tax shield on displaced debt: = [30.03 × PVIF (12,1) + 21.54 × PVIF (12,2) + 11.61 × PVIF (12,3)] × 0.35 = [(30.03 × 0.893) + (21.54 × 0.797) + (11.61 × 0.712)] × 0.35 = ₹18.29 lakh.

(Displaced) Debt (Present Value of Lease Rentals) Amortisation Schedule

(₹ lakh)

Year	Loan outstanding at the beginning	Interest content (at 17%)	Capital content	Instalment amount (176.61 ÷ 2.210)
1	176.61	30.03	49.89	79.92
2	126.72	21.54	58.38	79.92
3	68.34	11.61	68.34	79.92

Equal to the present value of lease rentals

5. Present value of net salvage value = 18 × PVIF (12,3) = 18 × 0.712 = ₹12.81 lakh

Example 25.3 (Monthly Lease Rentals)

In **Example 25.2**, assume a lease rental of ₹35/₹1,000 payable monthly, in advance. Compute the NAL/NPV(L). Should the HIL opt for lease financing?

Solution

Decision Analysis		(₹ lakh)
1. Investment outlay		₹180.00
2. Less: Present value of lease rentals (working note 1)		182.10
3. Plus: Present value of tax shield on lease rentals (2)		63.56
4. Less: Present value of tax shield on depreciation (3)		41.01
5. Less: Present value of interest shield on displaced debt (4)		13.12
6. Less: Present value of net salvage value (5)		12.81
NAL		(5.48)

As the NAL is negative, the lease is not financially advantageous and HIL should not opt for it.

Working Notes

- Present value of lease rentals: = ₹(180 × 0.035 × 12) × PVIFA_m(17,3) = 75.6 × $i^{\wedge} / d(12)$ × PVIFA(1,3), where $I = 0.17 = 75.6 \times 1.09$ (Table A-3) × 2.210 (Table A-2) = ₹182.10 lakh
- Present value of tax shield on lease payments: = ₹[(180 × 0.035 × 12) × PVIFA(12,3) × 0.35] = 75.6 × 2.402 × 0.35 = ₹63.56 lakh
- Present value of tax shield depreciation: No change from the annual payment (₹41.01 lakh)
- Present value of interest tax shield on displaced debt: = [(24.15 × 0.893) + (15.39 × 0.797) + (5.16 × 0.712)] × 0.35 = ₹13.12 lakh

Debt Amortisation Schedule					(₹ lakh)
Year	Loan outstanding at the beginning*	Interest content	Capital content	Instalment amount [182.10 + 2.409 (1.09 × 2.210)]	
1	181.10	24.15	51.45	75.60	
2	130.65	15.39	60.21	75.60	
3	70.44	5.16	70.44	75.60	

*Equal to the present value of lease rentals

- Present value of net salvage value: No change from annual payment basis (₹12.81 lakh)

It can be seen that in the case of monthly lease payment, the component of the lease-related cash flow streams that will change are: (1) Lease rentals, (2) Tax shield on lease rentals and (3) Interest tax shield on displaced debt.

Break-Even Lease Rental The break-even lease rental (BELR) is the rental at which the lessee is indifferent to a choice between lease financing and borrowing/buying. Alternatively, BELR has a NAL of zero. It reflects the maximum level of rental that the lessee would be willing to pay. If the BELR exceeds the actual lease rental, the lease proposal would be accepted, otherwise it would be rejected. The computation of the BELR is shown in example 25.4.

Example 25.4

For the HIL in Example 25.2, assume monthly lease payments in advance. Compute the break-even monthly lease rental. Can the HIL accept a lease quote of ₹35/₹1,000 per month, payable in advance?

Solution

The monthly break-even lease rental (B_L) can be obtained when NAL = zero. Thus, $[180 - (12 B_L \times 3.27 \times 2.210) + (12 B_L \times 0.35 \times 2.402) - 58.59 - [(11.49 \times 0.893) + (7.35 \times 0.797) + (2.43 \times 0.712)] \times 0.35 B_L - 12.81 = 0$. $B_L = ₹2.78$ lakh

Monthly lease rental payable by HIL = ₹180 lakh \times 0.035 = ₹6.30 lakh

Since the B_L is less than the actual rental to be paid, the lease proposal cannot be accepted.

Working Notes

Required Amortisation Schedule

(₹ lakh)

Year	Loan outstanding at the beginning	Interest content	Capital content	Instalment amount
1	86.73 B _L	24.51 B _L	11.49 B _L	12 B _L
2	66.22 B _L	28.65 B _L	7.35 B _L	12 B _L
3	33.57 B _L	33.57 B _L	2.43 B _L	12 B _L

Lessor's Viewpoint

The lease evaluation from the point of the lessor aims at ascertaining whether to accept a lessee proposal or to choose from alternative proposals. As in the case of an evaluation by a lessee, the appraisal method used is the discounted cash flow technique based on the lessor's cash flows. The lease related cash flow from his angle consists of (a) outflows in terms of the initial investment/acquisition cost of the asset at the inception of the lease; income tax on lease payments, sales tax on lease transaction, if any; lease administration expenses such as rental collection charges, expenses on suits for recovery, other direct costs and so on; (b) inflows such as lease rentals, management fee, tax shield on depreciation, residual value and security deposit, if any, and so on. The lease evaluation from the point of view of a lessor is illustrated here and includes aspects such as break-even rental for the lessor, negotiation and fixing of lease rentals.

Example 25.5

For the firm in our Example 25.1, assume further that; (i) the lessor's weighted average cost of capital is 14 per cent. (ii) The lessor would have sufficient short-term capital gain in year of sale of machine. Is it financially profitable for a leasing company to lease out the machine?

Solution

Determination of NPV of Cash Inflows

Particulars	Year				
	1	2	3	4	5
Lease rent	₹4,50,000	₹4,50,000	₹4,50,000	₹4,50,000	₹4,50,000
Less: Depreciation	3,00,000	2,40,000	1,92,000	1,53,600	1,22,880
Earnings before taxes	1,50,000	2,10,000	2,58,000	2,96,400	3,27,120
Less: Taxes (0.35)	52,500	73,500	90,300	1,03,740	1,14,492
Earnings after taxes	97,500	1,36,500	1,67,700	1,92,660	2,12,628
Cash inflows after Taxes	3,97,500	3,76,500	3,59,700	3,46,260	3,35,508
PV factor at (0.14)	0.877	0.769	0.675	0.592	0.519
Total	3,48,608	2,89,529	2,42,798	2,04,986	1,74,129
Total PV (operations)					12,60,050
Add: PV of salvage value of machine (1,00,000 \times 0.519)					51,900
Add: PV of tax savings on short-term capital loss (₹1,37,032 \times 0.519)					71,120
Gross PV					13,83,070
Less: Cost of machine					15,00,000
NPV					(1,16,930)

It is not financially profitable to let out the machine on lease by the leasing company, as NPV is negative.

Break-Even Lease Rental From the viewpoint of a lessor, the break-even lease rental represents the minimum (floor) lease rental that he can accept. The NAL/NPV(L) at this level of rental is zero. The discount rate to compute the NAL is the marginal overall cost of funds to the lessor. The application of the NAL approach to compute the break-even lease rental to a lessor is illustrated below.

Example 25.6

For facts contained in Example 25.5, (a) determine the minimum lease rentals at which the lessor would break-even. Also, prepare a verification table. Determine the lease rentals if the lessor wants to earn an NPV of ₹1 lakh.

Solution

(a) Break-even Lease Rental	
Cost of machine	₹15,00,000
Less: PV of salvage value to be received at the end of 5 years (₹1,00,000 × 0.519)	51,900
Less: PV of tax savings on short-term capital loss at the end of the 5 th year (₹1,37,032 × 0.519)	71,120
Less: PV of tax shield on depreciation: (₹3,00,000 × 0.35 × 0.877) + (₹2,40,000 × 0.35 × 0.769) + (₹1,92,000 × 0.35 × 0.675) + (₹1,53,600 × 0.35 × 0.592) + (₹1,22,880 × 0.35 × 0.519)	2,56,188
Required total PV of after tax lease rent	11,20,792
Divided by PVIFA for 5 years at 0.14	+3.433
After tax lease rentals	3,26,476
Break-even lease rentals (₹3,26,476/(1 – 0.35))	5,02,271

Verification Table

Particulars	Year				
	1	2	3	4	5
Lease rent	₹5,02,271	₹5,02,271	₹5,02,271	₹5,02,271	₹5,02,271
Less: Depreciation	3,00,000	2,40,000	1,92,000	1,53,600	1,22,880
Earnings before taxes	2,02,271	2,62,271	3,10,271	3,48,671	3,79,391
Less: Taxes (0.35)	70,795	91,795	1,08,595	1,22,035	1,32,787
Earnings after taxes	1,31,476	1,70,476	2,01,676	2,26,636	2,46,604
CFAT (EAT + Depreciation)	4,31,476	4,10,476	3,93,676	3,80,236	3,69,484
PV factor at (0.14)	0.877	0.769	0.675	0.592	0.519
Total	3,78,404	3,15,656	2,65,731	2,25,100	1,91,762
PV of Lease rent					13,76,653
Add: PV of salvage value					51,900
Add: PV of tax savings on short-term capital loss					71,120
Total PV					14,99,673*

(b) Lease-Rentals to be Charged to Earn NPV of ₹1,00,000

Required total PV of after-tax lease rentals (₹11,20,792 for break-even + ₹1,00,000)	₹12,20,792
Divided by PVIFA for 5 years at 0.14	+3.433
After-tax lease rentals	3,55,605
Lease rentals to be charged [₹3,55,605/(1 – 0.35)]	5,47,085

*Difference of ₹327 is due to rounding off the figures.

Example 25.7

The under mentioned facts relate to a lease proposal before the Hypothetical Leasing Ltd (HLL):

The initial cost of equipment to be leased out is ₹300 lakh, on which 10 per cent sales tax would be levied. At the end of the lease term, after 5 years, the salvage value is estimated to be ₹33 lakh. The other costs associated with the lease proposal payable in advance (front-ended) are initial direct cost, ₹3 lakh and management fee, ₹5 lakh. The marginal cost of funds to the HIL is 14 per cent while the marginal rate of tax is 35 per cent.

What is the break-even rental for HLL if the tax relevant rate of depreciation is 25 per cent?

Solution**Computation of Break-even Lease Rental (L)**

Particulars	Amount (₹ lakh)
1. Equipment cost (including ST)	3,30,000
2. Present value of lease rentals (working note 1)	3,433 L
3. Present value of tax on lease rentals (2)	1,202 L
4. Present value of tax shield on depreciation)	64,900
5. Present value of direct initial cost	3,000
6. Present value of management fee	5,000
7. Present value of tax shield on initial direct cost (4)	0,920
8. Present value of tax on management fee (5)	1,530
9. Present value of salvage value (6)	17,100

The break-even rental (L) can be derived from the equation:

$$3.433 L - 1.202 L + ₹64.90 \text{ lakh} - ₹3 \text{ lakh} + ₹5 \text{ lakh} + ₹0.902 \text{ lakh} - ₹1.53 \text{ lakh} + ₹17.10 \text{ lakh} - ₹330 \text{ lakh} = 0$$

$$L = ₹123.30 \text{ lakh}$$

Working Notes

- Present value of lease rental = $L [PVIFA (14,5)] = 3.433 L$
- Present value of tax on lease rental = $0.35 \times L \times PVIFA (14,5) = 1.202 L$
- Present value of tax shield on depreciation = $[₹82.50 \text{ lakh} \times PVIF (14,1) + ₹61.90 \text{ lakh} \times PVIF (14,2) + ₹46.40 \text{ lakh} \times PVIF (14,3) + ₹34.80 \text{ lakh} \times PVIF (14,4) + ₹26.1 \text{ lakh} \times PVIF (14,5)] \times 0.35 = [(₹82.50 \times 0.877) + (₹61.90 \times 0.769) + (₹46.40 \times 0.675) + (₹34.80 \times 0.592) + (₹26.1 \times 0.519)] \times 0.35 = ₹64.90 \text{ lakh}$
- Present value of tax shield on initial direct costs = $₹3 \text{ lakh} \times 0.35 \times PVIF (14,1) = ₹0.92 \text{ lakh}$
- Present value of tax shield on management fee = $0.35 \times ₹5 \text{ lakh} \times PVIF (14,1) = ₹1.53 \text{ lakh}$
- Present value of salvage value = $₹33 \text{ lakh} \times PVIF (14,5) = ₹17.10 \text{ lakh}$

Example 25.8

The Hypothetical Leasing Ltd (HLL) has a lease proposal under consideration. Its post-tax cost of funds is 14 per cent and it has to pay central sales tax (CST) @ 10 per cent of the basic price of the capital equipment on inter-state purchases. The marginal tax rate of the HLL is 35 per cent. The details of the proposed lease are given below:

- Primary lease period, 3 years
 - Tax relevant depreciation, 40 per cent on written down basis (with other assets in the block)
 - Residual value, 8 per cent of the original cost.
- If the monthly lease rentals are collected in advance, what is the minimum lease rental the HLL should charge for per ₹1,000 for the lease?
 - What is the minimum monthly lease rental for a lease proposal costing ₹660 lakh (including CST at 10 per cent)?

Solution

(a) Minimum Monthly Rental per ₹1,000	
1 Investment cost	₹1,000.00
2 Present value of lease rentals (working note 1)	29.93 L
3 Present value of tax shield on rentals (2)	9.75 L
4 Present value of tax shield on depreciation (3)	221.48
5 Present value of residual value (4)	54.00

The break-even level of rental (L) can be derived from the equation (NAL = 0)

$$= ₹1,000 + 29.93 L - 9.75 L + ₹221.48 + ₹54 = 0$$

$$L = ₹35.90, \text{ that is, } ₹35.90/₹1,000/\text{month}$$

- (b) Minimum monthly lease rental for the proposal costing ₹660 lakh = ₹660 lakh \times 0.03590
= ₹23.69 lakh

Working Notes

- Present value of lease rentals = $12 L \times PVIFA_m(14,3) = 12L \times 2.322 \times 1.0743 = 29.93 L$
- Present value of tax shield on lease rentals = $12L \times PVIFA(14,3) \times 0.35 = 12L \times 2.322 \times 0.35 = 9.75 L$
- Present value of tax shield on depreciation = $[\₹400 \times PVIF(9,14,1) + ₹240 \times PVIF(14,2) + ₹144 \times PVIF(14,3)] \times 0.35 = (\₹400 \times 0.877) + (\₹240 \times 0.769) + (\₹144 \times 0.675) = ₹221.48$
- Present value of residual value = $₹1,000 (0.08) \times PVIF(14,3) = ₹54.$

LO 25.3 HIRE-PURCHASE FINANCE

We examine below the conceptual, taxation, accounting and evaluation framework of hire-purchase finance. Historically, hire purchase finance has been associated with financing of commercial vehicles for road transport operators. It has emerged, in recent years as a source of equipment financing and an alternative to lease financing. We first explain the salient features/basics of hire-purchase transactions. The evaluation framework of hire-purchase transactions, from the viewpoint of the hirer as well as the intermediary (finance company), is outlined subsequently.

Conceptual Framework

Meaning and Characteristics Hire-purchase is a mode of financing the price of the goods to be sold on a future date. In a hire-purchase transaction, the goods are let on hire, the purchase price is to be paid in instalments and hirer is allowed an option to purchase the goods by paying all the instalments. A **hire-purchase agreement** is defined as peculiar kind of transaction in which the goods are let on hire with an option to the hirer to purchase them, with the following stipulations:

- Hire-purchase agreement
- is a peculiar type of transaction in which goods are let on hire with an option to the hirer to purchase them.

- Payment has to be made in instalments over a specified period;
- The possession is delivered to the hirer at the time of entering into the contract;
- The property in the goods passes to the hirer on payment of the last instalment;
- Each instalment is treated as hire charges so that if a default is made in payment of any instalment, the seller becomes entitled to take away the goods and
- The hire/purchaser is free to return the goods without being required to pay any further instalments falling due after the return.

Thus, a hire-purchase agreement has two aspects, firstly, an aspect of bailment of goods, subject to the hire purchase agreement, and secondly, an element of sale that fructifies when the option to

purchase is exercised by the intending purchaser. Though the option to purchase is allowed in the very beginning, it can be exercised only at the end of the agreement. The property in the goods does not pass at the time of the agreement but remains with the intending seller, it only passes later when the option is exercised by the intending purchaser.

The *modus operandi* of a hire-purchase transaction is structured around the following features:

The finance (hire purchase) company purchases the equipment from the equipment supplier and lets it on hire to the hirer who is required to make a down payment of 20 – 25 per cent of the cost and pay the balance with interest in Equated Monthly Instalments (EMI), in advance or arrears, spread over 36 – 48 months. Alternatively, in place of the margin in the down payment plan, under a deposit-linked plan, the hirer has to put in an equal amount as fixed deposit with the finance company, which provides the entire finance, on hire-purchase terms, repayable with interest in EMI's over 36 – 48 months. The deposit together with the accumulated interest is returned to the hirer after the payment of the last instalment. *The interest component of each hire purchase instalment is computed on the basis of a flat rate of interest and the effective rate of interest is applied to the declining balance of the original loan amount to determine the interest component of each instalment.* For a given flat rate of interest, the equivalent effective rate of interest is higher.

Hire-purchase Vs Instalment Payment

In an instalment sale, the contract of sale is entered into, the goods are delivered and the ownership is transferred to the buyer, but the price of the goods is paid in specified instalments over a definite period.

The first distinction between hire purchase and instalment purchase is based on the call option (to purchase the goods at any time during the term of the agreement) and the right of the hirer to terminate the agreement at any time before the payment of the last instalment (right of termination) in the former while in the latter the buyer is committed to pay the full price. Secondly, in instalment sale the ownership in the goods passes on to the purchaser simultaneously with the payment of the initial/first instalment, whereas in hire purchase the ownership is transferred to the hirer only when he exercises the option to purchase/or on payment of the last instalment.

Lease Financing Vs Hire-purchase Financing These two modes of financing differ in the following aspects:

Ownership The lessor (finance company) is the owner and the lessee (user/manufacturer) is entitled to the economic use of the leased asset/equipment only in case of lease financing. The ownership is never transferred to the user (lessee). In contrast, the ownership of the asset passes on to the user (hirer), in case of hire purchase finance, on payment of the last instalment; before the payment of the last instalment, the ownership of the asset vests in the finance company/intermediary (seller).

Depreciation The depreciation on the asset is charged in the books of the lessor in case of leasing while the hirer is entitled to the depreciation shield on assets hired by him.

Magnitude Both lease finance and hire-purchase are generally used to acquire capital goods. However, the magnitude of funds involved in the former is very large, for example, for the purchase of aircrafts, ships, machinery, air conditioning plants and so on. The cost of acquisition in hire purchase is relatively low, hence, automobiles, office equipments, generators and so on are generally hire purchased.

Extent Leasing financing is invariably 100 per cent financing. It requires no margin money or immediate cash down payment by the lessee. In a hire-purchase transaction typically a margin equal

to 20-25 per cent of the cost of the equipment is required to be paid by the hirer. Alternatively, the hirer has to invest an equivalent amount on fixed deposits with the finance company, which is returned after the payment of the last instalment.

Maintenance The cost of maintenance of a hired asset is to be borne, typically, by the hirer himself. In case of finance lease only, the maintenance of the leased asset is the responsibility of the lessee. It is the lessor (seller) who has to bear the maintenance cost in an operating lease.

Tax Benefits The hirer is allowed the depreciation claim and finance charge and the seller may claim any interest on borrowed funds to acquire the asset for tax purposes. In case of leasing, the lessor is allowed to claim depreciation and the lessee is allowed to claim the rentals and maintenance cost against taxable income.

Parties to a Hire-purchase Contract Basically, there are two parties in a hire-purchase contract, namely, the intending seller and the intending purchaser or the hirer. Nowadays, however, hire-purchase contracts generally involve three parties, namely, the seller, the financier and the hirer. With the acknowledgement of the finance function as a separate business activity and the substantial growth of finance companies in the recent times, the sale element in a hire purchase contract has been divorced from the finance element. A dealer now normally arranges a hire purchase agreement through a finance company with the customer. It is, therefore, a tripartite deal. A tripartite hire-purchase contract is arranged with following modalities:

1. The dealer contracts a finance company to finance hire-purchase deals submitted by him. For this purpose, they enter into a contract drawing out the terms, warranties that the dealer gives with each transaction and so on.
2. The customer selects the goods and expresses his desire to acquire them on hire purchase. The dealer arranges for a full set of documents to be completed to make a hire-purchase agreement with a customer. The documents are generally printed by the finance company.
3. The customer then makes a cash down payment on completing the proposal form. The down payment is generally retained by the dealer as a payment on account of the price to be paid to him by the finance company.
4. The dealer then sends the documents to the finance company requesting him to purchase the goods and accept the hire purchase transactions.
5. The finance company, if it decides to accept the transactions, signs the agreement and sends a copy to the hirer, along with the instructions as to the payment of the instalments. The finance company also notifies the same to the dealer and asks him to deliver the goods, if they are not already delivered.
6. The dealer delivers the goods to the hirer against acknowledgements and the property in the goods passes on to the finance company.
7. The hirer makes payment of the hire instalment periodically.
8. On completion of the hire term, the hirer pays the last instalment and the property in the goods passes on to him on issue of a completion certificate by the finance company.

Financial Evaluation

The framework of financial evaluation of a hire purchase deal *vis-à-vis* a finance lease, discussed below, covers both the hirer's as well the finance company's viewpoint.

From the Point of View of the Hirer (Hire-Purchaser) The tax treatment given to hire-purchase is exactly the opposite of that given to lease financing. It may be recalled that in leasing financing,

the lessor is entitled to claim depreciation and other deductions associated with the ownership of the equipment, including interest on the amount borrowed to purchase the asset, while the lessee enjoys full deduction of lease rentals. In sharp contrast, in a hire-purchase deal, the hirer is entitled to claim depreciation and the deduction for the finance charge (interest) component of the hire instalment. Thus, hire purchase and lease financing represent alternative modes of acquisition of assets. The evaluation of hire purchase transaction from the hirers' angle, therefore, has to be done in relation to the leasing alternative.

Decision Criterion The decision criterion from the point of view of a hirer is the cost of hire-purchase *vis-à-vis* the cost of leasing. If the cost of hire-purchase is less than the cost of leasing, the hirer (purchaser) should prefer the hire purchase alternative and vice versa.

Cost of Hire-purchase The cost of hire-purchase to the hirer (CHP) consists of the following:

1. Down payment
2. *Plus:* Service charges
3. *Plus:* Present value of hire purchase discounted by cost of debt (K_d)
4. *Minus:* Present value of depreciation tax shield discounted by cost of capital (K_c)
5. *Minus:* Present value of the net salvage value discounted by cost of capital (K_c)

Cost of Leasing The cost of leasing (COL) consists of the following elements:

1. Lease management fee
2. *Plus:* Present value of lease payments discounted by K_d
3. *Less:* Present value of tax shield on lease payments, and lease management fee discounted by K_c
4. *Plus:* Present value of interest tax shield on hire purchase discounted by K_c

The computation of the CHP and CL is shown in Example 25.9.

Example 25.9

The Hypothetical Industries Ltd (HIL) has an investment plan amounting to ₹108 lakh. The tax relevant rate of depreciation of the HIL is 25 per cent, its marginal cost of capital and marginal cost of debt are 16 per cent and 20 per cent respectively and it is in 35 per cent tax bracket.

It is examining financing alternatives for its capital expenditure. A proposal from the Hypothetical Finance Ltd (HFL), with the following salient features, is under its active consideration:

Hire Purchase Plan: The (flat) rate of interest charged by the HFL is 16 per cent. Repayment of the amount is to be made, in advance, in 36 equated monthly instalments. The hirer/hire-purchaser is required to make a down payment of 20 per cent.

Leasing Alternative: Lease rentals are payable @ ₹28 ptpm, in advance. The primary lease period can be assumed to be 5 years.

Assume that the SOYD method is used to allocate the total charge for credit under the hire-purchase plan. The net salvage value of the equipment after 3 years can be assumed to be ₹33 lakh.

Which alternative—leasing or hire-purchase—should the HIL use? Why?

Solution

The choice will depend on the relative cost of hire purchase and leasing

Cost of Hire-Purchase (CHP)		(₹ lakh)
1	Down payment (<i>working note 1</i>)	₹21.60
2	<i>Plus:</i> Present value of monthly hire-purchase instalment (<i>working note 2</i>)	99.19
3	<i>Minus:</i> present value of depreciation tax shield (<i>working note 3</i>)	20.44
4	<i>Minus:</i> present value of net salvage value	15.70
Total		84.65

Working Notes

- Down payment = ₹108 lakh × 0.20 = ₹21.6 lakh
- Monthly hire-purchase instalment = [₹86.4 lakh (₹108 lakh less 20 per cent down payment) + (₹86.4 lakh × 0.16 × 3 years)] ÷ 36 = ₹3.552 lakh
Present value of monthly hire purchase instalment
= ₹3.552 lakh × 12 × $\frac{I}{d^{(12)}}$ × PVIFA (20,3) where I = 0.20
= (₹3.553 lakh × 12) × 1.105 × 2.106 = ₹99.19 lakh
- Present value of depreciation tax shield:
= [₹27 lakh × PVIF (16,1) + ₹20.25 lakh × PVIF (16,2) + ₹15.19 lakh × PVIF (16,3) + ₹11.39 lakh × PVIF (16,4) + ₹8.54 lakh × PVIF (16,5)] × 0.35
= [(27 × 0.862) + (20.25 × 0.743) + (15.19 × 0.641) + (11.39 × 0.552) + (8.54 × 0.476)] × 0.35 = ₹20.44 lakh

Cost of Leasing (COL)	(₹ lakh)
1 Present value of lease payments (working note 1)	₹119.93
2 Minus present value of tax shield on lease payment (2)	41.58
3 Plus present value of tax shield on charge of credit (3)	11.56
Total	89.91

Working Notes

- Present value of lease payments:
= [₹108 lakh × 0.028 × 12] × $\frac{I}{d^{(12)}}$ × PVIFA (20,5), where I = 0.20
= ₹value of tax shield on lease payment = [₹108 lakh × 0.028 × 12 × PVIFA (16,5) × 35 = (₹36.29 lakh × 3.274)] × 0.35 = ₹41.58 lakh
- Present value of tax shield on charge for credit:
Total charge for credit = ₹108 lakh × 0.80 × 0.16 × 3 = ₹41.47 lakh

Allocation of Total Charge for Credit; SOYD Method

Year	SOYD factor	Annual charge (₹ lakh)
1	$\frac{36 + 35 + \dots + 25}{36 + 35 + \dots + 1} = \frac{366}{666}$	22.79
2	$\frac{24 + 23 + \dots + 13}{36 + 35 + \dots + 1} = \frac{222}{666}$	13.82
3	$\frac{12 + 11 + \dots + 1}{36 + 35 + \dots + 1} = \frac{366}{666}$	4.86

Present value of tax shield = [(₹22.79 × 0.862) + (₹13.82 × 0.743) + (₹4.86 × 0.641)] × 0.35
= ₹11.56 lakh

Decision Since the cost of leasing exceeds the cost of hire purchase, the HIL should acquire the equipment from the HFL under the hire purchase plan.

From the Viewpoint of Finance Company (Hire Vendor) Hire-purchase and leasing represents two alternative investment decisions of a finance company/financial intermediary/hire vendor. The decision criterion, therefore, is based on a comparison of the net present values of the two alternatives, namely, hire-purchase and lease financing. The alternative with a higher net present value would be selected and the alternative having a lower net present value would be rejected.

Net Present Value of Hire Purchase Plan [NPV (HPP)] The NPV (HPP) consists of:

1. Present value of hire purchase instalments
2. *Plus*: Documentation and service fee
3. *Plus*: Present value of tax shield on initial direct cost
4. *Minus*: Loan amount
5. *Minus*: Initial cost
6. *Minus*: Present value of interest tax on the finance income
7. *Minus*: Present value of income tax on finance income (interest) netted for interest tax
8. *Minus*: Present value of income tax on documentation and service fee

Net Present Value of Lease Plan [NPV (LP)] The NPV (LP) consists of the following elements:

1. Present value of lease rentals
2. *Add*: Lease management fee
3. *Add*: Present value of tax shield on initial direct costs and depreciation
4. *Add*: Present value of net salvage value
5. *Less*: Initial investment
6. *Less*: Initial direct costs
7. *Less*: Present value of tax liability on lease rentals and lease management fee

The decision analysis is shown in Example 25.10.

Example 25.10

For the HFL in Example 25.9, assume the following:

- Front-end (advance) cost of structuring the deal: 0.5 (half) per cent of the amount financed
- Marginal cost of debt: 20 per cent
- Marginal cost of equity: 25 per cent
- Target long-term debt-equity ratio: 4:1
- Marginal tax rate: 35 per cent
- Residual value under lease plan: 10 per cent of the investment cost

Required Which plan—hire-purchase or lease—is financially more attractive to the HFL? Why?

Solution

A	(i) Net Present Value of Hire-Purchase Plan	(₹ lakh)
1	Present value of monthly hire-purchase instalment (working note 1)	104.46
2	<i>Plus</i> present value of tax shield on initial direct costs (working note 2)	0.13
3	<i>Less</i> : Amount financed (₹108 lakh – ₹21.60 lakh, down payment)	86.40
4	<i>Less</i> : Initial direct cost (0.5 per cent of ₹86.4 lakh)	0.43
5	<i>Less</i> : Present value of interest tax on hire purchase-related income (working note 3)	0.67
6	<i>Less</i> : Present value of income tax on net finance income (working note 4)	11.41
Total		5.68

Working Notes

Marginal cost of capital $[0.80 \times 0.20 \times 0.65] + [0.20 \times 0.25] = (0.104 + 0.05) = 15.4$ per cent

1. Monthly hire-purchase instalment = $[(₹86.4 \text{ lakh} + (₹86.4 \text{ lakh} \times 0.16 \times 3))] \div 36 = ₹3.552 \text{ lakh}$

Present value of monthly hire-purchase instalments:

$$= ₹3.552 \text{ lakh} \times \text{PVIFA}_m(15.4, 3)$$

$$= ₹3.552 \text{ lakh} \times 12 \times 2.265 \times 1.082 = ₹104.46 \text{ lakh}$$

2. Present value of tax shield on initial direct cost:

$$\text{Initial direct cost (0.5 per cent of ₹86.4 lakh)} = 0.432 \text{ lakh}$$

$$\text{Present value} = ₹0.432 \text{ lakh} \times 0.866 \times 0.35 = ₹0.13 \text{ lakh}$$

3. Present value of interest tax on hire purchase related income:

Unexpired finance income (total charge for credit) at inception = ₹86.4 lakh × 0.16 × 3
= ₹41.47 lakh

Allocation of Unexpired Finance Income, Based on the SODY Method

(₹ lakh)

Year	SOYD factor	Annual charge (₹ lakh)
1	$\frac{36 + 35 + \dots + 25}{36 + 35 + \dots + 1} = \frac{366}{666} \times ₹41.47 \text{ lakh}$	22.79
2	$\frac{24 + 23 + \dots + 13}{36 + 35 + \dots + 1} = \frac{222}{666} \times ₹41.47 \text{ lakh}$	13.82
3	$\frac{12 + 11 + \dots + 1}{36 + 35 + \dots + 1} = \frac{78}{666} \times ₹41.47 \text{ lakh}$	4.86

Interest Tax and Income Tax on Annual Finance Income

(₹ lakh)

Year	Gross Finance Income	Interest tax (2%)	Net finance income	Income tax (0.35)
1	22.79	0.46	22.33	7.82
2	13.82	0.28	13.54	4.74
3	4.86	0.10	4.76	1.67

Present value = (₹0.46 lakh × 0.866) + (₹0.28 lakh × 0.751) + (₹0.10 lakh × 0.648)
= ₹0.67 lakh

4. Present value of income tax on net finance income:

= (₹7.82 lakh × 0.866) + (₹7.74 lakh × 0.751) + (₹1.67 lakh × 0.648) = ₹11.41 lakh

A

(ii) Net Present Value of Leasing

(₹ lakh)

1	Present value of lease rentals/receipts (working note 1)	130.08
2	Plus: Present value of depreciation tax shield (note 2)	20.62
3	Plus: Present value of tax shield on initial direct cost (note 3)	0.16
4	Plus: Present value of residual value (note 4)	5.21
5	Less: Initial investment	108.00
6	Less: Initial direct cost	0.54
7	Less: Present value of income tax on lease rentals (note 5)	42.09
Total		5.44

Working Notes

- Present value of lease rentals = ₹108 lakh × 0.028 × 12 × PVIFA (15.4, 5)
= ₹108 lakh × 0.028 × 12 × 1.082 × 3.313 = ₹130.08 lakh
- Present value of depreciation tax shield = [₹27 lakh × PVIF (15.4,1) + ₹20.25 lakh × PVIF (15.4,2) + ₹15.19 lakh × PVIF (15.4,3) + ₹11.34 lakh × PVIF (15.4,4) + ₹8.55 lakh × PVIF (15.4,5)] × 0.35 = [₹27 lakh × 0.866) + (₹20.25 lakh × 0.751) + (₹15.19 lakh × 0.648) + (₹11.34 lakh × 0.562) + (₹8.55 lakh × 0.482)]
= ₹20.62 lakh
- Present value of tax shield on initial direct cost:
= 0.54 lakh (0.5 per cent of ₹108 lakh) × PVIF (15.4,1) × 0.35 = ₹0.16 lakh
- Present value of residual value = ₹10.80 lakh (0.10 × ₹108 lakh) × PVIF (15.4,5) = ₹5.21 lakh
- Present value of income tax on lease rentals = ₹108 lakh × 0.028 × 12 × PVIFA (15.4,5) × 0.35
= (₹36.29 lakh × 3.314) × 0.35 = ₹42.09 lakh

As the present value of hire-purchase (₹5.68 lakh) exceeds the net present value of leasing (₹5.44 lakh), the hire purchase plan is financially more attractive to the HFL.

SUMMARY

Lease is a contractual arrangement under which the owner of an asset (lessor) allows the use of the asset to the user (lessee) for an agreed period of time (lease period) in consideration for the periodic payment (lease rent). At the end of the lease period, the asset reverts back to the owner, unless there is a provision for the renewal of the lease contract.

Leasing can be classified into four categories: (i) sale and lease back, and direct lease, (ii) single investor lease and leveraged lease, (iii) domestic lease and international lease, and (iv) finance lease and operating lease.

Sale and lease back arrangement provides for the sale of the asset by the present owner to the lessor who leases it back to the owner (lessee). In contrast, the lessee and the owner of the asset are two different entities in direct lease.

While a single investor lease involves two parties to the lease transaction, namely, the single investor/ the leasing company (lessor) and the lessee, a leveraged lease involves, besides the lessor and the lessee, a third party (a lender) who ordinarily funds a major share of the asset's price.

In domestic lease, all parties of a lease transaction are domiciled in the same country. In international lease, parties to the lease transactions are domiciled in different countries.

Short-term or cancelable leases (at the option of the lessee) are referred to as operating leases while long-term or non-cancellable leases are known as financial leases. The distinction between the two is based on the extent to which the risks and rewards of ownership are transferred from the lessor to the lessee. If a lease transfers a substantial part of the risks and rewards, it is called finance lease; otherwise, it is operating lease.

The cut-off criterion in India is that if the lease term exceeds 75 per cent of the useful life of the asset or if the present value of the minimum lease rentals exceeds 90 per cent of the fair market value (cost) of the equipment at the inception of the lease, the lease is classified as finance lease.

Lease financing provides several advantages to the lessee such as hundred per cent financing, tax-based benefits, convenience, better utilisation of own funds, expeditious use of asset, flexibility in lease rentals, and so on.

Full security, tax benefit, high profitability, trading on equity and so on are the major advantages to the lessor.

Finance lease can be evaluated from the point of view of both the lessee and the lessor. From the perspective of the lessee, leasing should be evaluated as a financing alternative to borrow and buy. The decision-criterion requires comparison of the present value (PV) of cash outflows after taxes under the leasing option *vis-à-vis* borrowing-buy alternative. The alternative with the lower PV should be selected.

The Net Advantage of Leasing (NAL) approach is the alternate approach to evaluate finance lease. The benefits from leasing are compared with cost of leasing. The benefits from leasing are: (i) Investment cost of asset (saved), (ii) Plus PV of tax shield on lease payment, discounted by k_c and (iii) Plus PV of tax shield on management fee, discounted by k_c .

The cost of leasing are: (i) Present value of lease rentals, discounted by k_d , (ii) Plus management fee, (iii) Plus PV of depreciation shield foregone, discounted by k_c , (iv) Plus PV of salvage value of asset, discounted by k_c and (v) Plus PV of interest shield, discounted by k_c .

In case NAL is positive (benefits > costs), leasing alternative is preferred.

For the lessor, lease decision is akin to a capital budgeting decision. The leasing is viable when the PV of cash inflows after taxes (CFAT) accruing to him exceeds the cost of asset. The CFAT are discounted at the weighted average cost of capital.

The NAL approach can also be used by the lessor to assess the financial viability of the lease decision. The NAL to a lessor = Present value of lease payment *plus* (i) Present value of management fee, (ii) Present value of depreciation tax shield, (iii) Present value of net salvage value, (iv) Present value of tax shield on initial direct costs, *minus*, (i) Initial investment, (ii) Present value of tax on lease payments, (iii) Present value of tax on management fee, and (iv) Present value of initial direct cost.

LO 25.1

LO 25.2

LO 25.2

The break-even lease rental is the rental at which the lessee is indifferent to the choice between the option of leasing and buying and borrowing. At this level, the NAL is zero. In a way, it represents the maximum lease rental which the lessee is willing to pay and constitutes an important input in the negotiation/determination of the lease rental.

From the point of view of the lessor, the break-even lease rental is the minimum which he can accept in lieu of leasing the equipment. At this level of rental, the NAL/NPV(L) to the lessor is zero. The lease-related cash flow streams relevant to the computation of the NAL are initial investment and often direct costs, income tax on lease payments, management fee, lease payments, tax shield on depreciation and residual value.

The lease rental is determined on the basis of the negotiation between the lessor and the lessee. The difference between the break-even lease rentals to the lessee and the lessor represents the spread/range for negotiation of lease rentals. A lease rental within the range ensures a positive NAL both to the lessor and the lessee.

LO 25.3

Hire-purchase is an agreement relating to a transaction in which goods are let on hire, the purchase price is to be paid in instalments and the hirer is allowed the option to purchase the goods, paying all the instalments. Though the option to purchase the goods is allowed in the very beginning, it can be exercised only at the end of the agreement. It implies ownership is transferred at the time of sale.

The ownership of the goods passes on to the purchaser simultaneously with the payment of the initial/first instalment in instalment sale. The hire-purchase also differs from the instalment sale in terms of the call option and right of termination in the former but not in the latter.

Hire-purchase and leasing as modes of financing are different in several respects such as ownership of the asset, its capitalisation, depreciation charge, extent of financing, tax treatment, and accounting and reporting.

Hire-purchase contract, basically, requires two parties, namely, the intending seller and the intending buyer. When such a sales is executed through the involvement of finance companies, the hire-purchase contracts involve three parties: the financier, the seller and the buyer.

The decision-criterion for evaluation of a hire-purchase deal from the point of view of hirer is the cost of hire-purchase *vis-à-vis* the cost the leasing.

The cost of hire-purchase consists of: (i) Cash down payment, (ii) Plus service charges, (iii) Plus PV of hire-purchase payment (discounted by cost of debt), (iv) Minus PV of depreciation tax shield, discounted by cost of capital and (v) Minus PV of the net salvage value discounted by the cost of capital.

The cost of leasing consists of: (i) Lease management fee, (ii) Plus PV of lease payments discounted by k_c , (iii) Less PV of tax shield on lease payments and lease management fee discounted by k_c and (iv) Plus PV of interest tax shield on hire-purchase discounted by k_c . The alternative with lower cost is preferred.

The decision-criteria from the viewpoint of hire vendor/financing company is based on a comparison of the net present values of the hire-purchase and the leasing alternatives. The finance company would choose the financing plan with the higher NPV.

SOLVED PROBLEMS

P.25.1 XYZ Builders Ltd need to acquire the use of a crane for their construction business, and are considering buying or leasing a crane. The crane costs ₹10,00,000, and is subject to the straight line method of depreciation to a zero salvage value at the end of 5 years. In contrast, the lease rent is ₹2,20,000 per year to be paid in advance each year for 5 years. XYZ Builders Ltd can raise debt at 14 per cent payable in 5 equal annual instalments, each instalment due at the beginning of the year. The company is in the 50 per cent tax bracket. Should it lease or buy the crane?

Solution

PV of cash outflows under leasing alternative

Year	Lease payment	Tax shield (Lease sum x Tax rate: 0.50)	Cash outflows after taxes	PV factor at 0.07(K_d)	Total PV
0	₹2,20,000	—	₹2,20,000	1.000	₹2,20,000
1-4	2,20,000	₹1,10,000	1,10,000	3.387	3,72,570
5	—	1,10,000	(1,10,000)	0.713	(78,430)
					5,14,140

Determination of interest and principal components of loan instalment

Year	Loan instalment	Loan at the beginning of the year	Payment of		Principal outstanding at the end of the year (Col 3 - Col 5)
			Interest (Col 3 × 0.14)	Principal (Col 2 - Col 4)	
1	2	3	4	5	6
0	₹2,55,493*	₹10,00,000	—	₹2,55,493	₹7,44,507
1	2,55,493	7,44,507	₹1,04,231	1,51,262	5,93,245
2	2,55,493	5,93,245	83,054	1,72,439	4,20,806
3	2,55,493	4,20,806	58,913	1,96,580	2,24,226
4	2,55,493	2,24,226	31,267	2,24,226	—

*Annual instalment of loan can be determined by solving the following equation:

$$₹10,00,000 = \sum_{t=0}^4 \frac{\text{Loan instalment}}{3.914 [2.914 + 1.0 (\text{PV factor for making payment in } t = 0)]}$$

$$\text{Loan instalment} = ₹10,00,000 / 3.914 = ₹2,55,493$$

PV of cash outflows under buying alternative

Year	Loan instalment	Tax advantage on		Cash outflows after taxes [Col 2 - (Col 3 + Col 4)]	PV factor at 0.07	Total PV
		Interest ($I \times t$)	Depreciation ($D \times t$)			
1	2	3	4	5	6	7
0	₹2,55,493	—	—	₹2,55,493	1.000	₹2,55,493
1	2,55,493	₹52,115	1,00,000	1,03,378	0.935	96,658
2	2,55,493	41,527	1,00,000	1,13,966	0.873	99,492
3	2,55,493	29,456	1,00,000	1,26,037	0.816	1,02,846
4	2,55,493	15,633	1,00,000	1,39,860	0.763	1,06,713
5	—	—	1,00,000	(-1,00,000)	0.713	(-71,300)
						5,89,902

Recommendation The company is advised to opt for leasing as the total PV of cash outflows is lower (₹5,14,140) than that of the buying and borrowing option (₹5,89,902).

P.25.2 An industrial unit desires to acquire a diesel generating set costing ₹20 lakh which has an economic life of 10 years at the end of which the asset is not expected to have any residual value. The unit is considering the alternative choices of (a) taking the machinery on lease, or (b) purchasing the asset outright by raising a loan.

Lease payments (₹2,95,902) are to be made in advance and the lessor requires the asset to be completely amortised over its useful period.

The cost of debt is worked out at 16 per cent per annum. The lender requires the loan to be re-paid in 10 equal annual instalment becoming due at the beginning of the first year. Average rate of income tax is 50 per cent. It is expected that the operating costs would remain the same under either method. The firm follows straight line method of depreciation and the same is accepted for tax purposes. As a financial consultant, indicate what your advice will be.

Solution

PV of cash outflows under leasing alternative

Year end	Lease payment	Tax shield	Cash outflows after taxes	PV factor [0.16 (1 - 0.5) = (0.08)]	Total present value
0	₹2,95,902	—	₹2,95,902	1.000	₹2,95,902
1-9	2,95,902	₹1,47,951	1,47,951	6.247	9,24,250
10	—	1,47,951	(1,47,951)	0.463	(68,501)
					<u>11,51,651</u>

Schedule of debt payment

Year-end	Loan instalment	Loan at the beginning of the year	Payments		Principal outstanding at the end of the year (Col 3 - Col 5)
			Interest on loan (Col 3 × 0.16)	Principal re-payment (Col 2 - Col 4)	
1	2	3	4	5	6
0	₹3,56,697*	₹20,00,000	—	₹3,56,697	₹16,43,303
1	3,56,697	16,43,303	₹2,62,928	93,769	15,49,534
2	3,56,697	15,49,534	2,47,925	1,08,772	14,40,762
3	3,56,697	14,40,762	2,30,522	1,26,175	13,14,587
4	3,56,697	13,14,587	2,10,334	1,46,363	11,68,224
5	3,56,697	11,68,224	1,86,916	1,69,781	9,98,443
6	3,56,697	9,98,443	1,59,751	1,96,946	8,01,497
7	3,56,697	8,01,497	1,28,240	2,28,457	5,73,040
8	3,56,697	5,73,040	91,686	2,65,011	3,08,029
9	3,56,697	3,08,029	48,668	3,08,029	—

*Annual instalment of loan = ₹20,00,000/5.607, that is, 4.607 + 1.0 (the PV factor for making payment in 0 year) = ₹3,56,697.

PV of cash outflows under buying alternative

Year	Loan instalment	Tax advantage		Net cash outflows (Col 2 - Col 3 + 4)	PV factor at after tax cost of debt (0.08)	Total PV

						13,28,670

Recommendation The company is advised to go for leasing of diesel generating set as the PV of cash outflows under leasing alternative is lower than that under buying alternative.

P.25.3 Mr. X, the Finance Manager of ABC Ltd, had almost decided to finance the purchase of ₹20 lakh in new computer equipment with 15% long-term debt when he was contacted by First Leasing Company Ltd. The manager of the leasing company tried to convince Mr. X that leasing the equipment would be more beneficial to ABC Ltd. LO 25.2 LOP

If ABC borrowed, the firm would be required to pay 15 per cent interest on the borrowed funds plus an annual principal repayment of ₹4,00,000 (at each-year end for 5 years). The equipment has an expected life of 5 years, with an anticipated salvage value of ₹2,00,000 at the year-end. The company follows written down value method, the depreciation rate being 20 per cent. The company has no other assets in the assets block of 20 per cent. The company is in 40 per cent tax bracket and is to bear maintenance expenses of ₹2,00,000 per annum. Assume the firm would have sufficient short-term capital gains in year 5.

The leasing company is willing to lease the equipment for ₹6,00,000 per year (with no maintenance). Further, it was stressed that the lease payments were fully tax deductible, while debt repayment was not.

Mr. X seeks your advice before committing to lease the computer equipment. What advice would you, as a financial consultant, give to the finance manager of ABC Ltd.?

Solution

PV of cash outflow under leasing alternative

Year	Lease rent	Lease rent after tax	PVF at 9%	Total PV
1-5	₹6,00,000	₹3,60,000	3.890	₹14,00,400

5(a)	4,60,000	—	24,000	4,36,000	0.650	2,83,400.00
						16,08,111.84
5(b)	Less PV of salvage value (₹2 lakh × 0.650)					(1,30,000)
5(c)	Less PV of tax advantage on STCL (₹2,47,680@ × 0.650)					(1,60,992)
NPV						13,17,119.84

* (₹20,00,000 - accumulated depreciation, ₹11,80,000 - ₹2,00,000, SV) × 0.40 = ₹2,47,680

Recommendation Borrow-buy option is better.

P.25.4 Alfa Ltd is thinking of installing a computer. Decide whether the computer is to be purchased outright (through 14 per cent borrowing) or to be acquired on lease rental basis. The company is in **LO 25.2** the 50 per cent tax bracket. The other data available are:

Purchase of computer:

- Purchase price: ₹20,00,000
- Annual maintenance, (to be paid in advance), ₹50,000 per year
- Expected economic useful life, 6 years
- Depreciation (for tax purposes), Straight line method
- Salvage value: ₹2,00,000

Leasing of computer:

- Lease charges (to be paid in advance): ₹4,50,000
- Maintenance expense to be borne by lessor
- Payment of Loan: 6 year-end equal instalments of ₹5,14,271

Solution

PV of cash outflows under leasing alternative

Year-end	Lease payment (net)	Tax shield	Cash outflows after taxes	PV factor (0.07)	Total PV

6	5,14,271	31,414	1,50,000	3,32,857	0.666	2,21,683
Present value of after-tax cash outflows						12,84,726
Less: PV of salvage value (₹2,00,000 × 0.666)						(1,33,200)
Net cash outflows under buying alternative						11,51,526

Recommendation Computer should be acquired on lease basis.

P.25.5 ABC Machine Tool Company Ltd is considering the acquisition of a large equipment to set up its factory in a backward region for ₹12,00,000. The equipment is expected to have an economic useful life of 8 years. The equipment can be financed either with an 8-year term loan at 14 per cent interest, repayable in equal instalments of ₹2,58,676 per year, or by an equivalent amount of lease rent per year. In both cases, payments are due at the end of the year. The equipment is subject to the straight line method of depreciation for tax purposes. Assuming no salvage value after the 8-year useful life and 50 per cent tax rate, which of the financing alternatives should it select?

LO 25.2

PV of cash outflows under buying alternative

Year	Loan instalment	Tax advantage on		Cash outflows after taxes [Col 2 – (Col 3 + Col 4)]	PV factor at 0.07	Total PV
		interest (I × t)	depreciation (D × t)			
1	2	3	4	5	6	7
1	₹2,58,676	₹84,000	₹75,000	₹99,676	0.935	₹93,197
2	2,58,676	77,652	75,000	1,06,024	0.873	92,559
3	2,58,676	70,416	75,000	1,13,260	0.816	92,420
4	2,58,676	62,167	75,000	1,21,509	0.763	92,711
5	2,58,676	52,764	75,000	1,30,912	0.713	93,340
6	2,58,676	42,043	75,000	1,41,633	0.666	94,328
7	2,58,676	29,822	75,000	1,53,854	0.623	95,851
8	2,58,676	15,838	75,000	1,67,838	0.582	97,682
						7,52,088

Recommendation The borrowing (buying) alternative of financing the purchase of the large equipment should be selected.

P.25.6 For P.25.5 compute the net advantage of leasing (NAL) to the lessee assuming (i) The company follows written down value method of depreciation, the depreciation rate being 25 per cent; (ii) The corporate tax is 35 per cent; (iii) Post-tax marginal cost of capital (K_c) is 12 per cent and (iv) The company has several assets in the asset block of 25 per cent.

LO 25.2 **LOD F**

Solution

Computation of NAL to the lessee

Benefits from lease:		
Cost of the equipment (investment saved)		₹12,00,000
PV of tax shield on lease rentals (working note 2)		4,49,786
Total		16,49,786
Cost of lease:		
PV of lease rental (1)		11,99,998
PV of tax shield foregone on depreciation (3)		2,72,333
PV of interest tax shield foregone on debt (4)		2,08,381
Total		16,80,712
NAL		(30,926)

Recommendation The lease is not financially viable.

Working Notes

- (1) PV of lease rentals: Lease rentals × PVIFA (14,8) = ₹2,58,676 × 4.639 = ₹11,99,998.
 (2) PV of tax shield on lease rentals: Lease rentals × tax rate × PVIFA (12,8) = ₹2,58,676 × 0.35 × 4.968 = ₹4,49,786

- (3) PV of tax shield foregone on depreciation

Year	Depreciation	Tax shield	PV factor (at 0.12)	Total PV
1	₹3,00,000	₹1,05,000	0.893	₹93,765
2	2,25,000	78,750	0.797	62,764
3	1,68,750	59,062	0.712	42,052
4	1,26,562	44,297	0.636	28,173

(Contd.)

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice.

2. The second part details the various methods used to collect and analyze data. It includes a list of procedures and the specific steps involved in each.

3. The final section provides a summary of the findings and conclusions drawn from the study. It highlights the key areas where improvements are needed.

Item	Quantity	Unit Price	Total
Office Supplies	100	0.50	50.00
Printing Costs	500	0.20	100.00
Travel Expenses	200	0.75	150.00
Utilities	100	1.00	100.00
Salaries	1000	1.00	1000.00
Depreciation	100	1.00	100.00
Interest	100	1.00	100.00
Income Tax	100	1.00	100.00
Profit	100	1.00	100.00
Total			1600.00

The following table provides a detailed breakdown of the financial data presented in the previous section. It shows the contribution of each category to the overall total.

The data indicates that salaries are the largest component of the total, followed by travel and printing costs. Other categories like depreciation and interest represent smaller but significant portions of the total.

Category	Sub-Category	Value
Salaries	Base Salaries	800.00
	Benefits	200.00
Travel	Domestic	100.00
	International	50.00
Printing	Internal	50.00
	External	50.00
Utilities	Electricity	50.00
	Water	50.00
Depreciation	Equipment	50.00
	Buildings	50.00
Interest	Bank Loans	50.00
	Bond Interest	50.00
Income Tax	Corporate	50.00
	Personal	50.00
Profit	Net Profit	100.00
Total		1600.00

(Contd.)

5	94,922	33,223	0.567	18,837
6	71,191	24,917	0.507	12,633

				2,08,381

P.25.7 For facts in P.25.6, determine the break even lease rentals (BELR) for the lessee.

LO 25.2 LOD M

Solution

Computation of BELR

Benefits from lease:

Cost of the equipment	₹12,00,000
PV of tax shield on lease rentals (working note 2)	1.62365L

Cost of lease:

PV of lease rentals (note 1)	4.639L
PV of tax shield foregone on depreciation	2,72,333
PV of interest tax shield foregone on debt	2,08,381

$$\text{BELR (L)} = 4.639L + ₹4,80,714 = 1.62365L + ₹12,00,000$$

$$4.639L - 1.62365L = ₹12,00,000 - ₹4,80,714$$

$$L = ₹7,19,286 / 3.01535 = ₹2,38,541$$
Working Notes(i) PV of lease rentals: $L \times \text{PVIFA} (14,8) = 4.639 \times L = 4.639L$ (ii) PV of tax shield on lease rentals: $L \times \text{PVIFA} (14,8) \times \text{tax rate} = 4.639L \times 0.35 = 1.62365L$

P.25.8 The Hypothetical Manufacturers Ltd (HML) has under consideration investment in a project. The cost of the equipment estimated to be ₹936 lakh. The useful life of the equipment is 5 years, with a salvage value of 40 per cent of the book value after 5 years. The depreciation relevant for tax purposes is 25 per cent. The HML has other assets in this block of 25 per cent. The investment is likely to generate an incremental earnings before depreciation, interest and tax of ₹720 lakh per annum for the first 3 years and ₹480 lakh per annum for the last 2 years.

LO 25.2 LOD D

The HML has two alternatives to choose from to finance the equipment:

Alternative I: Leasing of the equipment from the Hypothetical Leasing Ltd (HLL). The lease rental for a 5-year non-cancellable lease is ₹27 pmpt (per month per thousand) payable in arrears (at the end of the year). The purchase of the equipment by the HLL is subject to a CST of 10 per cent.

Alternative II: Borrow and buy the equipment at 20 per cent per annum. The debt is repayable in 5 equated annual instalment payable at the end of the year. The target debt-equity ratio of the HML is 2:1. Its cost of debt may be assumed to be 20 per cent while the cost of equity is 22 per cent. The marginal tax rate of HML is 35 per cent.

You are required to compute the BELR for the lessee (HML). Should it buy or lease the equipment?

Solution

Computation of BELR (L) for the lessee

(₹ lakh)

Benefits of leasing:

Investment cost (saved)	936
PV of tax shield on lease rentals (working note 2)	13.75L

Cost of leasing:

PV of lease rentals (note 1)	39.66L
PV of tax shield foregone on depreciation (3)	177.18
PV of the interest tax shield foregone on debt	6.58L
PV of salvage value (5)	178.21

₹936 lakh + 13.75L = 39.66L + 6.58L + ₹177.18 lakh + 178.12 lakh
 Or 32.49L = ₹580.61 lakh or L = ₹580.61/32.49 = ₹17.87 lakh per month

Working Notes

(1) PV of lease rentals: = $12L \times i/d^{(12)} \times PVIFA(20,5) = 12L \times 1.015 \times 2.991 = 39.66L$

(2) PV of tax shield on lease rentals: = $12L \times PVIFA(16^*,5) \times 0.35 = 13.75L$

*0.16 = (cost of debt, 0.13 × 2/3) + (cost of equity, 0.22 × 1/3)

(3) PV of tax shield foregone on depreciation (₹ lakh)

Depreciation	(Tax shield × PVf)	PV of tax shield
234	(81.90 × 0.862)	70.6
175	(61.25 × 0.743)	45.51
132	(46.20 × 0.641)	29.61
99	(34.65 × 0.552)	19.13
74	(25.90 × 0.476)	12.33
		177.18

(4) PV of interest on tax shield:

(a) Equated annual instalment = Amount borrowed/PVIFA(20,5) = 39.66L/2.991 = ₹13.26L

(b) Debt repayment schedule (₹ lakh)

Year	Amount outstanding at the beginning	Interest content (at 0.20)	Capital content	Instalment
1	39.66L	7.93L	5.33L	13.26L
2	34.33L	6.87L	6.39L	13.26L
3	27.94L	5.59L	7.67L	13.26L
4	20.27L	4.05L	9.21L	13.26L
5	11.06L	2.20L	11.06L	13.26L

(c) PV of interest tax shield: [(7.93L × 0.862) + (6.87L × 0.743) + (5.59L × 0.641) + (4.05L × 0.552) + (2.20L × 0.476)] × 0.35 = (6.84L + 5.10L + 3.58L + 2.24L + 1.05L) × 0.35 = 6.58L

(5) PV of salvage value: ₹936 lakh × 0.4 × 0.476 = ₹178.21 lakh

P.25.9 For the Hypothetical Manufacturers Ltd (HIM) of **P.25.8** compute the NAL to the lessee. Is the lease economically viable?

Solution

Computation of NAL to the lessee

(in lakh of rupees)

Benefits from leasing:	
Investment cost (saved)	936
PV of tax shield on lease rentals (2)	367.57
Total	1,303.57
Cost of leasing:	
PV of lease rentals (working note 1)	1,064.93
PV of tax shield foregone on depreciation	177.18
PV of the interest tax shield foregone on debt (3)	176.73
PV of salvage value	178.21
Total	1,597.05
NAL (₹1,303.57 – ₹1,597.05)	(293.48)

Since NAL is negative, the lease is economically not viable.

Working Notes

- (1) PV of lease rentals: $(₹990 \text{ lakh} \times 0.027 \times 12 \text{ months}) \times i/d^{12} \times \text{PVIFA}(20,5) = ₹320.76 \text{ lakh} \times 1.11 \times 2.991 = ₹1,064.93 \text{ lakh}$
- (2) PV of tax shield on lease rentals: $(₹320.76 \text{ lakh} \times 0.35) \times \text{PVIFA}(16,5) = ₹112.27 \text{ lakh} \times 3.274 = ₹367.57 \text{ lakh}$

(3) (a) Debt repayment schedule

Year	Amount outstanding at the beginning	Interest content (at 0.20)	Capital content	Instalment*
1	1,064.93	212.99	143.05	356.04
2	921.88	184.38	171.66	356.04
3	750.22	150.04	206.00	356.04
4	544.22	108.84	247.20	356.04
5	297.02	59.02	297.02	356.04

$$*₹1,064.93/2.991 = ₹356.04$$

(3) (b) PV of interest tax shield (in lakh of ₹)

$$[(₹212.99 \times 0.862) + (₹184.38 \times 0.743) + (₹150.04 \times 0.641) + (₹108.84 \times 0.552) + (₹59.02 \times 0.476)] \times 0.35 = (₹183.60 + ₹137 + ₹96.18 + ₹60.08 + ₹28.09) \times 0.35 = ₹176.73 \text{ lakh.}$$

P.25.10 For the facts in **P.25.8** assume the lease rental is payable annually in arrear. What is the break even lease rental (BELR) from the point of view of the lessor? Which alternative would you suggest and why? Assume the marginal cost of funds to the HLL is 15 per cent.

LO 25.2

Solution

Computation of BELR (L) for the lessor

(₹ in lakh)

Benefits from leasing:	
PV of lease rentals (working note 1)	3.352L
PV of tax shield on depreciation (3)	190.56
PV of salvage proceeds (₹990 lakh \times 0.4 \times 0.476)	188.50
Cost of leasing:	
Cost of equipment (₹900 lakh + 10%)	990
PV of tax payment on lease rentals (2)	1.173L
$3.352L + 190.56 \text{ lakh} + ₹188.50 \text{ lakh} - ₹990 \text{ lakh} - 1.173L = 0$	
$3.352L - 1.173L = ₹990 \text{ lakh} - ₹190.56 - ₹188.50$	
$2.179L = ₹610.94 \text{ lakh or } L = ₹610.94/2.179 = ₹280.38 \text{ lakh}$	

Working Notes

- (1) PV of lease rentals: $L \times [PVIFA(15,5)] = 3.352L$
 (2) PV of tax payment on lease: $0.35 \times 3.352L = 1.173L$

PV of tax shield on depreciation			(Amount in lakh of rupees)
Depreciation	Tax shield \times PVf	PV of tax shield	
247	$\text{₹}86.45 \times 0.870$	₹75.21	
185	64.75×0.756	48.95	
139	48.65×0.658	32.01	
104	36.40×0.572	20.82	
78	27.30×0.497	13.57	
		190.56	

P.25.11 The Hypothetical Manufacturers Ltd (HML) has taken a plant on lease, valued at ₹20 crore. The lease arrangement is in the form of a leveraged lease. The HLL is the equity participant and the Hypothetical Bank Ltd (HBL) is the loan participant. They fund the investment in the ratio of 2 : 8. The loan from HBL carries a fixed rate of interest of 19 per cent, payable in 6 equated annual instalments. The lease term is 6 years, with lease rental payable annually in arrear.

LO 25.1,2 LOD D

- (a) Compute the equated annual instalment from the point of view of HBL.
 (b) If the lease rate is unknown, and HBL's per-tax yield is 25 per cent, what is the minimum lease rate that must be quoted?

Solution

- (a) Equated annual instalment to HBL: Loan amount, or ₹20 crore \times 8/10 = ₹16 crore/PVIFA(19, 6), or 3.410 = ₹4.692 crore
 (b) Annual lease rental (Y): Annual cash flow to HLL = $(Y - \text{₹}4.692 \text{ crore})$. Given the required rate of return to HLL of 25 per cent, Y would be, $(Y - \text{₹}4.692 \text{ crore}) \times PVIFA(25,6) = \text{₹}4 \text{ crore equity or } 2.951 (Y - \text{₹}4.692 \text{ crore}) = \text{₹}4 \text{ crore}$, $Y = 17.846 \text{ crore}/2.951 = \text{₹}6.05 \text{ crore}$.

P.25.12 The controller of General Electronics Corporation of India Ltd has been analysing the firm's policy regarding computers, which are now being leased on a yearly basis on rental amounting to ₹1,00,000 per year. The computers can be bought for ₹5,00,000. The purchase would be financed by 16 per cent loan repayable in 4 equal annual instalments.

LO 25.2 LOD D

On account of rapid technological progress in the computer industry, it is suggested that a 4-year economic life should be used, instead of the 10-year physical life. It is estimated that the computers would be sold for ₹2,00,000 at the end of 4 years.

The company uses the straight line method of depreciation. Corporate tax rate is 50 per cent.

- (a) Comment on whether the equipment should be bought or leased?
 (b) Analyse the financial viability from the point of view of the lessor, assuming 14 per cent cost of capital.
 (c) Determine the minimum lease rent at which the lessor would break even.
 (d) Determine the lease rent which will yield an IRR of 16 per cent to the lessor.

Solution

(a) PV of cash outflows under leasing alternative					
Year	Lease rent after taxes	PV factor (0.08)		Total PV	
1-4	₹50,000	3.312		₹1,65,600	
Cash outflows under buying alternative					
Year-end	Loan at the beginning of the year	Loan instalment	Interest on loan (0.16)	Principal repayment	Principal outstanding at the end of year
1	₹5,00,000	₹1,78,699*	₹80,000	₹98,699	₹4,01,301
2	4,01,301	1,78,699	64,208	1,14,491	2,86,810

* $(₹5,00,000 + 2.798 \text{ (PV factor of annuity of ₹1 at 16 per cent for 4 years)})$

PV of cash outflows under buying alternatives

Year	Loan instalment	Payment of		Net cash outflows	PV factor (0.08)	Total PV
		Interest	Depreciation			
1	₹1,78,699	₹40,000	₹37,500	₹1,01,199	0.926	₹93,710
2	1,78,699	32,104	37,500	1,09,095	0.857	93,494
3	1,78,699	22,945	37,500	1,18,254	0.794	93,894
4	1,78,699	12,349	37,500	1,28,850	0.735	94,705
4	Salvage value			(2,00,000)	0.735	(1,47,000)
						2,28,803

Recommendation The leasing option is financially superior.

(b) Viability from the lessor's point of view

(i) Determination of CFAT

Lease rent received	₹1,00,000
Less: Depreciation	75,000
EBT	25,000
Less: Taxes (0.50)	12,500
EAT	12,500
Add: Depreciation	75,000
CFAT	87,500

(ii) Determination of NPV

Year	CFAT	PV factor (at 0.14)	Total PV
1-4	₹87,500	2.914	₹2,54,975
4	2,00,000	0.592	1,18,400
Total PV			3,73,375
Less: Cost of computer			5,00,000
NPV			(1,26,625)

The proposal is not financially viable to the lessor.

(c) Lease rent, at which lessor would break-even

Cost of computers	₹5,00,000
Less: PV of salvage price of computers	1,18,400
Net cost to be recovered	3,81,600
Divide by PV annuity factor (14.4)	÷ 2.914
CFAT (desired)	1,30,954
Less: Depreciation	75,000
EAT	55,954
Add: Taxes	55,954
EBT	1,11,908
Add: Depreciation	75,000
Lease rental (desired)	1,86,908

(d) Lease rent to yield 16 per cent IRR

CFAT (desired)	₹1,39,242
Less: Depreciation	75,000
EAT	64,242
Add: Tax (0.50)	64,242
EBT	1,28,484
Add: Depreciation	75,000
Lease rental (desired)	2,03,484

Working Notes

Desired CFAT: ₹5,00,000 $\sum_{t=1}^4 \frac{X}{(1+0.16)^t} + \frac{₹2,00,000}{(1+0.16)^4}$, where X = CFAT

$$₹5,00,000 - \left(\frac{₹2,00,000}{(1.16)^4} \right) = \sum_{t=1}^n \frac{X}{(1.16)^t}$$

Substituting (i) PV factor of annuity (16, 4) 2.798 and (ii) PV factor (16, 4), 0.552, ₹5,00,000 - (₹2,00,000 × 0.552) = X/2.798

3,89,600/2.798 = X, or X = ₹1,39,242.

P.25.13 NBT Ltd is thinking of installing a computer. It is to decide whether the computer should be acquired on lease, or be purchased through borrowings at a 12 per cent rate of interest payable at the end of the each year. Principal is due for repayment after 10 years. The following data has been collected for the purpose:

LO 25.2 LOD M

Purchase of computer:

- Purchase price, ₹40,00,000
- Annual maintenance, ₹50,000 (to be paid in advance every year)
- Life of the computer, 10 years
- Depreciation, 15 per cent per annum on written down value basis
- Salvage value, ₹4,00,000

Leasing of computer:

- Initial lease payment, ₹4,00,000
- Lease rent, ₹7,00,000 (payable in advance every year for 10 years)
- Maintenance expenses, to be borne by the lessor.

You are required to advise NBT Ltd as to whether it should purchase the computer or acquire its services on lease basis, assuming it does not pay tax.

Solution**PV of cash outflows under leasing alternative**

Year	Payment under lease contract	PV factor (at 0.12)	Total PV
0	₹4,00,000	1.000	₹4,00,000
1-10	7,00,000	6.328*	44,29,600
			48,29,600

*6.328, that is, 5.328 (PV factor for 9 years) + 1.000 (PV factor for payment at the beginning of year 1).

PV of cash outflows under buying alternative

Particulars	Year	Amount	PV factor (0.12)	Total PV
Annual maintenance (advance)	1-10	₹50,000	6.328	₹3,16,400
Interest (end of the year)	1-10	4,80,000	5.650	27,12,000

Principal repayment	10	40,00,000	0.322	12,88,000
Salvage value	10	(4,00,000)	0.322	(1,28,800)
Total				41,87,600

Note: Depreciation is ignored as no tax advantage is accruing to the firm.

Recommendation NBT Ltd is advised to buy the computer under consideration, as it is economical compared to the leasing alternative.

P.25.14 HCL Ltd is considering acquiring an additional computer to supplement its time-share computer services to its clients. It has two options:

LO 25.2	LOD
	M

(i) To purchase the computer for ₹22,00,000.

(ii) To lease the computer for 3 years from a leasing company for ₹5,00,000 annual lease rent plus 10 per cent of gross time-share service revenue. The agreement also requires an additional payment of ₹6,00,000 at the end of the third year. Lease rent are payable at the year end, and the computer reverts to the lessor after the contract period.

The company estimates that the computer under review now will be worth ₹10 lakh at the end of the third year.

Forecast revenues are:

Year 1	₹22,50,000
2	25,00,000
3	27,50,000

Annual operating costs (excluding depreciation and lease rent of computer) are estimated at ₹9,00,000, with an additional ₹1,00,000 for start-up and training costs at the beginning of the first year.

HCL Ltd will borrow at 16 per cent interest to finance the acquisition of the computer; repayments are to be made according to the following schedule.

Year-end	Principal	Interest	Total
1	₹5,00,000	₹3,52,000	₹8,52,000
2	8,50,000	2,72,000	11,22,000
3	8,50,000	1,36,000	9,86,000

The company uses the straight line method to depreciate its assets and pays 50 per cent tax on its income. The management of HCL Ltd approaches you for advice. Which alternative would you recommend? Why?

Solution

PV of cash outflows under leasing alternative

Year	Payment under lease contract			Tax shield @ 50% on lease payments	Net cash outflows	PV factor (0.08)	Total PV
	Lease rent	10% of gross revenue	Lumpsum payment				
1	₹5,00,000	₹2,25,000	—	₹3,62,500	₹3,62,500	0.926	₹3,35,675
2	5,00,000	2,50,000	—	3,75,000	3,75,000	0.857	3,21,375
3	5,00,000	2,75,000	₹6,00,000	6,87,500	6,87,500	0.794	5,45,875
							12,02,925

PV of cash outflows under borrowing alternative

Year	Loan instalment	Tax advantage on		Net cash outflows	PV factor (0.08)	Total PV
		(I × 0.50)	(D × 0.50)			
1	₹8,52,000	₹1,76,000	₹2,00,000	₹4,76,000	0.926	₹4,40,776
2	11,22,000	1,36,000	2,00,000	7,86,000	0.857	6,73,602
3	9,86,000	68,000	2,00,000	7,18,000	0.794	5,70,092
	Salvage value			(10,00,000)	0.794	(7,94,000)
						8,90,470

Assumption The start-up and training costs are to be borne by the lessee even if the computer is acquired on lease basis.

Recommendation The management is advised to buy the computer.

P.25.15 Infotel Broadband Limited is in need to acquire towers for its 4G rollout. It is considering buying or leasing them. Towers can be acquired at ₹150 lakh and are expected to have economic useful life of 5 years. At year-end 5, these towers are expected to have salvage value of ₹6 lakh. In contrast, the towers can be taken at lease rent of ₹39 lakh.

LO 25.2 **LOP D**

Infotel Broadband can raise loan at 15 per cent payable in 5 equal instalments, each instalment is due at the end of year. For your exercise, you may assume the following:

(1) Towers will constitute a separate block for depreciation purposes. The company follows written down value method of depreciation, the rate of depreciation being 20 per cent, (2) Tax rate is 33 per cent, (3) Lease rents are to be for 5 years (and are to be paid at the end of the year), (4) Maintenance expenses are estimated at ₹10 lakh per year and are to be borne by the lessee, (5) Assume firm would have sufficient short-term capital gains in year 5.

Required: Should Infotel lease or buy towers? Use present value method as well as IRR method in support of your answer. Also analyse the financial viability from the point of view of the lessor, assuming 16 per cent cost of capital and tax rate of 33 per cent. Assume further the lessor would have sufficient short-term capital gains in year 5. Also, determine minimum lease rent acceptable to lessor.

Solution

Financial Analysis whether to have towers on a lease option basis or buying option basis (set up towers)

Determination of present value of cash outflows under leasing option

Year	Lease rent after taxes [R(1-T)] ₹39,00,000 (1 - 0.33)	PVIFA factor at [15% (1 - 0.33)] 10%*	Total PV
1-5	₹26,13,000	3.791	₹99,05,883

*For calculation purposes, 10.05% has been taken as 10%.

Present value of cash outflow under buying option

Year-end	Loan instalment	Tax advantage on		Net cash outflow 2 - (3 + 4)	PVIF at 10%	Total PV 5 × 6
		(I × 0.33)	(D × 0.33)			
1	2	3	4	5	6	7
1	₹44,74,940	₹7,42,500	₹9,90,000	₹27,42,440	0.909	₹24,92,878
2	44,74,940	6,32,365	7,92,000	30,50,575	0.826	25,19,775

3	44,74,940	5,05,711	6,33,600	33,35,629	0.751	25,05,057
4	44,74,940	3,60,058	5,06,880	36,08,002	0.683	24,64,265
5	44,74,940	1,93,017	4,05,504	38,76,419	0.621	24,07,256
						1,23,89,238
	Less: PV of salvage value (₹6,00,000 × 0.621)					3,72,600
	Less: PV of tax savings on STCL (₹49,15,200 - ₹6,00,000) × 0.33 = (₹14,24,016 × 0.621)					8,84,314
	Total					1,11,32,324

Working Notes

(i) Equivalent annual loan instalment = Price of towers/ PVF at 15% for 5 years
= ₹1,50,00,000/3.352 = ₹44,74,940

(ii) Schedule of debt payment

Year-end	Loan instalment	Loan at the beginning of the year	Payments		Loan outstanding at the end of the year (col. 3 - col. 5)
			Interest (col. 3 × 0.15)	Principal repayment	
1	2	3	4	5	6
1	₹44,74,940	₹1,50,00,000	₹22,50,000	₹22,24,940	₹1,27,75,060
2	44,74,940	1,27,75,060	19,16,259	25,58,681	1,02,16,379
3	44,74,940	1,02,16,379	15,32,457	29,42,483	72,73,896
4	44,74,940	72,73,896	10,91,084	33,83,856	38,90,040
5	44,74,940	38,90,040	5,84,900*	38,90,040	—

*Difference between the loan instalment and loan outstanding

Schedule of depreciation

Year	1	2	3	4	5
WDV	₹1,50,00,000	1,20,00,000	96,00,000	76,80,000	61,44,000
Depreciation	₹30,00,000	24,00,000	19,20,000	15,36,000	12,28,800

Cost of Leasing**Determination of after-tax cost of lease financing**

Year-end	Cost of towers	Lease payments (L)	Depreciation (D)	Incremental tax shield on leasing $0.33 \times (L - D)$	Net cash outflows under leasing (3 - 5)
1	2	3	4	5	6
0	₹1,50,00,000	—	—	—	—
1		₹39,00,000	₹30,00,000	₹2,97,000	(₹36,03,000)
2		39,00,000	24,00,000	4,95,000	(34,05,000)
3		39,00,000	19,20,000	6,53,400	(32,46,600)
4		39,00,000	15,36,000	7,80,120	(31,19,880)
5 (a)		39,00,000	12,28,800	8,81,496	(30,18,504)
5 (b) Salvage value					(6,00,000)
5 (c) Tax saving on STCL					(14,24,016)
Total					1,84,17,000

Average cash outflow per year = ₹1,84,17,000/5 = ₹36,83,400

Pay Back Period = ₹1,50,00,000/₹36,83,400 = 4.07

Look for the PV factors closest to 4.07 in the present value of annuity table in year 5. The two closest factors are 4.100 (at 7%) and 3.993 (at 6%). Given the fact that net cash outflows in year 5 is substantially higher (at ₹50,42,520) compared to average cash outflows of ₹36,83,400, IRR has been attempted at 6 per cent and 7 per cent.

Determination of IRR

Year	Net cash outflow under leasing	PV Factor at		Total PV at	
		7%	6%	7%	6%
1	₹36,03,000	0.935	0.943	₹33,68,805	₹33,97,629
2	34,05,000	0.873	0.890	29,72,565	30,30,450
3	32,46,600	0.816	0.840	26,49,226	27,27,144
4	31,19,880	0.763	0.792	23,80,468	24,70,945
5	50,42,520*	0.713	0.747	35,95,317	35,95,317
				1,49,66,381	1,52,21,485

* [5(a) +5(b) +s(c) = ₹30,18,504 + ₹6,00,000 + ₹14,24,016]

$$\begin{aligned} \text{IRR (by interpolation)} &= 7\% - \frac{[\text{₹1,50,00,00} - \text{₹1,49,66,381}]}{[\text{₹1,52,21,485} - \text{₹1,49,66,381}]} \\ &= 7\% - \frac{\text{₹33,619}}{\text{₹2,55,104}} = 7\% - 0.13 = 6.83\% \end{aligned}$$

Cost of leasing = 6.83 per cent; after tax cost of debt = 10 per cent

Recommendation Infotel Broadband is advised to go for leasing to take advantage of its lower cost relative to the cost of debt. Similar conclusion follows based on comparison of PV of cash outflows under lease option compared to borrow/buy option.

Financial Analysis whether to give towers by Reliance Infratel on lease rent or not using NPV method

Determination of NPV of cash inflows

Particulars	Year				
	1	2	3	4	5
Lease rent	₹39,00,000	₹39,00,000	₹39,00,000	₹39,00,000	₹39,00,000
Less: Depreciation	30,00,000	24,00,000	19,20,000	15,36,000	12,28,800
Earnings before taxes	9,00,000	15,00,000	19,80,000	23,64,000	26,71,200
Less: Taxes (0.33)	2,97,000	4,95,000	6,53,400	7,80,120	8,81,496
Earnings after taxes	6,03,000	10,05,000	13,26,600	15,83,880	17,89,704
CFAT (EAT + D)	36,03,000	34,05,000	32,46,600	31,19,880	30,18,504
PV factor at (0.16)	0.862	0.743	0.641	0.552	0.476
Total	31,57,786	25,29,915	20,81,071	17,22,174	14,36,808
Total PV of lease rent					1,08,75,754
Add: PV of salvage value (₹6,00,000 × 0.476)					2,85,600
Add: PV of tax savings on STCL (₹14,24,016 × 0.476)					6,77,832
Gross PV					1,18,39,186
Less: Cost of towers					1,50,00,000
NPV					(31,60,814)

Recommendation It is not financially profitable to let out towers on lease by Reliance Infratel, as NPV is negative.

Break-even lease rental—minimum lease rental Infratel can accept

Cost of Towers	₹1,50,00,000
Less: PV of Salvage value to be received at the end of year 5 (₹ 6,00,000 × 0.476)	2,85,600
Less: PV of tax saving on STCL at the end of 5th year (₹ 14,24,016 × 0.476)	6,77,832
Less: PV of tax shield on Depreciation: (₹30,00,000 × 0.33 × 0.862 + ₹24,00,000 × 0.33 × 0.743 + ₹19,20,000 × 0.33 × 0.641 + ₹15,36,000 × 0.33 × 0.552 + ₹12,28,800 × 0.33 × 0.476)	23,20,791
Total PV after tax lease rent	1,17,15,777
Divided by PVIFA for 5yrs at 0.16	÷ 3.274
After tax lease rentals	35,78,429
Break-even lease rentals [₹35,78,429/(1 - 0.33)]	₹53,40,939

Recommendation Thus, the minimum lease rental that Infratel should charge is ₹53,40,939.

Verification table—for Break-even lease rental

Particulars	Year				
	1	2	3	4	5
Lease rent	₹53,40,939	₹53,40,939	₹53,40,939	₹53,40,939	₹53,40,939
Less: Depreciation	30,00,000	24,00,000	19,20,000	15,36,000	12,28,800
Earnings before taxes	23,40,939	29,40,939	34,20,939	38,04,939	41,12,139
Less: Taxes (0.33)	7,72,510	9,70,510	11,28,910	12,55,630	13,57,006
Earnings after tax	15,68,429	19,70,429	22,92,029	25,49,309	27,55,133
CFAT (EAT + D)	45,68,429	43,70,429	42,12,029	40,85,309	39,83,933
PV Factor at (0.16)	0.862	0.743	0.641	0.552	0.476
Total	39,37,986	32,47,229	26,99,911	22,55,091	18,96,352
Total PV of lease rent					1,40,36,569
Add: PV of salvage value (₹6,00,000 × 0.476)					2,85,600
Add: PV of tax savings on STCL (₹14,24,016 × 0.476)					6,77,832
Total PV					₹1,50,00,000

P.25.16 A departmental store owns a large building and the land on which it is situated. Their respective book values are ₹20 crore and ₹8 crore. The building is being depreciated @ ₹1 crore per year over 20 years.

LO 25.1.2 LOD
M

Canhome Finance Ltd has offered to buy the land and building at book value and to lease it back to the firm for 20 years at annual rental of ₹3 crore, payable at the end of each year. At the end of the 20th year, it is estimated that, after paying the costs of demolishing the building, the land could net ₹9 crore.

If the sale and lease back proposals were accepted, the departmental store would still be responsible for maintenance, insurance and so on, but would have no residual claims on the property at the end of the 20th year. The finance manager of the departmental store estimates the firm's after tax cost of capital is 12 per cent. The firm can borrow at 10.75 per cent. The corporate tax rate on ordinary income is likely to remain unchanged at the present level of 35 per cent and on capital gains at 20 per cent.

Advise the company on the relative suitability of the options.

Solution

PV of cash outflows under leasing alternative

Year	Lease payment after taxes	PV factor (0.07)	Total PV
1	₹1,95,00,000	10.594	₹20,65,83,000

PV of cash outflows under retaining the asset alternative

PV of land and building			₹28,00,00,000
Less: PV of tax shield on depreciation foregone [$₹1,00,00,000 \times 0.35 (t) \times 7.469$ (PV factor of annuity for 20 years at 12%)			2,61,41,500
Less: Effective salvage value foregone [$₹9$ crore – $₹0.20$ crore (capital gain tax on $₹1,00,00,000 \times$ PV factor at 12% in 20th year, ie, 0.104)]			91,52,000
			<u>24,47,06,500</u>

Advice It will be advantageous for the firm to sell, and then acquire the asset on lease basis.

MINI CASES

25.C.1 Leasing Vs. Buying—Borrowing Teddy Bear Ltd is in the business of making toys of different ranges. Presently, Teddy Bear has one manufacturing plant having production capacity of 30,00,000 toys annually. They are sold through registered dealers in India who take delivery of toys directly from the factory situated in NOIDA. Teddy Bear does not incur any transport cost.

The demand for toys has shown tremendous growth in recent years. The Vice President Marketing, Sanjay Khanna, has submitted a proposal to the CEO, Bikrant Kumar Singh, to expand the production capacity of Teddy Bear to 40,00,000 toys. The CEO directs the Vice President, Manufacturing, Virender Kumar Rathi, to put a proposal regarding the availability of the required equipment for the expansion of the plant. A survey shows that the machinery is available for ₹12.5 crore having a useful life of five years and no salvage. Assume straight line depreciation for tax purposes. It also shows that there are two alternatives to finance the proposal. The equipment can be bought and financed by borrowing from the Udharwala Financial Services Ltd at 10 per cent interest. The equipment can be alternatively taken on lease from the First Leasing Company of India Ltd at ₹3.5 crore annual lease rental. The First Leasing would bear the associated taxes, insurance and maintenance cost amounting to ₹60,00,000 annually.

Required Bikrant Singh engages you as a financial consultant to advise him on the choice of the funding alternatives. Should Teddy Bear buy the equipment through borrowing or acquire it on lease? What advice would you give and why? Assume 30 per cent corporate tax.

Solution

1. Present Value of Cash Outflows Under Leasing Alternative (₹ crore)

Year-end	Lease rent after taxes [₹3.50 (1 - 0.30)]	PVIFA [10% (1-0.30)]	Total PV
1 - 5	₹2.45	4.100	₹10.04

2. Present Value of Cash Outflows Under Buying-Borrowing Alternative (₹ crore)

	Year-end tax advantage					Total
	1	2	3	4	5	
Tax advantage:						
Interest on loan (Working note 10)	₹1.25	₹1.04	₹0.82	₹0.57	₹0.30	3.98

(Contd.)

(Contd.)

Taxes/maintenance cost	0.60	0.60	0.60	0.60	0.60	3.00
Depreciation (₹12.50 crore + 5 years)	2.50	2.50	2.50	2.50	2.50	12.50
	4.35	4.14	3.92	3.67	3.40	19.48
(A) Tax advantage (0.30)	1.30	1.24	1.18	1.10	1.02	5.84
(B) Payments:						
(a) Loan payment (Working note 1)	3.30	3.30	3.30	3.30	3.30	16.5
(b) Taxes/ maintenance costs	0.60	0.60	0.60	0.60	0.60	3.00
	3.90	3.90	3.90	3.90	3.90	19.50
(C) Net cash outflows (B-A)	2.60	2.66	2.72	2.80	2.88	13.66
(D) PVIF (0.07)	0.935	0.873	0.816	0.763	0.713	
(E) Total present value	2.43	2.31	2.22	2.14	2.05	11.15

Advice: As the present value of cash flow under the buying-borrowing alternative is higher, lease financing is a better alternative.

Working Note

25.C.2 Symphosis is planning to open a new office in Safdarjung Enclave, Delhi to expand its operations and to cater to the clients emerging as entrepreneurs in NCR area. For the purpose, it has acquired a complex spread in 2 acres. The complex has 30 rooms in total (spread across 4 floors). There are 20 corridors and 2 staircases that connect the floors on two sides. The company plans to employ a Security-cum- Surveillance system in the complex. The team has met with a consultancy firm (headed by Mr. Sukhvinder) and has decided upon the following requirements in the context of Surveillance system.

Equipment/product	Quantity	Cost per unit₹	Remarks
IP cameras	50	13,000	0.5 lux
PTZ (pan till zoom) cameras	8	45,000	SMGH/PELCO
Video server	1	2,00,000	3 client access
POE server	1	32,000	—
LCD screen	1	55,000	With screens for all the camera feeds

Apart from the equipment, certain other costs are also to be incurred. Installation costs are ₹3.5 lakh and the civil construction costs are at real-time. The rate for the same is ₹150 per square feet of digging undertaken. Based on this exercise and after allowing for contingencies, total costs are ₹12,97,000. The annual maintenance costs can be covered through an AMC (with increase of 10 per cent per year). The AMC would cost ₹10 lakh in year 1. The useful life of such a system is 10 years. The company is thinking of financing its initiative by bank loan. The bank has agreed to finance ₹12.97 lakh and has agreed to charge interest at 14 per cent for the loan payable in 10 annual equal instalments of ₹2, 48,652.

As the agreement with the bank was about to be signed, the CFO received an email from his junior stating that Convenience Ltd. is a company that provides such equipment on lease and has been in the industry for 6 years and before that has been actively involved in providing security solutions across the globe for the past 15 years. The company is offering the equipment for 10 years financial lease (along with the AMC) for an annual lease rental of ₹14 lakh. The CFO now wants to evaluate the two options (borrow – buy and leasing).

You are also required to evaluate financial soundness of the proposal from the point of view of leasing company. The company can arrange the AMC for ₹7 lakh per annum (with increase of 10 per cent per year). The cost of capital for the lessor is 18 per cent. Also, suggest the minimum lease rent it can offer.

The depreciation rates are 15 per cent as CCTVs fall under plant and machinery category and not specifically under any block. Tax rate applicable for both the companies is 30 per cent. Assume that the block ceases to exist at the end of year 10 and the salvage value is ₹50,000 (for both the companies). Assume further both the companies would have sufficient short-term capital gains in year 10.

Solution

Evaluation from Lessee's perspective

Present value of Cash Outflows under Leasing Option

Year end	Annual lease rent	Tax shield @ 30%	Lease rent after taxes	PVIFA@9.8% (K_d)	Total PV
1-10	₹14,00,000	₹4,20,000	₹9,80,000	6.198	₹60,73,762

K_d has been calculated as follows. Given $K_f = 14\%$ (as leasing is compared with borrow-buy option) and $t = 30\%$, $K_d = ki \times (1 - t) = 14\% (1 - 0.3) = 9.8\%$. Since the present values are not given in the table for fractional rates, these have been calculated by using the following formula:

So PVIFA (9.8,10) = $\left[\frac{1}{(1+K_d)} + \frac{1}{(1+K_d)^2} + \frac{1}{(1+K_d)^3} + \dots + \frac{1}{(1+K_d)^{10}} \right]$

Present value of Cash Outflows under Borrow-Buy Option

(Amount in ₹)

Year end	Loan instalment	Maintenance expenses	Tax shield on maintenance expenses	Total interest on loan	Tax shield on interest	Tax shield on depreciation	NCOAT	PVIFA @9.8% (K_d)	Total PV

*Assuming the firm has taxable income from other sources, it has tax advantage on losses accruing in years 8-10.
Recommendation Since NPV is positive, the leasing proposal is financially sound and profitable for Convenience Ltd.

Calculation of Break-Even Lease Rental

Cost of machine	₹12,97,000.00
Add PV of after tax cost of providing AMC per year	30,88,710.49
Less PV of SV after expiry of third year	9,550.00
Less PV of tax savings on STCL after expiry of third year	14,348.32
Less PV of tax shield on depreciation	1,67,594.40
Required total PV of after tax lease rent	41,94,217.77
Divided by PVIFA for 3 years at 18%	4.494
After tax lease rental	9,33,292.76
Break even lease rental (₹9,33,292.76/0.7)	13,33,275.30

25.C.3 XYZ Telecom Limited is a data telecom service and IT solutions provider. It offers innovative IP based infrastructural solutions and has been the front-runner in providing and managing multi-location wide-area networks for various industry verticals. XYZ Ltd. is a Bombay Stock Exchange (BSE) and National Stock Exchange (NSE) listed company with secure assets and loyal customer base that includes some of the biggest blue-chip companies in the world.

The company has number of customers in Delhi- Bombay corridor who require internet connection. However, presently, company is faced with a problem of bandwidth. Its financial manager suggests that it should build its own infrastructure, i.e., it should lay own optical fiber cable for communication given bulk demand from customers in present and future scenario) while the company technical manager feels that it is beneficial to take the bandwidth on lease from ABC Transmission Ltd.

ABC Transmission Ltd is discharging its responsibilities efficiently in construction, operation and maintenance of regional power grids. The company has achieved many milestones and established benchmarks in various areas of its business operations and is playing a strategic role in Indian power sector in establishing and maintaining transmission infrastructure.

Cost of building its own infrastructure (buying the fiber, digging and laying of cable, etc.) is estimated at ₹300 million. Optical fiber cable is expected to have a life of 10 year with salvage value of 5 per cent at year-end 10. The purchase can be financed at 15 per cent debt from a bank payable in 10 equal instalments (inclusive of interest) becoming due at the end of each year.

Alternatively, the financial manager of the XYZ Telecom Limited suggests that it should go for year-end lease rentals of ₹50 million.

Additional information:

- (i) The fiber would constitute a separate block for depreciation purpose. For tax purposes, the company is to follow written down value method of depreciation with the rate of depreciation at 10 per cent.
- (ii) Tax rate is 40 per cent.
- (iii) Lease rentals are to be paid at the end of each year.
- (iv) Maintenance and insurance expenses estimated ₹10 million per year is to be borne by ABC Transmission Ltd (lessor)

The question remains whether XYZ Telecom Limited should construct its own infrastructure for solving the problem of bandwidth (i.e. buying the optical fiber cable, digging, laying and taking permission for right of way etc.) or it should take it on lease from ABC Transmission Ltd. Assume the firm would have sufficient short-term capital gains in year 10.

Solution**Option-1: Leasing Option**

PV of Cash Outflow Under Leasing Alternative

Year End	Lease rent (LR)	Lease rent after tax $LR \times (1-0.4)$	PVIF at 9 % $[15\% \times (1-0.4)]$	Total PV
1-10	₹50,000,000	₹30,000,000	6.418	₹192,540,000

Option-2: Borrow-buy (Building his own infrastructure for communication):

Computation of loan installment

Loan Amount = ₹3,00,000,000

Present value of annuity of ₹1 for 10 years @15% = 5.019 (PVIF for 10 years at 15% i.e., 15, 10)

Loan instalment payable (i / ii) = ₹300,000,000/5.019 = ₹59,772,863

Computation of Interest and Principal Component of Loan Repayment

Year	Loan instalment	Loan at beginning of the year	Payment		Loan outstanding at end of the year
			Interest(I)	Principal(P) repayment	
(1)	(2)	(3)	(4)	(5)	(6)
1	₹59,772,863	₹300,000,000	₹45,000,000	₹14,772,863	₹285,227,137
2	59,772,863	285,227,137	42,784,071	16,988,792	268,238,345
3	59,772,863	268,238,345	40,235,752	19,537,111	248,701,233
4	59,772,863	248,701,233	37,305,185	22,467,678	226,233,555
5	59,772,863	226,233,555	33,935,033	25,837,830	200,395,725
6	59,772,863	200,395,725	30,059,359	29,713,504	170,682,221
7	59,772,863	170,682,221	25,602,333	34,170,530	136,511,692
8	59,772,863	136,511,692	20,476,754	39,296,109	97,215,582
9	59,772,863	97,215,582	14,582,337	45,190,526	52,025,057
10	59,772,863	52,025,057	7,747,806	52,025,057	

Computation of Depreciation

Year	WDV at beginning of the Year	Depreciation @ 10%	WDV at end of the Year
1	₹300,000,000	₹30,000,000	₹270,000,000
2	270,000,000	27,000,000	243,000,000
3	243,000,000	24,300,000	218,700,000
4	218,700,000	21,870,000	196,830,000
5	196,830,000	19,683,000	177,147,000
6	177,147,000	17,714,700	159,432,300
7	159,432,300	15,943,230	143,489,070
8	143,489,070	14,348,907	129,140,163
9	129,140,163	12,914,016	116,226,147
10	116,226,147	11,622,615	104,603,532

Computation of short-term capital loss

WDV at the end of 10 years = ₹104,603,532

Salvage Value = $0.05 \times ₹300,000,000 = ₹15,000,000$

Short-term capital loss = (i) - (ii) = ₹(104,603,532 - 15,000,000) = ₹89,603,532

PV of cash outflow under borrowing (building its own infrastructure for telecommunication) alternative

(Amount in ₹)

Year	Loan Instalment	Maintenance	Tax advantage on			Net Cash outflows	PVIF at 9 % [15%*(1-0.4)]	Total PV	
			Interest	Depreciation	Maintenance				
(1)	(2)	(3)	(4)=I*0.4	(5)=D*0.4	(6)=(2)*0.4	(7)=(2)+(3)-(4)-(5)-(6)	(8)	(9)	
1	59,772,863	10,000,000	18,000,000	12,000,000	4,000,000	35,772,863	0.917	32,819,140	
2	59,772,863	10,000,000	17,113,628	10,800,000	4,000,000	37,859,235	0.842	31,865,360	
3	59,772,863	10,000,000	16,094,301	9,720,000	4,000,000	39,958,562	0.772	30,855,342	
4	59,772,863	10,000,000	14,922,074	8,748,000	4,000,000	42,102,789	0.708	29,826,677	
5	59,772,863	10,000,000	13,574,013	7,873,200	4,000,000	44,325,650	0.650	28,808,631	
6	59,772,863	10,000,000	12,023,744	7,085,880	4,000,000	46,663,239	0.596	27,823,765	
7	59,772,863	10,000,000	10,240,933	6,377,292	4,000,000	49,154,638	0.547	26,889,270	
8	59,772,863	10,000,000	8,190,701	5,739,563	4,000,000	51,842,599	0.502	26,018,052	
9	59,772,863	10,000,000	5,832,935	5,165,607	4,000,000	54,774,322	0.460	25,219,619	
10-a	59,772,863	10,000,000	3,099,123	4,649,046	4,000,000	58,024,695	0.422	24,510,258	
10-b	Less PV of salvage value (₹1,50,00,000*0.422)								(6,336,162)
10-c	Less PV of tax saving on short term capital loss (₹89,603,532*0.422)								(37,849,500)
Total									240,450,453

Recommendation The company XYZ Telecom Limited is advised to go for leasing as present value of cash outflow under leasing option (₹19,25,40,000) is lower than buying option (i.e. laying his own optical fiber cable, digging and taking permission for right of way, etc., for Delhi-Bombay corridor) (₹24,04,50,453)

IRR based approach

Determination of After-tax-cost of Lease Financing

(Amount in ₹)

Year end	Cost of machine	Lease rent after tax	Tax advantage foregone on depreciation	After tax maintenance expenses to be borne by lessor	Effective COAT under leasing
0	300,000,000				300,000,000

(Contd.)

7	30,000,000	6,377,292	(6,000,000)	30,377,292
8	30,000,000	5,739,563	(6,000,000)	29,739,563
9	30,000,000	5,165,607	(6,000,000)	29,165,607
10	30,000,000	4,649,046	(6,000,000)	28,649,046
10* Salvage value				15,000,000
10* Tax saving on short term capital loss				89,603,552

*Salvage value of machine foregone and short-term capital loss constitute the opportunity cost of lease financing and, therefore, cash outflows of lease financing.

Given the fact that lease option is better, the cost of leasing, that is, IRR is to be lower than after tax cost of debt of 9 per cent. Further, there is a substantial difference between present value of COAT under leasing compared to borrow-buy option, the IRR has been attempted at 5 per cent and 6 per cent.

Determination of IRR

Year	Effective cash outflows under leasing	PV factor at		Total PV at	
		5%	6%	5%	6%
1	₹36,000,000	0.952	0.943	₹34,272,000	₹33,948,000

REVIEW QUESTIONS

LOD: Easy

RQ.25.1 Provide appropriate answer for the following:

[LO 25.1,2,3]

- (i) While operating leases are _____ (cancelable/non-cancelable) during lease period at the option of the lessee, financial leases are _____ (cancelable/non-cancelable).
- (ii) Lease rents are higher in case of _____ (financial/operating) leases.
- (iii) Lease period is higher for _____ (operating/financial) leases.
- (iv) Lease is classified as a _____ if it transfers substantially all the risk and rewards incidental to ownership.

- (v) Lease is classified as an _____ if it does not transfer substantially all the risk and rewards incidental to ownership.
- (vi) It is mandatory for the lessor to transfer ownership to the lessee in the case of Financial leases. (True/False)
- (vii) Sale and lease back is _____ (a direct/an indirect) form of leasing.
- (viii) There are _____ (two/three) parties in the leveraged lease.
- (ix) _____ lease is subject to renewal for the secondary lease period during which lease rents are substantially low.
- (x) From the perspective of lessee, the lease is similar to _____ (debt/equity) form of financing.
- (xi) From the perspective of lessor, leasing is _____ (capital budgeting/financing) decision.
- (xii) In _____ (hire-purchase/lease) agreement, the ownership is transferred on payment of last installment.
- (xiii) In _____ (hire-purchase/lease), it is customary to make cash down payment to the owner of the asset.
- (xiv) In _____ (installment/hire-purchase/lease) contract of sales is entered into, the goods are delivered and the ownership is transferred to the buyer.
- (xv) Depreciation is charged in the books of the owner in leasing as well as hire-purchase. (True/False)
- (xvi) The lessor uses _____ (pre-tax cost of debt/cost of capital) as a discount rate to evaluate financial lease.
- (xvii) The lessee will opt for the leasing decision if the NAL amount is _____ (positive/negative).

[Answers: (i) cancelable, non-cancelable, (ii) operating, (iii) financial, (iv) financial, (v) operating, (vi) false, (vii) an indirect, (viii) three, (ix) financial, (x) debt, (xi) capital budgeting, (xii) hire-purchase, (xiii) hire-purchase, (xiv) installment, (xv) false, (xvi) cost of capital, (xvii) positive]

RQ.25.2 What is equipment lease? What are its essential elements? [LO 25.1]

RQ.25.3 Briefly discuss an operating lease. [LO 25.1]

RQ.25.4 Distinguish between import lease and cross-border lease. What are the advantages of the latter? [LO 25.1]

RQ.25.5 Discuss the advantages of leasing. What are its limitations? [LO 25.1]

LOD: Medium

RQ.25.6 List the criteria for classifying lease as finance lease. What are the features around which it is structured? [LO 25.1]

RQ.25.7 Distinguish between a single investor lease and a leveraged lease. [LO 25.1]

RQ.25.8 Compare and contrast sales and leasing and bipartite leasing. How can sales aid leasing be done? [LO 25.1]

	Item 3	50	60	70
	Item 4	60	70	80

Section 3: Summary and Conclusions

Section 4: Final Remarks and Next Steps

Main body of text on page 2, containing detailed analysis and discussion.

Section 5: Appendix and References

- RQ.25.12** Differentiate between (i) hire-purchase, (ii) instalment sale and (iii) leasing. [LO 25.2,3]
- RQ.25.13** Briefly explain the framework of financial evaluation of a hire-purchase transaction from the view point of (a) hirer and (b) financing company. [LO 25.3]
- RQ.25.14** What are the unique features of hire-purchase accounting? [LO 25.3]
- RQ.25.15** The Hypothetical Equipments Ltd (HEL) has recently leased assets worth ₹2,500 lakh from the Hypothetical Leasing Ltd (HLL). The following facts are available: [LO 25.1]
- (1) Lease period, 9 years, of which the first 6 years constitute the lease term
 - (2) Annual lease rates: First 6 years, ₹360/₹1,000; Next 3 years, ₹15/₹1,000
 - (3) Incremental borrowing rates for HEL, 22 per cent
- (a) Assuming 14 years as the average economic life of the equipment, is the lease a finance lease or an operating lease?
- (b) Assuming further (i) physical life of 14 years, (ii) technological life of 9 years and (iii) product-market life of 11 years, how will you classify the lease?

- RQ.25.16** In RQ 25.15, assume the following: [LO 25.1,2]
- (1) Monthly lease rentals payable in advance; first 6 years: ₹26/1,000; next 3 years, ₹1.50/1,000;
 - (2) Incremental borrowing rate of HEL, 23 per cent compounded monthly.

$$\left[\text{hint : } \frac{i(.23)}{(d)^2} = 1.121 \text{ (Table A - 6)} \right]$$

What will be your answer to RQ.25.17 (a) and (b)?

- RQ.25.17** For RQ 25.15, assume (i) average economic life of the equipment, 10 years, (ii) salvage value, 10 per cent of the original cost, (iii) implicit rate of interest in lease, 25 per cent. Is it a finance lease? [LO 25.1]
- RQ.25.18** Alfa Ltd is thinking of installing a computer. Decide whether the computer is to be purchased outright (through 14 per cent borrowing) or to be acquired on lease rental basis. The company is in the 50 per cent tax bracket. The other data available are: [LO 25.2]

Purchase of computer:

- Purchase price: ₹20,00,000
- Annual maintenance, (to be paid in advance), ₹50,000 per year
- Expected economic useful life, 6 years
- Depreciation (for tax purposes), Straight line method
- Salvage value: ₹2,00,000

Leasing of computer:

- Lease charges (to be paid in advance): ₹4,50,000
- Maintenance expense to be borne by lessor
- Payment of Loan:* 6 year-end equal instalments of ₹5,14,271

- RQ.25.19** Engineers Ltd. is in the business of manufacturing nut bolts. Some more product lines are being planned to be added to the existing system. The machinery required may be bought or may be taken on lease. The cost of machine is ₹20,00,000 having a useful life of 5 years with the salvage value of ₹4,00,000 (consider short term capital loss/gain for the income tax). The full purchase value of the machine can be financed by a bank loan at the rate of 20 per cent interest repayable in five equal instalments falling due at the end of each year. Alternatively, the machine can be procured on a 5 years' lease, year-end lease rentals being ₹6,00,000 per annum. The company follows the written down value method of depreciation at the rate of 25 per cent. The company's tax rate is 35 per cent and cost of capital is 14 per cent. [LO 25.2]
- (i) Advise the company which option it should choose - lease or borrow.
 - (ii) Assess the proposal from the lessor's point of view examining whether leasing the machine is financially viable at 14 per cent cost of capital.
 - (iii) Assume both the companies would have sufficient short-term capital gains in year 5. Detailed working notes should be given.

RQ.25.20 Armada Leasing Company is considering a proposal to lease out a school bus. The bus can be purchased for ₹5,00,000 and, in turn, be leased out at ₹1,25,000 per year for 8 years with payments occurring at the end of each year: **[LO 25.2]**

- (i) Estimate the internal rate of return for the company assuming tax is ignored.
- (ii) What should be the yearly lease payment charged by the company in order to earn 20 per cent annual compounded rate of return before expenses and taxes?
- (iii) Calculate the annual lease rent to be charged so as to amount to 20 per cent after tax annual compound rate of return, based on the following assumptions:
 - (i) Tax rate, 40 per cent
 - (ii) Straight line depreciation
 - (iii) Annual expenses, ₹50,000 and
 - (iv) Resale value, ₹1,00,000 after the turn.

LOD: Difficult

RQ.25.21 What is the debt displacement effect of leasing? **[LO 25.2]**

RQ.25.22 Leasing and buying cannot be considered as two mutually exclusive investment proposals for the purpose of financial evaluation. Comment. **[LO 25.1,2]**

RQ.25.23 Computeronics Ltd sells computer services to its clients. The company has recently completed a feasibility study and decided to acquire an additional computer the details of which are as follows: **[LO 25.2]**

1. The purchase price of the computer is ₹2,30,000; maintenance, property taxes and insurance will be ₹20,000 per year. The additional annual expenses to operate the computer are estimated at ₹80,000. If the computer is rented, the annual rent will be ₹85,000, plus 5 per cent of annual billings. The rent is due on the last day of each year.
2. Due to competitive conditions, the company feels it will be necessary to replace the computer after the expiry of 3 years with a more advanced model. The resale value is estimated at ₹1,10,000.
3. The appropriate income tax rate is 35 per cent. The relevant block-wise depreciation on the written down value basis is 25 per cent. There are no other assets in this block.
4. The estimated annual billing for the services of the new computer will be ₹2,20,000 during the first year, and ₹2,60,000 during the subsequent 2 years.
5. If the computer is purchased, the company will borrow to finance the purchase from a bank with interest at 20 per cent. The interest will be paid regularly, and the principal will be returned in one lumpsum at the end of year 3.

Should the company purchase the computer or lease it?

Assuming (i) cost of capital at 12 per cent, (ii) straight-line method of depreciation, (iii) Salvage Value of ₹1,10,000, (iv) the firm would have sufficient short-term capital gains in year of sale of computer, and (v) corporate tax rate of 35 per cent, you are also required to analyse the financial viability of the proposal from the view point of the leasing company.

RQ.25.24 Assume for the firm in RQ.25.23 the following: (a) the leasing company follows written down value method of depreciation, the depreciation rate being 30 per cent; there is no other asset in this block, (b) the expected salvage value after the expiry of 3 years of the computer is ₹1,00,000. (c) the corporate tax rate is 35 per cent. Assume the leasing company would have sufficient short-term capital gain in year of sale of machine. **[LO 25.2]**

Determine (a) NAL and (b) BELR for the lessor.

ANSWERS

- 25.15** (a) Finance lease as PV ₹2,873 lakh exceeds the cost of asset.
(b) Finance lease as term of lease is $9/9 = 100$ per cent.
- 25.16** (a) Finance lease
(b) Finance lease
- 25.17** Yes, it is a finance lease.
- 25.18** Computer should be acquired on lease basis as PV of cash outflow ₹10,86,800 is less than PV of cash outflow in buying alternative ₹11,51,526.
- 25.19** Since the present value of cash outflows is lower under buy-borrow alternative, the company is advised to opt for purchase of machinery.
PV of cash outflows under leasing ₹13,71,630; and under buy-borrow alternative ₹13,67,084.
- 25.20** (i) IRR 18.63%;
(ii) ₹1,30,310.14;
(iii) ₹2,23,729.47
- 25.23** Computeronics Ltd should buy the computer; From the point of view of lessor, the proposal is financially sound with positive NPV (₹2,564).
- 25.24** (a) NAL ₹58,839;
(b) BLER ₹58,795

Venture Capital Financing

LEARNING OBJECTIVES

- | | |
|----------------|---|
| LO 26.1 | Discuss the basic features of venture capital: selection of investments, stages of financing, financial analysis, structuring the deal/financing instruments; investment monitoring/nurturing in terms of style, objectives of after care and techniques; portfolio valuation; structure and legal framework; and exit of investments |
| LO 26.2 | Review of Indian venture capital scenario in terms of the SEBI regulations |

INTRODUCTION

Venture capital institutions which emerged the world over to fill gaps in the conventional financial mechanism focused on new entrepreneurs, commercialisation of new technologies and support to small and medium enterprises in the manufacturing and the service sectors. Over the years, the concept of venture capital has undergone significant changes. The *modus operandi* has shifted from technology-oriented manufacturing organisations to being very close to “private equity class” for unlisted new companies in all sectors of the economy, irrespective of the nature of their projects. They also maintain a close rapport and a *hands-on* approach in nurturing investments during their association with the assisted/investee companies as active partners rather than as passive investors.

Although the development of the venture capital started in the US in the mid-fifties, venture capital institutions are of fairly recent origin in India. Before their emergence, the development finance institutions partially played the role of venture capitalists by providing assistance for direct equity participation to ventures in the pre-public issue stage and by selectively supporting new technologies. The initial steps for the institutionalisation of venture capital in India were taken by the Government in November, 1988, when guidelines were issued for setting up of venture capital funds/companies (VCFs/VCCs) for investing in unlisted companies and to avail of a concessional facility of capital gains tax.

The various facets of venture capital institutions/financing are discussed in this Chapter. The theoretical aspects of such organisations are examined first. A brief account of the venture capital

scenario in India in terms of SEBI regulations is presented subsequently. The main points are summarised by way of recapitulation.

LO 26.1 THEORETICAL FRAMEWORK¹

Venture capital financing is emerging as a new institutional mechanism post-1990 in the country. As a new technique of financing to inject long-term capital into the small and medium sectors, it has made notable contribution to growth in the developed countries, particularly in the US and the UK. The nascent venture capital industry in India can profitably draw upon their experiences. The theoretical aspects of the venture capital institutions, based largely on these experiences, are briefly described in this Section. The aspects covered below include features, selection of investments, investment monitoring/nurturing, portfolio valuation, structure and legal framework and existing form of investments.

Features

Venture capital has, somehow, come to acquire various connotations. It is defined as an equity/equity-related investment in a growth-oriented small/medium business to enable investees to accomplish corporate objectives, in return for minority shareholding in the business or the irrevocable right to acquire it.

Venture capital is a way in which investors support entrepreneurial talent with finance and business skills to exploit market opportunities and, thus, to obtain long-term capital gains. It is the provision of risk-bearing capital, usually in the form of participation in equity, to companies with high-growth potential.

In addition, it provides some value addition in the form of management advice and contribution to over-all strategy. The relatively high risks are compensated by the possibility of high return, usually through substantial capital gains in the medium term.²

According to a very widely-accepted definition, venture capital is described as a separate asset class, often labelled as private equity. Private equity investment sits at the furthest end of the risk-reward spectrum from Government bonds and can broadly describe equity investment in private companies not quoted on the stock market.³

Based on the above description of venture capital, some of the distinguishing features of VC as against other capital investments can be identified as:

- Venture capital is basically equity finance in relatively new companies when it is too early to go to the capital market to raise funds. However, such investment is not exclusively equity investment. It can also be made in the form of loan finance/convertible debt to ensure a running yield on the portfolio of venture capitalists. Nonetheless, the basic objective of venture capital financing is to earn capital gain on equity investment at the time of exit and debt financing is only supplementary.
- It is a long-term investment in growth-oriented small/medium firms. The acquisition of outstanding shares from other shareholders cannot be considered venture capital investment. It is new, long-term capital that is injected to enable the business to grow rapidly.
- There is a substantial degree of active involvement of the venture capital institutions with the promoters of the venture capital undertakings. It means such finance also provides business skills to the investee firms which is termed as 'hands-on' approach/management. However, venture capitalists do not seek/acquire a majority/controlling interest in the investees, though under special circumstances and for a limited period, they might have a controlling interest. But the objective is to provide business/managerial skill only and not interfere in management.

- Venture capital financing involves high risk-return spectrum. Some of the ventures yield very high returns to more than compensate for heavy losses on others which also may have had potential of profitable returns. The returns in such financing are essentially through capital gains at the time of exits from disinvestments in the capital market.
- Venture capital is not technology finance though technology finance may form a sub-set of venture capital financing. The concept of venture capital embraces much more than financing new, high technology-oriented companies. It essentially involves the financing of small and medium-sized firms through early stages of their development until they are established and are able to raise finance from the conventional, industrial finance market. The scope of venture capital activity is fairly wide.

In brief, a **venture capital institution** is a financial intermediary between investors looking for high potential returns and entrepreneurs who need institutional capital as they are yet not ready/able to go to the public.⁴

- **Venture capital institution (fund)**
- is a financial intermediary between investors looking for high potential returns and entrepreneurs who need institutional capital as they are yet not ready to go to the public.

Selection of Investment

The first step in the venture capital financing decision is the selection of investment. The starting point of the evaluation process by the venture capital institution (VCI) is the business plan of the venture capital undertaking (promoter). The appraisal is akin to the feasibility studies of the development finance institutions for grant of term loans and other financial assistance.

In addition to the project history, if any, track record of the entrepreneur, market potential study and projections of future turnover, profitability and so on, it also covers a review of the likely threats from technological obsolescence/competing technologies and preliminary views on preferred exits.

The selection of the investment proposal includes, *inter alia*, stages of financing, methods to evaluate deals and the financial instruments to structure a deal.

Stages of Financing The selection of investment by a VCI is closely related to the stages and type of investment. From analytical angle, the different stages of investments are recognised and vary as regards the time-scale, risk perceptions and other related characteristics of the investment decision process of the VCIs. The stages of financing, as differentiated in the venture capital industry, broadly fall into two categories: **(a)** early stage, and **(b)** later stage.

Early Stage Financing This stage includes **(i)** seed capital/pre-start-up, **(ii)** start-up and **(iii)** second-round financing.

Seed Capital This stage is essentially an *applied research* phase where the concepts and ideas of the promoters constitute the basis of a pre-commercialisation research project usually expected to end in a prototype which may or may not lead to a business launch. This phase gradually moves towards the development phase leading to a prototype product testing and then to commercialisation. The evaluation of the project by the VCIs has to ensure that the technology skills of the entrepreneur matches with market opportunities.

The main risk at this stage is marketing related. The commercial acumen of the promoter to take advantage of the market opportunity, awareness of competition, the timing of launching the product

THE NEW YORK PUBLIC LIBRARY, ASTOR LENOX AND TILDEN FOUNDATIONS, 410 FIFTH AVENUE, NEW YORK, N. Y.

and so on, are important elements of the appraisal. The risk perception of investment at this stage is extremely high. However, very few VCIs invest in this pre-commercialisation/seed stage of product development.

Start up is a stage when product/service is commercialised for the first time in association with venture capital institutions.

Start-Up This is the stage when commercial manufacturing has to commence. Venture capital financing here is provided for product development and initial marketing. The essence of this stage is that the product/service is being commercialised for the first time in association with the VCIs. It includes several types of new projects such as **(i)** greenfield based on a relatively new or high technology, **(ii)** new business in which the entrepreneur has good knowledge and working experience, **(iii)** new projects by established companies and **(iv)** a new company promoted by an existing company with limited finance to commercialise new technology.

At this stage, some indication of the potential market for the new product/service is available. Partly because of the equity dilution syndrome⁵, in the sense of resistance from the promoters to the dilution of control of the business, and partly due to the unviability of the small amount of equity investment, the involvement of VCIs in start-up projects is generally and relatively low. The risk perception is very high.

Second Round Financing This represents the stage at which the product has already been launched in the market but the business has not yet become profitable enough for public offering to attract new investors. The promoter has invested his own funds but further infusion of funds by the VCIs is necessary. The time-scale for the investment is shorter than in the case of start-ups. The VCIs provide larger funds at this stage than at other early-stage financing. This financing is partly in the form of debt to also provide some income to them.

Later Stage Financing This stage of venture capital financing involves established businesses which require additional financial support but cannot take recourse to public issues of capital. It includes mezzanine/development capital, bridge/expansion, buyouts and turnarounds.

Mezzanine/Development Capital This is financing of established businesses which have overcome the extremely high-risk early stage, have recorded profits for a few years but are yet to reach a stage when they can go public and raise money from the capital market/conventional sources.

Buyouts implies transfer of management control.

Among the uses of such types of venture capital financing are purchase of new equipment/plant, expansion of marketing and distribution facilities, re-finance of existing debt, penetration into new regions, induction of new management and so on. The development finance stage has a time-frame of one to three years and falls in the medium risk category. It constitutes a significant part of the activities of many VCIs.

Bridge/Expansion This finance by VCIs involves low risk perception and a time-frame of one to three years. Venture capital undertakings use such finance to expand business by way of growth of their own productive asset or by the acquisition of other firms/assets of other firms. In a way, it represents the last round of financing before a planned exit.

Management buyouts are provisions of funds to enable existing management/investors to acquire an existing product.

Buyouts These refer to the transfer of management control. They fall into two categories: **(a)** management buyouts (MBOs), and **(b)** management buyins (MBIs).

Management Buyouts In MBOs, VCIs provide funds to enable the current operating management/investors to acquire an existing product line/business. They represent an important part of the activity of VCIs.

Management Buyins MBIs are funds provided to enable an outside group [of manager(s)] to buy an ongoing company. They usually bring three elements together: a management team, a target company and an investor (VCI). MBIs are less popular than MBOs. An MBI is inherently more risky because the management comes from outside and finds it difficult to assess the actual potential of the target company. Generally, MBIs are able to target only the weaker/underperforming companies.

Buyouts involve a time-frame from investment to public offering of one to three years with low risk perception.

Turnarounds These are a sub-set of buyouts and involve buying the control of a sick company. Two kinds of inputs are required in a turnaround—namely, money and management. The VCIs have to identify good management and operations leadership. Such form of venture capital financing involves medium to high risk and a time-frame of three to five years. It is gaining widespread acceptance and increasingly becoming the focus of attention of VCIs.

To conclude, venture capital firms finance both early and later stage investments to maintain a trade-off between risk and profitability. In early stage investment, particularly start-ups in high-technology industries, the technology is often untried at a commercial level of operation, market is undeveloped and potential competition is unknown as the product itself is new. Apart from the evaluation of the technology and the likely market, the most important factor to be considered by VCIs is the capability of the promoter/entrepreneur to implement the project with a reasonable chance of success.

In later stage investments, the technology has already been tried out commercially, the products have been introduced in the market and the business/entrepreneur has a track record which is closely examined by the VCIs.⁷

Financial Analysis⁸ Venture capital investments are generally *idea-based* and *growth-based* in contrast to the conventional investments which are *asset-based*. While the latter type are generally valued on the basis of tangible assets/future earnings streams, the former have to be in the nature of things valued differently in order to decide the required venture capital percentage ownership of the VCIs in venture capital undertaking. Some of the valuation methods which illustrate the approach that VCIs can adopt are: **(i)** conventional venture capitalist valuation method, **(ii)** the first Chicago method and **(iii)** the revenue multiplier method.

Conventional Venture Capitalist Valuation Method This method of valuation of venture capital undertakings (VCUs)/investee companies (ICs) takes into account only two points of time in the life of the venture capital investment, namely, the starting time of investment and the exit time when the investments would be liquidated through sale to public/third party and so on. The sequence of steps in the valuation of the VCUs and the determination of the percentage share ownership of the VCIs in the ICs are:

- (i)** To compute the annual revenue at the time of liquidation of the investments, the present annual revenue in the beginning is compounded by an expected annual growth rate for the holding period, say, seven years;
- (ii)** Compute the expected earnings level, that is equal to future earnings level multiplied by after tax margin percentage at the time of liquidation;
- (iii)** Compute the future market valuation of the VCU, that is equal to earnings levels multiplied by expected P/E ratio on the date of liquidation;
- (iv)** Obtain the present value of the ICs, using a suitable discount factor; and

- **Management buyins**
- are funds provided to enable an outside group buy an ongoing venture/company.

- **Conventional method**
- is a method of valuation of venture capital undertakings which takes into account only the starting time of investment and the exit time.

...the ... of ...

- (v) If the present value of the VCU is ₹50 lakh and the entrepreneur wants ₹20 lakh as the venture capital from the VCIs, the minimum percentage of ownership required is two-fifths (40 per cent).

The weakness of this method is that it ignores the stream of earnings (losses) during the entire period and over-emphasises the one exit date.

The First Chicago Method This method is an improvement over the conventional method of valuation to the extent it gives allowance to the nature of the path between the starting point and the exit point/date and considers the entire earnings stream. The steps involved in the valuation process are:

The first
chicago method
is a method of
valuation that
considers the entire
earnings stream
of the venture
capital undertaking/
investor companies.

- (i) Three alternative scenarios, are perceived/considered, namely, *success*, *sideways survival* and *failure*. Each one of these is assigned a probability rating;
- (ii) Using a discount rate, the discounted present value of the VCU is computed. The discount rate is substantially higher to reflect risk dimension.
- (iii) The discounted present value is multiplied by the respective probabilities. The expected present value of the VCU is equal to the total of these in the three alternative scenarios.
- (iv) Assuming expected present value of the VCU at ₹5 crore and the fund requirement from the VCIs as ₹2.5 crore, the minimum ownership required is 50 per cent (half).

Revenue Multiplier Method A revenue multiplier is a factor that can be used to estimate the value of a VCU. By multiplying that factor the annual revenue of the company is estimated by VCIs. Symbolically,

$$M_t = \frac{V}{R} = \frac{(1+r)^n (a)(p)}{(1+d)^n}$$

Where, V = present value of the VCU,

R = annual revenue level,

r = expected annual rate of growth of revenue,

n = expected number of years from the starting date to the exit date (holding period),

a = expected after-tax profit margin percentage at the time of exit,

P = expected price/earnings (P/E) ratio at exit time, and

d = appropriate discount rate for a venture investment at this stage, risk and other relevant factors

This method can be used in the case of early stage/start-up venture capital investments when earnings, based on after-tax profits, may be low/negative in early years but there may be revenue/sales income. However, the technique requires a wealth of data which may not be available in a country like India at this stage of the growth of VCFs. Where it is difficult to estimate the revenue multiplier, the Chicago method would give better results than the conventional valuation method.

Structuring the Deal/Financial Instruments The structuring of the deal refers to the financial instruments through which venture capital investment is made. The availability of a wide variety of financial instruments provides considerable flexibility in structuring a venture capital deal. From the point of view of nature, the financial instruments a VCI can choose from, can be broadly divided into equity and debt instruments.

Equity Instruments (1) Ordinary equity shares; (2) Non-voting equity shares which are entitled to a higher dividend but carry no voting rights; (3) Deferred ordinary shares on which the ordinary share rights are deferred for a specified period/until the happening of a certain event such as listing of

shares on the stock exchange or the sale of the company; (4) Preferred ordinary shares. In addition to the voting rights, such shares also carry rights to a modest fixed dividend; (5) Equity warrants entitle investors in debentures/bonds to acquire ordinary shares at a future date; (6) Preference shares; (7) Cumulative convertible preference shares which are converted into equity shares after a specified time; (8) Participating preference shares which, in addition to the preference dividend, are entitled to an extra dividend after the payment of dividend to the equity shareholders; (9) Cumulative convertible participatory preferred ordinary shares combine the benefit of preferred dividend and cumulative as well as participative features and (10) Convertible cumulative redeemable preference shares have two elements, namely, convertibility into equity at specified point of time and redeemability on the expiry of a certain period. The redeemable part carries a fixed coupon rate by way of preference dividend. Of the types of equity-linked financial instruments, the equity warrants, non-voting equity shares and cumulative convertible participating preferred ordinary shares can be used to structure a flexible venture capital deal.

Debt Instruments To ensure that the entrepreneur retains managerial control and the VCI receives a running yield during the early years when the equity portion is unlikely to yield any return, debt instruments are also used by VCIs. They include, in addition to conventional loans, income notes, non-convertible debentures, partly convertible debentures, fully convertible debentures, zero interest bonds, secured premium notes and deep discount bonds.

Conditional Loan This is a form of loan finance without any pre-determined repayment schedule or interest rate. The suppliers of such loans recover a specified percentage of sales towards the recovery of the principal as well as revenue in a pre-determined ratio, usually 50:50. The charges on sales is known as **royalty**. The investor stands to gain/lose depending on whether the actual sales are higher/lower than the projected sales. Conditional loan, in a sense, is *quasi-equity* instrument.

Conventional Loans These are modified to the requirements of venture capital financing. They carries lower interest initially which increases after commercial production commences. A small royalty is additionally charged to cover the interest foregone during the initial years. Although the repayment of the principal is based on a pre-stipulated schedule, VCIs usually do not insist upon mortgage/other security.

Income Notes These fall between the conventional and the conditional loans and carry a uniform low rate of interest plus a royalty on sales. The principal is repaid according to a stipulated schedule.

Non-convertible Debentures (NCDs) These carry a fixed/variable rate of interest, are redeemable at par/premium, are secured, and can be cumulative/non-cumulative.

Partly Convertible Debentures (PCDs) These have two components: (i) a convertible portion and (ii) a non-convertible portion. The convertible portion is converted into equity shares at par/premium. The non-convertible portion earns interest till redemption generally at par. Such instruments are best suited to second round venture capital financing.

Zero Interest/Coupon Bonds/Debentures These can be either convertible or non-convertible with zero/no interest rate. The non-convertible bonds are sold at a discount from their maturity value while the convertible ones are converted into equity shares at a stipulated price and time. They offer considerable flexibility and are an appropriate instrument for later stage venture capital financing.

- **Conditional loan**
- is a quasi-equity instrument without any pre-determined repayment schedule or interest rate; the charge is a royalty on sales.

- **Income notes**
- are instruments which carry a uniform low rate of interest plus a royalty on sales.

Secured Premium Notes These are secured, redeemable at premium in lumpsum/instalments, have zero interest and carry a warrant against which equity shares can be acquired. This instrument is also useful for later stage financing.

Deep Discount Bonds These are issued at a large discount to their maturity value. As a long-term instrument, these are not suited to venture capital investment.

Investment Nurturing/Aftercare

Unlike the conventional financial institutions, which normally keep aloof from the management and operations of the assisted concerns, VCIs have an active, intimate and constant ongoing involvement during the entire life of the investment in VCUs. The enduring relationship between the VCIs and VCUs and the active role by the former in the management of the latter is termed as **investment nurturing/after care**. The main elements of after care are: **(i)** after the stage of investment decision, provision of continuing guidance and support to optimise the benefits of investment to both—VCIs and VCUs, **(ii)** building of joint relationship to tackle operational and other problems of business and **(iii)** protection of the investment/interest of the VCIs. Investment nurturing differs from the investment monitoring by the conventional financial institutions which collect and use specific information about the operations of the assisted project, whereas the former is wider in coverage to include the provision of guidance and skills for the management of the venture. The after care stage of venture capital financing relates, *inter alia*, to different styles of nurturing, its objectives and techniques.

Styles The styles of nurturing refers to the extent of participation by VCIs in the affairs of VCUs.

Hands-on nurturing is a continuous and constant involvement in the operations of the investee company by the venture capital institution which is institutionalised in the form of representation on the board of directors. The style depends upon a variety of factors such as the specialisation of the VCI, stage of investment, financing plan, the stage of the development of the venture capital industry itself and so on. It broadly falls into three categories: **(i)** hands-on, **(ii)** hands-off and **(iii)** hand-holding.

Hands-on Nurturing It refers to continuous and constant involvement in the operations of the investee company which is institutionalised in the form of representation on the board of directors. With wider exposure and experience, VCIs can provide useful guidance on aspects of long-term business planning, technology development, financial planning, marketing strategy and so on. The hands-on care style is useful/essential in early stage financing, i.e., seed capital and start-up investments. This type of care is provided either by the in-house expertise or by a core group of external advisors/experts in specific areas if the former is not available in all types of projects.

Hand-off nurturing is the passive role played by venture capital funds in formulating strategies/policy matters. **Hands-off Nurturing** VCIs play a relatively passive role in the hands-off style. Although they usually reserve the right, they rarely have nominee directors on the board of the VCUs. Normally, they do not actively participate in formulating strategies/policy matters in spite of the right to do so. This type of nurturing style is appropriate in case of syndicated/joint/consortium venture financing in which some financiers may follow the hands-on approach while others may follow the hands-off approach. The hands-off style may also be appropriate after the initial plan of the venture is over and the business is running smoothly.

Hands-holding Nurturing This is mid-way between hands-on and hands-off styles. It is, essentially, a reactive approach. Like the hands-on style, the VCI has the right to have a nominee on the board

of directors of the VCU, but actively participates in the decision making process only on being approached by the latter. If the VCU experiences any difficulty, the VCI provides either in-house assistance or assistance from outside experts.

Objectives of Aftercare⁹ The objectives of nurturing by VCIs, *inter alia*, are:

- (i) To ensure the proper utilisation of assistance provided. Any deviation from the programme/appraisal should be within the prior approval of the VCI;
- (ii) To ensure the implementation of the project/venture within the time and costs envisaged;
- (iii) In case of time and cost overruns beyond the control of the VCU, to assist in finding additional/supplementary finance;
- (iv) To provide strategic inputs in technology production, finance, marketing, personnel and so on;
- (v) To anticipate likely problems and advise preventive/remedial actions;
- (vi) To ensure that the venture does not default in any statutory/other obligations;
- (vii) To evaluate the performance of the project and suggest measures for improvement, if required;
- (viii) To use the feedback received during the course of nurturing the investment for studying the problems and finding suitable solutions; and
- (ix) To utilise the experience gained for a better appraisal of new ventures.

Techniques VCIs follow systematic techniques to achieve the foregoing objective. Some of the important techniques are briefly discussed below.

Personal Discussions One technique for obtaining information from a VCU is personal/informal discussion with the entrepreneur(s). Though the information, thus, collected does not have any formal sanctity, it provides the most comprehensive and effective insight into the working of the venture. This technique is especially useful when the venture is facing operational problems.

Plant Visits These refer to the collection of information from on the spot visit of the plant site. In the case of ventures at the implementation stage, the purpose of plant visit is to review the progress of the project, to see that adequate and well-qualified personnel have been appointed for its implementation, to ensure that the requisite sanctions are obtained for funds from other sources, if necessary, and to check if the venture has initiated action for obtaining working capital from banks. For projects which are complete and on which production has started, the plant visit technique examines, *inter alia*, the following aspects:

- The staffing pattern of the production, marketing, finance and personnel departments;
- Operational performance of the project;
- Marketing aspects with special reference to product acceptance, market penetration, distribution, pricing, product awareness, advertising, competition and so on;
- Management of accounts with special reference to overdues of receivables;
- Proper costing of products and efficient control of inventory;
- Position regarding statutory liabilities; and
- Labour relations.

Feedback Through Nominee Directors The nominee directors not only protect the interest of the VCIs, but they are also expected to effectively contribute to the management and provide requisite guidance. They should also ensure that the business is run on a sound basis. Moreover, they should be able to anticipate problems and suggest solutions. The nominee directors should, therefore, have a good exposure to industry, have adequate knowledge about technological development, changes in government policies, financial management, laws, regulations and so on.

Periodic Reports VCIs should receive periodic reports about the operations of projects. These should be properly analysed. The projected and actual performance should be compared and analysed and follow-up action initiated.

Commissioned Studies If VCUs are not performing well/experiencing difficulties which cannot be solved by VCIs themselves, special studies may be commissioned to identify problems and offer solutions so that preventive action may be taken.

Valuation of Portfolio¹⁰

The venture capital portfolio has to be valued from time to time to monitor and evaluate the performance of the venture capital investment, that is, whether there has been an appreciation in the value of the investment or otherwise. The portfolio valuation approaches/techniques depend on the type of investments, namely, equity and debt instruments. These, in turn, depend on the stage of investment: seed, start-up, early and later stages of the venture.

Equity Investments The valuation methods for equity instruments of VCUs are: (i) cost method, and (ii) market value-based methods.

Cost Method According to this method, the value of equity holding is computed/recorded at the historical cost of acquisition until it is disposed of. Although simple, objective, and easy to understand, it does not indicate a fair value of investment, does not reflect management performance and may result in two values for equity acquired at two different points in time. It does not provide a satisfactory basis of valuation of venture capital investments.

Market Value-based Methods Such methods can be divided into: (i) quoted market value, (ii) fair market value and (iii) others. They are conceptually superior to the cost method.

Quoted Market Value Method This is based on market quotations of securities. It is, therefore, relevant only to organisations listed on stock exchanges. Moreover, market values may not be available for infrequently traded shares. In addition, if the holdings of VCIs are substantially large, the realisable value on the market may be considerably lower than the quoted value. In the foregoing situations, the market value may not reflect the real/true valuation. Therefore, an appropriate discount should be applied to the quoted price while valuing the portfolio. This approach is better than the cost-based approach for evaluation of a venture portfolio.

Fair value is the price to be agreed upon in an open and unrestricted market between parties and equationally expressed as: a representative level of earnings \times appropriate capitalisation rate.

Fair Market Value Method This considers the fair price as the basis of portfolio valuation and is used where the quoted market value does not reflect the correct value of the venture capital investment. The fair value refers to the price that would be agreed upon in an open and unrestricted market between fully informed, knowledgeable and willing parties at an arm's length without constraint. It is, thus, a subjective value.

This approach to valuation of venture capital investments is based on the assumption that *assets are worth what they can earn*. In operational terms, a representative level of earnings is selected and capitalised by an appropriate multiplicity/capitalisation rate which provides a reasonable return on the basis of the estimated future earnings and degree of risk.

Stages of Investments As pointed out earlier, the methods of portfolio valuation of shares depend on the stage of venture capital investments. From the viewpoint of stages of investments, the equity investments fall into three broad categories:

Unquoted Venture Investments Unquoted venture investments are defined as investments in immature companies, namely, seed, start-up and early stage, until the companies stabilise and grow. They should generally be valued at cost as their market value is not available. They may, however, have to be written up (valued at higher than cost) or written down in (assigned a lower value than cost) exceptional circumstances/cases.

The unquoted venture investments can be written up in cases where a third party with arm's length relationship with the VCU values it at a significantly higher value which may be taken to represent the value of the investment. They can also be valued at a price higher than the cost when the operating results are significantly higher than those projected originally. The investment should be valued using an appropriate P/E ratio and suitably adjusted/discounted to account for the unquoted nature of investments as well as the relatively short profit-earning record of the venture. However, care should be taken while upvaluing investment that the venture has started generating a reasonable turnover and independent third party transactions have taken place.

Investments should be written down if the venture is facing long-term problems, requires additional finance or the operating results are substantially below the original projections or a third party with an arm's length relationship values it at less than the original cost. However, undervaluation should be revalued as early as justified.

Unquoted Development Investments Unquoted development investments are investments in mature companies with a profit record and where an exit can be reasonably foreseen. They also do not have a market value. The basis of valuation should be somewhat similar to unquoted venture investments, based on a suitable P/E ratio applied to earnings of the venture, suitability discounted to take care of the limited marketability of the unquoted nature of the investment. The discount would depend upon the subjective judgement of the valuer but should generally vary between 20 and 25 per cent depending on various factors. The percentage of discounts would depend on the proximity to the exit point: *a lower discount when prospects of an exit are foreseen early and a higher discount if it is likely to be delayed.*

Quoted Investments Quoted investments in companies which have achieved a possible exit by floatation of issues. They are valued at market quotations. In case of restrictions/limitations on the sale of shares, a suitable discount should be applied to the market value of the shares. The rate of discount would depend on the size and depth of the market, the period of applicability of restrictions, the holdings of VCIs relative to public holdings, restrictions in any buy-back agreement with promoters and statutory restrictions.

Debt Instruments VCIs provide, in addition to equity capital, debt finance. From the point of view of their valuation as a part of the overall portfolio (fund), they are divided into (i) convertible, (ii) non-convertible and (iii) leveraged.

Convertible Debt Debt instruments are generally valued at cost. But convertible debts are converted into equity at a specified price and time. They should, therefore, be valued in the case of VCIs on the same basis as equity investments. There are two appropriate methods for valuing them, that is, market value method and fair value method.

Market Value Method This is appropriate for quoted convertible debt investments on the basis of the same principles as are applicable to quoted investments. A modified/refined version of this approach is the use of the moving average/weighted average of the market values of the investments at the end of a pre-determined number of periods as the basis of valuation of convertibles.

...the ... of ...

...the ... of ...

1. The ... of ...

...the ... of ...

The merit of this modification is that it retains the benefit of market value method and, at the same time, the effects of temporary fluctuations are minimised as the average value represents the long-term value of investment. The market value method, however, underestimates the net realisable value in a growing VCU.

Fair Value Method This is appropriate, as in the case of unquoted equity investments, for unquoted convertible debt investments. As pointed out earlier, the valuation according to this method is based on the price agreed upon in an open and unrestricted market. This is a subjective method as the valuation is significantly influenced by judgement and experience.

Non-convertible Debt This debt supplied by VCIs can be of two types: fixed interest bearing such as bonds/debentures and mortgages and non-interest bearing such as zero interest bonds and secured premium notes.

Fixed Interest Non-convertible Debt This should be valued by relating the nominal yield of the investment to an appropriate current yield which depends upon a number of factors such as interest yield on the date of valuation, maturity date of the issue, safety of the principal, debt-service coverage, stability and growth of the earnings of the venture and so on.

Non-interest Non-convertible Debt A factor of critical importance in this case is the solvency of the venture. If it is doubtful, an appropriate discount rate may be used to the value computed according to the method used for valuating fixed interest non-convertible debt.

Highly Leveraged Investments These should, generally, be valued at cost.

Structural Aspects¹¹

The structuring of VCIs is important from the viewpoint of the profitability of such organisations and their contributors and participants. While deciding upon a structure, the objectives generally sought are:

- Limited liability of investors;
- Simple operation of funds;
- Tax transparency of the fund in the sense that double taxation is avoided;
- Tax exemption of the **carried interest** defined as the extra incentive/profit to the managers over and above the share attributed to their capital contribution and the management fee;
- Maximum tax benefits to investors.

The alternative forms in which VCIs can be structured are: **(i)** limited partnership, **(ii)** investment company, **(iii)** investment trust, **(iv)** offshore funds and **(v)** small business investment company.

Limited Partnership Normally, the partnership form of organisation/structure has unlimited liability of partners. Limited partnership has evolved to cater to the needs of venture capital industry in the US as the most favoured method of their structuring but is, relatively, less popular in the UK. Limited partnership consists of two types of partners: general and limited. The general partner, whose liability is unlimited, invites other investors to become limited partners in the partnership with limited liability and invest but do not participate in the actual operations of the business.

The general partners can be individuals, a corporate body or a partnership. In other words, a venture capital organisation can be structured as a limited partnership and one more partnership acting as the general partner can be formed. As an alternative to the second partnership, the general partners as individuals may set up a service corporation to discharge the functions of the general

partner on payment of fee. The main functions of the general partners/service corporations are: **(i)** business identification and development, **(ii)** investment appraisal and investigation of potential investment, **(iii)** negotiation and closing of deals, **(iv)** investment monitoring, advice and assistance to VCUs; **(v)** arrangement for sale of shares at the exit time and **(vi)** other fund management functions.

Mode of Compensation The general partner/service corporation as a fund manager is compensated in two ways: **(1)** annual management fee, **(2)** carried interest.

Annual Management Fee This covers the normal operating expenses such as salary and allowances of employees, administrative expenses and all expenses related to the selection of investments as well as disinvestments but excludes legal expenses and professional fee related to investment portfolio which are reimbursed separately. It is generally 2-3 per cent of the net asset value (NAV) or the capital of the fund, the latter being the more preferred basis.

Carried Interest The most popular approach is that the general partner contributes one per cent and the limited partners contribute 99 per cent of the capital of the fund. The general partner normally receives one-fifth of the net gains as carried interest while the remaining four-fifths is distributed among the limited partners.

Evaluation The benefit of limited partnership, as a form of structuring of VCIs, is its tax treatment. The profit of limited partnership is taxed only at the level of the partners. It is completely tax free if the partner is a tax free entity such as pension funds. The second advantage is operational in the sense that the fund managers are entitled to an incentive in the form of carried interest. However, a major drawback is the unlimited liability of the general partner. Moreover, he is liable to tax on gains on sale of investments, whether distributed or not. Nevertheless, on balance, the advantages outweigh the disadvantages and limited partnership emerges as a satisfactory form of venture capital organisation.

Investment Company This is organised as a limited company. Although it is the simplest structure for a VCI, a serious drawback is the double taxation of income. Both the investment company and its shareholders are liable to tax on their respective incomes.

Investment Trust This is a company and is, generally, not liable to tax on chargeable gains/dividends but most of the other income of the trust is taxable. The entitlement to tax concessions is subject to certain stipulations such as income should be derived wholly/mainly from investment in shares/securities, holding in any single company other than another investment trust should not exceed 15 per cent of the value of the investment, the shares are listed, it distributes at least 85 per cent of the income from shares/securities and so on.

Offshore Investment Company This is incorporated in a country other than the country in which the offshore company makes an investment. Its tax liability depends on the tax laws applicable to the resident status of the company.

Offshore Unit Trust This resembles an offshore investment company in organisation but enjoys tax concessions and has a very flexible structure.

Small Business Investment Company This provides an impetus to banks to participate in ventures in the form of equity and long term debt. It can, however, invest only in small concerns. It is prohibited from investing more than 20 per cent of its capital and reserves nor is it allowed to acquire controlling interest in a single company. The loans must be for more than five years. It has a very flexible structure of equity investments.

Exit

The last stage in venture capital financing is the exit to realise the investment so as to make a profit/minimise losses. In fact, the potential exit in terms of the realisation horizon (exit timing) has to be planned at the time of the initial investment itself. The precise timing of exit depends on several factors such as nature of the venture, the extent and type of financial stake, the state of actual and potential competition, market conditions, the style of functioning as well as perception of VCIs and so on. For example, early stage financing typically takes a long-term view of eventual realisation/exit from five to seven years. In case of later stage financing, the realisation horizon could be shorter in the range of three to five years.

The important aspect of the exit stage of venture capital financing is the decision regarding the disinvestments/realisation alternatives which are related to the type of investment, namely, equity/quasi-equity and debt instruments.

Disinvestments of Equity/Quasi-Equity Investments There are five disinvestment channels for realisation of such investments: **(i)** going public, **(ii)** sale of shares to entrepreneurs/employees, **(iii)** trade sales/sale to another company, **(iv)** selling to a new investor and **(v)** liquidation/receivership. The first four alternative routes are voluntary while the last one is involuntary.

Going Public/Initial Public Offering/Flotation The most common channel of disinvestment by a VCI is through public issue of capital of the VCU, including its own holdings. The merits of public issues are liquidity of investments through listing on stock exchanges, higher price of securities compared to private placement, better image and credibility with public, managers, customers, financial institution and so on. However, companies going public are subject to reporting requirements, stock exchange regulations and disclosure requirements; the cost of issue is higher; the accountability to shareholders' increases and so on.¹² On the whole, public issue method is the most popular exit route for VCIs.

Related to the public issues method is the OTCEI route. A VCI can exit by way of a boughtout deal to a member of the OTCEI who would offer the shares thus acquired to the public at a future date.

Earnout is the sale of shares/stake of venture capital institution to entrepreneurs/investee companies themselves.

Sale of Shares to Entrepreneurs/Employees/Earnout The shares/stakes of VCIs may be sold to the entrepreneurs/companies themselves who are allowed to buy their own equity. Alternatively, the entrepreneurs can acquire the shares from VCIs through employees by forming an 'employees stock ownership trust'. The sources of the trust to acquire the shareholding of the VCIs are contribution by the employees/company and borrowing from financial institutions and banks.

A related alternative is *exit by puts and calls* when VCIs may have entered into a formal exit agreement at a price based on a pre-determined formula with the entrepreneurs. The **put option** is the right to sell while the **call option** is the right of the entrepreneurs to buy. This is a fairly popular exit route.

Important Put-and-call Formulae

Book Value Method This is used in mature companies that have achieved a healthy track record, that is they have achieved a reasonable degree of stability in operations.

P/E Ratio This is the most common method for exercising the put and call option. The price is equal to the earnings per share multiplied by the P/E ratio.

Percentage of Sales Method This is a modified P/E ratio. On the basis of the pre-tax earnings/profit before tax as a percentage of sales for the industry, the hypothetical/notional profit before tax for the investee company is determined as also the earnings per share. The value of the shares is obtained by multiplying the notional earnings per share with the industry P/E ratio. This method is suitable in the early stages when profits are lower but the sales have reached a reasonable level.

Multiple of Cash Flow Method In this, cash flow is used in place of the earnings or sales. The cash flow is multiplied by the industry multiplier to arrive at the value of the company/shares.

Independent Valuation This is valuation by outside experts on the basis of either earnings potential method/price-earnings ratio method or the liquidation method. On the assumption of liquidation a VCU, the net value is computed on the basis of the net/reisable value of all the assets less the liabilities.

Agreed Price This is the price between the VCIs and the entrepreneur agree on at the time of making the investment itself.

Trade Sales The entire company is sold to another company/third party. Highly popular method, at times the trade sales may be through a management buyin or buyout. The most appropriate method for such a sale would vary from one case to another, keeping in view taxation and other considerations. The alternative modalities for trade sales are:

- (i) Cash sales of equity ownership of both the parties which would attract heavy tax burden.
- (ii) Against issue of notes secured by the assets of the buyer company and receive cash in pre-determined instalments in order to ensure proper tax planning.
- (iii) In consideration for the shares of the buying company with no tax liability.

- **Trade sales**
- implies the sale
- of entire investee
- company to another
- company/third
- party.

Sales to a New Investor/Takeout The equity stake of VCIs can be sold to a new investor who may be a corporate body or even another venture capital organisation. The corporate investor may acquire the stake to develop a business relationship due to considerations of synergy of operations.

The purchase of the equity holdings of a VCI by another VCI may be related to the nature of the business objectives of the original VCI. For instance, he may have financed an early stage venture and may like to exit after its operations have stabilised. For second round financing, he may sell his equity to another VCI which is willing to provide financing to the venture.

- **Takeout**
- is the sale of equity
- stake of a VCI to
- a new investor
- including another
- VCF.

Liquidation This is an involuntary exit forced on the VCI as a result of a totally failed investment. The VCIs can use this exit method when the venture is not performing well and has reached a stage beyond recovery due to stiff competition, technology failure/obsolescence of technology, poor management and so on.

Exit of Debt Instruments Exit in case of debt component of venture capital financing, in contrast with equity/quasi-equity component, has to normally follow the pre-determined route. In case of a normal loan, the exit is possible only at the end of the period of loan. If the loan agreement permits, whole or part can be converted into equity prior to that. For conditional loans, exit, earlier than projected at the time of initial investment, is possible on the basis of lumpsum repayment consistent with the expectations of the VCI of the likely return on the loan.

LO 26.2 INDIAN VENTURE CAPITAL SCENARIO

AIF means any fund established/incorporated in India in the form of a trust/company/partnership/body corporate which is (i) a privately pooled investment vehicle and collects funds from Indian/foreign investors for investing in accordance with a defined investment policy for the benefit of its investors, and (ii) not covered under the mutual fund/other regulations of the SEBI to regulate fund management activities.

The venture capital funds were regulated by the (i) SEBI Venture Capital Funds Regulation, 2000 and (ii) SEBI Foreign Venture Capital Investors Regulation Act, 2000. The SEBI Alternative Investment Fund Regulations, 2012 has replaced the SEBI VCF Regulations. The salient features of the regulatory framework in terms of these two SEBI regulations are discussed below.

SEBI Alternative Investment Funds Regulation, 2012

Alternative Investment Fund (AIF) means any fund established/incorporated in India in the form of a trust/company/limited liability partnership/body corporate which is (i) a privately pooled investment vehicle and collects funds from Indian/foreign investors for investing in accordance with a defined investment policy for the benefit of its investors, and (ii) not covered under the mutual fund/other regulations of the SEBI to regulate fund management activities. However, it excludes: (i) family trusts set up for the benefit of relatives, (ii) ESOP (employees stock option plans) trusts, (iii) employee welfare/gratuity trusts, (iv) holding companies, (v) other special purpose vehicles (SPVs) including securitisation trusts, (vi) funds managed by a securitisation/reconstruction company, and (vii) any such pool of funds directly regulated by another regulator in India. The main elements of the SEBI regulation relating to AIFs, namely, (a) registration, (b) investment conditions/restrictions, (c) general obligations and responsibilities and transparency, (d) inspection, and (e) procedure for action in case of default are discussed below.

Registration of Alternative Investment Funds (AIFs) To set-up an AIF, an entity/person has to obtain a certificate of registration from the SEBI. However, the funds registered as venture capital fund under SEBI Venture Capital Funds Regulations, would continue to be regulated by the respective regulations till the existing fund or scheme managed by the fund is wound up and such funds would not launch any new scheme. Moreover, the existing fund or scheme would not increase the targeted corpus of the fund or scheme. The venture capital funds may seek re-registration as AIFs subject to approval of two-thirds of their investors by value of their investment. The AIFs can seek registration in one of the three categories: (i) I, (ii) II, (iii) III.

“Category I AIF” which invests in start-up or early stage ventures/social ventures/small and medium enterprises (SMEs)/infrastructure/other sectors or areas which the Government/regulators consider as socially/economically desirable and would include venture capital funds, SME funds, social venture funds, infrastructure funds and such other specified alternative investment funds. The AIFs which are generally perceived to have positive spillover effects on economy and for which the SEBI/Government of India/other regulators in India might consider providing incentives/concessions would be included and such funds which are formed as trusts/companies would be construed as “venture capital company/fund” as specified under the Income Tax Act. **Venture capital fund** means an alternative investment fund which invests primarily in unlisted securities of start-ups, emerging/early-stage venture capital undertakings mainly involved in new products/services, technology/intellectual property right based activities/a new business model.

Venture capital fund means an alternative investment fund which invests primarily in unlisted securities of start-ups, emerging/early-stage venture capital undertakings mainly involved in new products/services, technology/intellectual property right based activities/a new business model.

new business model. **Venture capital undertaking** means a domestic company which is (i) not

SME fund means an alternative investment fund which invests primarily in unlisted securities of investee companies which are SMEs or securities of those SMEs which are listed/proposed to be listed on a SME exchange/SME segment of an exchange.

listed on a recognised stock exchange in India at the time of making investment; and (ii) engaged in the business for providing services, production/manufacture of article/things and does not include the following activities/sectors: (1) non-banking financial companies; (2) gold financing; (3) activities not permitted under industrial policy of Government of India; and (4) any other activity which may be specified by the SEBI in consultation with the Government of India from time to time. **SME fund** means an alternative investment fund which invests primarily in unlisted securities of investee companies which are SMEs or securities of those SMEs which are listed/proposed to be listed on a SME exchange/SME segment of an exchange.

Venture capital undertaking means a domestic company which is (i) not listed on a recognised stock exchange in India at the time of making investment; and (ii) engaged in the business for providing services, production/manufacture of article/things.

Social venture means a trust/society/company/venture capital undertaking/limited liability partnership formed with the purpose of promoting social welfare/solving social problems/providing social benefits.

Social venture means a trust/society/company/venture capital undertaking/limited liability partnership formed with the purpose of promoting social welfare/solving social problems/providing social benefits and includes: (i) public charitable trusts registered with the charity commissioner; (ii) societies registered for charitable purposes/promotion of science, literature/fine arts; (iii) company registered under Section 25 of the Companies Act; (iv) micro finance institutions. **Social venture fund** means an alternative investment fund which invests primarily in securities/units of social ventures and which satisfies social performance norms laid down by the fund and whose investors may agree to receive restricted or muted returns.

Social venture fund means an alternative investment fund which invests primarily in securities/units of social ventures and which satisfies social performance norms laid down by the fund and whose investors may agree to receive restricted or muted returns.

Private equity fund means an AIF which invests primarily in equity/equity linked instruments (i.e. instruments convertible into equity/preference shares, share warrants, compulsorily/optionally convertible debentures) or partnership interests of investee companies (i.e. companies/SPVs/limited partnership/body corporate in which an AIF makes an investment) according to the stated objectives of the fund.

Infrastructure funds invest primarily in unlisted securities/partnership interest/listed debt/secured debt instruments of investee companies/SPVs engaged in or formed for the purpose of, operating/developing/holding infrastructure.

Category II AIF which does not fall in Category I and III and which does not undertake leverage or borrowing other than to meet day-to-day operational requirements. Funds such as private equity funds/debt funds for which no specific incentives or concessions are given by the Government or any other regulator would be included.

Private equity fund means an AIF which invests primarily in equity/equity linked instruments (i.e. instruments convertible into equity/preference shares, share warrants, compulsorily/optionally convertible debentures) or partnership interests of investee companies (i.e. companies/SPVs/limited partnership/body corporate in which an AIF makes an investment) according to the stated objectives of the fund.

Debt fund is an AIF which invests primarily in debt/debt securities of listed/unlisted investee companies according to its stated objectives.

Category III AIF which employs diverse or complex trading strategies and may employ leverage including through investment in listed or unlisted derivatives. Funds such as hedge funds or funds

Infrastructure funds invest primarily in unlisted securities/partnership interest/listed debt/secured debt instruments of investee companies/SPVs engaged in or formed for the purpose of, operating/developing/holding infrastructure.

Debt fund is an AIF which invests primarily in debt/debt securities of listed/unlisted investee companies according to its stated objectives.

Hedge funds employ diverse/complex trading strategies and invest in securities having diverse risks or complex products including listed/unlisted derivatives.

which trade with a view to make short-term returns or such other funds which are open-ended and for which no specific incentives or concessions are given by the Government or any other regulator would be included. **Hedge funds** employ diverse/complex trading strategies and invest in securities having diverse risks or complex products including listed/unlisted derivatives.

An application for grant of certificate should be made for any of these categories of ₹1,00,000. The certificate of registration would be valid till the alternative investment fund is wound up. The SEBI may, in the interest of the investors, issue directions with regard to the transfer of records, documents or securities or disposal of investments relating to its activities as an alternative investment fund. It may, in order to protect the interests of investors, also appoint any person to take charge of records, documents, securities on specified terms and conditions of such an appointment.

Eligibility Criteria The eligibility criteria for registration as AIF are:

- (a) The memorandum of association/trust/partnership deed respectively in case of company/trust/limited liability partnership permits it to carry on the activity of an AIF;
- (b) The applicant is prohibited by its memorandum and articles of association/trust/partnership deed from making an invitation to the public to subscribe to its securities;
- (c) The instrument of trust in case of a trust-applicant is in the form of a deed and has been duly registered under the provisions of the Registration Act;
- (d) The partnership in case of partnership-applicant is duly incorporated and the partnership deed has been duly filed with the Registrar under the provisions of the Limited Liability Partnership Act;
- (e) A body corporate-applicant is set up/established under the laws of the central or state legislature and is permitted to carry on the activities of an AIF;
- (f) The applicant, sponsor and manager are fit and proper persons based on the criteria specified in **SEBI Intermediaries Regulations**;^{@@}
- (g) The key investment team of the manager of the AIF has adequate experience, with at least one key personnel having not less than five years experience in advising/managing pools of capital or in fund/asset/wealth/portfolio management or in the business of buying, selling and dealing of securities/other financial assets and has relevant professional qualification;
- (h) The manager/sponsor has the necessary infrastructure and manpower to effectively discharge its activities;
- (i) The applicant has clearly described at the time of registration the investment objective, the targeted investors, proposed corpus, investment style/strategy and proposed tenure of the fund/scheme;
- (j) Whether the applicant or any entity established by the sponsor/manager has earlier been refused registration by the SEBI.

Furnishing of Information The SEBI may require the applicant to furnish any such further information/clarification regarding the sponsor/manager or nature of the fund/fund management activities or any such matter connected thereto to consider the application for grant of a certificate or after registration. If required, the applicant/sponsor/manager would appear before the SEBI for personal representation.

^{@@}An account available in Khan, M.Y., *Indian Financial System*, MHE, India, 2018, Chapter 4.

Procedure for Grant of Certificate The SEBI may grant certificate under any specific category of alternative investment fund, if it is satisfied that the applicant fulfills the specified requirements. It would, on receipt of the registration fee (₹5,00,000) grant a certificate of registration. The registration may be granted with such conditions as may be deemed appropriate by the SEBI.

Conditions of Certificate The certificate would, *inter-alia*, be subject to the following conditions. The AIF would (a) abide by the provisions of the SEBI Act/regulations; (b) not carry on any other activity other than the permitted activities; (c) forthwith inform the SEBI in writing, if any information or particulars previously submitted are found to be false or misleading in any material particular or if there is any material change in the information already submitted. Prior approval of the SEBI would be necessary to change category of registration.

Investment Conditions and Restrictions The investment conditions/restrictions relate to: (i) investment strategy, (ii) investment in AIF, (iii) placement memorandum, (iv) schemes, (v) tenure, (vi) listing, (vii) general investment conditions, (viii) conditions for category I AIF, (ix) conditions for category II AIF, (x) conditions for category III AIFs and (xi) other AIF.

Investment Strategy The AIF should state investment strategy, investment purpose and its investment methodology in its placement memorandum to the investors. Any material alteration to the fund strategy can be made with the consent of at least two-thirds of unit holders by value of their investment.

Investment in AIF Investment in all categories of AIFs would be subject to the following conditions:

- (a) The AIF may raise funds from any Indian, foreign or non-resident Indian investor by way of issue of **units** (i.e. a beneficial interest of the investors in the AIF/a scheme of the AIF including shares/partnership interests);
- (b) Each scheme of the AIF would have **corpus** (i.e. total amount of funds committed by the investor in the AIF by way of a written contract/any such document as on a particular date) of at least twenty crore rupees;
- (c) The AIF would not accept an investment of value less than one crore rupees from an investor. In case of investors who are employees or directors of the AIF/manager, the minimum value of investment should be twenty five lakh rupees;
- (d) The manager/sponsor would have a continuing interest in the AIF of not less than the lower of 2.5 percent of the corpus or five crore rupees in the form of investment in the AIF and such interest should not be through the waiver of management fees. For Category III AIF, the continuing interest should be not less than 5 percent of the corpus or ten crore rupees, whichever is lower;
- (e) The manager/its sponsor should disclose their investment in the AIF to investors;
- (f) No scheme of the AIF would have more than one thousand investors;
- (g) The fund would not solicit/collect funds except by way of private placement.

- **Units**
- are beneficial
- interest of the
- investors in the
- AIF/a scheme of
- the AIF including
- shares/partnership
- interests.

- **Corpus**
- is total amount of
- funds committed
- by the investor in
- the AIF by way of
- a written contract/
- any such document
- as on a particular
- date.

Placement Memorandum Funds would be raised by the AIFs through private placement by issue of information/placement memorandum containing all material information about the AIF and the manager, background of key investment team of the manager, targeted investors, fees and all other expenses proposed to be charged, tenure of the AIF/scheme, conditions/limits on redemption, investment strategy, risk management tools and parameters employed, key service providers, conflict of interest and procedures to identify and address them, disciplinary history, the terms and conditions

on which the manager offers investment services, its affiliations with other intermediaries, manner of winding up of the AIF/scheme and such other information as may be necessary for the investor to take an informed decision on whether to invest in the AIF.

Schemes The placement memorandum should be filed with the SEBI at least thirty days prior to launch of scheme along with the specified fees of ₹100,000. Payment of fees would not be required in case of launch of first scheme by the AIF. The SEBI may communicate its comments, if any, to the applicant who should incorporate them in placement memorandum prior to launch of scheme.

Tenure Category I and Category II AIF would be close-ended and the tenure of fund/scheme would be determined at the time of application subject to a minimum tenure of three years. Category III AIF may be open-ended or close-ended. Extension of the tenure of the close-ended AIF may be permitted up to two years subject to approval of two-thirds of the unit holders by value of their investment. In the absence of consent of unit holders, the AIF should fully liquidate within one year following expiration of the fund tenure/extended tenure.

Listing Units of close-ended AIF may be listed on stock exchange only after final close of the fund/scheme subject to a minimum tradable lot of one crore rupees and permitted.

General Investment Conditions Investments by all categories of AIFs would be subject to the following conditions:

- (a) They may invest in securities of companies incorporated outside India subject to such conditions/guidelines that may be stipulated/issued by the RBI/SEBI;
- (b) Co-investment in an investee company by a manager/sponsor would not be on terms more favourable than those offered to the AIF;
- (c) Category I and II AIFs should invest not more than 25 percent and Category III 10 per cent of the corpus in one investee company;
- (d) The AIFs should not invest in **associates** (i.e. a company/limited liability partnership/body corporate in which a director/trustee/partner/sponsor/manager of the AIF or director/partner of the manager/sponsor holds individually/collectively more than 15 per cent of its paid-up equity share capital/partnership interest) except with the approval of 75 percent of investors by value of their investment;
- (e) The un-invested portion of the corpus may be invested in liquid mutual funds/bank deposits/other liquid assets of higher quality such as T-bills, CBLOs, CPs, CDs, till deployment of funds as per the investment objective;
- (f) The AIFs may act as nominated investor as specified in SEBI Issue of Capital and Disclosure Requirements Regulations. (**discussed in Chapter 14**). The SEBI may specify additional requirements/criteria for AIF/for a specific category.

Conditions for Category I AIF (a) The following investment conditions would apply to all Category I AIFs:

They should invest in investee companies/venture capital undertaking/special purpose vehicles/limited liability partnerships/units of other AIFs. They may invest in units of Category I AIFs of same sub-category subject to the condition that they would not invest in units of other fund of funds. The investment conditions applicable to the venture capital funds (**discussed later**) would not be applicable to investments by them. Such investment funds cannot borrow funds directly/indirectly/engage in any leverage except for meeting temporary funding requirements for not more than thirty days, on not more than four occasions in a year and not more than 10 percent of the corpus.

Associates
is a company/
limited liability
partnership/body
corporate in which
a director/trustee/
partner/sponsor/
manager of the
AIF or director/
partner of the
manager/sponsor
holds individually/
collectively more
than 15 per cent of
its paid-up equity
share capital/
partnership interest.

(b) **Venture Capital Funds** The following additional investment conditions would apply to venture capital funds:

- (1) At least two-thirds of the corpus should be invested in unlisted equity shares/equity linked instruments of a venture capital undertaking/in companies listed/proposed to be listed on a SME exchange or SME segment of an exchange;
- (2) Not more than one-third of the corpus should be invested in: (i) subscription to initial public offer of a venture capital undertaking whose shares are proposed to be listed; (ii) debt/debt instrument of a venture capital undertaking in which the fund has already made an investment by way of equity or contribution towards partnership interest; (iii) preferential allotment, including through qualified institutional placement, of equity shares or equity-linked instruments of a listed company subject to lock-in period of one year; (iv) the equity shares/equity-linked instruments of a **financially weak company**, (i.e. a company, which has at the end of the previous financial year accumulated losses, resulting in erosion of more than 50 per cent but less than 100 per cent of its net worth as at the beginning of the previous financial year) or a sick industrial company whose shares are listed; (v) special purpose vehicles which are created by the fund for the purpose of facilitating/promoting investment in accordance with these regulations. The above investment conditions/restrictions should be achieved by the fund by the end of its life cycle.
- (3) Such funds may enter into an agreement with a merchant banker to (i) subscribe to the unsubscribed portion of the issue (ii) receive/deliver securities in the process of market making under SEBI Issue of Capital and Disclosure Requirements Regulations.
- (4) They would be exempt from **SEBI Prohibition of Insider Trading Regulations**,^{@@} in respect of investment in companies listed on SME exchange or SME segment of an exchange pursuant to due their diligence subject to the following conditions: (i) the fund would disclose within two working days of such acquisition/dealing to the stock exchanges where the investee company is listed; (ii) such investment would be locked -in for a period of one year from the date of investment.

Financially weak company is a company, which has at the end of the previous financial year accumulated losses, resulting in erosion of more than 50 per cent but less than 100 per cent of its net worth as at the beginning of the previous financial year.

(c) **SME Funds** The following additional conditions would apply to SME funds: At least 75 per cent of the corpus should be invested in unlisted securities/partnership interest of venture capital undertakings/investee companies which are SMEs or in companies listed/proposed to be listed on SME exchange/SME segment of an exchange. The conditions stipulated in (b) (3) and (b) (4) above in relation to venture capital fund would be applicable to the SME funds also.

(d) **Social Venture Funds** The following additional conditions would apply to social venture funds: (1) At least 75 percent of their corpus would be invested in unlisted securities/partnership interest of social ventures. (2) They may (i) accept grants, provided that utilisation of such grants would be restricted to investment specified in (1) above; (ii) give grants to social ventures, provided that appropriate disclosure is made in the placement memorandum; (iii) accept **muted returns** for their investors, that is, they may accept returns on their investments which may be lower than the prevailing returns for similar investments.

(e) **Infrastructure Funds** The following additional conditions would apply to infrastructure funds: At least 75 percent of the corpus should be invested in unlisted securities/units or partnership interest

of venture capital undertaking/investee companies/special purpose vehicles, which are engaged in, or formed for the purpose of, operating, developing or holding infrastructure projects. They may also invest in listed securitised debt instruments/debt securities of investee companies/special purpose vehicles, which are engaged in, or formed for the purpose of, operating, developing or holding infrastructure projects.

Conditions for Category II AIFs The applicable investment conditions are as follows. They should invest primarily in unlisted investee companies/units of other AIFs specified in the placement memorandum. They may also invest in units of Category I/II AIFs but not in units of other fund of funds. The restrictions on borrowing funds/leveraging applicable to Category I funds would also apply to them. They may engage in hedging, subject to SEBI guidelines, The conditions stipulated in (b) (3) and (b) (4) in relation to venture capital funds would also be applicable to such funds.

Conditions for Category III Alternative Investment Funds The applicable investment conditions are. They may invest in (i) securities of listed/unlisted investee companies/derivatives/complex/structured products, (ii) units of Category I/II AIFs. But they cannot invest in units of other fund of funds. They may engage in leverage or borrow subject to consent from the investors in the fund and subject to a SEBI-specified maximum limit. They should disclose information regarding the overall level of leverage employed, the level of leverage arising from borrowing of (i) cash, (ii) position held in derivatives/in any complex product and the (iii) main source of leverage in their fund to the investors and to the SEBI periodically. They would be regulated through issuance of SEBI-specified directions regarding areas such as operational standards, conduct of business rules, prudential requirements, restrictions on redemption and conflict of interest.

Other AIFs The SEBI may lay down framework for AIFs other than the Category I, II and III funds.

General Obligations and Responsibilities and Transparency Included in general obligations/responsibility and transparency of the AIFs are: (i) general obligations, (ii) conflict of interest, (iii) transparency, (iv) valuation, (v) obligation of manager, (vi) dispute resolution, (vii) power to call for information, (viii) maintenance of records, (ix) submission of reports to the SEBI, and (x) winding-up.

General Obligations The AIFs should review the policies and procedures, and their implementation, on a regular basis, or as a result of business developments to ensure their continued appropriateness. Their sponsor/manager should appoint a SEBI-registered custodian for safekeeping of securities if the corpus of the AIF is more than five hundred crore rupees. However, the sponsor/manager of a Category III AIF should appoint custodian irrespective of the size of corpus. The should inform the SEBI in case of any change in the sponsor/manager/designated partners/any other material change from the information provided by them at the time of application for registration. In case of change in **control** (i.e. change in control in terms of **SEBI Substantial Acquisition of Shares/Takeovers**^{**} if its shares are listed and change in the controlling interest/legal form in other cases) of the AIF, sponsor/manager, prior approval from the SEBI should be taken by the AIF. Their books of accounts should be audited annually by a qualified auditor.

Conflict of Interest The sponsor/manager of the AIF should act in a fiduciary capacity towards its investors and disclose to them all conflicts of interests as and when they arise or seem likely to arise. The manager should establish and implement written policies and procedures to identify, monitor and appropriately mitigate conflicts of interest throughout the scope of business. They should abide by SEBI-specified high level principles on avoidance of conflicts of interest with associated persons.

^{**}An account available in Chapter 32.

Transparency All the AIFs should ensure transparency and periodical disclosure of information to investors on the following: **(a)** financial, risk management, operational/portfolio, and transactional information regarding fund investments; **(b)** any fees **(i)** ascribed to the manager /sponsor **(ii)** charged to the AIF/any investee company by an associate of the manager/sponsor; **(c)** any inquiries/legal actions by legal/regulatory bodies in any jurisdiction, as and when occurred; **(d)** any material liability arising during the AIF's tenure as and when occurred; **(e)** any breach of a provision of the placement memorandum/agreement made with the investor or any other fund documents as and when occurred; **(f)** change in control of the sponsor/manager/investee company; **(g)** provide at least on an annual basis, within 180 days from the year-end, reports to investors including the following information, **(1)** financial information of investee companies, **(2)** material risks and how they are managed which may include: **(i)** concentration risk at fund level, **(ii)** foreign exchange risk at fund level, **(iii)** leverage risk at fund and investee company levels, **(iv)** realisation risk (i.e. change in exit environment) at fund and investee company levels, **(v)** strategy risk (i.e. change in or divergence from business strategy) at investee company level, **(vi)** reputation risk at investee company level, **(vii)** extra-financial risks, including environmental, social and corporate governance risks, at fund and investee company level. Category III fund should, however, provide quarterly reports to investors within 60 days of the end of the quarter, **(h)** any significant change in the key investment team; **(i)** When required by the SEBI, information for systemic risk purposes (including the identification, analysis and mitigation of systemic risks).

Valuation The AIF should provide to its investors, a description of its **(i)** valuation procedure and **(ii)** the methodology for valuing assets. The Category I and II funds should undertake valuation of their investments, atleast once in every six months, by an independent valuer. Such period may be enhanced to one year on approval of atleast 75 percent of the investors by value of their investment. Category III funds should ensure that calculation of the net asset value (NAV) is independent from the fund management function of the AIF and disclosed to the investors at intervals not longer than a quarter for close-ended funds and a month for open-ended funds.

Obligation of Manager The manager would be obliged to: **(a)** address all investor complaints; **(b)** provide to the SEBI any information sought; **(c)** maintain all specified records; **(d)** take all steps to address conflict of interest; and **(e)** ensure transparency and disclosure.

Dispute Resolution By itself or through the manager/sponsor, the AIF should lay down procedures for resolution of disputes between the investors, AIF, manager/sponsor through arbitration or any such mechanism as mutually decided between the investors and the AIF.

Power to Call for information The SEBI may at any time call for any information from an AIF, its manager/sponsor/trustee/investor with respect to any matter relating to its activity as an AIF or for the assessment of systemic risk or prevention of fraud. The information should be furnished within the specified time.

Maintenance of Records The manager/sponsor of the AIF should maintain for a period of five years after the winding up of the fund the following records describing: **(a)** the assets under the scheme/fund; **(b)** valuation policies and practices; **(c)** investment strategies; **(d)** particulars of investors and their contribution; and **(e)** rationale for investments made.

Submission of Reports to the SEBI The SEBI may at any time call upon the AIF to file such reports, as it may desire, with respect to the activities carried on by the AIF.

Winding-up An AIF set up as a trust would be wound up: **(a)** when its tenure or all schemes launched by it, as mentioned in the placement memorandum, is over; **(b)** if it is the opinion of the trustees/trustee company, that it be wound-up in the interests of investors in the units; **(c)** if 75 percent of the investors by value of their investment pass a resolution at a meeting of unitholders that it be wound up; and **(d)** if the SEBI so directs in the interests of investors.

An AIF set up as a limited liability partnership should be wound up in accordance with the provisions of The Limited Liability Partnership Act: in terms of stipulations **(a)**, **(c)** and **(d)** applicable to the winding up of trust-AIFs.

An AIF set up as a company should be wound up in accordance with the provisions of the Companies Act. An AIF set up as a body corporate should be wound up in accordance with the provisions of the statute under which it is constituted.

The trustees/trustee company/Board of Directors/designated partners of the AIF should intimate to the SEBI and investors of the circumstances leading to its winding up. On and from the date of intimation, no further investments should be made on behalf of the AIF. Within one year from the date of intimation, the assets should be liquidated, and the proceeds accruing to investors distributed to them after satisfying all liabilities. Upon winding up, the certificate of registration should be surrendered to the SEBI.

Inspection The SEBI may, *suo motu*, or upon receipt of information/complaint, appoint person(s) as inspecting authority to undertake inspection of the books of account, records and documents relating to an AIF for any of the following reasons: to **(a)** ensure that the books of account, records and documents are being maintained by the in the specified manner; **(b)** inspect complaints received from investors, clients or any other person, on any matter having a bearing on its activities; **(c)** ascertain whether the provisions of the SEBI Act/regulations are being complied with; **(d)** inspect *suo motu* its affairs in the interest of the securities market/investors. Before ordering an inspection, the SEBI should give not less than ten days notice to the AIF. However, where the SEBI is satisfied that in the interest of the investors no such notice should be given, it may by an order in writing direct that the inspection of the affairs of the AIF be taken up without such notice.

Obligations During the course of an inspection, the concerned AIF would be duty bound to discharge its obligations specified below. It would be the duty of every officer of the AIF and any other associated person who is in possession of relevant information pertaining to its conduct and affairs of including manager to produce such books, accounts and other documents in his custody or control and furnish him with such statements and information as the inspecting authority may require for the purposes of the inspection. It would also be their duty to give to the inspecting authority all such assistance and extend all such co-operation as may be required in connection with the inspection and furnish such information as sought in connection with the inspection. The inspecting authority would, have the power to examine on oath and record the statement of any employees/directors/person responsible for, or connected with, their activities of or any other associated person having relevant information pertaining to the fund. The inspecting authority would also have power to obtain authenticated copies of documents, books, accounts from any person having control over or custody of them. The inspecting authority would, as soon as possible, on completion of the inspection, submit an inspection report to the SEBI and if directed submit an interim report.

The SEBI may after consideration of the inspection report and giving reasonable opportunity of hearing to the AIF or its trustees/directors/manager issue such direction as it deems fit in the interest

of securities market/investors including directions in the nature of: **(a)** requiring not to launch new schemes or raise money from investors for a particular period; **(b)** prohibiting the person concerned from disposing of any of the properties of the fund or scheme acquired in violation of these regulations; **(c)** requiring the person connected to dispose of the assets of the fund/scheme in a manner as may be specified in the directions; **(d)** requiring the person concerned to refund any money or the assets to the concerned investors along with the requisite interest or otherwise, collected under the scheme; and **(e)** prohibiting the person concerned from operating in the capital market or from accessing the capital market for a specified period.

Procedure for Action in Case of Default An AIF which: **(a)** contravenes any of the provisions of the SEBI Act/regulations, **(b)** fails to furnish any information relating to its activity, **(c)** furnishes information which is false or misleading in any material particular, **(d)** does not submit periodic returns or reports as required, **(e)** does not co-operate in any enquiry, inspection or investigation conducted, **(f)** fails to resolve the complaints of investors/give a satisfactory reply in this behalf, would be dealt with in the manner provided under the **SEBI Intermediaries Regulations**.^{@@} The SEBI may also to issue directions or measures under the SEBI Act or under any other law for the time being in force.

SEBI Foreign Venture Capital Investors (FVCIs) Regulations, 2000

A foreign venture capital investor (FVCI) is an investor incorporated and established outside India and proposes to make investment in accordance with these regulations. The main elements of FVCIs are described below.

Registration A FVCI should be registered with SEBI to carry on business in India. To seek registration with SEBI, an applicant should apply in the prescribed form along with an application fee of US\$ 2,500. The eligibility criteria for registration of an applicant include the following conditions: **(i)** its track record, professional competence, financial soundness, experience, general reputation of fairness and integrity; **(ii)** the RBI's approval for investing in India; **(iii)** it is an investment company/trust/partnership, pension/mutual/endowment fund, charitable institution or any other entity incorporated outside India; **(iv)** it is an asset/investment management company, investment manager or any other investment vehicle incorporated outside India; **(v)** it is authorised to invest in Venture Capital Funds (VCFs)/Alternative Investment Fund/carry on activity as a FVCI; **(vi)** it is regulated by an appropriate foreign regulatory authority or is an income tax payer or submits a certificate from its banker of its promoters' track record where it is neither a regulated entity nor an income tax payer; **(vii)** it has not been refused a certificate by SEBI and **(viii)** it is a fit and proper person. The provisions of the **SEBI Intermediaries Regulation, 2008** would apply to determine if the applicants are fit and proper persons. The applicant may be required by SEBI to furnish such further information as it may consider necessary. A VCF means a fund established in the form of a trust/company including a body corporate and registered under the SEBI VCF Regulations which **(i)** has dedicated pool of capital, **(ii)** raised in the manner specified under the regulations and **(iii)** invests in accordance with the regulations.

On being satisfied that the applicant is eligible and on receipt of the registration fee of US\$ 10,000, SEBI would grant it a certificate of registration subject, *inter alia*, on the conditions that it would **(a)** abide by the *SEBI Act* and FVCIs regulation, **(b)** appoint a domestic custodian (i.e. a person registered under SEBI Custodian of Securities Regulations, 1996) for custody of securities **(c)** enter into an

^{@@}An account available in Khan, M.Y., *Indian Financial System*, MHE, India, 2018, Chapter 4.

arrangement with a designated bank (i.e. any bank in India permitted by the RBI to act as a banker to the FVCI) for operating a special non-resident rupee/foreign currency account, and **(d)** forthwith inform SEBI, in writing, if any information/particulars previously submitted to it are found to be false/misleading in any material particular or if there is any change in any information already submitted.

Investment Criteria The investments by FVCIs should conform to the norms prescribed by SEBI. First, they should disclose their investment strategy to SEBI. They can invest their total funds committed in one VCF/AIF. At least 66.67 per cent of the investible fund (i.e. the funds committed for investment in India net of expenditure for administration/management of the fund) should be invested in unlisted equity shares or equity linked instruments of venture capital undertakings (VCUs). Further, not more than 33.33 per cent of the investible funds may be invested by way: **(a)** subscription to the IPO (initial public offer) of VCUs whose shares are proposed to be listed, **(b)** debt/debt instruments of a VCU in which the FVCI has already made an investment by way of equity, **(c)** preferential allotment of equity shares of a listed company subject to lock-in period of one year, **(d)** it should disclose the duration of the life cycle of the fund, and **(e)** special purpose vehicles (SPVs) created to facilitate/promote investment according to share regulations.

Equity-linked instruments include instruments convertible into equity shares or share warrants, preference shares, debentures compulsorily/optionally convertible into equity. A VCU means a domestic company **(i)** whose shares are not listed on a recognised stock exchange in India, **(ii)** which is engaged in the business of providing services, production/manufacture of articles/things but excludes such activities/sectors which are specified in the negative list by the SEBI with approval of Government, namely, **(a)** non-banking financial services excluding the NBFCs registered with and categorised as asset finance companies by the RBI, **(b)** gold financing excluding companies engaged in gold financing for jewellery, **(c)** activities not permitted under the industrial policy of the Government of India, and **(d)** any other activity specified by the SEBI from time to time.

General Obligations and Responsibilities The FVCIs have to maintain, for a period of eight years, books of accounts/records/documents which would give a true and fair picture of their affairs and intimate to SEBI the place where they are being maintained. They may be called upon at any time by SEBI to furnish within a specified time any information with respect to any matter relating to their activities. Moreover, they/a global custodian acting on their behalf should enter into an agreement with the domestic custodian to act as a custodian of securities for them. They have also to ensure that the domestic custodian takes steps for **(i)** monitoring of their investments in India, **(ii)** furnishing of periodic reports to, and such information as may be called for by SEBI. A branch of a bank approved by the RBI should be appointed by the FVCIs the as designated bank for opening of foreign currency denominated accounts/special non-resident rupee account.

Inspection and Investigation The SEBI has the right to, *suo moto*, or upon receipt of information/complaint, order an inspection/investigation in respect of conduct and affairs of any FVCI by an officer to **(i)** ensure that the books/accounts/documents are being maintained in the specified manner, **(ii)** inspect/investigate into complaints from investors/clients/any other person on any matter having a bearing on its activities, **(iii)** ascertain whether the provisions of the SEBI Act and FVCIs regulations are being complied with and **(iv)** inspect/investigate, *suo moto*, into its affairs in the interest of the securities market/investors. The FVCI/any other associated person, including asset management company/fund manager, in possession of information relevant to its conduct/affairs must **(1)** produce to the investigating/inspecting officer such books/accounts/other documents in his custody/control and furnish him such statements and information as he may acquire and **(2)** give to him all assistance and extend all cooperation, and furnish all information sought by him.

He would also have the power (1) to examine on oath and record the statement of any person responsible for or connected with the activities of the FVCI and (2) to get authenticated copies of documents/books/accounts of the FVCI from any person having control/custody over them. On the basis of the inspection/investigation report, SEBI has the right to require the FVCI to take such measures or issue such directions as it deems fit in the interest of the capital market and investors, including directions in the nature of (a) requiring the disposal of the securities or investment in a specified manner, (b) requiring not to further invest for a particular period and (c) prohibiting operation in the capital market in India for a specified period.

Procedure for Action in Case of Default In addition to the issue of appropriate directions specified above, SEBI can also suspend/cancel registration of the FVCI on the basis of the investigation report in terms of the **Intermediaries Regulation, 2008**.

Suspension of Registration The registration of a FVCI can be suspended by SEBI if it (1) contravenes any of the provisions of the SEBI Act or SEBI FVCI Regulations, (2) fails to furnish any information relating to its activities as required by SEBI, (3) furnish to it information which is false/misleading in any material particular, (4) does not submit periodic returns/reports as required by it and (5) does not cooperate in any enquiry/inspection conducted by it.

Cancellation of Registration The SEBI may cancel the registration of a FVCI when he (1) is guilty of fraud/has been convicted of an offence involving moral turpitude, (2) has been guilty of repeated defaults of the nature resulting in suspension of registration; (3) does not meet the eligibility criteria laid down in SEBI FVCIs Regulations and (4) contravenes any of the provisions of *SEBI Act*/these regulations.

The order of suspension/cancellation of registration may be published by SEBI in two newspapers. Action may also be initiated by SEBI for suspension/cancellation of registration of an intermediary who fails to exercise due diligence in the performance of its functions/comply with its obligations under these regulations. Any person aggrieved by an order of SEBI may prefer an appeal to Securities Appellate Tribunal (SAT).

SUMMARY

Venture capital, as a fund-based financial service, has emerged the world over to fill gaps in the conventional financial mechanism, focusing on new entrepreneurs, commercialisation of new technologies and support to small/medium enterprises in the manufacturing and the service sectors. Over the years, the concept of venture capital has undergone significant changes. The nascent venture capital industry in India can profitably draw upon the experiences of the developed countries.

The characteristics features of venture capital differentiate it from other capital investments. It is basically equity finance in relation to new listed companies and debt financing is only supplementary to ensure running yield on the portfolio of the venture capitalists/capital institution (VCIs). It is long-term investment in growth-oriented small/medium firms. There is a substantial degree of active involvement of VCIs with the promoters of venture capital undertakings (VCUs) to provide, through a hands-on approach, managerial skills without interfering in the management. The venture capital financing involves high risk-return spectrum. It is not technology finance, though technology finance may form a sub-set of such financing. Its scope is much wider.

The first step in venture capital financing is the selection of the investment. It includes stages of financing, methods to evaluate deals and the financial instruments to structure a deal. The stages of

financing as differentiated in venture capital industry are early stage and later stage. Included in early stage are seed capital/pre-start-up, start-up and second-round financing. The later stage of venture capital financing covers mezzanine/development capital, bridge/expansion, buyouts and turnarounds. The venture investments are generally **idea-based and growth-based**. Of the three methods of financial analysis/evaluation which VCs can adopt, namely, conventional venture capital valuation method, the first Chicago method and the revenue multiplier method, the first Chicago method gives better results. The structuring of venture capital deals is a mix of the available financial instruments: equity and debt. The equity instruments include ordinary, non-voting, deferred ordinary, preference, warrants, cumulative convertible preference, participating preference and so on. The main types of debt instruments are conventional loan, conditional loan, income notes, NCDs, PCDs, zero interest bonds, secured premium notes and deep discount bonds.

The after-care stage of venture capital financing relates to different styles of nurturing, its objectives and techniques. The style of nurturing which refers to the extent of participation by VCs in the affairs of the venture, falls into three broad categories: hands on, hands off and hands holding. Some of the important techniques to achieve the objectives are personal discussion; plant visits, nominate directors, periodic reports and commissioned studies.

The valuation of the venture capital portfolio to monitor and evaluate the performance of the equity investment is done by using cost method or market value-based methods consisting of quoted market value method and fair market value method. The methods of valuing debt instruments vary with the nature of such instruments.

The alternative forms in which VCs can be structured are: limited partnership, company, trust and small business investment company.

The last stage in venture capital financing is the exit to realise the investment so as to maximise profit/minimise loss. The alternative routes for disinvestments of equity/quasi-equity instruments are market flotation, arnout, trade sales, takeout and liquidation.

The venture capital industry in India is of relatively recent origin. Before its emergence, the DFIs had partially been playing the role of venture capitalists by providing assistance for direct equity participation to ventures in the pre-public stage and by selectively supporting new technologies. The concept of venture capital was institutionalised/operationalised in November 1988 when the CCI issued guidelines for setting up of VCFs for investing in unlisted companies and to avail of a concessional facility of capital gains tax. These guidelines, however, construed venture capital rather narrowly as a vehicle for equity-oriented finance for technological upgradation and commercialisation of technology promoted by relatively new entrepreneurs. These were repealed on July 25, 1995. Recognising the growing importance of venture capital, the Government announced a policy for governing the establishment of domestic VCFs. They were exempted from tax on income by way of dividends and long-term capital gains from equity investment in the specified manner and in conformity with stipulations in unlisted companies in the manufacturing sector, including software units, but excluding other service industries. To augment the availability of venture capital, guidelines were issued in September, 1995 for overseas venture capital investments in the country. After empowerment to register and regulate VCFs, SEBI issued VCF Regulations, 1996. They have now been replaced by the Alternative Investment Fund Regulations.

Alternative investment fund (AIF) means any fund established/incorporated in India in the form of a trust/company/limited liability partnership/body corporate which is (i) a privately pooled investment vehicle and collects funds from Indian/foreign investors for investing in accordance with a defined investment policy for the benefit of its investors, and (ii) not covered under the mutual fund/other regulations of the SEBI to regulate fund management activities. The main elements of the SEBI regulation relating to AIFs, namely, (a) registration, (b) investment conditions/restrictions, (c) general obligations and responsibilities and transparency, (d) inspection, and (e) procedure for action in case of default are discussed in this Section.

To set an **AIF**, an entity/person has to obtain a certificate of registration from the SEBI. The existing venture capital funds may seek re-registration as AIFs subject to approval of two-thirds of their investors by value of their investment. The AIFs can seek registration in one of the three categories: (i) I, (ii) II, (iii) III.

“Category I AIF” which invests in start-up or early stage ventures/social ventures/small and medium enterprises (SMEs)/infrastructure/other sectors or areas which the Government/regulators consider as socially/economically desirable and would include venture capital funds, SME funds, social venture funds, infrastructure funds and such other specified alternative investment funds. The **AIFs** which are generally perceived to have positive spillover effects on economy and for which the SEBI/Government of India/other regulators in India might consider providing incentives/concessions would be included and such funds which are formed as trusts/companies would be construed as “venture capital company”/fund” as specified under the Income Tax Act. **Venture capital fund** means an alternative investment fund which invests primarily in unlisted securities of start-ups, emerging/early-stage venture capital undertakings mainly involved in new products/new services, technology/intellectual property right based activities/a new business model. **Venture capital undertaking** means a domestic company which is (i) not listed on a recognised stock exchange in India at the time of making investment; and (ii) engaged in the business for providing services, production/manufacture of article/things and does not include the following activities/sectors: (1) non-banking financial companies; (2) gold financing; (3) activities not permitted under industrial policy of Government of India; and (4) any other activity which may be specified by the SEBI in consultation with the Government of India from time to time. **SME fund** means an alternative investment fund which invests primarily in unlisted securities of investee companies which are SMEs or securities of those SMEs which are listed/proposed to be listed on a SME exchange/SME segment of an exchange. **Social venture** means a trust/society/company/venture capital undertaking/limited liability partnership formed with the purpose of promoting social welfare/solving social problems/providing social benefits and includes: (i) public charitable trusts registered with the charity commissioner; (ii) societies registered for charitable purposes/promotion of science, literature/fine arts; (iii) company registered under Section 25 of the Companies Act; (iv) micro finance institutions. **Social venture fund** means an alternative investment fund which invests primarily in securities/units of social ventures and which satisfies social performance norms laid down by the fund and whose investors may agree to receive restricted or muted returns. **Infrastructure funds** invest primarily in unlisted securities/partnership or interest/listed debt/securitised debt instruments of investee companies/SPVs engaged in. or formed for the purpose of, operating/developing/holding infrastructure.

“Category II AIF” which does not fall in Category I and III and which does not undertake leverage or borrowing other than to meet day-to-day operational requirements. Funds such as private equity funds/debt funds for which no specific incentives or concessions are given by the Government or any other regulator would be included. **Private equity fund** means an **AIF** which invests primarily in equity/equity linked instruments (i.e. instruments convertible into equity/preference shares, share warrants, compulsorily/optionally convertible debentures) or partnership interests of investee companies (i.e. companies/SPVs/limited partnership/body corporate in which an AIF makes an investment) according to the stated objectives of the fund. **Debt fund** is an AIF which invests primarily in debt/debt securities of listed/unlisted investee companies according to its stated objectives.

... the first of the year, the weather was very cold, and the snow lay deep upon the ground. The people were all dressed in heavy cloaks, and many of them wore hats of fur. The streets were very quiet, and the houses were all shut up. The only noise that was heard was the sound of the wind blowing through the trees. The children were all at home, and the old people were sitting in their chairs, looking out of the windows at the snow. The day was very long, and the sun did not come out. The people were all very sad, and they all wished for the spring to come. The night was very dark, and the stars were very bright. The moon was in the sky, and it shone very brightly. The people were all asleep, and the world was very quiet. The next day, the weather was still very cold, and the snow lay deep upon the ground. The people were all dressed in heavy cloaks, and many of them wore hats of fur. The streets were very quiet, and the houses were all shut up. The only noise that was heard was the sound of the wind blowing through the trees. The children were all at home, and the old people were sitting in their chairs, looking out of the windows at the snow. The day was very long, and the sun did not come out. The people were all very sad, and they all wished for the spring to come. The night was very dark, and the stars were very bright. The moon was in the sky, and it shone very brightly. The people were all asleep, and the world was very quiet.

The people were all asleep, and the world was very quiet.

“**Category III AIF**” which employs diverse or complex trading strategies and may employ leverage including through investment in listed or unlisted derivatives. Funds such as hedge funds or funds which trade with a view to make short term returns or such other funds which are open-ended and for which no specific incentives or concessions are given by the Government or any other regulator would be included. **Hedge funds** employ diverse/complex trading strategies and invest in securities having diverse risks or complex products including listed/unlisted derivatives.

The eligibility criteria for registration as AIF are: **(a)** The memorandum of association/trust/partnership deed respectively in case of company/trust/limited liability partnership permits it to carry on the activity of an AIF; **(b)** The applicant is prohibited by its memorandum and articles of association/trust/partnership deed from making an invitation to the public to subscribe to its securities; **(c)** The instrument of trust in case of a trust-applicant is in the form of a deed and has been duly registered under the provisions of the Registration Act; **(d)** The partnership in case of partnership-applicant is duly incorporated and the partnership deed has been duly filed with the Registrar under the provisions of the Limited Liability Partnership Act; **(e)** A body corporate-applicant is set up/established under the laws of the central or state legislature and is permitted to carry on the activities of an AIF; **(f)** The applicant, sponsor and manager are fit and proper persons based on the criteria specified in SEBI Intermediaries Regulations; **(g)** The key investment team of the manager of the AIF has adequate experience, with at least one key personnel having not less than five years experience in advising/managing pools of capital or in fund/asset/wealth/portfolio management or in the business of buying, selling and dealing of securities/ other financial assets and has relevant professional qualification; **(h)** The manager/sponsor has the necessary infrastructure and manpower to effectively discharge its activities; **(i)** The applicant has clearly described at the time of registration the investment objective, the targeted investors, proposed corpus, investment style/strategy and proposed tenure of the fund/scheme; **(j)** Whether the applicant or any entity established by the sponsor/manager has earlier been refused registration by the SEBI.

The investment conditions/restrictions relate to: **(i)** investment strategy, **(ii)** investment in AIF, **(iii)** placement memorandum, **(iv)** schemes, **(v)** tenure, **(vi)** listing, **(vii)** general investment conditions, **(viii)** conditions for category I AIF, **(ix)** conditions for category II AIF, **(x)** conditions for category III AIFs and **(xi)** other AIF.

Investment in all categories of AIFs would be subject to the following conditions:- **(a)** The AIF may raise funds from any Indian, foreign or non-resident Indian investor by way of issue of **units** (i.e. a beneficial interest of the investors in the AIF/a scheme of the AIF including shares/partnership interests); **(b)** Each scheme of the AIF would have **corpus** (i.e. total amount of funds committed by the investor in the AIF by way of a written contract/any such document as on a particular date) of atleast twenty crore rupees; **(c)** The AIF would not accept an investment of value less than one crore rupees from an investor. In case of investors who are employees or directors of the AIF/manager, the minimum value of investment should be twenty five lakh rupees. **(d)** The manager/sponsor would have a continuing interest in the AIF of not less than the lower of 2.5 percent of the corpus or five crore rupees in the form of investment in the AIF and such interest should not be through the waiver of management fees. For Category III AIF, the continuing interest should be not less than 5 percent of the corpus or ten crore rupees, whichever is lower. **(e)** The manager/its sponsor should disclose their investment in the AIF to investors; **(f)** No scheme of the AIF would have more than one thousand investors; **(g)** The fund would not solicit/collect funds except by way of private placement.

Category I and Category II AIF would be close-ended fund/scheme. Category III AIF may be open-ended or close-ended.

Units of close-ended AIF may be listed on stock exchange only after final close of the fund/scheme subject to a minimum tradable lot of one crore rupees and permitted.

Investments by all categories of AIFs would be subject to the following conditions: **(a)** They may invest in securities of companies incorporated outside India subject to such conditions/guidelines that may be stipulated/issued by the RBI/SEBI; **(b)** Co-investment in an investee company by a manager/sponsor would not be on terms more favourable than those offered to the AIF; **(c)** Category I and II AIFs should invest not more than 25 percent and Category III 10 per cent of the corpus in one investee company; **(d)** The AIFs should not invest in **associates** (i.e. a company/limited liability partnership/body corporate in which a director/trustee/partner/ sponsor/manager of the AIF or director/partner of the manager/sponsor holds individually/collectively more than 15 per cent of its paid-up equity share capital/partnership interest) except with the approval of 75 percent of investors by value of their investment; **(e)** The un-invested portion of the corpus may be invested in liquid mutual funds/bank deposits/other liquid assets of higher quality such as T-bills, CBLs, CPs, CDs, till deployment of funds as per the investment objective; **(f)** The AIFs may act as nominated investor as specified in SEBI Issue of Capital and Disclosure Requirements Regulations. **(discussed in Chapter 14)**. The SEBI may specify additional requirements/criteria for AIF/for a specific category.

The following investment conditions would apply to all Category I AIFs: **(a)** They should invest in investee companies/venture capital undertaking/special purpose vehicles/limited liability partnerships/units of other AIFs. They may invest in units of Category I AIFs of same sub-category subject to the condition that they would not invest in units of other fund of funds. The investment conditions applicable to the venture capital funds **(discussed later)** would not be applicable to investments by them. Such investment funds cannot borrow funds directly/indirectly/engage in any leverage except for meeting temporary funding requirements for not more than thirty days, on not more than four occasions in a year and not more than 10 percent of the corpus. **(b) Venture Capital Funds** The following additional investment conditions would apply to venture capital funds: **(1)** At least two-thirds of the corpus should be invested in unlisted equity shares/equity linked instruments of a venture capital undertaking/in companies listed/proposed to be listed on a SME exchange or SME segment of an exchange; **(2)** Not more than one-third of the corpus should be invested in: **(i)** subscription to initial public offer of a venture capital undertaking whose shares are proposed to be listed; **(ii)** debt/debt instrument of a venture capital undertaking in which the fund has already made an investment by way of equity or contribution towards partnership interest; **(iii)** preferential allotment, including through qualified institutional placement, of equity shares or equity-linked instruments of a listed company subject to lock-in period of one year; **(iv)** the equity shares/equity-linked instruments of a **financially weak company**, (i.e. a company, which has at the end of the previous financial year accumulated losses, resulting in erosion of more than 50 per cent but less than 100 per cent of its net worth as at the beginning of the previous financial year) or a sick industrial company whose shares are listed, **(v)** special purpose vehicles which are created by the fund for the purpose of facilitating/promoting investment in accordance with these regulations. The above investment conditions/restrictions should be achieved by the fund by the end of its life cycle. **(3)** Such funds may enter into an agreement with a merchant banker to **(i)** subscribe to the unsubscribed portion of the issue **(ii)** receive/deliver securities in the process of market making under SEBI Issue of Capital and Disclosure Requirements Regulations. **(4)** They would be exempt from SEBI Prohibition of Insider Trading Regulations, in respect of investment in companies listed on SME exchange or SME segment of an exchange pursuant to due their diligence subject to the following conditions: **(i)** the fund would disclose within two working days of such acquisition/dealing to the stock exchanges where the investee company is listed; **(ii)** such investment would be locked-in for a period of one year from the date of investment. **(c) SME Funds**

The following additional conditions would apply to SME funds: **(1)** At least 75 per cent of the corpus should be invested in unlisted securities/partnership interest of venture capital undertakings/investee companies which are SMEs or in companies listed/proposed to be listed on SME exchange/SME segment of an exchange. The conditions stipulated in **(b) (3)** and **(b) (4)** above in relation to venture capital fund would be applicable to the SME funds also. **(d) Social Venture Funds** The following additional conditions would apply to social venture funds: **(1)** At least 75 percent of their corpus would be invested in unlisted securities/partnership interest of social ventures. **(2)** They may **(i)** accept grants, provided that utilisation of such grants would be restricted investment specified in **(1)** above; **(ii)** give grants to social ventures, provided that appropriate disclosure is made in the placement memorandum; **(iii)** accept muted returns for their investors, that is, they may accept returns on their investments which may be lower than the prevailing returns for similar investments. **(e) Infrastructure Funds** The following additional conditions would apply to infrastructure funds: At least 75 percent of the corpus should be invested in unlisted securities/units or partnership interest of venture capital undertaking/investee companies/special purpose vehicles, which are engaged in, or formed for the purpose of, operating, developing or holding infrastructure projects. They may also invest in listed securitised debt instruments/debt securities of investee companies/special purpose vehicles, which are engaged in, or formed for the purpose of, operating, developing or holding infrastructure projects.

The applicable investment conditions are as follows. They should invest primarily in unlisted investee companies/units of other AIFs specified in the placement memorandum. They may also invest in units of Category I/II AIFs but not in units of other fund of funds. The restrictions on borrowing funds/leveraging applicable to Category I funds would also apply to them. They may engage in hedging, subject to SEBI guidelines, The conditions stipulated in **(b) (3)** and **(b) (4)** in relation to venture capital funds would also be applicable to such funds.

The applicable investment conditions are. They may invest in **(i)** securities of listed/unlisted investee companies/derivatives/complex/structured products, **(ii)** units of Category I/II AIFs. But they cannot invest in units of other fund of funds. They may engage in leverage or borrow subject to consent from the investors in the fund and subject to a SEBI-specified maximum limit. They should disclose information regarding the overall level of leverage employed, the level of leverage arising from borrowing of **(i)** cash, **(ii)** position held in derivatives/in any complex product and the **(iii)** main source of leverage in their fund to the investors and to the SEBI periodically. They would be regulated through issuance of SEBI-specified directions regarding areas such as operational standards, conduct of business rules, prudential requirements, restrictions on redemption and conflict of interest.

The SEBI may lay down framework for AIFs other than the Category I, II and III funds.

Valuation The AIF should provide to its investors, a description of its **(i)** valuation procedure and **(ii)** the methodology for valuing assets. The Category I and II funds should undertake valuation of their investments, at least once in every six months, by an independent valuer. Such period may be enhanced to one year on approval of at least 75 percent of the investors by value of their investment. Category III funds should ensure that calculation of the net asset value (NAV) is independent from the fund management function of the AIF and disclosed to the investors at intervals not longer than a quarter for close-ended funds and a month for open-ended funds.

An AIF which: **(a)** contravenes any of the provisions of the SEBI Act/regulations, **(b)** fails to furnish any information relating to its activity, **(c)** furnishes information which is false or misleading in any material particular, **(d)** does not submit periodic returns or reports as required, **(e)** does not co-operate in any enquiry, inspection or investigation conducted, **(f)** fails to resolve the complaints of investors/give a satisfactory reply in this behalf, would be dealt with in the manner provided under the SEBI Intermediaries Regulations. The SEBI may also to issue directions or measures under the SEBI Act or under any other law for the time being in force.

REVIEW QUESTIONS

LOD: Easy

RQ.26.1 (a) Indicate whether the following statements are true or false:

[LO 26.1.2]

- (i) Venture capital is a vehicle for equity-oriented finance for technological upgradation and commercialisation of technology promoted by relatively new entrepreneurs.
- (ii) Before the emergence of venture capital financing in India, developmental financial institutions played the role of venture capitalists.
- (iii) In management buyins, funds are provided to enable the current operating management to acquire an existing business.
- (iv) Venture capital investments are generally idea-based and growth-based in contrast to conventional investments, which are asset-based.
- (v) The First Chicago Method of valuing venture capital undertakings takes into account only two points of time in the life of the venture capital investment, namely, the starting time of investment and the exit time.
- (vi) A conditional loan is a form of loan finance without any pre-determined repayment schedule or interest rate.
- (vii) An offshore investment company is incorporated in the country in which it makes an investment.
- (viii) Carried interest is defined as the extra incentive/profit to the managers over and above the share attributed to their capital contribution and the management fee.
- (ix) Under the Venture Capital Funds (VCFs) Regulations, 1996, any type of organisation can file an application for being registered as a VCF.
- (x) A venture capital investor can be structured as a limited partnership.

[Answers: (i) False (ii) True (iii) False (iv) True (v) False (vi) True (vii) False (viii) True (ix) False (x) True]

(b) Fill in the blanks with the correct answer (out of the choices provided).

- (i) In the First Chicago Method for valuation of venture capital undertakings _____ (two/three) alternative scenarios are perceived/considered.

The first part of the book is devoted to a description of the various parts of the world, and the manner in which they are situated with respect to each other. The author has endeavored to give a clear and concise account of the most important countries, and to show the manner in which they are connected together by land and sea. He has also taken notice of the principal cities, and the manner in which they are situated with respect to each other. RISK MANAGEMENT

Chapter 27
OPTION VALUATION

Chapter 28
**DERIVATIVES: MANAGING
FINANCIAL RISK**

The framework for an explicit understanding of risk and return and the nature of relationship between them was discussed in Chapter 3. This part explores further how financial managers can deal with various types of risks. Chapter 27 covers option valuation in terms of pay-off boundaries and the relevant factors. It also describes the Black-Scholes model of option valuation. The management of financial risk through derivatives—forwards, futures and options—is described in Chapter 28.

CHAPTER

27

Option Valuation

LEARNING OBJECTIVES

LO 27.1	Define option and describe the two types of options—call option and put option
LO 27.2	Discuss the call option payoffs and the put option payoff—returns and losses to the buyers and sellers of options
LO 27.3	Describe the range/boundaries of the value of call option
LO 27.4	Enumerate the factors—current share price, exercise price, risk-free rate, time to maturity and price volatility of shares—which determine the worth of a call option
LO 27.5	Explain and illustrate the Black-Scholes Option Pricing Model
LO 27.6	Provides option market practices in India

INTRODUCTION

“We should keep our options open” is the phrase preferred in our day-to-day life. The reason is option brings privileged position to its holder by providing him discretion to use it if he so desires. In finance, an option entitles its holder to buy or sell an asset at a specified (predetermined/fixed) price on or before a specified date. Although the concept is generic, option is more commonly used in the context of corporate securities. This Chapter, therefore, focuses on stock/share options only. It describes the concept of option and its types first. Option payoffs and option boundaries have been explained in the subsequent discussions. The factors influencing its valuations are also explained. The Black-Scholes model of option valuation has been described subsequently. The summary of the main points is provided by way of recapitulation.

LO 27.1 OPTION: CONCEPT AND TYPES

Concept

An option belongs to the family of derivative securities. It is a contract that confers the right to its owner/holder but not the obligation to buy or sell a specified security at a specified price on or before a given date. **Options** are a special type of financial contracts in that the buyer of the option has the right to buy or sell the securities but

- **Option**
- is a contract that
- confers to its
- holder/owner the
- right but not the
- obligation to buy/
- sell a specified
- security at a
- specified price on/
- before a given date.

is under no obligation to do so. The buyer of the option is placed in an advantageous/favourable situation as he will exercise his option only when it is profitable to do so. In other words, the seller of the option is in disadvantageous position as he is under obligation to buy or sell the securities in case the buyer exercises his option. In operational terms, the seller/writer of the option runs the risk of loss for assuming which he charges **option premium** from the buyer of the option.

Some options are European while others are American. **American options** are more flexible in nature in that they can be exercised at any time upto the expiration date. In contrast, **European options** can be exercised only on the expiration date. In view of greater flexibility, most exchange traded options are American.

Important Terms Associated with Options

Buyer of an Option is the one, who by paying the option premium buys the right to buy/sell securities but not the obligation to exercise his option on the seller/writer of the option.

Writer of an Option is the one who receives the option premium and is thereby obliged to sell/buy the securities if the buyer exercises the option on him.

Option Price/Premium is the price that the option buyer pays to the option seller. It is aptly referred to as the option premium.

Expiration Date is the date specified in the options contract by which the option can be exercised. It is also known as the exercise date, the strike date or the maturity date.

Strike Price The price specified in the options contract at which the buyer can exercise his right to buy or sell the securities is known as the strike price or the exercise price.

At-the-Money Option is an option that would lead to zero cash flow (no profit no loss) to the holder if it were exercised immediately.

In-the-Money Option is an option that would lead to a positive cashflow to the holder if it were exercised immediately.

Out-of-the-Money Option is an option that would lead to a negative cashflow to the holder if it were exercised immediately.

Types

- **Call option** Options are essentially of two types, namely, call options and put options.
- entitles the holder the right but not the obligation to buy securities. • **Call Option** An **American call option** is a contract that gives the holder the right but not the obligation to buy (i.e., to call in) specified securities at a specified price on or before a specified exercise date. For instance, if an investor buys one call option (normally consisting of 100 shares) on Reliance, he has the right to buy 100 equity shares of Reliance at a specified exercise price anytime between today and a specified date by paying option premium. The fact that the call holder is under no obligation to buy securities implies that he has limited liability. In case the price of the equity shares of Reliance falls at expiration date, he would prefer to walk away from the call contract. In other words, he would not exercise his right to buy equity shares of Reliance. In such a situation, his loss is equal/limited to the option premium paid by
- **American call option** can be exercised at any time up to expiration.

him at the time of contract. Should the price of Reliance shares increase, he would exercise his right to buy these shares and gain from the transaction. His gain is equal to the difference between the share price and exercise price minus the option premium.

In contrast, **European call options** can be exercised only on the maturity date. Since American options provide the owner an additional timing option (to exercise early), they cannot be less valuable than equivalent European options. Given the fact that European options are easier to analyse than American options, and properties of an American option are frequently deduced from those of its European counterpart, our discussion in this Chapter primarily focuses on European options.

The call option buyers expect the price of securities to go up as it benefits them. They are bullish. The reverse holds true for the call writers; they expect/hope the price of securities to fall. They are bearish. In case of the decrease in price, the call buyer does not buy the securities (as the prevailing share price is less than the exercise price). In such a situation, the call writer gains equivalent to the option premium he has received at the time of selling the call option.

From the above discussion, it can be deduced that the value of call option is either zero (when the prevailing share price, S_1 , on the date of maturity is equal to or less than the exercise price, E) or positive (when $S_1 > E$). It cannot be negative as it implies that the call-holder buys the share at E price which is higher than the market price of the share, S_1 . Obviously, no rational investor will act that way. The value of call option (C_1) on its expiration date is given by Equation 27.1.

$$C_1 = \text{Max} (S_1 - E, 0) \quad (27.1)$$

Where Max implies the maximum value of $S_1 - E$ or Zero whichever is higher.

Example 27.1

Suppose the market price of equity share of Reliance on the expiration date is ₹140 and the exercise price is ₹125. The value of call option is ₹15 (₹140 - ₹125). In case, the value of the share on expiration date turns out to be ₹120, the value of C_1 would not be negative ₹5 (₹120 - ₹125); it would be zero as the investor would not purchase shares at ₹125 which is available in the market and thereby incur a loss of ₹5 per share.

The value of call option (for the facts contained in Example 27.1) is shown in Fig. 27.1. The price of share is plotted on X-axis and the call option value on Y-axis. It may be noted that for market price of share less than exercise price, the value of the option is zero; for $S_1 > E$, the option has a positive value and increases in a linear manner, rupee for rupee, with the increase in the share price. For instance, when S_1 goes up from ₹140 to ₹150 (by ₹10), the value of call option also increases by ₹10 (from ₹15 to ₹25).

Gain or Loss Assuming no transaction costs, the purchase of call option primarily requires the payment of premium to the option writer. Assuming premium (P) paid is ₹5 per share, the gain (G) to the call-holder of Reliance (assuming $S_1 = ₹140$) will be reduced by the amount of P as shown by Equation 27.2.

$$\begin{aligned} G &= \text{Max} (S_1 - E, 0) - P \\ &= (\text{₹}140 - \text{₹}125) - \text{₹}5 = \text{₹}10 \end{aligned} \quad (27.2)$$

In case the value of the share is ₹120, the loss to the call-holder would be ₹5 (equivalent to the amount of the premium paid). His loss will not increase to ₹10 ($E - S_1 = ₹125 - ₹120 = ₹5 + ₹5$, premium paid) because the call-holder is under no obligation to buy the share. He will obviously not buy the share at ₹125 whose market price is ₹120. Therefore, it can be generalised that the loss is equal to the premium paid whenever $S_1 < E$. When $S_1 > E$, gain would be as shown by Equation 27.2. This is illustrated in Fig. 27.2. It may be noted from the Figure that the call-holder suffers a

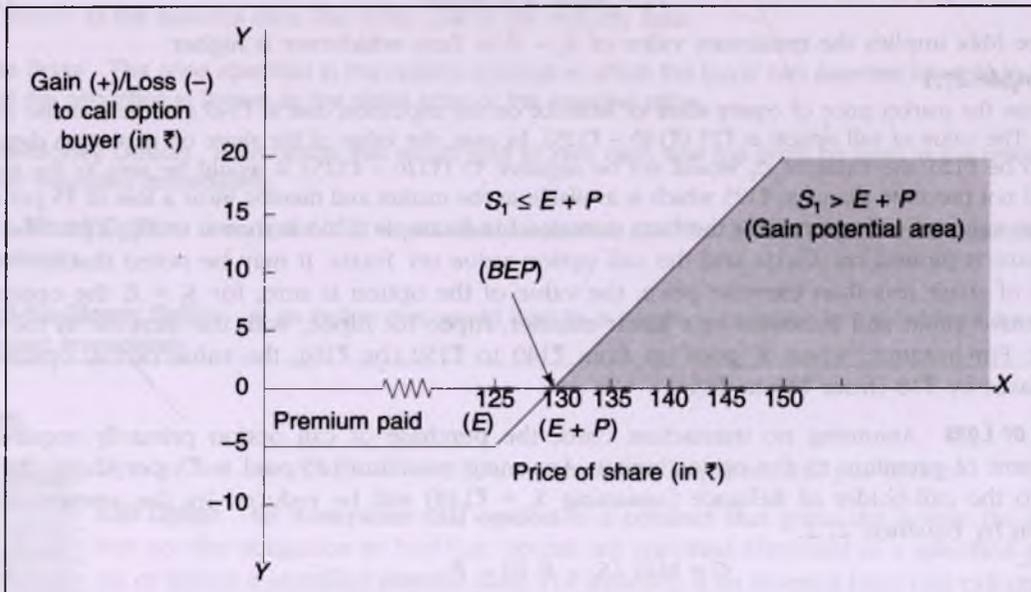

FIGURE 27.2 Gain/Loss to Call Option Buyer

loss until the S_1 rises to the point where it equals $E + P$. This point of equality can be referred to as break-even point (BEP), given by Equation 27.3.

$$BEP = S_1 - (E + P) = \text{zero} \tag{27.3}$$

Beyond the BEP, the call-holder would gain with rise in share prices.

In contrast, the writer of the call option gains as long as the price of the share (S_1) on the date of maturity is less than the sum of exercise price and premium received. Equation 27.4 indicates gain to the writer of the call option.

$$S_1 > (E + P) \text{ subject to } (S_1 - E) < P \quad (27.4)$$

Continuing with Example 27.1, the call option writer gains if the price of the share on the date of expiration is less than ₹130, that is ₹125, $E + ₹5, P$. However, the maximum gain would be ₹5 only (equivalent to the option premium received) and this will accrue to him if $S_1 < E$ at the date of maturity. The profit margin would be lower if $S_1 > E$, but less than $E + P$. Assume Reliance share's market value is ₹128. The call-holder gains by exercising his right to buy Reliance share at ₹125. The call option writer's profit margin would be reduced by ₹3 as he would have to buy the share at ₹128 and sell at ₹125; his profit margin would be ₹2 ($P, ₹5 - ₹3, S_1 - E$).

Whereas the call writer's profits are limited to ₹5 per share, his losses can rise sharply with increase in the market price of the share. Suppose Reliance share's market price jumps to ₹200; his loss will be ₹70 per share ($S_1 - E + P = ₹200 - ₹125 + ₹5$). Figure 27.3 shows the profit or loss position of the call option writer.

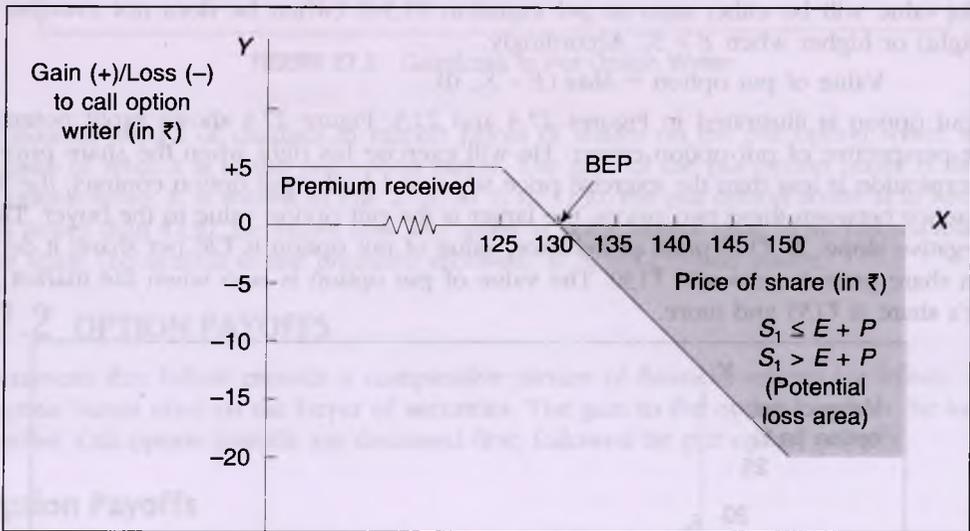

FIGURE 27.3 Gain/Loss to Call Option Writer

The call writer will be at the *BEP* when $S_1 = E + P$. In Example 27.1, he would be at break-even when share price is ₹130 = ₹125, $E + ₹5, P$.

Put Option A put option is just the opposite of a call option. A put option gives the holder the right but not the obligation to sell securities (i.e. to put them) on or by a certain date at a fixed exercise price. In other words, the seller/writer of the put option has the obligation to buy securities in case the put owner decides to exercise his option. Since the put option writer is at the receiving end, he receives the **put premium** (as a compensation for risk assumed) from the put buyer.

The put option holder will exercise his right to sell the securities should the price of the securities fall below the exercise price (E) at the date of expiration. In case

- **Put option**
- entitles the holder
- the right but not
- the obligation to
- sell securities.

- **Put premium**
- is the compensation
- received by the
- put option writer
- from the put option
- buyer.

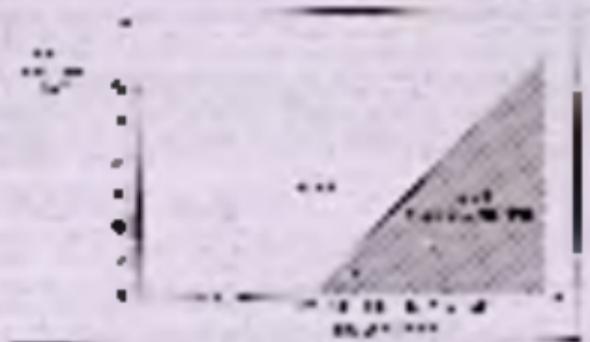

FIGURE 1

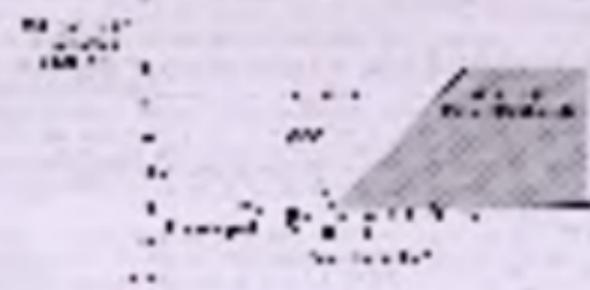

FIGURE 2

The area of a triangle is given by the formula $A = \frac{1}{2}bh$, where b is the base and h is the height. The area of a trapezoid is given by the formula $A = \frac{1}{2}(b_1 + b_2)h$, where b_1 and b_2 are the lengths of the parallel bases and h is the height.

The area of a triangle is given by the formula $A = \frac{1}{2}bh$, where b is the base and h is the height. The area of a trapezoid is given by the formula $A = \frac{1}{2}(b_1 + b_2)h$, where b_1 and b_2 are the lengths of the parallel bases and h is the height.

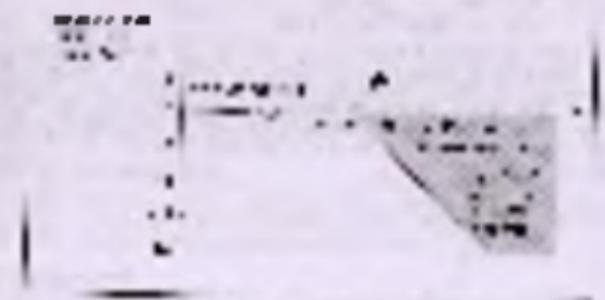

FIGURE 3

The area of a trapezoid is given by the formula $A = \frac{1}{2}(b_1 + b_2)h$, where b_1 and b_2 are the lengths of the parallel bases and h is the height. The area of a triangle is given by the formula $A = \frac{1}{2}bh$, where b is the base and h is the height.

$S_1 > E$, he will prefer to sell at a higher price in the market than to sell to the put option writer. Consider Example 27.2.

Example 27.2

Suppose an investor wants the right to sell Reliance equity shares at ₹135 after 2 months. He is to buy a 2-month put option with a ₹135 exercise price. In case the market price of Reliance share increases to ₹150 ($S_1 > E$), the put option will expire worthless as it will be more profitable for an investor to sell in the open market (at ₹150) than to the put option writer (at ₹135).

Assuming the market price of the share falls below the strike price, say to ₹125, it will be profitable for the put option holder to exercise his put option right as it fetches him ₹135 compared to ₹125 he can otherwise obtain from the market.

Equations 27.5-A and 27.5-B can be inferred from Example 27.2. The equation can serve as a benchmark/guide when to avail put option and when not to avail it.

$$E > S_1, \text{ avail put option} \quad (27.5-A)$$

$$E < S_1, \text{ do not avail put option} \quad (27.5-B)$$

Like call options, put options cannot have negative value as the put option owner will not sell securities at a lower price (compared to the higher price available in the market) to the put option writer. Its value will be either zero as per equation 27.5-B (when he does not exercise his put option right) or higher when $E > S_1$. Accordingly,

$$\text{Value of put option} = \text{Max} (E - S_1, 0) \quad (27.6)$$

The put option is illustrated in Figures 27.4 and 27.5. Figure 27.4 shows profit potential area from the perspective of put option owner. He will exercise his right when the share price on the date of expiration is less than the exercise price stipulated in the put option contract; the bigger is the difference between these two prices, the larger is the put option value to the buyer. The curve has a negative slope. At ₹115 price of Reliance, value of put option is ₹20 per share; it declines to ₹5 when share price increases to ₹130. The value of put option is zero when the market price of Reliance's share is ₹135 and more.

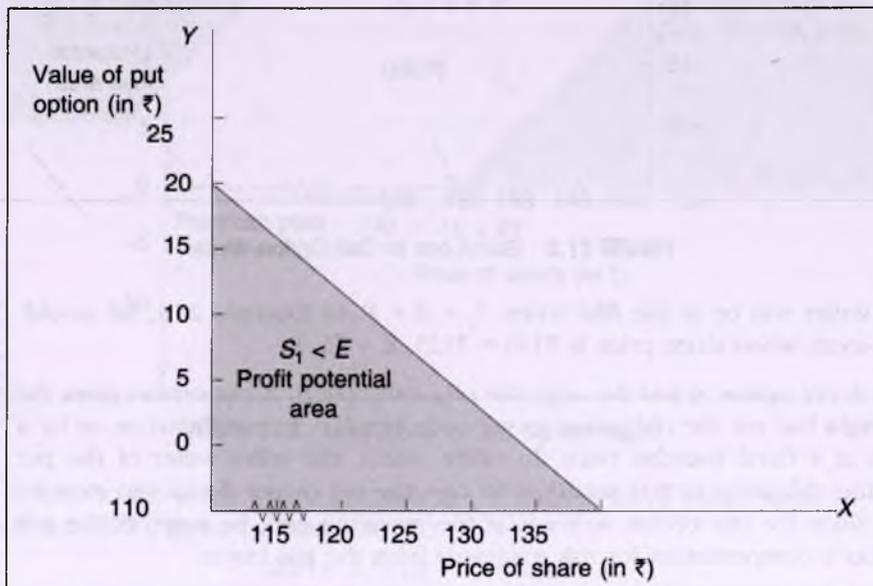

FIGURE 27.4 Value of Put Option to Buyer

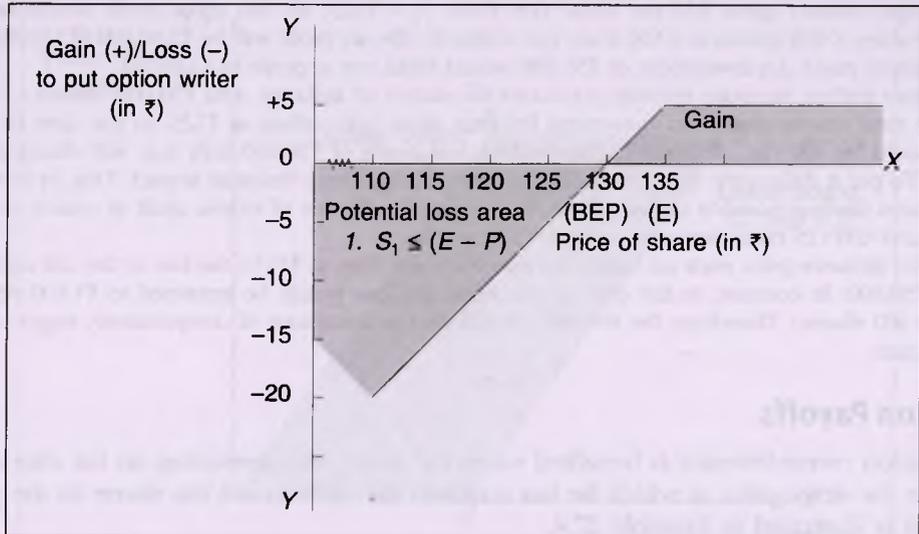

FIGURE 27.5 Gain/Loss to Put Option Writer

The financial impact of changes in market prices of shares on the put option writer is exactly the opposite of what it is to the put option buyer. The gain of the put option buyer is the loss of the put option seller. It is shown in Fig. 27.5. At S_1 of ₹130, the put option writer is at break-even; at prices lower than ₹130, he incurs loss and gains at price higher than ₹130. His maximum gain is ₹5 per share (equivalent to the premium received) at $S_1 = ₹135$ and above.

LO 27.2 OPTION PAYOFFS

The discussions that follow provide a comparative picture of financial returns (or losses) available to the option buyer *vis-à-vis* the buyer of securities. The gain to the option buyer is the loss to the option seller. Call option payoffs are discussed first, followed by put option payoffs.

Call Option Payoffs

The call option owner's loss is limited to the call **option premium**. The profit he can earn is not so limited. In case the market price of the share on the expiration date turns out to be substantially higher than the exercise price, his total profit from the call option contract would be substantial in relation to the investment (equivalent to the call option premium paid up-front) he has made. Consider Example 27.3.

Example 27.3

Suppose an investor buys 3-month 100 call option contracts (one call contract consists of 100 equity shares) of Reliance with strike price of ₹125 and call option premium of ₹5 per share. The one call option contract involves cost/investment of ₹500 (i.e., 100 equity shares \times ₹5). Therefore, the total sum invested is ₹50,000 (i.e. ₹500 per contract \times 100 contracts).

After 3 months, if the market price of Reliance turns out to be ₹125 or less, the option is of no value and the investor loses ₹50,000.

In case Reliance's price moves up to more than ₹125 on the date of expiration of the contract, the investor would exercise his option as the share price exceeds the exercise price. Assume Reliance has risen to ₹150

• Option premium is the price the option buyer pays to the option seller

... of

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

per share. The investor gains ₹25 per share (i.e. ₹150, $S_1 - ₹125$, E). His gross profit would be ₹2,50,000 (i.e. ₹25 per share \times 100 contracts \times 100 share per contract). His net profit will be ₹2,00,000 (₹2,50,000 – ₹50,000 option premium paid). An investment of ₹50,000 would yield him a profit of ₹2,00,000.

To illustrate further, suppose investor purchases the shares of Reliance with ₹50,000 instead of buying call option. The total shares purchased (assuming Reliance share was selling at ₹125 on the date of call option contract) would be 400 (i.e., ₹50,000/₹125), yielding him profit of ₹10,000 only (i.e. 400 shares \times ₹25 profit per share). To put it differently, the option position brings magnifying financial impact. This, in turn, is caused by large shares dealing possible under option. The respective figures of shares dealt in option and purchase are 10,000 and 400 (25 times larger in option).

In case the Reliance price ends up below the exercise price (say, at ₹115), the loss to the call option investor would be ₹50,000. In contrast, in the case of purchase, his loss would be restricted to ₹4,000 only (i.e. ₹10 per share \times 400 shares). Therefore, the investor should also be conscious of comparatively larger losses under option contract.

Put Option Payoffs

The put option owner/investor is benefited when the share price prevailing on the date of maturity is less than the strike price at which he has acquired the right to sell the shares to the put option writer. This is illustrated in Example 27.4.

Example 27.4

Assume an investor buys 3-month 200 put option contracts (each contract involving 100 shares) of Reliance with strike price of ₹200 and put option premium of ₹8 per share. On the date of maturity, Reliance is selling at ₹180.

Solution

- The investor will obviously exercise his option of selling 20,000 shares (200 contracts \times 100) at strike price of ₹200 as the market price is lower at ₹180.
- His gross profit will be ₹4 lakh (i.e. 20,000 shares \times ₹20 profit per share).
- His net profits will be ₹2.4 lakh (i.e. ₹4 lakh – put option premium of ₹1,60,000 on 20,000 shares @ ₹8 per share).
- Had he invested ₹1.6 lakh in Reliance, his shares purchases would have been ₹1,60,000/₹200 = 800.
- Instead of earning profits, he would have, in fact, suffered a loss of ₹16,000 (i.e. 800 shares \times ₹20 per share) in case of purchase of shares.
- In case the market price of Reliance ends up with a price higher than strike price (say, ₹210), the put option has zero value as the investor can sell his shares in open market at a higher price.
- He would lose ₹1.6 lakh put option premium.
- He would have gained ₹8,000 by investing in shares (₹10 \times 800 shares owned).
- Thus, the risk-return trade-off in put option is of more severe nature than in call option.

LO 27.3 CALL OPTION BOUNDARIES

Hitherto we have focussed on call option valuation on the date of its maturity. What will be its value before maturity? To explain the concept let us consider Example 27.3 where the option is to buy Reliance shares at ₹125. In case the ruling price on the exercise date is less than ₹125, the call option has zero value; if the share price turns out to be higher than ₹125, the option would have worth equivalent to the price of the share (S_1) minus the exercise price (E). This position was depicted in Fig. 27.1.

Even before maturity, the price of the call option can never remain below the heavy line in Fig. 27.6 (replicated from Fig. 27.1) as the value of option can never be negative and its worth will be positive at least equivalent to $S_0 - E$ when the price of the share (before maturity) is higher than the exercise price. Otherwise, it will create/cause arbitrage opportunity. Continuing with our Example

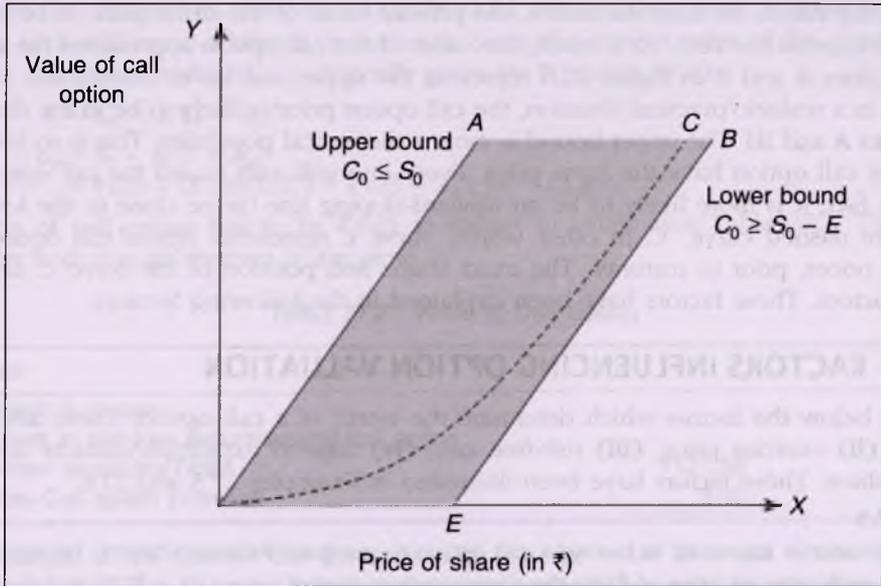

FIGURE 27.6 Upper and Lower Boundaries of Call Option Value

27.3, suppose Reliance share is selling at ₹133 (with strike price of ₹125 and call option premium of ₹5). Clearly, there are profit opportunities; the arbitrageur/investor can buy the call for ₹5 and immediately exercise it by buying shares at ₹125; his total cost/investment is ₹130 per share; by immediately selling it at ₹133, he earns *riskless profit* of ₹3 per share. What holds true for the hypothetical investor will also be applicable to other investors in the well-organised/**efficient markets**. As a result, there will be more demand for call option (at ₹5) till such time there is an upward revision of the option price (in this case to ₹8). Therefore, to prevent arbitrage, the value of the call today (C_0) must be either greater than or equal to the difference of the share price today (S_0) and the exercise price. In equation terms:

$$C_0 \geq S_0 - E \quad (27.7)$$

From the above, it can be deduced that the call options which have still some time to run have their *lower bound* either zero or $S_0 - E$, whichever is higher. This has been depicted by point A in Figure 27.6.

The lower bound determines the **intrinsic value** of the call option. The intrinsic value of a call is the amount the option is *in the money (ITM)*, that is, the excess of share price over exercise price; if it is *out of the money (OTM)*, that is, the exercise price is higher than share price; its intrinsic value is zero. On the other hand, the *time value of an option* is the difference between the option premium and its intrinsic value. The longer the time to expiration, the greater is an option's time value, other things being equal. At expiration, an option would have no time value.

The highest value of the call option (*the upper bound*) can never be more than the price of the share itself (shown as point B in Figure 27.6). This value can be reached only if the option has a very long time to expiration or is not likely to be exercised

- **Efficient markets** embrace all information and arbitrage opportunities do not exist.

- **Intrinsic value of a call** is the excess of share price over exercise price.

- **Time value of an option** is the difference between the option premium and the intrinsic value.

The first part of the paper is devoted to a general discussion of the problem of the structure of the polymer chain. It is shown that the structure of the polymer chain is determined by the nature of the monomer and the conditions of polymerization. The second part of the paper is devoted to a detailed study of the structure of the polymer chain. It is shown that the structure of the polymer chain is determined by the nature of the monomer and the conditions of polymerization.

until far into the future. In these situations, the present value of the strike price to be paid in very distant future approaches zero. As a result, the value of the call option approaches the value of the share. Thus, lines A and B in Figure 27.6 represent the upper and lower boundaries.

However, in a realistic/practical situation, the call option price is likely to be in the shaded region (between lines A and B). The upper bound is more a theoretical possibility. This is so because if the share and the call option have the same price, every one will rush to sell the call option and buy the share. In fact, it is more likely to be an upward-sloping line (more close to the lower bound) shown by the dashed curve, C. In other words, curve C represents *typical* call option values at varied share prices, prior to maturity. The exact shape and position of the curve C depends on a number of factors. These factors have been explained in the following Section.

LO 27.4 FACTORS INFLUENCING OPTION VALUATION

We describe below the factors which determine the worth of a call option. These are: (i) current share price, (ii) exercise price, (iii) risk-free rate, (iv) time to expiration/maturity and (v) price volatility of share. These factors have been illustrated in Examples 27.5 and 27.6.

Example 27.5

Suppose an investor is interested in buying a call option to purchase Reliance share to be exercised exactly after one year with exercise price of ₹130; the share's current market price (S_0) is ₹125 and the risk-free rate available on T-bills (R_f) is 7 per cent.

Assume further that the share price of Reliance will be either ₹140 or at ₹160 after one year. Since the exercise price is ₹130, the call option will either carry the value of ₹10 (i.e. ₹140 – ₹130) or of ₹30 (i.e. ₹160 – ₹130). In both the situations, the call option will be in the money to the investor.

Let us assume further that the investor wants to have the same value of investment/financial return (i) either from purchase of shares (ii) or from buying a call option. In case of the latter alternative, the investor is required to invest present value of the exercise price (₹130) in T-bills/risk-free securities to exercise call option at year-end 1. The requisite sum is provided by Equation 27.8.

$$E/(1 + R_f)^t \quad (27.8)$$

$$= ₹130/(1 + 0.07)$$

$$= ₹130 \times 0.935 \text{ (PV of rupee one at year-end 1 discounted at 7 per cent as per Table A-1).}$$

In both the situations the value of his investments (depending on the price of share at year-end) will be the same as shown in Table 27.1.

TABLE 27.1 Value of Investment at Year-end 1 (i) When Shares are Purchased and (ii) When Call Options are Purchased in Conjunction with Treasury Bills

Particulars	Amount (year-end 1)
(a) When call value is ₹10:	
(i) Compounded value of ₹121.55 invested at 7 per cent risk-free rate [₹121.55 (1 + 0.07)]	₹130
(ii) Plus call value	10
(iii) Equal to market price of share	140
(b) When call value is ₹30:	
(i) Compounded value of ₹121.55	130
(ii) Plus call value	30
(iii) Equal to market price of share	160

Since both the alternatives have the same financial returns, they must *a priori* have the same value today or it will cause arbitrage opportunity. Since the current price of the share is ₹125, the value of the call option today (C_0) is logically given by Equation 27.10.

$$S_0 = C_0 + E/(1 + R_f)^t \quad (27.9)$$

$$\text{Or } C_0 = S_0 - E/(1 + R_f)^t \quad (27.10)$$

$$= ₹125 - (₹130/1.07) = ₹125 - 121.55 = ₹3.45$$

The value of call option has to be ₹3.45 as shown in verification Table 27.2. The investment outlay under both the alternatives is the same.

TABLE 27.2 Value of Call Option

Particulars	Amount
(A) Investment in shares	₹125
(B) Investment in risk-free securities and call option	
Risk-free securities/T-bills	₹121.55
Plus: Call option premium	3.45
	125

From Equation 27.10, follows the generalisation that the value of a call option is the current market price of share less the present value of exercise price (discounted at risk-free rate of return). To put it differently, the value of call option is a function of (i) current share price, S_0 , (ii) exercise price, E , (iii) risk-free rate of return, R_f and (iv) time to expiration, t . The impact of these factors on call option value is now explained.

Current Share Price

The current share price prevailing in the market has a positive impact on the call value. In other words, the higher is the current market price (S_0), the higher is the value of the call option. Other things being equal, assume in Example 27.5, the value of S_0 is ₹127 (instead of ₹125), the value of call option, C_0 increases by ₹2 [from ₹3.45 to ₹5.45 (i.e. ₹127 – ₹121.55)].

Exercise Price

The exercise price on the date of expiration has a negative influence on the value of a call option, that is, the value of C_0 is negatively related to E ; the higher the value of E , the lower is the value of C_0 and *vice-versa*. Assuming other factors constant and the value of E increases to ₹132, the value of C_0 decreases to ₹1.68 (i.e. ₹125 – ₹123.42, *PV* of ₹132 × 0.935).

Risk-Free Rate

Risk-free rate (interest rate) has a positive relationship with the value of call option. The higher is the interest rate the higher is the C_0 . This is so because the final payment for the purchase of shares is delayed till the time the option is exercised at some future date. The higher is the R_f , the lower is the *PV* of exercise price; since this price is to be subtracted from S_0 as per Equation 27.10, the value of call option increases. To put differently, the *PV* of exercise price will be less with higher discount rate causing higher value of C_0 . Assuming 10 per cent discount rate (in place of 7 per cent), the value of C_0 increases to ₹6.83 (i.e. ₹125 – ₹118.17, *PV* of ₹130 × 0.909, *PV* factor at 10%), other factors remaining unchanged.

Time to Expiration/Maturity

It is very evident from the right part of Equation 27.10, $[E/(1+r)^t]$ that the higher is the value of t , the lower will be the present value of exercise price (to be paid in future year, t). Since this amount is to be subtracted from S_0 , to determine C_0 , it obviously implies the higher value of call option, assuming other things remain constant. In Example 27.5, let us assume time to expiration of 2 years instead of one year. The value of call option enhances to ₹11.51 (i.e. ₹125 – ₹113.49, PV of ₹130 × 0.873, PV factor for two years at 7 per cent rate of discount).

The above four factors are the only relevant factors affecting the value of call option when an option is certain to finish in the money. However, in practice, the option may finish out of the money also. In the latter situation, the fifth factor related to price volatility of share becomes relevant. This is illustrated in Example 27.6.

Example 27.6

For the facts in Example 27.5 assume that (i) the exercise price is ₹145 instead of ₹130 and (ii) current market price of the share is ₹135 and not ₹125. Determine the value of call option.

In case, the share price of year-end 1 ends up at ₹140, the value of call option will be zero as $S_1 < E$ (₹140 < ₹145). If the share price ends up at ₹160, the value of call option will be (₹160 – ₹145) = ₹15.

The basic approach of determining the value of the call option remains the same, that is, the payoffs to the investor should be identical whether he purchases shares or he goes for a combination of buying risk-free asset and call option.

To make the two alternatives comparable, (i) the investor will be required to invest the present value of the lower price of the share in a riskless asset and (ii) purchase the number of call options, determined by Equation 27.11.

$$\Delta S / \Delta C \quad (27.11)$$

Where ΔS = Difference in possible share prices, and ΔC = Difference in call option values.

Accordingly,

- (i) The investor will be required to invest ₹130.90 (i.e. ₹140 × 0.935, PV factor at 7 per cent for one year).
- (ii) The number of call options purchased is 4/3, that is,

$$\frac{\text{₹160} - \text{₹140}}{\text{₹15} - \text{zero}}$$

Thus, either buying 4/3 call options and investing ₹130.90 in a riskless security or making investment in shares fetch the identical financial returns to the investor (Table 27.3)

TABLE 27.3 Value of Investment at Year-end 1 (i) When Shares are Purchased and (ii) when Call Options are Purchased in Conjunction with Treasury Bills

Particulars	Amount (year-end 1)
(A) When call value is zero	
(i) Compounded sum of ₹130.90 (1 + 0.07)	₹140
(ii) Plus call value	0
(iii) Equal to market price of share	140
(B) When call value is ₹15	
(i) Compounded sum of ₹130.90	140
(ii) Plus call value (₹15 × 4/3)	20
(iii) Equal to market price of share	160

Since both the alternatives have exactly the same value in the *future*, they should have the same value *today*; otherwise, difference in value gives rise to arbitrage. The value of call option (C_0) should be:

$$\begin{aligned} S_0 &= 4/3 C_0 + (\text{₹}140/1 + R_f) \\ \text{₹}135 &= 4/3 C_0 + \text{₹}130.90 \\ 4/3 C_0 &= \text{₹}135 - \text{₹}130.90 = \text{₹}4.10 \\ C_0 &= (\text{₹}4.10 \times 3)/4 = \text{₹}3.075 \end{aligned}$$

Each call option is worth ₹3.075. Table 27.4 contains its verification.

TABLE 27.4 Value of Call Option

(A) Investment in shares		₹135
(B) Investment in risk free security and call option:		
Purchase of Treasury Bills	₹130.90	
Add: Call option premium (₹3.075 × 4/3)	4.10	135

Thus, with the same investment outlay/cost (of ₹135) both the alternatives yield the same value to the investor.

Price Volatility of Share

Volatility in the share price significantly influences the call option value. In operational terms, the greater is the possibility of extreme outcomes, the greater is the call option value to its holder, all other things remaining the same. In statistical terms, the greater is the variance/standard deviation of the financial returns on the associated share, the more is the worth of the option to its owner. The reason is that a decrease in the lower possible share price, say, to ₹130 (from ₹140 in Example 27.6) does not cause loss to the call owner as the call option worth remains zero at both the levels of price. However, any possible increase in the upper share price (say, to ₹170 from ₹160) makes the option worth more as the call option is in the money.

To make things more explicit, the value of C_0 is determined with reference to new set of possible market prices of the underlying share for the facts contained in Example 27.6. The steps involved are as follows:

- (i) The investor is required to invest in risk free security/treasury bills equivalent to the present value of the lower share price (₹130 in this case); the amount of investment is ₹121.55 (discount rate is 7 per cent). In addition, he is to buy 1.6 call options (explained in step ii). In case, the share price ends up at ₹130, the call option has no value as the exercise price is ₹145.
- (ii) In case the share price turns out to be ₹170, the call option has worth of (₹170 - ₹145) ₹25. The investor would get ₹130 from his investments in risk-free asset. He would fall short of ₹40 to make his portfolio worth of ₹170 (equal to the share price). Since, one call is worth of ₹25, the required number of calls to be purchases is (₹40/₹25) 1.6.
- (iii) Alternatively, the number of call options to be purchased to make it equal to the price of a share can be determined by Equation 27.11.

$$\frac{(\text{₹}170 - 130) = \text{₹}40}{(\text{₹}25 - 0) = \text{₹}25} = 1.6$$

Since the variance of the financial return associated with the security has increased (in view of greater span of plausible price range, now of ₹130 and ₹170 *vis-à-vis* ₹140 and 160 earlier) the call value has risen to ₹8.4 as shown below.

$$₹135 = 1.6 C + ₹130/(1 + 0.07)$$

$$1.6 C = ₹135 - ₹121.55 = ₹13.45$$

$$C_0 = ₹13.45/1.6 = ₹8.406$$

With increased volatility in share prices as reflected in the higher value of variance, the value of C_0 has more than doubled from ₹3.075 to ₹8.406.

Assigning Probabilities Hitherto volatility in share prices has been explained without assigning any probability. The induction of an element of probability would provide more insight into the matter. Consider Example 27.7.

Example 27.7

An investor is considering call option on the two shares, X and Y. Details are as follows:

Particulars	Probability	Share price	Expected share price
Share X:	0.10	₹90	₹9
	0.25	108	27
	0.30	120	36
	0.25	132	33
	0.10	150	15
			120
Share Y:	0.10	60	6
	0.25	90	22.5
	0.30	120	36
	0.25	150	37.5
	0.10	180	18.0
			120.0

The expected value of share price at the end of the period is the same for both shares, X and Y: ₹120. There is a much larger dispersion of possible outcomes for share Y (the range being ₹60 – ₹180) *vis-à-vis* share X (the range of price variation is ₹90 – ₹150). Suppose the exercise prices of both the shares at year-end 1 is ₹115. Will these shares (having the same expected value of ₹120 and the exercise price of ₹115) have the same call value? Since the price volatility is comparatively more in share Y, its call option value is higher at ₹16.75 than that of share X of ₹9.25 (Table 27.5).

TABLE 27.5 Determination of Call Option Value

Particulars	Expected share price	Exercise price	Call value	Probability	Expected call value
Share X:	₹90	₹115	₹0	0.10	₹0
	108	115	0	0.25	0
	120	115	5	0.30	1.50
	132	115	17	0.25	4.25
	150	115	35	0.10	3.50
					9.25
Share Y:	60	115	0	0.10	0
	90	115	0	0.25	0
	120	115	5	0.30	1.50
	150	115	35	0.25	8.75
	180	115	65	0.10	6.50
					16.75

To conclude, the greater is the dispersion of the possible outcomes for share prices, the greater is the call option value. Thus, there are five factors which have a bearing on the value of call option*. Their impact on the value of call option in terms of their positive or negative relationship is shown in Exhibit 27.1.

EXHIBIT 27.1 Factors Affecting Call Value

Factor	Impact
Current share price	Positive (+)
Exercise price	Negative (-)
Risk-free rate of return/Interest-rate	Positive (+)
Time to expiration on the option	Positive (+)
Variance/Price-volatility of share	Positive (+)

Finally, the stock index options (say NIFTY Index) are valued in the same way as options related to ordinary/equity shares. The market lot size of stock index options for trading purposes in India is 200.

So far we have considered simple examples showing how to value a call option. In fact, the option value was applicable only for the given example. In the following section, a more comprehensive and precise option valuation framework known as the Black-Scholes option pricing model (associated with seminal work of Fischer Black and Myron Scholes) is discussed.

LO 27.5 THE BLACK-SCHOLES OPTION PRICING MODEL

Black and Scholes (BS) developed a precise model to arrive at the equilibrium value of an option. Before the BS model is discussed in detail, it will be useful to understand the concept of **option equivalent**. The concept involves the purchase of a certain number of equity shares (say Δ shares) through the partial sum raised by debt. This combination should be such that the payoffs from the levered investment in the share (or index) are identical to the payoffs from the call option. This is illustrated in Example 27.8.

- Option equivalent
- involves purchase of equity shares partially through debt.

Example 27.8

Suppose an investor can purchase one-year call option of Reliance with an exercise price of ₹150; its current market price is also ₹150. The interest rate is 10 per cent. It is assumed that in a year's time only two things are possible. Its price may fall by 10 per cent to ₹135 or increase by 20 per cent to ₹180. In case Reliance share price decreases to ₹135, the call option will be worthless and have zero value. However, if the price increases, the call option will be worth (₹180 - ₹150) ₹30. The possible payoffs from the call option are either zero or ₹30. The payoffs from the levered investment in shares must be identical to that of call option so that both the investments have the same value.

- Black Scholes option pricing model
- is a precise model to arrive at the equilibrium value of an option.

To ascertain the number (or a fraction) of shares to be purchased, the amount to be borrowed and other aspects, the following steps are suggested.

- (i) The inverse of the ratio $\Delta S \div \Delta C$ given by Equation 27.11 referred to as **hedge ratio** or **option delta** is useful here. Symbolically,

$$\begin{aligned} \text{Option delta} &= \frac{\text{Spread of possible option prices, } \Delta C}{\text{Spread of possible share prices, } \Delta S} && (27.12) \\ &= (\text{₹}30 - 0) / (\text{₹}180 - \text{₹}135) = \text{₹}30 / \text{₹}45 = 2/3 \end{aligned}$$

- (ii) The option delta of 2/3 implies that the investor will buy 2/3 of Reliance share and borrow ₹81.82. (explained in step iii).
- (iii) Investor will borrow ₹81.82 at 10 per cent; the *modus-operandi* of determining ₹82.82 is explained in Table 27.6.

TABLE 27.6 Payoffs with Purchase of 2/3 Share with Borrowings

Particulars	Possible share price at year-end 1	
	₹135	₹180
2/3 market price of a share	90	120
Less: Payoffs (as under call option)	0	30
Repayment of loan along with interest	90	90
Borrowings at $t = 0$ [$₹90/(1 + 0.1)$] = ₹81.82		

- (iv) Since both alternatives yield identical payoffs, both investments today must have the same value to avoid arbitrage (explained earlier).

$$C_0 = \text{Value of } 2/3 \text{ of a share} - \text{Borrowings} \\ = ₹100 - ₹81.82 = ₹18.18.$$

The call option should sell at ₹18.18. The net cost of buying the *option equivalent* (Price of 2/3rd share, ₹100 – Borrowings, ₹81.82) is equal to the value of call option.

The BS Formula

Pricing of an option requires building a portfolio in shares and a loan in such a manner that its payoffs are equivalent to the payoffs from the option. We also know that there are five factors which influence the value of option: current share price, exercise price, risk free rate of interest, time to expiration on the option and price volatility of share (measured in terms of variance).

The BS model/formula makes, *inter-alia*, use of the above propositions and factors to determine the value of call option. The additional/redeeming feature of the BS model is that it takes into account the changes in the price of shares at shorter and shorter intervals, with each interval showing two possible changes in share; eventually, a situation is reached in which price of the share is changing continuously and generating a continuum of possible share prices, and, therefore, to replicate option investors must continuously adjust their holdings in the shares. Though in practice, it is not feasible, the BS formulas (explained below) performs remarkably well in the real world where shares trade only intermittently and prices jump from one level to another. In fact, it has become the standard model for valuing options and is used by dealers on the options exchange.

Assumptions⁵ The BS model is based on the following assumptions.

- (1) It considers only those options which can be exercised at their maturity, that is, European options.
- (2) The market is efficient and there are no transaction costs and taxes. Options and shares are infinitely divisible. Information is available to all investors with no costs.
- (3) The risk-free rate or interest rate are known and constant during the period of option contract. Investors can borrow as well as lend at this rate.
- (4) No dividend is paid on the shares.
- (5) Share prices behave in a manner consistent with a random walk in continuous time.
- (6) The probability distribution of financial returns on the share is normal.
- (7) The variance/standard deviation of the return is constant during the life of the option contract and is known to market participants/investors.

Given these assumptions, the Black-Scholes formulas for the prices of European calls and puts on a non-dividend paying stock are:

$$C = SN(d_1) - Ee^{-rt} N(d_2) \quad (27.13)$$

$$P = Ee^{-rt} N(-d_2) - SN(-d_1) \quad (27.14)$$

Where
$$d_1 = \frac{\ln S/E + (r + \sigma^2/2)t}{\sigma\sqrt{t}}$$

$$d_2 = d_1 - \sigma\sqrt{t}$$

or
$$\frac{\ln(S/E) + \left[r - \frac{1}{2}\sigma^2\right]t}{\sigma\sqrt{t}}$$

- The Black-Scholes equation is done in continuous time. This requires continuous compounding. The r is short-term annual interest rate compounded annually.
- $N(d)$ is the cumulative normal distribution. $N(d_1)$ is called the *delta of the option*, which is a measure of change in option price with respect to change in the price of the underlying asset.
- σ , a *measure of volatility*, is the annualised standard deviation of continuously compounded returns on the underlying stock. When daily sigma are given, they need to be converted into annualised sigma.
- $\text{Sigma}_{\text{annual}} = \text{sigma}_{\text{daily}} \times \sqrt{\text{Number of trading days per year}}$. On an average, there are 250 trading days in a year.
- E is the exercise price, S the spot price and t the time to expiration measured in years.
- e is 2.71828, the base of natural logarithms and \ln is natural logarithm.

In Equation 27.13 $N(d_1)$ represents the option delta or hedge ratio (already explained). The ratio indicates number of shares required to be purchased for each option to maintain a fully hedged position. Further, the option holder is considered as a levered investor and, hence, is required to borrow an amount equal to the present value (PV) of exercise price at risk-free interest rate. The aspect of loan is represented on the right side of Equation 27.13; it indicates the PV of the exercise price times an adjustment factor of $N(d_2)$. In simple terms, Equation 27.13 shows the following value of call option,

$$C = (\text{Option delta} \times \text{Share price}) - \text{Loan adjusted} \quad (27.15)$$

Application of BS Model The solution of BS formula requires five variables. Out of these 5 variables, the four variables, namely, E , R , T and S are easily observable/known to market participants. The only unknown variable is the standard deviation of the share price; its value can be determined by referring to weekly observations of the share prices in the immediate preceding year; this value of standard deviation can, then, be used as a surrogate in the BS formula. The application of BS formula is illustrated in Example 27.9.

Example 27.9

From the following information available to a market participant, determine the value of an European call option as per the BS formula.

Spot price of the share = ₹1,120

Exercise price of the call option = ₹1,100

Short-term risk-free interest rate (continuously compounded) = 10 per cent per annum

Time remaining for expiration = 1 month

Volatility of the share/standard deviation = 0.2

Solution

$$C = SN(d_1) - Ee^{-rt} N(d_2)$$

$$d_1 = \frac{\ln S/E + (r + \sigma^2/2)t}{\sigma\sqrt{t}}$$

$$= \frac{\ln(1,120/1,100) + (0.1 + (0.2)^2/2)(0.08)}{0.2\sqrt{0.08}}$$

$$= \frac{\ln(1.02) \text{ (as per Table A-6)} + (0.1 + 0.02)(0.08)}{0.2 \times 0.28284}$$

$$d_1 = \frac{0.019803 * \text{(As per Table A-6 (website**))} + (0.12)(0.08)}{0.2 \times 0.28284} = 0.5197^*$$

$$d_2 = 0.5197 - 0.2\sqrt{0.08}$$

$$= 0.5197 - 0.2(0.28284)$$

$$= 0.5197 - 0.056568 = 0.4631$$

$$Ee^{-rt} = 1100e^{-0.008}$$

$$1100e^{-0.01}$$

$$1100[0.9901 \text{ As per Table A-7 (website**)}]$$

$$= 1089.1$$

$$C = 1120 N(0.5197) - 1089.1 N(0.4631)$$

= Values of $N(0.5197)$ and $N(0.4631)$ have been determined with reference to cumulative standardised normal probability distribution Table A-8 (website**)

$$= 1120 [N(0.51) + 0.97 (N(0.52) - N(0.51))]$$

$$= 1089.1 [N(0.46) + 0.31 (N(0.47) - N(0.46))]$$

$$= 1120 [0.6950 + 0.97 (0.6985 - 0.6950)] - 1089.1 [0.6772 + 0.31 (0.6808 - 0.6772)]$$

$$= 1120 [0.6950 + 0.003395] - 1089.1 [0.6772 + 0.001116]$$

$$= 1120 [0.698395] - 1089.1 [0.678316]$$

$$= 782.20 - 738.75 = 43.45$$

Thus, the value of the call option is ₹43.45.

From Example 27.9, it is evident that the application of the BS formula is straight forward, given the availability of statistical tables, computer package or specifically programmed calculators to determine the required inputs. The model has immense theoretical and practical significance to identify the over-valued and under-valued options in the market.

LO 27.6**OPTION MARKET IN INDIA**

- The vast majority of participants have relatively a meagre share (upto 20 per cent) in the options compared with other derivative products in the portfolio.
- They have accorded relatively less weightage to options; their major interest being in future contracts.
- An overwhelming majority (95 per cent) of the respondents have been using the option market primarily for hedging; speculation has been the second most preferred objective (75 per cent); and arbitrage emerged as the least preferred objective.

- The respondents encounter more difficulty in valuation of options *vis-à-vis* futures.
- The Black-Scholers (BS) model (of valuing options) has been found to be the most popular amongst the respondents compared with the other two models, namely, Binomial-Tree (BT) and Hull and White (HW) models, the respective percentages being 49, 3 and zero.
- Respondents using BD and BT models (in pricing options) have not considered all the factors reckoned by these models in valuating options; out of six factors, two factors, namely, interest rate and dividend yield have generally not been used.
- A significant number of respondents do not have a proper understanding of the put-call-parity (PCP) relationship. The finding has serious implications for the pricing efficiency of options in India, as the PCP relationship helps to identify the pricing anomalies/arbitrage opportunities to the relative price of call and put options and, in turn, helps to restore equilibrium in the market.
- Majority of the respondents perceived that options in Indian securities market are not correctly priced, causing arbitrage opportunities to exist in the market.
- The vast majority of respondents strongly feel the need of enhanced investors' education on derivatives and recommend for a separate educational body with the public-private partnership (PPP) kind of ownership pattern.

Source: Dixit, Alok, Surendra S Yadav and P K Jain, "Pricing of Options in Indian Derivatives Market: A Survey of Trading Members Organizations", *South Asian Journal of Management*, Vol. 17, No. 4, 2010, pp. 105-132.

SUMMARY

Options are a special type of financial contracts under which the buyers of the options have the right to buy or sell the shares/stocks but do not have obligation to do so.

Essentially, options are of two types: call and put. A call option gives the holder the right, but not the obligation to buy specified stocks at a specified price (known as the exercise price) on or before a specified maturity date. A put option provides the holder the right, but not the obligation to sell securities on or by a certain date at a predetermined exercise price.

The buyer of an option (of call as well as put) is in a privileged position as he will exercise it when he finds it profitable. In other words, the seller/writer of the option is under obligation to buy or sell the securities in case the buyer decides to exercise his option. The writer of the option runs the risk of loss. For assuming such a risk, he is paid option premium by the option buyer; the higher is the risk, the higher is the option premium.

Options can either be an European or an American. While an European option can be exercised only on the expiration date, an American option is more flexible in nature and can be exercised at any time up to the expiration date.

Since the buyer of the option has the right to buy (in the case of call option) and sell (in the case of put option) the stock at a predetermined fixed exercise price, its value at a maturity/expiration date depends on the price of the associated stock on such a date. The value of the call option on the date of maturity is equal to the price of the stock on this date minus the exercise price. It cannot be a negative value as it implies that the call-holder buys the stock at an exercise price (E) which is higher than the market price of the share (S_1). The value of a call option (C_1) on its expiration date is either positive ($S_1 > E$) or zero.

As the call owner is to pay option premium (P), his profit would be $S_1 - (E + P)$. In case the price of a share is less than or equal to exercise price ($S_1 \leq E$), he incurs loss equivalent to the amount of call option premium paid up-front by him. He is at the break-even point (BEP) when $S_1 - (E + P) = \text{zero}$.

LO 27.1	The put option holder will exercise his right to sell the securities if the price of securities fall below the exercise price at the date of expiration. Accordingly, the value of a put option (P_1) is equal to the difference between the exercise price and stock price ($E - S$). Like call options, put options cannot have negative value as the put-owner will obviously not sell at a price lower than the market price ($E < S_1$). In such a situation, his loss is equal to the put option premium. He is at the BEP when $E - (S_1 + P) = \text{zero}$.
LO 27.2	The option - payoffs are very attractive because while the option owner's loss is limited (to the extent of option premium paid), his gains are not so limited. For instance, in the case of a call option, if the market price of the share turns out to be substantially higher than the exercise price, total profit accruing to him will be substantial, in relation to the investment (of option premium) he has made. In other words, options have magnifying financial impact. This, in turn, is caused by large scale dealing possible under option contracts <i>vis-à-vis</i> the investment in shares.
LO 27.3	The value of the option is to be in a certain range. While upper range/bound of a call option can never be more than the price of share, its lower bound/range is either zero or equal to the price of the share less exercise price ($C_0 \geq S_0 - E$) which ever is higher. However, in a real/practical market situation, the upper bound is more a theoretical possibility; it is more close to the lower bound. Its value depends on five factors: (i) current share price, S_0 , (ii) exercise price, E , (iii) risk-free rate of return, R_f , (iv) time to expiration, t and (v) price-volatility of stock (measured in terms of variance/standard deviation).
L 27.4	The value of call option (C_0) is $= S_0 - E/(1 + R_f)^t$. The value of C_0 is affected positively by increase in current share price, increase in the risk-free rate of return/interest rate and time to expiration of the option; exercise price has a negative relationship with its value. The greater is the price volatility of share, the greater is the value of the option, all other things remaining the same. In efficient markets, it is possible for the market participant (say, call-buyer) to establish a riskless hedged position. The payoffs to the investor would be identical whether he invests in shares or goes for a combination of buying risk-free security (say, invest in treasury bills) and call option from the same investment. This situation of identical payoffs enables us to determine the value of call option at the beginning of the period itself (C_0). Difference in payoffs give rise to riskless arbitrage opportunities to investors. In an efficient/well-organised market, significant arbitrages will, of course, be rare.
LO 27.5	The Black-Scholes option pricing model provides a precise formula to determine the value of call as well as put options. Given certain assumption, the BS formula requires input of five variables, namely, spot price of the share, exercise price, short-term risk-free interest rate (continuously compounded), time remaining for expiration and standard deviation. Out of these five variables, the first four are known to the market participants. The fifth variable related to standard deviation can be determined by referring to weekly observations of the share prices in the immediate preceding year. Given the availability of computer package or specifically programmed calculators, the application of BS formula, in practice, is straight forward and widely used by dealers for valuing options on the options exchange.

SOLVED PROBLEMS

P.27.1 An investor has purchased a 4-month call option on the equity share of Birla company for ₹5. It has a present market price per share of ₹112, exercise price of ₹120. At the end of 4 months, the investor expects the price of share to be in the following range of ₹90 to 170 with varying probabilities. LO 27.1,4 LOD M

Expected price	₹100	₹110	₹125	₹150	₹170
Probability	0.10	0.25	0.30	0.25	0.10

From the above, you are required to answer the following:

- What is the expected value of share price 4-months hence? What is the value of call option at its expiration (C_1) if the expected value of share price prevails at the end of 4 months?
- Determine the expected value of option price at maturity, assuming that the call option is held to this time. Why does it differ from the option value determined in part (i)?
- What is the theoretical value of the option, at the beginning of 4-month period? Give comments on the market value of the call option in relation to its theoretical value.

Solution

(i) Expected value of share at the end of 4 months

Expected price	Probability	Expected value of share price
₹100	0.10	₹10.00
110	0.25	27.50
125	0.30	37.50
150	0.25	37.50
170	0.10	17.00
Expected value of share price		129.50

$$C_1 = S_1 - E$$

$$₹129.50 - ₹120 = ₹9.5$$

(ii) Expected Value of Call Option

Expected price	Exercise price	Call value	Probability	Expected call value
₹100	₹120	0	0.10	0
110	120	0	0.25	0
125	120	5	0.30	1.50
150	120	30	0.25	7.50
170	120	50	0.10	5.00
Expected call option value				14.00

Reason for difference: At share prices of less than ₹120, the call option has zero value (as the call option cannot have a negative value). This has enhanced the expected call option value (i.e. ₹14.00) *vis-à-vis* ₹9.5 in part (i). In part (i), calculation is based on negative call option values also as all the share prices have been considered (from ₹100 to 170).

(iii) Theoretical value of call option = $Max. (S_0 - E, 0) = (₹112 - ₹120, 0) = 0$. However, the call option has a positive value of ₹5. The reason is probability distribution of possible share prices (higher than exercise price) is relatively wide. This optimism of the market price of the share explains the positive call option price.

P.27.2 For facts given in P.27.1, answer the following:

- Determine the gain (loss) to the call option holder if the price of the share at the end of 4-month period ends up at ₹129.50. LO 27.2 LOD M
- Determine the price of share (on the expiry date of the call option contract) at which the call owner will be at the break-even.

- (iii) Determine the maximum loss to the call owner.
- (iv) Determine the maximum gain to the call option holder and what is its probability?
- (v) What is the maximum gain to the call writer and when will it be possible?
- (vi) Determine the price of share (at the end of 4 months) at which the call writer will be at break-even.
- (vii) State the major assumption in computing values from (i) to (vi).

Solution

- (i) Gain to the call-holder = $S_1 - (E + P)$ where P = Call option premium
 $= ₹129.50 - (₹120 + ₹5) = ₹4.50$
 Alternatively, Gain = Value of call option, ₹9.50 – Option premium, ₹5 = ₹4.50.
- (ii) $BEP = (\text{Exercise price on maturity date of call option contract} + \text{Option premium paid}) = ₹120 + ₹5 = ₹125.$
- (iii) Maximum loss to the call owner is limited to the call option premium of ₹5 per share.
- (iv) The maximum gain to the call option holder = The maximum price of S_1 on the date of maturity, ₹170 – (Exercise price, ₹120 + Premium paid, ₹5) = ₹45. Its probability is 0.10.
- (v) The maximum gain to the call writer is ₹5 (i.e., the call option premium received). It will be possible when the price of the share at the expiry date is equal to the exercise price of ₹120 or less.
- (vi) $BEP = \text{Exercise price} + \text{Call option premium received} = ₹120 + ₹5 = ₹125.$
- (vii) There are no transaction costs for both call option buyer and call option writer.

P.27.3 A call option at a strike price of ₹170 is selling at a premium of ₹15. At what share price on maturity will it break-even for the buyer of the option? Will the writer of the option also break-even at the same price?

LO 27.2 LOD E

Solution

- (i) To recover the call option premium of ₹15, the share price on the date of expiration should rise to (₹15 + ₹170) = ₹185. The buyer of the call option would be at break-even if the share price (S_1) ends-up at ₹185.
- (ii) The option writer will also break-even at ₹185. This price is equal to ₹170 exercise price received from the buyer plus ₹15 option premium already received up-front.

P.27.4 A stock currently sells at ₹120. The put option to sell the stock sells at ₹135 and costs ₹18. Determine the time value of the option.

LO 27.2 LOD E

Solution

$$\begin{aligned} \text{Time value of option} &= (\text{Option premium} - \text{Intrinsic value of the option, } S_1 - E) \\ &= ₹18 - (₹134 - ₹120) = ₹4. \end{aligned}$$

P.27.5 An investor is bullish about Cipla which trades in the spot market at ₹1,025. He buys two one-month call option contracts (having a market lot of 100) on Cipla with a strike price of ₹1,050 at a premium of ₹10 per call. Three months later, Cipla is selling at ₹1,080. Compute his profit on the position.

LO 27.2 LOD E

Solution Investor's profits are = $(₹1,080, S_1 - ₹1,050, E - ₹10, P) \times 2 \times 100 = ₹4,000.$

P.27.6 Vijay is bullish about the index. Spot Nifty stands at ₹1,300. He decides to buy one three-month Nifty call option contract with a strike price of ₹1,350 at ₹50 a call. Three months later, the index closes at 1,340. Determine the amount of profit (or loss) to Vijay. Assume the market lot is of 200.

LO 27.2 LOD E

Solution Vijay loses as the Nifty index on the date of maturity is lower (at ₹1,340) than the exercise price (₹1,350). He loses the entire sum of call premium (₹50 × 200 units) = ₹10,000.

P.27.7 Akbar is bearish about the index. Spot Nifty stands at ₹1,250. He decides to buy two three-month Nifty put option contract (each contract has a market lot of 200) with a strike price of ₹1,275 at a premium of ₹40. Three months later, the index closes at ₹1,225. Compute his pay off on the position.

LO 27.2 LOD E

Solution Akbar earns on the put option contract as the closing index is lower than the strike price. His gain is $(\text{₹}1,275, E - \text{₹}1,225, S_1 - \text{₹}40, P) \times 400 = \text{₹}4,000$.

P.27.8 An investor buys one market lot of December ₹1,230 Nifty calls at ₹70 a call, and sells one market lot of December ₹1,300 Nifty calls for ₹34 a call. If the Nifty closes at ₹1,210 on the expiration **LO 27.2** **LOD M**
date, what is the payoff from this spread position.

Solution Since Nifty closes at ₹1,210 on the expiration date (lower than the exercise prices of ₹1,230 and ₹1,300), both the options are out-of-the-money. Therefore, neither the investor himself nor the call-buyer from him will exercise their call options. Therefore, the payoff from the spread is the amount he has paid on buying the call option and the amount he has received on selling the option. As the amount paid as premium is more than the amount received, he suffers loss of $(\text{₹}70 - \text{₹}34) \times 200 = \text{₹}7,200$.

P.27.9 Maruti's share price is at present ₹120. After 6-months, its price will be either ₹150 with probability of 0.8 or ₹110 with probability of 0.20. An European call option exists with an exercise price of ₹130. Based on these facts, answer the following: **LO 27.1.2** **LOD M**

- As a call option writer, if you intend to create a perfectly hedged position, what will you do?
- What will be the value of your hedged position in each of these two possibilities?
- What is the expected value of call option price at the maturity date?

Solution

(i) Hedge ratio = (Spread of possible call option prices, ΔC / Spread of possible share prices, ΔS)

$$\Delta C = (\text{₹}20 - 0); \Delta S = (\text{₹}150 - \text{₹}110)$$

$C_1 = \text{Max}(S_1 - E, 0) = \text{₹}150 - \text{₹}130 = \text{₹}20$ when share price is ₹150 and it is zero when share price is ₹110. Hedge ratio = $\text{₹}20/\text{₹}40 = 0.5$

The hedge ratio of 0.5 implies that the call option writer is to purchase one share of Maruti in a long position for every 2 call options sold (short position).

(ii) Value of hedged position at two share prices

Particulars	Amount
(a) When the share price is ₹150/Call option value is ₹20	
Value of long position in shares (1 × ₹150)	₹150
Less: Loss on exercising call option right on 2 calls by call option buyer (2 × ₹20)	40
Value of hedged position	110
(b) When share price is ₹110/Call option value is zero	
Value of long position in share (1 × ₹110)	110
Less: Value of call option	0
Value of hedged position	110

Thus, the value of the hedged position to the call option writer is the same irrespective of the share price of Maruti, six months hence.

(iii) Expected value of call option

Expected share price	Exercise price	Call value	Probability	Expected call option value
₹110	₹130	0	0.2	0
150	130	20	0.8	16
Expected value of call option				16

P.27.10 A patient investor is interested in buying a call option on TCS equity share to be exercised exactly after two years from now with exercise price of ₹200. The share's current market price is ₹180. He expects after two years, the price of TCS share will be either at ₹210 or ₹240. The risk-free rate of interest is 6 per cent. Based on the above information, answer the following: **LO 27.1.2** **LOD D**

- (i) What are the expected value of option prices at the end of two years?
 (ii) As a call option buyer, what will you do to have the same payoffs from both alternatives, i.e., shares and call option?

Solution

(i) $C_1 = \text{Max}(S_1 - E, 0)$

(a) When $S_1 = ₹210$

$$C_1 = ₹210 - ₹200 = ₹10$$

(b) When $S_1 = ₹240$

$$C_1 = ₹240 - 200 = ₹40$$

- (ii) (a) In the case of investment in shares of TCS, his investment value will be either ₹210 or ₹240 at year-end 2.

(b) In the case of the second alternative, the investor is to invest in risk-free securities (say, treasury bills). The amount is given by $E/(1 + R)^t = ₹200/(1 + 0.06)^2$

$$= ₹200 \times 0.890 \text{ (PV of rupee one at year-end 2 discounted at 6 per cent)} = ₹178.$$

Obviously, this sum will compound to ₹200 after 2 years at rate of interest of 6 per cent.

To this sum of ₹200, the value of call option is to be added which will be either ₹10 or ₹40. As a result, the investment value will be either ₹200 + ₹10 = ₹210 or ₹200 + ₹40 = ₹240.

Thus, the value of the investment at year-end 2 is the same irrespective of the price of the TCS share at the date of expiration.

P.27.11 If the daily volatility of the Nifty is 1.75 and 250 trading days in a year, compute the *sigma* figure used in the BS formula.

LO 27.5 LOD E

Solution The Black-Scholes formula uses the annualised sigma. The daily sigma must be expressed in terms of the annualised sigma.

$$\text{Sigma (annual)} = \text{Sigma (daily)} \times \sqrt{\text{Number of trading days per year}}$$

On an average, there are 250 trading days in a year.

$$\text{Sigma (annual)} = 1.75 \times \sqrt{250} = 1.75 \times 15.81 = 27.67 \text{ per cent.}$$

P.27.12 If the continuously compounded annual risk free rate is 0.095 per cent, compute the '*r*' used in the BS formula.

LO 27.5 LOD E

Solution The BS equation is based on continuous compounding. The '*r*' that figures in this must be the continuously compounded rate. In this case, it is 0.095.

P.27.13 On March 1, a call option on the Nifty with a strike price of ₹1,300 is available for trading. Expiration date is 31st March. Compute '*t*' that is used in the BS formula.

LO 27.5 LOD M

Solution The time to expiration is 31 days. The '*t*' used in the BS is time-to-expiration measured in years. Hence, the '*t*' used = $31/365 = 0.08$.

P.27.14 A stock is currently trading for ₹28. The riskless interest rate is 6 per cent per annum continuously compounded. Estimate the value of European call option with a strike price of ₹30 and a time of expiration of 3 months. The standard deviation of the stock's annual return is 0.44. Apply BS model.

LO 27.5 LOD M

Solution

Spot price of the share (<i>S</i>)	₹28
Exercise price of the call option (<i>E</i>)	30
Risk-free interest rate (<i>r</i>)	0.06
Time remaining for expiration (<i>t</i>) = 3 months = 3/12 (year)	0.25
Volatility of the stock (<i>σ</i>)	0.44

The value of European call option can be obtained by using Black-Scholes option pricing model. $C = S N(d_1) - E e^{-rt} N(d_2)$

Computation of call option essentially requires calculation of three values, viz., d_1 , d_2 and present value of the exercise price (Ee^{-rt}).

$$d_1 = \frac{\ln S/E + (r + \sigma^2/2)t}{\sigma\sqrt{t}}$$

Substituting values from the information given above we get

$$d_1 = \frac{\ln (28/30) + (0.06 + (0.44)^2/2) 0.25}{0.44\sqrt{0.25}}$$

$$d_1 = \frac{\ln (0.9333) + (0.06 + 0.0968) 0.25}{0.44(0.5)}$$

$$\begin{aligned}\ln (0.9333) &= \text{Log}_{10} (0.9333) \times 2.3026 \\ &= (\bar{1}.9700) \times 2.3026 \\ &= (\bar{1} + 0.9700) \times 2.3026 \\ &= -2.3026 + 2.2335\end{aligned}$$

$$\ln (0.9333) = -0.0691$$

$$d_1 = \frac{-0.0691 + 0.0392}{0.22} = -0.1359$$

$$d_2 = d_1 - \sigma\sqrt{t} = -0.1359 - (0.44)\sqrt{0.25}$$

$$d_2 = -0.3559$$

$$\begin{aligned}\text{and } Ee^{-rt} &= 30 e^{-(0.06 \times 0.25)} = 30 e^{-0.015} \\ &= 30 e^{-0.02} (e^{-0.02} = 0.9802 \text{ as per Table A - 7}) \\ &= 30 (0.9802) = 29.406\end{aligned}$$

The equation of call option looks like $C = 28 N(-0.1359) - 29.406 N(-0.3559)$

The next step is to look up the values of a cumulative standardised normal probability distribution at (-0.1359) and (-0.3559)

$$\begin{aligned}N(-0.1359) &= N(-0.13) - 0.59 [N(-0.13) - N(-0.14)] \\ &= 0.4483 - 0.59 [0.4483 - 0.4443] \\ &= 0.4483 - 0.00236 = 0.4459\end{aligned}$$

$$\begin{aligned}N(-0.3559) &= N(-0.35) - 0.59 [N(-0.35) - N(-0.36)] \\ &= 0.3632 - 0.59 [0.3632 - 0.3594] \\ &= 0.3632 - 0.00224 = 0.3610\end{aligned}$$

$$\begin{aligned}C &= 28 (0.4459) - 29.406 (0.3610) \\ &= 12.4852 - 10.6156 = ₹1.87\end{aligned}$$

Thus, the value of European call option is ₹1.87.

REVIEW QUESTIONS

LOD: Easy

RQ.27.1 Indicate whether the following statements are true or false:

[LO 27.1-5]

- (i) An option is a contract that gives a right to its holder along with the responsibility to purchase/sell stipulated units of underlying asset at the predetermined rate on/up to a specified date.
- (ii) An option writer is one who sells an option contract.
- (iii) Expiration date is the date beyond which the option has no value.
- (iv) Strike price is the price at which the holder of the option can buy/sell the underlying asset.

- (v) American and European options are alike.
- (vi) At a given point of time, spot rate > exercise price in the case of in-the-money option, either call or put.
- (vii) A call/put option is a contract that gives the right but not the responsibility to its holder to purchase/sell the underlying asset at a stipulated price on/up to a specified date.
- (viii) Writing a call option and a put option will result in the same course of action.
- (ix) A holder of a call option can incur losses at the most upto the amount of premium he pays.
- (x) A put option holder can earn profits at the most (theoretically) up to its strike price.
- (xi) The intrinsic value of an out of the money option is negative.

[Answers: (i) False (ii) True (iii) True (iv) True (v) False (vi) False (vii) True (viii) False (ix) True (x) True (xi) False]

(b) Identify the correct answer out of the choices provided:

- (i) Value of an out of the money option is
 - (a) Zero
 - (b) Negative
 - (c) $(S_0 - E)$
 - (d) $(E - S_0)$
- (ii) The price of a call option contract should not be less than
 - (a) $(S_0 - E)$
 - (b) $(E - S_0)$
 - (c) S_0
 - (d) E
- (iii) The maximum price of a call option contract should not be more than
 - (a) $(S_0 - E)$
 - (b) $(E - S_0)$
 - (c) S_0
 - (d) E
- (iv) Time value of an option is
 - (a) Price of the option – Intrinsic value of the option
 - (b) Intrinsic value of the option – Price of the option
 - (c) $(S_0 - E)$
 - (d) $(E - S_0)$
- (v) Fair value of an option represents
 - (a) Intrinsic value of the option
 - (b) Time value of the option
 - (c) Both
 - (d) None of the above
- (vi) Which of the following factor(s) has/have a bearing on the option price
 - (a) Price of the underlying asset
 - (b) Time to maturity
 - (c) Strike price
 - (d) Volatility of underlying asset
 - (e) Risk-free rate of return
 - (f) All of them

[Answers: (i) a (ii) a (iii) c (iv) a (v) c (vi) f]

RQ.27.2 What is a call option? State the situation when you will like to go for such an option. When will you not exercise it? [LO 27.1]

RQ.27.3 What is a put option? Specify whether put option owner expects the share price to rise or fall. [LO 27.1]

RQ.27.4 Mr. Kapoor is bullish about the index. Spot Nifty stands at ₹1,250. He decides to buy one three-month Nifty call option contract with a strike of ₹1,290, at ₹20 per call three months later, the index closes at ₹1,330. Assuming a market lot size of 200, compute his payoff on the position. [LO 27.2]

RQ.27.5 Assuming that the daily volatility of the Nifty is 1.75 and trading happens on 256 days in a year. Compute the sigma figure used in the Black-Scholes formula. [LO 27.4]

LOD: Medium

RQ.27.6 Do you subscribe to the view that the buyer of the call as well as the seller of the put have the identical expectations pertaining to the share prices? Explain your answer with appropriate example. [LO 27.1]

RQ.27.7 What is the value of a call option on maturity? When the call option owner is said to be at break-even? Can the value of call option be negative? [LO 27.1,2]

RQ.27.8 "Option investments have magnifying impact on financial gains and losses compared to share investments." Elucidate the statement with appropriate example. [LO 27.1,2]

RQ.27.9 Indicate the factors that influence call option's value. What is the effect of an increase in each of these factors on the value of a call option? [LO 27.4]

- RQ.27.10** Describe in brief the Black-Scholes model of option pricing. State its major assumptions also. [LO 27.5]
- RQ.27.11** Ramesh is bearish about the index. Spot Nifty stands at 1,250. He decides to buy one three-month Nifty put option contract (of 200) with a strike of ₹1,225 at ₹27 a put. Three months later the index closes at 1,260. What is his pay off on the position? [LO 27.2]
- RQ.27.12** An investor has purchased a 3-month call option on Reliance share for ₹8 with exercise price of ₹132. Its current market price is ₹120. At the end of 3 months, the investor expects the price of share to be in the following range of ₹100 to 160 with varying probabilities. [LO 27.4]

Expected price	₹100	₹115	₹130	₹150	₹160
Probability	0.15	0.20	0.30	0.20	0.15

From the above, determine the expected value of option price at maturity, assuming that the call option is held to this time.

LOD: Difficult

- RQ.27.13** What are the upper and lower boundaries on the value of a call option any time before maturity? Which limit do you expect to be more realistic? State reasons in support of your answer. [LO 27.3]
- RQ.27.14** Do you agree that an option is always more risky than the associated share with it? How does the risk of an option change when the share price changes? [LO 27.2]

ANSWERS

- 27.4** Gain = ₹4,000
27.5 28 per cent
27.11 Loss = ₹5,400
27.12 Value of call option = ₹7.8

Derivatives: Managing Financial Risk

LEARNING OBJECTIVES

LO 28.1	Discuss forward contracts and their usefulness in hedging and speculation, and limitations of forward contracts
LO 28.2	Explain the features of future contracts, the distinction between futures and forwards, payoffs for futures and pricing of futures—index futures and stock futures
LO 28.3	Examine the fundamental characteristics of option contracts, the distinction between futures and options and the option payoffs and pricing of options
LO 28.4	Summarise the structure of derivative market in India

INTRODUCTION

This Chapter describes derivatives. **Derivative** instruments are defined by the Securities Contracts (Regulation) Act to include (1) a security derived from a debt instrument, share, secured/unsecured loan, risk instrument or contract for differences, or any other form of security and (2) a contract that derives its value from the prices/index of prices of underlying securities. Derivative contracts have several variants. The most common variants are forwards, futures and options. Three broad categories of participants—*hedgers*, *speculators* and *arbitrageurs*—trade in the derivatives market. Hedgers face risk associated with the price of an asset. They use futures or options markets to reduce/eliminate this risk. Speculators wish to bet on future movements in the price of an asset. Futures and options contracts can give them an extra leverage, that is, they can increase both the potential gains and potential losses in a speculative venture. Arbitrageurs are in business to take advantage of a discrepancy between prices in two different markets. If, for example, they see the futures price of an asset getting out of line with the cash price, they will take offsetting positions in the two markets to lock-in a profit.

The derivatives market performs a number of *economic functions*. First, prices in an organised derivatives market reflect the perception of the market participants

- **Derivatives**
- are instruments
- which include
- (a) security
- derived from a
- debt instrument,
- share, loan,
- risk instrument
- or contract for
- differences or
- any other form of
- security and (b)
- a contract that
- derives its value
- from the price/
- index of prices
- of underlying
- securities.

about the future and lead the prices of underlying to the perceived future level. The prices of derivatives converge with the prices of the underlying at the expiration of the derivatives contract. Thus, derivatives help in the discovery of the future as well as current prices. Second, the derivatives market helps to transfer risks from those who have them but may not like them to those who have an appetite for them. Third, derivatives, due to their inherent nature, are linked to the underlying cash markets. With the introduction of derivatives, the underlying market witnesses higher trading volumes because of participation by more players who would not otherwise participate for lack of an arrangement to transfer risk. Fourth, speculative trades shift to a more controlled environment of derivatives market. In the absence of an organised derivatives market, speculators trade in the underlying cash markets. Margining, monitoring and surveillance of the activities of various participants become extremely difficult in these kind of mixed markets. Fifth, an important incidental benefit that flows from derivatives trading is that it acts as a catalyst for new entrepreneurial activity. Derivatives have a history of attracting many bright, creative, well educated people with an entrepreneurial attitude. They often energise others to create new businesses, new products and new employment opportunities, the benefit of which are immense. Finally, derivatives markets help increase savings and investment in the long-run. Transfer of risk enables market participants to expand their volume of activity. The chapter dwells on the three most commonly used derivative contracts, namely, forwards, futures and options. The main points are summarised by way of recapitulation.

LO 28.1 FORWARD CONTRACTS

A **forward contract** is an agreement to buy or sell an asset on a specified date for a specified price. One of the parties to the contract assumes a long position and agrees to buy the underlying

Forward contract is an agreement to buy (long position) or sell (short position) an asset/security on a specified date for a specified price; settlement happens at the end of the period.

asset on a certain specified future date, for a certain specified price. The other party assumes a short position and agrees to sell the asset on the same date for the same price. Other contract details like delivery date, price and quantity are negotiated bilaterally by the parties to the contract. Forward contracts are normally traded outside stock exchanges. They are popular on the Over the Counter (OTC) market. The *salient features* of forward contracts are as follows: **(i)** They are bilateral contracts and, hence, exposed to counterparty risk; **(ii)** Each contract is customer designed, and, hence, is unique in terms of contract size, expiration date and the asset type and quality; **(iii)** The contract price is generally not available in public domain; **(iv)** On the expiration date, the contract has to be settled by delivery of the asset and **(v)** If a party wishes to reverse the contract, it has to compulsorily go to the same counterparty, which often results in a high price being charged. However, forward contracts in certain

markets have become very standardised, as in the case of foreign exchange, thereby reducing transaction costs and increasing transaction volume. This process of standardisation reaches its limit in the organised futures market.

Forward contracts are very useful in hedging and speculation. A classic hedging application would be that of an exporter who expects to receive payment in dollars, three months later. He is exposed to the risk of exchange rate fluctuations. By using the currency forward market to sell dollars forward, he can lock-on a rate today and reduce his certainty. Similarly, an importer who is required to make a payment in dollars two months hence can reduce his exposure to exchange rate fluctuations by buying dollars forward. If a speculator has information or analysis, which forecasts an upturn in a price, he can go along on the forward market instead of the cash market. The speculator would go long on the forward, wait for the price to rise and then take a reversing transaction to book profits. Speculators may well be required to deposit a margin up-front. However, this is

generally a relatively small proportion of the value of the assets underlying the forward contract. The use of forward markets here supplies leverage to the speculator.

Limitations of Forward Contracts

Forward markets are afflicted by several problems: **(i)** Lack of centralisation of trading, **(ii)** Liquidity and **(iii)** Counterparty risk. The basic problem in the first two is that they have too much flexibility and generality. The forward market is like a real estate market in that any two consenting adults can form contracts against each other. This often makes them design terms of the deal that are very convenient in that specific situation, but makes the contracts non-tradable. **Counterparty risk** arises from the possibility of default by any one party to the transaction. When one of the two sides to the transaction declares bankruptcy, the other suffers. Even when forward markets trade standardised contracts and, hence, avoid the problem of illiquidity, the counterparty risk remains a very serious issue.

- Counter party risk
- is the possibility of default by any one party to the transaction.

LO 28.2 FUTURES/FUTURE CONTRACTS

Futures markets are designed to solve the problems that exist in forward markets. A **futures contract** is an agreement between two parties to buy or sell an asset at a certain time in the future, at a certain price. But unlike forward contracts, futures contracts are standardised and stock exchange traded. To facilitate liquidity in the futures contracts, the exchange specifies certain standard features for the contract. It is a standardised contract with a standard underlying instrument, a standard quantity and quality of the underlying instrument that can be delivered, (or which can be used for reference purposes in settlement) and a standard timing of such settlement. A futures contract may be offset prior to maturity by entering into an equal and opposite transaction. The standardised items in a futures contract are: **(i)** Quantity of the underlying, **(ii)** Quality of the underlying, **(iii)** The date/month of delivery, **(iv)** The units of price quotation and minimum price change and **(v)** Location of settlement. The distinction between forward and future contracts are listed in Table 28.1.

- Future contract/ futures
- is an agreement between two parties to buy/sell an asset /security at a certain time in future; it follows daily settlement.

TABLE 28.1 Distinction Between Futures and Forwards

<i>Futures</i>	<i>Forwards</i>
1. Traded on an organised stock exchange	1. Over the Counter (OTC) in nature
2. Standardised contract terms, hence, more liquid	2. Customised contract terms, hence, less liquid
3. Requires margin payments	3. No margin payment
4. Follows daily settlement	4. Settlement happens at the end of the period

Thus, future contracts are a significant improvement over forward contracts as they eliminate counterparty risk and offer more liquidity. This section illustrates future contracts with reference to **(i)** Futures terminology, **(ii)** Payoff for futures, **(iii)** Pricing futures, **(iv)** Issuing index futures and **(v)** Using futures on individual securities (stock futures).

Futures Terminology

Important terms associated with futures contracts are as follows:

Spot Price The price at which an instrument/asset trades in the spot market.

Future Price The price at which the futures contract trade in the future market.

Contract Cycle The period over which a contract trades. For instance, the index futures contracts typically have one month, two months and three months expiry cycles that expire on the last Thursday of the month. Thus, a January expiration contract expires on the last Thursday of January and a February expiration contract ceases trading on the last Thursday of February. On the Friday following the last Thursday, a new contract having three month expiry is introduced for trading.

Expiry Date It is the date specified in the futures contract. This is the last day on which the contract will be traded, at the end of which it will cease to exist.

Contract Size The amount of asset that has to be delivered under one contract. For instance, the contract size of the NSE future market is 200 Nifties.

Basis Basis is defined as the futures price minus the spot price. There will be a different basis for each delivery month for each contract. In a normal market, basis will be positive. This reflects that futures prices normally exceed spot prices.

Cost of Carry The relationship between futures prices and spot prices can be summarised in terms of the cost of carry. This measures the storage cost plus the interest that is paid to finance the asset, less the income earned on the asset.

Initial Margin The amount that must be deposited in the margin account at the time a futures contract is first entered into is the initial margin.

Marking to Market In the futures market, at the end of each trading day, the margin account is adjusted to reflect the investor's gain or loss depending upon the futures closing price. This is called marking to market.

Maintenance Margin This is somewhat lower than the initial margin. This is set to ensure that the balance in the margin account never becomes negative. If the balance in the margin account falls below the maintenance margin, the investor receives a margin call and is expected to top up the margin account to the initial margin level before trading commences on the next day.

Payoff for Futures

Payoffs A **payoff** is the likely profit/loss that would accrue to a market participant with change in the price of the underlying asset. Futures contracts have **linear payoffs**. In simple words, it means that the losses as well as profits, for the buyer and the seller of futures contracts, are unlimited. The pay off for futures, that is, for buyers (long futures) and sellers (short futures) is discussed below.

Linear payoff implies losses as well as profits for both the buyer and the seller of futures are unlimited.

Payoff for Buyer of Futures: Long Futures The pay offs for a person who buys a futures contract is similar to the pay off for a person who holds an asset. He has a potentially unlimited upside as well as downside. Take the case of a speculator who buys a two month Nifty index futures contract when the Nifty stands at 1220. The underlying asset in this case is the Nifty portfolio. When the index moves up, the long futures position starts making profits and when the index moves down it starts making losses.

Payoff for Seller of Futures: Short Futures The payoff for a person who sells a futures contract is similar to the payoff for a person who shorts an asset. He has a potentially unlimited upside as well as downside. Take the case of a speculator who sells a two month Nifty index futures contract when the Nifty stands at 1220. The underlying asset in this case is the Nifty portfolio. When the index moves down, the short futures position starts making profits and when the index moves up, it starts making losses. The payoff for futures is illustrated in Examples 28.1 to 28.4.

Example 28.1

On January 15, X bought a January Nifty futures contract that cost him ₹5,38,000. For this he had to pay an initial margin of ₹43,040 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 2,720. How much profit/loss did he make?

Solution

X bought one futures contract costing him ₹5,38,000. At a market lot of 200, this means he paid ₹2,690 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 2,720 this must be the futures close price as well. Hence, he would have made of profit of $(₹2,720 - ₹2,690) \times 200 = ₹6,000$.

Example 28.2

X sold a January Nifty futures contract for ₹5,38,000, on January 15. For this he had to pay an initial margin of ₹43,040 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 2,520. How much profit/loss did he make?

Solution

X sold one futures contract costing in ₹5,38,000. At a market lot of 200, this works out to be ₹2,690 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 2,520 this must be the futures close price as well. Hence, he would have made profit of $(₹2,690 - ₹2,520) \times 200 = ₹34,000$.

Example 28.3

On January 15, X bought one January Nifty futures contract that cost him ₹2,69,000. For this he had to pay an initial margin of ₹21,520 to his broker. Each Nifty contract is for the delivery of 200 Nifties. On January 25, the index closed at 1,280. How much profit/loss did he make?

Solution

X bought one futures contract for ₹2,69,000. At a market lot of 200, this means he paid ₹1,345 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 1,280, this must be the futures close price as well. Hence, he made of loss of $(₹1,345 - ₹1,280) \times 200 = ₹13,000$.

Example 28.4

X sold one January Nifty futures contract for ₹2,69,000, on January 15. For this he had to pay an initial margin of ₹21,520 to his broker. Each Nifty futures contract is for the delivery of 200 Nifties. On January 25, the index closed at 1,390. How much profit/loss did he make?

Solution

X sold one futures contract for ₹2,69,000. In a market lot of 200, this works out to be ₹1,345 per Nifty future. On the futures expiration day, the futures price converges to the spot price. If the index closed at 1,390, this must be the futures close price as well. Hence, he made of loss of $(₹1,390 - ₹1,345) \times 200 = ₹9,000$.

Pricing Futures

The pricing of futures is illustrated below with reference to (1) The Cost-of-Carry Model, (2) Pricing equity index futures and (3) Pricing stock futures.

The Cost-of-Carry Model The cost-of-carry model explains the dynamics of pricing that constitute the estimation of the fair value of futures. The fair value calculation of futures is used to decide the no arbitrage limits on the price of a future contract. According to this model, using discrete compounding, where interest rates are compounded at discrete intervals, (for example, annually/semi-annually) the price of the contract is defined as:

Cost of carry model explains the dynamics of pricing that constitute the estimation of the fair value of futures.

$$F = S + C \quad (28.1)$$

where F = Futures price,
 S = Spot price, and
 C = Holdings costs or carry posts

This can also be expressed as:

$$F = S(1 + r)^T \quad (28.1.1)$$

where r = Cost of financing and T = Time till expiration

If $F < S(1 + r)^T$ or $F > S(1 + r)^T$, arbitrage opportunities would exist, that is, whenever the futures price moves away from the fair value, there would be chances for arbitrage. The components of holding cost vary with contracts on different assets. At times, the holding cost may even be negative. In the case of commodity futures, the holding cost is the cost of financing plus cost of storage and insurance purchased and so on. In the case of equity futures, the holding cost is the cost of financing minus the dividends returns.

Using continuous compounding, the Equation 28.1 would be expressed as

$$F = Se^{rT} \quad (28.2)$$

where r = Cost of financing (using continuously compounded interest rate),
 T = Time till expiration, and
 $e = 2.71828$

To illustrate cost of carry, let us take an example of a futures contract on a commodity and work out the cost of contract. The spot price January 1, Year 1, of silver is assumed to be ₹7,000/kg. Assuming an annual cost of financing of 15 per cent and no storage cost, the fair value of the future price of 100 gms of silver one month hence (January 30, Year 1) would be as follows:

$$F = S(1 + r)^T + C = ₹700 (₹7,000 \div 10) [1.15] \times 30/365 = ₹708$$

If the contract is for a three month period expiring on March 30, Year 1, the cost of financing would increase the future price, that is, $F = ₹700 (1.15) \times 90/365 = ₹724.5$. If, however, the one month contract was for 10,000 kgs, it would involve storage cost and the price of the future contract would be ₹708 plus the cost of storage.

Pricing Index Futures A futures contract on the stock market gives its owner the right and obligation to buy or sell the portfolio of stocks characterised by the index. Stock index futures are cash settled; there is no delivery of the underlying stocks. The main differences between commodity and equity index futures are that: **(i)** There are no costs of storage involved in holding equity and **(ii)** Equity comes with a dividend stream, which is a negative cost if you are long the stock and a positive cost if you are short the stock. Therefore, cost of carry = financing cost – dividends. Thus, a crucial aspect of dealing with equity futures, as opposed to commodity futures, is an accurate forecasting of dividends. The better the forecast of dividend offered by a security, the better is the estimate of the futures price. The pricing of equity index futures is illustrated below with reference to **(i)** expected dividend amount and **(ii)** expected dividend yield.

Index futures is a future contract that gives the owner the right/obligation to buy/sell the portfolio of stocks characterised by the index.

Pricing Index Futures Given Expected Dividend Amount The pricing of index futures is also based on the cost-of-carry model, where the carrying cost is the cost of financing the purchase of the portfolio underlying the index, minus the present value of dividends obtained from the stocks in the index portfolio. Consider Example 28.5.

Example 28.5

Nifty futures trades on a stock exchange (NSE) as one, two and three-month contracts. Money can be borrowed at a rate of 15 per cent per annum. Compute the price of a new two month futures contract on Nifty of X Ltd (XL).

Solution Let us assume that XL will be declaring a dividend of ₹10 per share after 15 days of purchasing the contract. The current value of Nifty is 1,200 and Nifty trades with a multiplier of 200. The value of the contract is $200 \times ₹1200 = ₹2,40,000$. If XL has a weight of 7 per cent in Nifty, its value in Nifty is ₹16,800 ($₹2,40,000 \times 0.07$). If the market price of XL is ₹140, a traded unit of Nifty involves 120 shares ($₹16,800/140$). To calculate the futures price, we need to reduce the cost-of-carry to the extent of the dividend received. The amount of dividend received is ₹1,200 ($120 \times ₹10$). The dividend is received 15 days later and, hence, compounded only for the remainder of the 45 days. To calculate the futures price we need to compute the amount of dividend received per unit of Nifty. Hence, we divide the compounded dividend figure by 200. Thus, the futures price is

$$F = 1,200 (1.15)^{60/365} - \frac{[120 \times 10 (1.15)^{45/365}]}{200} = ₹1,221.80$$

Pricing Index Futures Given Expected Dividend Yield If the dividend flow throughout the year is generally uniform, that is, there are few historical cases of clustering of dividends in any particular month, it is useful to calculate the annual dividend yield.

$$F = S(1 + r - q)^T \quad (28.3)$$

where F = futures price,
 S = spot index value,
 r = cost of financing,
 q = expected dividend yield, and
 T = holding period

Example 28.6

A two month futures contract trades on the NSE. The cost of financing is 15 per cent and the dividend yield on Nifty is 2 per cent annualised. The spot value of Nifty is ₹1,200. What is the fair value of the futures contract?

Solution

Fair value = $₹1,200 (1 + 0.15 - 0.02) \times 60.365 = ₹1,224.35$

The cost-of-carry model explicitly defines the relationship between the futures price and the related spot price. The difference between the spot price and the futures price is called the **basis**. As the date of expiration comes near, the basis reduces: there is a *convergence* of the futures price towards the spot price. On the date of expiration, the basis is zero. If it is not, then there is an arbitrage opportunity. Arbitrage opportunities can also arise when the basis (difference between spot and futures price) or the spreads (difference between prices of two futures contracts) during the life of a contract are incorrect. How these arbitrage opportunities can be exploited is discussed subsequently. There is nothing but cost-of-carry related arbitrage that drives the behaviour of the futures price. Moreover, transactions costs are very important in the business of arbitrage. However, these pricing models give an approximate idea about the true future price. The price observed in the market is the outcome of the price discovery mechanism (demand-supply principle) and may differ from the so called true price.

...the ... of ...

Pricing Stock Futures A futures contract on a stock gives its owner the right and obligation to buy or sell the stocks. Like index futures, stock futures are also cash settled; there is no delivery of the underlying stocks. Just as in the case of index futures, the main difference between

Stock futures is a future contract that gives its owner the right/obligation to buy/sell the stocks (shares).

commodity and stock futures are that: **(i)** There are no costs of storage involved in holding stock, and **(ii)** Stocks come with a dividend stream, which is a negative cost if you are long) the stock and a positive cost if you are short the stock. Therefore, cost of carry = financing cost – dividends. Thus, a crucial aspect of dealing with stock futures, as opposed to commodity futures, is an accurate forecasting of dividends.

The better the forecast of dividend offered by a security, the better is the estimate of the futures price. The pricing of stock futures is discussed below when **(i)** no dividend is expected, **(ii)** when dividend is expected.

Pricing Stock Futures When No Dividend Expected The pricing of stock futures is also based on the cost-of-carry model, where the carrying cost is the cost of financing the purchase of the stock, minus the present value of dividends obtained from the stock. If no dividends are expected during the life of the contract, pricing futures on that stock is very simple. It simply involves multiplying the spot price by the cost of carry.

Example 28.7

SBI futures trade on NSE as one, two and three-month contracts. Money can be borrowed at 15 per cent per annum. What will the price of a unit of new two month futures contract on the SBI be if no dividends are expected during the two month period, assuming spot price of the SBI is ₹228?

Solution

Futures price, $F = ₹228 \times (1.15) \times 60/365 = ₹233.30$

Pricing Stock Futures When Dividends Are Expected When dividends are expected during the life of the futures contract, pricing involves reducing the cost of carry to the extent of the dividends. The net carrying cost is the cost of financing the purchase of the stock, minus the present value of dividends obtained from the stock.

Example 28.8

XL futures trade on NSE as one, two and three month contracts. What will the price of a unit of new two-month futures contract on XL be if dividends are expected during the two month period? Assume that XL will be declaring a dividend of ₹10 per share after 15 days of purchasing the contract. The market price of XL may be assumed as ₹140.

Solution

To calculate the futures price, we need to reduce the cost-of-carry to the extent of dividend received. The amount of dividend received is ₹10. The dividend is received 15 days later and, hence, compounded only for the remainder of 45 days. Thus, the futures price, $F = ₹140 \times (1.15) \times 60/365 - [10 \times (1.15) \times 45/365] = ₹133.08$.

LO 28.3 OPTIONS/OPTIONS CONTRACTS

Option/option contract is a contract that gives the holder the right but not the obligation to buy/sell an asset/ security.

Options are fundamentally different from forward and futures contracts. An **option** gives the holder of the option the right to do something. The holder does not have to necessarily exercise this right. In contrast, in a forward or futures contract, the two parties have committed themselves to doing something. Whereas it costs nothing (except margin requirements) to enter into a futures contract, the purchase of an option requires an up front payment. This section discusses and illustrates options as a derivative contract, with reference to **(i)** Option terminology, **(ii)** Comparison of options and futures, **(iii)** Option payoffs, **(iv)** Pricing options and **(v)** Using stock options.

Option Terminology

Index Options These options have the index as the underlying. Some options are European while others are American. American options can be exercised at any time upto the expiration date. Most exchange traded options are American. European options can be exercised only on the expiration date itself. European options are easier to analyse than American options, and properties of an American option are frequently deduced from those of its European counterpart. Like index futures contracts, index options contracts are also cash settled.

Stock Options Stock options are options on individual stocks. A contract gives the holder the right to buy or sell shares at the specified price.

Buyer of an Option The buyer of an option is the one who by paying the option premium buys the right but not the obligation to exercise his option on the seller/writer.

Writer of an Option The writer of a call/put option is the one who receives the option premium and is thereby obliged to sell/buy the asset if the buyer exercises the option on him.

There are two basic types of options, call options and put options.

Call Option A call option gives the holder the right but not the obligation to buy an asset by a certain date for a certain price.

Put Option A put option gives the holder the right but not the obligation to sell an asset by a certain date for a certain price.

Option Price/Premium Option price is the price that the option buyer pays to the option seller. It is also referred to as the option premium.

Expiration Date The date specified in the options contract is known as the expiration date, the exercise date, the strike date or the maturity.

Strike Price The price specified in the options contract is known as the strike price or the exercise price.

In-the-Money Option An in-the-money (ITM) option is an option that would lead to a positive cashflow to the holder if it were exercised immediately. A call option on the index is said to be in-the-money when the current index stands at a level higher than the strike price (that is, spot price > strike price). If the index is much higher than the strike price, the call is said to be deep ITM. In the case of a put, the put is ITM if the index is below the strike price.

At-the-Money Option An at-the-money (ATM) option is an option that would lead to zero cashflow if it were exercised immediately. An option on the index is at-the-money when the current index equals the strike price (that is, spot price = strike price).

Out-of-the-Money Option An out-of-the-money (OTM) option is an option that would lead to a negative cashflow if it were exercised immediately. A call option on the index is out-of-the-money when the current index stands at a level that is less than the strike price (that is, spot price < strike price).

If the index is much lower than the strike price, the call is said to be deep OTM. In the case of a put, the put is OTM if the index is above the strike price.

Intrinsic Value of an Option The option premium can be broken down into two components (i) intrinsic value and (ii) time value. The intrinsic value of a call is the amount the option is ITM, if it is ITM. If the call is OTM, its intrinsic value is zero. Putting it another way, the intrinsic value of a call is $\text{Max}[0, (S_t - K)]$ which means the intrinsic value of a call is the greater of 0 or $(S_t - K)$. Similarly, the intrinsic value of a put is $\text{Max}[0, K - S_t]$, that is, the greater of 0 or $(K - S_t)$. K is the strike price and S_t is the spot price.

Time Value of an Option The time value of an option is the difference between its premium and its intrinsic value. Both calls and puts have time value. An option that is OTM or ATM only has time value. Usually, the maximum time value exists when the option is ATM. The longer the time to expiration, the greater is an option's time value, other things being equal. At expiration, an option would have no time value.

Futures and Options

Options are different from futures in several respects. At a practical level, the option buyer pays for the option in full at the time it is purchased. After this, he only has an upside. There is no possibility of the options position generating any further loss to him (other than the funds already paid for the option). In contrast, futures are free to enter into but can generate very large losses. This characteristic makes options attractive to many occasional market participants who cannot put in the time to closely monitor their futures positions.

Buying put options is buying insurance. To buy a put option on the Nifty is to buy insurance that reimburses the full extent to which the Nifty drops below the strike price of the put option. This is attractive to many people and to mutual funds creating "guaranteed return products". The Nifty index fund industry will find it very useful to make a bundle of a Nifty index fund and a Nifty put option to create a new kind of Nifty index fund, which gives the investor protection against extreme drops in the Nifty. Selling put options is selling insurance. Anyone who feels like earning revenues by selling insurance can set himself up to do so on the index options market.

More generally, options offer "non-linear payoffs", whereas futures only have "linear payoffs". By combining futures and options, a wide variety of innovative and useful payoff structures can be created. The distinction between futures and option is summarised in Table 28.2.

TABLE 28.2 Distinction Between Futures and Options

<i>Futures</i>	<i>Options</i>
Exchange traded, with novation	Same as futures
Exchange defines the product	Same as futures
Price is zero, strike price moves	Strike price is fixed, price moves
Price is zero	Price is always positive
Linear payoff	Non linear payoff
Both long and short at risk	Only short at risk

Options Payoffs

A pay off for derivative contracts is the likely profit/loss that would accrue to the market participant with change in the price of the underlying asset. The optionality characteristic of options results in

a **non-linear payoff** for options. In simple words, it means that the losses for the buyer of an option are limited. However, the profits are potentially unlimited. For a writer, the pay off is exactly the opposite. His profits are limited to the **option premium**. However, his losses are potentially unlimited. These non-linear payoffs are fascinating as they lend themselves to be used to generate various payoffs by using combinations of options and the underlying. We illustrate below six basic pay offs.

- **Non-linear payoff**
- implies the losses for the buyer of the option are limited but profits are potentially unlimited; profits to the writer of the option are limited to the option premium but losses are potentially unlimited.

Payoff Profile of Buyer of Asset: Long Asset In this basic position, an investor buys the underlying asset, the Nifty for instance, for 1,220 and sells it at a future date at an unknown price, S_t . Once it is purchased, the investor is said to be “long” the asset. The investor would make profit if the index goes up. If the index falls he would lose.

Payoff Profile for Seller of Asset: Short Asset In this basic position, an investor shorts the underlying asset, the Nifty for instance, for 1,220 and buys it back at a future date at an unknown price, S_t . Once it is sold, the investor is said to be “short” the asset. The investor sold the index at 1,220. If the index falls, he profits. If the index rises, he loses.

- **Option premium**
- is the price that the option buyer pays to the option seller.

Payoff Profile for Buyer of Call Options: Long Call A call option gives the buyer the right to pay the underlying asset at the strike price specified in the option. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. If upon expiration, the spot price exceeds the strike price, he makes a profit. The higher the spot price, the more profit he makes. If the spot price of the underlying is less than the strike price, he lets his option expire unexercised. His loss in this case is the premium he paid for buying the option.

Payoff Profile for Writer to Call Options: Short Call A call option gives the buyer the right to buy the underlying asset at the strike price specified in the option. For selling the option, the writer of the option charges a premium. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. Whatever is the buyer’s profit is the seller’s loss. If upon expiration, the spot price exceeds the strike price, the buyer will exercise the option on the writer. Hence, as the spot price increases, the writer of the option starts making losses. The higher the spot price, the more is the loss he makes. If upon expiration the spot price of the underlying is less than the strike price, the buyer lets his option expire unexercised and the writer gets to keep the premium.

Payoff Profile for Buyer of Put Options: Long Put A put option gives the buyer the right to sell the underlying asset at the strike price specified in the option. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. If upon expiration the spot price is below the strike price, he makes a profit. The lower the spot price, the more is the profit he makes. If the spot price of the underlying is higher than the strike price, he lets his option expire unexercised. His loss in the case is the premium he paid for buying the option.

Payoff Profile for Writer of Put Options: Short Put A put option gives the buyer the right to sell the underlying asset at the strike price specified in the option. For selling the option, the writer of the option charges a premium. The profit/loss that the buyer makes on the option depends on the spot price of the underlying. The buyer’s profit is the seller’s loss. If upon expiration the spot price happens to be below the strike price, the buyer will exercise the option on the writer. If upon expiration the spot price of the underlying is more than the strike price, the buyer gets his option expire unexercised and the writer gets to keep the premium.

...the ... of ...

Pricing Options

An option buyer has the right but not the obligation to exercise on the seller. The worst that can happen to a buyer is the loss of the premium paid by him. His downside is limited to this premium, but his upside is potentially unlimited. This optionality has a value expressed in terms of the option price. Just like in other free markets, it is the supply and demand in the secondary market that drives the price of an option. There are various models that help us get close to the true price of an option. Most of these are variants of the celebrated Black-Scholes Model for pricing European options.

Black-Scholes Option Pricing Model/Formulae Black and Scholes start by specifying a simple and well known equation that models the way in which stock prices fluctuate. This equation, called **Geometric Brownian Motion**, implies that stock returns will have a lognormal distribution, meaning that the logarithm of the stock's return will follow the normal (bell shaped) distribution. They then propose that the option's price is determined by only two variables that are allowed to change: time and the underlying stock price. The other factors, namely, the volatility, the exercise price, and the risk free rate do affect the option's price but they are not allowed to change. By forming a portfolio consisting of a long position in stock and a short position in calls, the risk associated with the stock is eliminated. This hedged portfolio is obtained by setting the number of shares of stock equal to the approximate change in the call price for a change in the stock price. This mix of stock and calls must be revised continuously. This process is known as **delta hedging**. They then turn to a little known result in a specialised field of probability known as stochastic calculus. This result defines how the option price changes in terms of the change in the stock price and time to expiration. They then reason that this hedged combination of options and stock should grow in value at the risk free rate. The result then is a partial differential equation. The solution is found by forcing a condition called a *boundary condition* on the model that requires the option price to converge to the exercise value at expiration. The end result is the Black and Scholes Model.

The Black-Scholes formulas for the prices of European calls and puts on a non-dividend paying stock are:

$$C = SN(d_1) - Xe^{-rT} N(d_2) \quad (28.4)$$

$$P = Xe^{-rT} N(-d_2) - SN(-d_1)$$

where $d_1 = \frac{\ln \frac{S}{X} + (r + \sigma^2/2)T}{\sigma\sqrt{T}}$

and $d_2 = d_1 - \sigma\sqrt{T}$

- The Black-Scholes equation is done in continuous time. This requires continuous compounding. The r that figures in this is $1n(1 + r)$. Example, if the interest rate per annum is 12 per cent, you need to use $1n 1.12$ or 0.1133, which is the continuously compounded equivalent of 12 per cent per annum.
- $N()$ is the cumulative normal distribution. $N(d_1)$ is called the *delta of the option*, which is a measure of change in option price with respect to change in the price of the underlying asset.
- σ a measure of volatility, is the annualised standard deviation of continuously compounded returns on the underlying. When daily *sigma* are given, they need to be converted into annualised *sigma*.

- $\text{Sigma}_{\text{annual}} = \text{sigma}_{\text{daily}} \times \sqrt{\text{Number of trading days per year}}$. On an average there are 250 trading days in a year.
- X is the exercise price, S the spot price and T the time to expiration measured in years.

Pricing Index Options Under the assumption of the Black-Scholes Options Pricing Model, index options should be valued in the same way as ordinary options on common stock, the assumption being that investors can purchase, without cost, the underlying stocks in the exact amount necessary to replicate the index, that is, stocks are infinitely divisible and the index follows a diffusion process such that the continuously compounded returns distribution of the index is normally distributed. To use the Black-Scholes formula for index options we must, however, make adjustments for the dividend payments, replacing the current index value S in the model with Se^{-qT} where q is the annual dividend yield and T is the time to expiration in years. Consider Example 28.9.

Example 28.9

A three-month call option on the Nifty with a strike of 1,180 is available for trading. The Nifty stands at ₹1,150, and it has a volatility of 30 per cent per annum. The annual risk free rate is 12 per cent. We can calculate the price of the 1,180 option using the Black-Scholes option pricing formula. We take $T = 0.25$, $S = 1,150$, $X = 1,180$, $r = 12$, and $\sigma = 0.3$. Substituting these values in the formula, we get the call price as ₹70.15. The put price on an option with the same strike works out to be ₹67.19.

Pricing Stock Options Much of what was discussed about index options also applies to stock options. The factors that affect option prices are listed below.

The Stock Price The payoff from a call option will be the amount by which the stock price exceeds the strike price. Call option, therefore, becomes more valuable as the stock price increases and less valuable as the stock price decreases. The payoff from a put option will be the amount by which the strike price exceeds the stock price. Put options, therefore, become more valuable as the stock price decreases and less valuable as the stock price increases.

The Strike Price In the case of a call, as the strike price increases, the stock price has to make a larger upward move for the option to go in-the-money. Therefore, for a call option, as the strike price increases, options become less valuable and as the strike price decreases they become more valuable. Put options behave exactly in the opposite way to call options.

Time to Expiration Both put and call American options become more valuable as the time to expiration increases. Consider the case of two options that differ only as far as their expiration date is concerned. The owner of the long-life option has all the exercise opportunities open to the owner of the short-life option, and more. The long-life option must, therefore, always be worth at least as much as the short life option.

Volatility The volatility of a stock price is a measure of how uncertain we are about future stock price movements. As volatility increases, the chance that the stock will do very well or very poorly increases. The value of both calls and puts, therefore, increases as volatility increases.

Risk Free Interest Rate The effect of the risk free interest rate is less clear cut. It is found that the put option prices decline as the risk free rate increases, whereas the prices of calls always increase as the risk free interest rate increases.

Dividends Dividends have the effect of reducing the stock price on the ex-dividend date. This has a negative effect on the value of call options and a positive effect on the value of put options.

1. Introduction

The first part of the report discusses the background and objectives of the study. It highlights the importance of understanding the current state of the industry and the challenges it faces. The study aims to provide a comprehensive overview of the market and identify key trends and opportunities.

The second part of the report focuses on the methodology used for data collection and analysis. It details the sources of information, the data collection process, and the analytical techniques employed. The findings are presented in a clear and concise manner, supported by relevant data and statistics. The report concludes with a summary of the key findings and recommendations for future research and action.

2. Methodology

The methodology section describes the research design and the data collection process. It includes information on the sample size, the data sources, and the analytical methods used. The study employed a combination of primary and secondary data to ensure a thorough understanding of the market.

- Data was collected from various sources, including industry reports, government statistics, and direct interviews with key stakeholders.
- The analysis was conducted using statistical software to identify trends and correlations in the data.
- The findings were validated through a series of focus groups and expert consultations to ensure accuracy and relevance.

The second part of the report focuses on the methodology used for data collection and analysis. It details the sources of information, the data collection process, and the analytical techniques employed. The findings are presented in a clear and concise manner, supported by relevant data and statistics.

The third part of the report discusses the results of the study. It presents the key findings and trends identified in the market. The data shows a steady increase in demand for certain products, while others have seen a decline. The study also identifies several key challenges facing the industry and offers recommendations for addressing them.

The fourth part of the report provides a detailed analysis of the market trends. It examines the factors driving growth and the challenges facing the industry. The study identifies several key opportunities for businesses and offers recommendations for maximizing their potential.

3. Results and Discussion

The results of the study show a clear upward trend in the market. The data indicates that demand for certain products is increasing, while others are declining. The study also identifies several key challenges facing the industry and offers recommendations for addressing them.

The discussion section provides a detailed analysis of the market trends. It examines the factors driving growth and the challenges facing the industry. The study identifies several key opportunities for businesses and offers recommendations for maximizing their potential.

The findings of the study are summarized in the following table:

4. Conclusion

The study concludes that the market is showing a strong upward trend. The data indicates that demand for certain products is increasing, while others are declining. The study also identifies several key challenges facing the industry and offers recommendations for addressing them.

The study provides a comprehensive overview of the market and identifies key trends and opportunities. It offers valuable insights for businesses and stakeholders in the industry.

Application of Black-Scholes Option Pricing Formula to Stock Options The Black-Scholes option pricing formula, with some adjustment, can be used to price American calls and puts options on stocks. Pricing American options becomes a little difficult because unlike European options, American options can be exercised any time prior to expiration. However, it is never optimal to exercise a call option on a non-dividend paying stock before expiration. When no dividends are expected during the life of the option, the option can be valued simply by substituting the values of the stock price, strike price, stock volatility, risk free rate and time-to-expiration in the Black-Scholes formula. However, when dividends are expected during the life of the option, it is sometimes optimal to exercise the option just before the underlying stock goes ex-dividend. Hence, when valuing options on dividend paying stock, we should consider exercise possibilities at two times: (i) just before the underlying stock goes ex-dividend and (ii) at the expiration of the options contract.

Therefore, owning an option on a dividend paying stock today is like owning two options: one being a long maturity option with a time-to-maturity from the starting date till the expiration day, and the other being a short maturity option with a time-to-maturity from the starting date till just before the stock goes ex-dividend.

Some adjustment needs to be made before using the Black-Scholes formula. The first step is to value the option on the assumption that it will be exercised on expiry. Thus, the present value of the dividends is deducted from the stock price and the adjusted value, S_d , is used in the Black-Scholes Model. The second step is to assume that the option will be exercised just before the ex-dividend date. The unadjusted stock price is used. In addition, the time to expiry is shortened to be the period up to the ex-dividend date. Following these adjustments, the Black-Scholes model can be applied. The actual value of the option will be the highest of the two valuations. Consider Example 28.10.

Example 28.10

Assume that the price of a stock is ₹50, the exercise price is ₹45, the risk free rate of interest is 6 per cent per annum and that the ex dividend adjustment of 2.5 will occur 0.1644 years hence. The volatility of the stock is 20 per cent. The discount rate on dividend is also taken to be 6 per cent. We have now two call options, a long maturity call option with a maturity of 0.25 years, which can be exercised on the expiration date, and a short maturity call option with a maturity of 0.166 years, which can be exercised just before the ex-dividend date. We will now value both these options.

- The details of the long option are: $T = 0.25$, $r = 0.06$, $D = 2.5$, $S = ₹50$, $X = ₹45$, and $S_d = [S - D / (1 + r)^T] = ₹47.52$. The stock price to be used in the Black-Scholes option pricing formula is S_d , the adjusted price of the stock after deducting the present value of the dividends. Using these values, we get the price of the long option as ₹3.84.
- The details of the short option are: $T = 0.166$, $r = 0.06$, $D = 2.5$, $S = ₹50$ and $X = ₹45$. Since the option is exercised just before the stock goes ex-dividend, the unadjusted stock price of ₹50 is used. Using these values, we get the price of the short option as ₹5.56.

Thus, using the above approximation, the American option on the dividend paying stock would be valued at the higher of the two options, that is, at ₹5.58.

LO 28.4

STRUCTURE OF DERIVATIVE MARKET IN INDIA

- High networth individuals (HNIs) and proprietary traders contribute to the major proportion of trading volumes in the derivative segment. Foreign institutional investors and mutual funds are relatively small players in this segment and so also the corporate clients. Surprisingly, retail investors contributed to 25-30 per cent of the total trading turnover. The maximum trading was done in futures on individual shares. These contracts accounted for more than 50 per cent of the turnover. Shock index futures accounted for less than 25 per cent of the total turnover.

- Brokers attributed the high acceptability of futures on individual shares to the similarity of these contracts with **badla**. There is a need to popularise option instruments as they may be a useful medium for enhancing retail participation. Derivative securities have definitely penetrated into the Indian stock market and investors are using these securities for different purposes, namely, risk management, profit enhancement, speculation and arbitrage.
- As far as pricing of derivative securities is concerned, spot price are an important factor in the pricing of future contracts. Dividend yield and future outlook are the other factors. Only 54 per cent identified time to maturity as relevant for pricing. The other factors like interest rate, implied cost of carry, trading volume, and so on seemed to be not very relevant in pricing. The Black-Scholes Option Pricing Model figured among the most popularly used models.

Source: Srivastava, Sandeep, Surender S Yadav and P K Jain, "Derivative Trading in Indian Stock Market: Broker's Perception", *IIMB Management Review*, September, 2008, Vol. 20, No. 3, pp. 311-323.

SUMMARY

Derivative instruments include (a) a security derived from a debt instrument, share, loan, risk instrument or contract for differences or any other form of security and (b) a contract that derives its value from the price/index of prices of underlying securities.

The economic functions performed by the derivatives markets are: (i) they help in the discovery of the future as well as current prices, (ii) they transfer risk to those who have an appetite for them, (iii) the underlying cash markets witness high trading volumes, (iv) speculative trades shift to a more controlled environment, and (v) they help increase savings and investment in the long run.

The most common variants of derivatives are forward, futures and options.

A forward contract is an agreement to buy/sell an asset on a specified date for a specified price. It is very useful in hedging and speculations. A very serious limitation of forward contracts is counterparty risk arising from possibility of default of any one party to the transaction.

A future contract is an agreement between two parties to buy/sell an asset at a certain time in future at a certain price. It may be offset prior to maturity by entering into an equal but opposite transaction. It eliminates counterparty risk and offers more liquidity.

Future contracts have linear payoffs. It means that the losses as well as the profit, for the buyer and the seller are unlimited.

Pricing of futures is done with reference to (1) the cost of carry model, (2) pricing equity index futures and pricing stock futures.

According to the cost of carry method, the price of a future contract, $F = S + C$.

Pricing of equity index futures given expected dividend, $F =$ carrying cost/cost of financing the purchase of the portfolio less the present value of dividends.

Pricing of equity index given expected dividend yield, $F = S(1 + r - q)^T$

Price of stock futures when no dividend expected = Spot price \times Cost of carry.

Price of stock future when dividends are expected = Cost of financing the purchase of stock less present value of dividend received.

An option gives the holder the right but not the obligation to do something.

Options offer non-linear payoffs in that while the losses for the buyer of the option are limited, the profits are potentially unlimited. For a writer, the pay-off is exactly the opposite.

The pricing of an option is based on the Black-Scholes Pricing formula:

$$P = X_0^{-rT} (N - d_2) - SN(-d_1)$$

SOLVED PROBLEMS

P.28.1 Suppose the Nifty spot is at ₹1,000 and two month futures trade at ₹1,040. Suppose the transaction costs involved in placing an index trade are 0.25 per cent and the Nifty index dividends over two months are 0.10 per cent. What is the net rate of return? LO 28.2 LOD E

Solution The return on the futures is $\frac{₹1,040}{₹1,000} = 4$ per cent. After adding 0.10 per cent dividends and deducting 0.25 per cent transaction cost, the total return over 2 months works out to be 3.85 per cent. Therefore, the net return per month works out to be 1.92 per cent.

P.28.2 What is the riskless profit that can be earned over two months if the Nifty spot is at 1,000 and the two month futures are at 1,010, suppose cash can be risklessly invested at 12 per cent per annum and there are no transaction costs. LO 28.2 LOD M

Solution At a risk-free rate of 12 per cent, futures are underpriced. One can make an arbitrage profit by buying Nifty futures at 1,010, selling the Nifty spot and investing the 1,000 risklessly for two months. At the end of two months, this money would grow to be about ₹1,019, that is, a return of $(1019 - 1010)/1000 = 0.09$ per cent.

P.28.3 What is the fair value of one month futures if the spot value of Nifty is 1150? The money can be invested at 11 per cent per annum and Nifty gives a dividend yield of 1 per cent per annum. LO 28.2 LOD M

Solution The fair value = $₹1,150 \times [1 + (0.11 - 0.01)] \times 1/12 = ₹1,159$.

P.28.4 What is the fair value of one month future if the spot value of Nifty is 1,150? The money can be invested at 14 per cent per annum and Nifty gives a dividend yield of 4 per cent per annum. LO 28.2 LOD M

Solution The fair value = $1,150 \times [1 + (0.14 - 0.04)] \times 1/12 = ₹1,159$.

P.28.5 Nifty futures trade on NSE as one, two and three month contracts. Spot Nifty stands at 1,200. BASF which currently trades at ₹120 has a weight of 5 per cent in Nifty. It is expected to declare a dividend of ₹20 per share after 15 days of purchasing the contract. The cost of borrowing is 15 per cent per annum. What will the price of a new two-month futures contract on Nifty be? LO 28.2 LOD D

Solution Since the Nifty stands at 1,200, the value of the contract = $200 - ₹1200 = ₹2,40,000$. As the BASF has a weight of 5 per cent in Nifty, its value in Nifty = $₹12,000$ ($₹2,40,000 \times 0.05$). If the market price = ₹120, a traded unit of Nifty involves 100 shares. Thus, the futures price,

$$F = 1,200 \times (1.15) \times 60/365 - \left(\frac{100 \times 200 \times (1.15) \times 45/365}{200} \right) = ₹1,217.70$$

P.28.6 The Tata Tea trades on the spot market at ₹177. The cost of financing is 12 per cent per year. What is the fair value of one month futures on Tata Tea? LO 28.2 LOD E

Solution The price of the futures contract = $₹177 \times (1.12) \times 30/365 = ₹178.65$. This could also be computed as $₹177 \times ((1.12)^{1/12}) = ₹178.65$.

P.28.7 The ITC trades on the spot market at ₹720. The cost of financing is 15 per cent per year. What is the fair value of two month futures on ITC? LO 28.2 LOD E

Solution The price of the futures contract is = $720 \times ((1.15) \times 60/365) = ₹736.73$.

P.28.8 If the annual risk free rate is 12 per cent, compute the 'r' used in the Black-Scholes formula. LO 28.3 LOD E

Solution The Black-Scholes equation is done in continuous time. This requires continuous compounding. The r that figures in this is $1n(1 + r)$. Therefore, if the interest rate is 12 per cent, we need to use $1n 1.12$ or 0.1133.

P.28.9 On February 1, a call option on the Nifty with a strike of ₹1,280 is available for trading. Expiration date is February 22. Compute T that is used in the Black-Scholes formula. LO 28.3 LOD E

Solution The time to expiration is 22 days. The T used in the Black-Scholes is time-to-expiration measured in years. Hence, the T used = $22/365 = 0.06$.

P.28.10 On May 1, a two-month call option on the Nifty with a strike of ₹1,280 is available for trading. Compute the T that is used in the Black-Scholes formula.

LO 28.3 LOD E

Solution The time to expiration is 2 months. The T used in the Black-Scholes is the time-to-expiration measured in years. Hence, the T used = $2/12 = 0.166$.

P.28.11 A three-month call option on the Nifty with a strike of ₹1280 is available for trading. Nifty stands at 1,260 and has a volatility of 30 per cent per annum. If the annual risk free rate is 12 per cent, what is the price of the call?

LO 28.3 LOD M

Solution Using the Black-Scholes option pricing formula with $T = 0.25$, $S = 1,260$, $X = 1,280$, $r = 12(1.12)$, and $\sigma = 0.3$ and substituting these values in the formula, the price = ₹83.10.

P.28.12 A three-month put option on the Nifty with a strike of 1,280 is available for trading. The Nifty stands at 1,260 and has a volatility of 30 per cent per annum. If the annual risk free rate is 12 per cent, compute the price of the put.

LO 28.3 LOD M

Solution Using the Black-Scholes option pricing formula with $T = 0.25$, $S = 1260$, $X = 1280$, $r = 12(1.12)$, $\sigma = 0.3$ and substituting these values in the formula, the price of the put = ₹67.35.

P.28.13 A three-month put option on the Nifty with a strike of 1,280 is available for trading. Nifty stands at 1,260 and has a volatility of 30 per cent per annum. The continuous dividend yield on the Nifty is 5 per cent. If the annual risk free rate is 12 per cent, compute the price of the put.

LO 28.3 LOD M

Solution Using the Black-Scholes option pricing formula with $T = 0.25$, $S = 1,260$, $X = 1,280$, $r = 12(1.12)$, $\sigma = 0.3$, in this case where the annual dividend yield is known, replace the index value 1,260 with $1,244 (1,260e^{-0.05 \times 0.25})$. Substituting these values in the formula, the price of the put = ₹74.60.

P.28.14 A three-month call option on a stock with a strike of ₹45 is available for trading. The spot price is ₹50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 2.5 will occur two months hence. The volatility of the stock is 20 per cent. The discount rate on dividend is also taken to be 6 per cent. Compute the maturity of the short maturity option.

LO 28.3 LOD M

Solution The short maturity option has a maturity of 0.166 years since the ex-dividend date is two months later.

P.28.15 A three-month call option on a stock with a strike of ₹45 is available for trading. The spot price is ₹50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 2.5 will occur two months hence. The volatility of the stock is 20 per cent. The discount rate on dividends is also taken to be 6 per cent. Compute the maturity of the long maturity option.

LO 28.3 LOD M

Solution The long maturity option has a maturity of 0.25 years since it is a three-month call option.

P.28.16 A three-month call option on a stock with a strike of ₹45 is available for trading. The spot price is ₹50. The risk free rate of interest is 6 per cent per annum and an ex-dividend adjustment of 5 will occur one month hence. The volatility of the stock is 20 per cent. The discount rate on dividends is also taken to be 8 per cent. Compute the stock price to be used for valuing the long maturity option.

LO 28.3 LOD D

Solution The stock price to be used for valuing the long maturity option is $S_d = ₹50 - 2.5/(1.08)^{0.083} = ₹45.03$.

LEARNING OBJECTIVES **DIVIDEND DECISION***Chapter 29***DIVIDEND AND VALUATION***Chapter 30***DETERMINANTS OF
DIVIDEND POLICY**

The third major decision area in financial management relates to dividend policy. The dividend policy decision involves the choice between distributing the profits belonging to the shareholders and their retention by the firm. The selection would be influenced by the effect on the objective of financial management of maximising shareholders' wealth. Given the net value maximisation objective, there are two aspects of dividend decision which are relevant. The first of these, that is, whether the dividend policy has a bearing on the value of the firm is discussed in Chapter 29. The focus of the chapter is primarily on the different theories/approaches to analyse the relationship between dividend policy and valuation of the firm. Chapter 30 describes the determinants of an appropriate dividend policy for a firm in the light of its facts and circumstances.

PART 8

DIVIDEND DECISION

The third major decision area in financial management relates to dividend policy. The dividend policy decision involves the choice between allocating the profits belonging to the shareholders and their retention by the firm. The decision would be influenced by the effect on the objective of financial management of retaining shareholders' wealth. Given the net value maximization objective, there are two aspects of dividend decision which are relevant. The first of these is whether the dividend policy has a bearing on the value of the firm as discussed in Chapter 27. The focus of the chapter is primarily on the different methodologies used to analyse the relationship between dividend policy and valuation of the firm. Chapter 28 describes the determinants of an appropriate dividend policy for a firm in the light of its facts and circumstances.

Dividend and Valuation

LEARNING OBJECTIVES

LO 29.1	Describe the residual theory of dividends and Modigliani-Miller (MM) approach to the irrelevance of dividends and evaluate its validity
LO 29.2	Explain and illustrate the two models—Walter's and Gordon's—according to which dividends are relevant and affect the value of the firm

INTRODUCTION

Dividends refer to that portion of a firm's net earnings which are paid out to the shareholders. Our focus here is on dividends paid to the ordinary shareholders because holders of preference shares are entitled to a stipulated rate of dividend. Moreover, the discussion is relevant to widely-held public limited companies as the dividend issue does not pose a major problem for closely-held private limited companies. Since dividends are distributed out of the profits, the alternative to the payment of dividends is the retention of earnings/profits. The retained earnings constitute an easily accessible important source of financing the investment requirements of firms. There is, thus, a type of inverse relationship between retained earnings and cash dividends: *larger retentions, lesser dividends; smaller retentions, larger dividends*. Thus, the alternative uses of the net earnings—dividends and retained earnings—are competitive and conflicting.

- **Dividend**
- refers to the
- corporate
- net profits
- distributed among
- shareholders.

A major decision of financial management is the dividend decision in the sense that the firm has to choose between distributing the profits to the shareholders and ploughing them back into the business. The choice would obviously hinge on the effect of the decision on the maximisation of shareholders' wealth. Given the objective of financial management of maximising present values, the firm should be guided by the consideration as to which alternative use is consistent with the goal of wealth maximisation. That is, the firm would be well advised to use the net profits for paying dividends to the shareholders if the payment will lead to the maximisation of wealth of the owners. If not, the firm should rather retain them to finance investment programmes. The relationship between dividends and value of the firm should, therefore, be the decision criterion.

There are, however, conflicting opinions regarding the impact of dividends on the valuation of a firm. According to one school of thought, dividends are irrelevant so that the amount of dividends

paid has no effect on the valuation of a firm. On the other hand, certain theories consider the dividend decision as relevant to the value of the firm measured in terms of the market price of the shares.

The purpose of the present Chapter is, therefore, to present a critical analysis of some important theories representing these two schools of thought with a view to illustrating the relationship between dividend policy and the valuation of a firm. It focuses on the theory(ies) relating to the irrelevance of dividends to valuation as well as the theories which support the relevance hypothesis. The main points are summarised by the way of recapitulation.

LO 29.1 IRRELEVANCE OF DIVIDENDS

General

The crux of the argument supporting the irrelevance of dividends to valuation is that the dividend policy of a firm is a part of its financing decision. As a part of the financing decision, *the dividend policy of the firm is a residual decision and dividends are a passive residual.*¹

Residual
dividend
policy pays out only
excess cash.

If dividend policy is strictly a financing decision, whether dividends are paid out of profits, or earnings are retained, will depend upon the available investment opportunities. It implies that when a firm has sufficient investment opportunities, it will retain the earnings to finance them. Conversely, if acceptable investment opportunities are inadequate, the implication is that the earnings would be distributed to the shareholders. The test of adequate acceptable investment opportunities is the relationship between the return on the investments (r) and the cost of capital (k). As long as r exceeds k , a firm has acceptable investment opportunities. In other words, if a firm can earn a return (r) higher than its cost of capital (k), it will retain the earnings to finance investment projects. If the retained earnings fall short of the total funds required it will raise external funds—both equity and debt—to make up the shortfall. If, however, the retained earnings exceed the requirements of funds to finance acceptable investment opportunities, the excess earnings would be distributed to the shareholders in the form of cash dividends. The amount of dividend will fluctuate from year to year depending upon the availability of acceptable investment opportunities. With abundant opportunities, the dividend payout ratio (D/P ratio, that is, the ratio of dividends to net earnings) would be zero. When there are no profitable opportunities, the D/P ratio will be 100. For situations between these extremes, the D/P ratio will range between zero and 100.

That dividends are irrelevant, or are a passive residual, is based on the assumption that the investors are indifferent between dividends and capital gains. So long as the firm is able to earn more than the equity-capitalisation rate (k_e), the investors would be content with the firm retaining the earnings. In contrast, if the return is less than the k_e , investors would prefer to receive the earnings (i.e. dividends).

Residual Theory of Dividends

The residual theory of dividend suggests that the dividends paid by a corporate should be viewed as a **residual**, that is, the amount left over after meeting the financing requirements of all the acceptable/profitable investment projects.² Dividends can be paid only out of the left over amount after financing all new projects with positive NPV. If no amount is left, there will be no dividend payments. The treatment of dividend payments as a **passive residual** implies that the dividend decisions are **irrelevant**. The approach is guided not only by the availability of acceptable investment

opportunities but is also concerned with maintaining a desirable/target capital structure in deciding about cash dividends. They are guided by the following four steps. The firm should:

- (1) Prepare a **capital budget** indicating the capital expenditure requirements of all profitable investment projects.
- (2) Determine the total equity funds requirements, based on the desired debt-equity ratio, to support the capital expenditure requirements in **Step 1**.
- (3) Use the retained earnings to the maximum extent possible to meet the funds requirements as per **Step 2**. The retained earnings are preferred to the external equity as the cost of the former is lower than that of the latter due to flotation costs. This is consistent with the pecking order hypothesis and signalling theory (**explained in Chapter 19**). New equity shares should be issued only when retained earnings are insufficient to meet the funds requirements of the target capital structure.
- (4) Pays cash dividend only if its available earnings are more than the required amount of equity funds in terms of the desired debt-equity ratio.

Example 29.1

Assume a company has (i) earnings after taxes (available for equityholders) of ₹90 lakh, (ii) target debt-equity ratio of 1:2 and (iii) new profitable investment projects in the size range of (1) ₹150 lakh, (2) ₹120 lakh, (3) ₹75 lakh, (4) ₹60 lakh, and (5) zero. Determine the amount of dividends paid and dividend payout ratio at varying levels of investment requirements as per residual theory of dividends.

Solution

Table 29.1: Dividends Paid and Dividend Payout Ratio Under Residual Theory of Dividends (Amount in ₹ lakh).

Particulars	Profitable investment projects				
	Case 1	2	3	4	5
Capital budget	₹150	₹120	₹75	₹60	Nil
Earnings after taxes	90	90	90	90	90
Target D/E ratio	1:2	1:2	1:2	1:2	1:2
Equity funds needed	100	80	50	40	Nil
Retained earnings available to pay dividends/ Dividends paid	Nil	10	40	50	90
Dividend payout ratio (%)	Nil	11.11	44.44	55.55	100

Table 29.1 indicates that the amount of dividends fluctuates depending on the availability of profitable investment projects and earnings. With abundant investment opportunities (**Case 1**), the dividend payout (D/P) ratio is zero. In contrast, in **Case 5** when there are no profitable investment projects, the D/P ratio is 100. For cases between these two extremes (i.e., **Cases 2 to 4**), the D/P ratio varies in the range of 11.11 to 55.55. Thus, it has inverse relationship with the available investment opportunities.

Given the fact that the earnings of a firm as well as the profitable investment projects available to it are likely to vary from year to year, strict adherence to the residual theory of dividends would result in wide fluctuations in dividend payments/unstable dividend policy from period to period. Since investors prefer stable dividend policies (**explained in Chapter 30**), the residual dividend policy by a firm would require higher required rate of return for equity investors (k_e). This, in turn, would result in lower share prices. A firm should, therefore, attempt to stabilise its dividend over time. To achieve the same, it is suggested that³ firms should (1) Estimate their net earnings after taxes and investment opportunities, on an average, for the next 5 years or so, (2) Use this forecasted information to determine the residual model payout ratio and absolute sum of dividend payments during the planning period and (3) Set a target dividend payout ratio on the basis of the projected data. A firm may smooth out actual dividend payments by saving some funds in surplus years, in anticipation of deficit/lean years.⁴ Surplus funds may be invested temporarily in marketable securities.

The residual theory of dividends provides an explanation why mature industries (with few opportunities for growth) have large dividend payments and high dividend-payment ratios. They succeed in attracting equity investors—clienteles who prefer high dividends. In contrast, high growth industries with abundant investment opportunities, prefer low dividend payments and attract equity investors who prefer capital gains.

In brief, the residual theory of dividends indicates that the dividend policy of a firm is a residual decision and not an active decision variable and dividends are a passive residual/irrelevant decision. Its strength is that a firm should retain its earnings when it has profitable investment projects and should favour its distribution when such opportunities are lacking. The rationale is sound as firms would retain profits when they can earn higher than what the equityholders can and prefer distribution of earnings when shareholders can earn higher. Its adverse impact in terms of unstable dividends can be minimised by creating **dividend equalisation reserve**. Funds can be transferred to this reserve in surplus years to be used in lean years.

Modigliani and Miller (MM) Hypothesis

Dividend irrelevance implies that the value of a firm is unaffected by the distribution of dividends and is determined solely by the earning power and risk of its assets.

The most comprehensive argument in support of the **irrelevance of dividends** is provided by the MM hypothesis.⁵ Modigliani and Miller maintain that dividend policy has no effect on the share price of the firm and is, therefore, of no consequence. What matters, according to them, is the investment policy through which the firm can increase its earnings and thereby the value of the firm. Given the investment decision of the firm, the dividend decision—splitting the earnings into packages of retentions and dividends—is a matter of detail and does not matter. 'Under conditions of perfect capital markets, rational investors, absence of tax discrimination between dividend income and capital appreciation, given the firm's investment policy, its dividend policy may have no influence on the market price of shares.'⁶

Assumptions The MM hypothesis of irrelevance of dividends is based on the following critical assumptions:

1. Perfect capital markets in which all investors are rational. Information is available to all free of cost, there are no transactions costs; securities are infinitely divisible; no investor is large enough to influence the market price of securities; there are no flotation costs.
2. There are no taxes. Alternatively, there are no differences in tax rates applicable to capital gains and dividends.
3. A firm has a given investment policy which does not change. The operational implication of this assumption is that financing of new investments out of retained earnings will not change the business risk complexion of the firm and, therefore, there would be no change in the required rate of return.
4. There is a perfect certainty by every investor as to future investments and profits of the firm. In other words, investors are able to forecast future prices and dividends with certainty. This assumption is dropped by MM later.

Crux of the Argument The crux of the MM position on the irrelevance of dividend is the arbitrage argument. The arbitrage process involves a switching and balancing operation. In other words, arbitrage refers to entering simultaneously into two transactions which exactly balance or completely offset each other. The two transactions here are the acts of paying out dividends and raising external funds—either through the sale of new shares or raising additional loans—to finance investment programmes. Assume that a firm has some investment opportunity. Given its investment decision, the firm has two alternatives: **(i)** it can retain its earnings to finance the investment programme; **(ii)** or distribute the earnings to the shareholders as dividend and raise an equal amount externally

through the sale of new shares/bonds for the purpose. If the firm selects the second alternative, **arbitrage process** is involved, in that payment of dividends is associated with raising funds through other means of financing. The effect of dividend payment on shareholders' wealth will be exactly offset by the effect of raising additional share capital.

When dividends are paid to the shareholders, the market price of the shares will decrease. What is gained by the investors as a result of increased dividends will be neutralised completely by the reduction in the market value of the shares. The terminal value before and after the payment of dividend would be identical. The investors, according to Modigliani and Miller, would, therefore, be indifferent between dividend and retention of earnings. Since the shareholders are indifferent, the wealth would not be affected by current and future dividend decisions of the firm. It would depend entirely upon the expected future earnings of the firm.

- Arbitrage
- implies the
- distribution
- of earnings to
- shareholders and
- raising an equal
- amount externally;
- the effect of
- dividend payment
- would be offset by
- the effect of raising
- additional funds.

There would be no difference to the validity of the MM premise, if external funds are raised in the form of debt instead of equity capital. This is because of their indifference between debt and equity with respect to leverage. The cost of capital is independent of leverage and the real cost of debt is the same as the real cost of equity.⁷

That investors are indifferent between dividend and retained earnings implies that the dividend decision is irrelevant. The arbitrage process⁸ also implies that the total market value plus current dividends of two firms which are alike in all respects except D/P ratio will be identical. The individual shareholder can retain and invest his own earnings as well as the firm would.

With dividends being irrelevant, a firm's cost of capital would be independent of its D/P ratio.

Finally, the arbitrage process will ensure that under conditions of *uncertainty* also the dividend policy would be irrelevant. When two firms are similar in respect of business risk, prospective future earnings and investment policies, the market price of their shares must be the same. This, MM argue, is because of the rational behaviour of investors who are assumed to prefer more wealth to less wealth. Differences in current and future dividend policies cannot affect the market value of the two firms as the present value of prospective dividends plus terminal value is the same.

Proof MM provide the proof in support of their argument in the following manner.

Step 1 The market price of a share in the beginning of the period is equal to the present value of dividends paid at the end of the period plus the market price of share at the end of the period. Symbolically,

$$P_0 = \frac{1}{(1 + k_e)} (D_1 + P_1) \quad (29.1)$$

where P_0 = Prevailing market price of a share,

k_e = Cost of equity capital,

D_1 = Dividend to be received at the end of period 1, and

P_1 = Market price of a share at the end of period 1

Step 2 Assuming no external financing, the total capitalised value of the firm would be simply the number of shares (n) times the price of each share (P_0). Thus,

$$nP_0 = \frac{1}{(1 + k_e)} (nD_1 + nP_1) \quad (29.2)$$

Step 3 If the firm's internal sources of financing its investment opportunities fall short of the funds required, and Δn is the number of new shares issued at the end of year 1 at price of P_1 , Eq. 29.2 can be written as:

$$nP_0 = \frac{1}{(1+k_e)} [(nD_1 + (n + \Delta n) P_1 - \Delta n P_1)] \quad (29.3)$$

where n = Number of shares outstanding at the beginning of the period, and
 Δn = Change in the number of shares outstanding during the period/Additional shares issued

* Equation 29.3 implies that the total value of the firm is the capitalised value of the dividends to be received during the period plus the value of the number of shares outstanding at the end of the period, considering new shares, less the value of the new shares. Thus, in effect, Eq. 29.3 is equivalent to Eq. 29.2.

Step 4 If the firm were to finance all investment proposals, the total amount raised through new shares issued would be given in Eq. 29.4.

$$\begin{aligned} \Delta n P_1 &= I - (E - nD_1) \\ \text{or } \Delta n P_1 &= I - E + nD_1 \end{aligned} \quad (29.4)$$

where $\Delta n P_1$ = Amount obtained from the sale of new shares of finance capital budget,
 I = Total amount/requirement of capital budget,
 E = Earnings of the firm during the period,
 nD_1 = Total dividends paid, and
 $(E - nD_1)$ = Retained earnings

According to Equation 29.4, whatever investment needs (I) are not financed by retained earnings, must be financed through the sale of additional equity shares.

Step 5 If we substitute Eq. 29.4 into Eq. 29.3 we derive Eq. 29.5.

$$nP_0 = \frac{1}{(1+k_e)} [nD_1 + (n + \Delta n) P_1 - (I - E + nD_1)] \quad (29.5)$$

Solving Eq. 29.5 we have

$$nP_0 = \frac{nD_1 + (n + \Delta n) P_1 - I + E - nD_1}{(1+k_e)}$$

There is a positive nD_1 and negative nD_1 . Therefore, nD_1 cancels. We then have

$$nP_0 = \frac{(n + \Delta n) P_1 - I + E}{(1+k_e)} \quad (29.6)$$

Step 6 Conclusion Since dividends (D) are not found in Eq. 29.6, Modigliani and Miller conclude that dividends do not count and that dividend policy has no effect on the share price.

MM's approach to irrelevance of dividend to valuation is illustrated in Example 29.2.

Example 29.2

A company belongs to a risk class for which the approximate capitalisation rate is 10 per cent. It currently has outstanding 25,000 shares selling at ₹100 each. The firm is contemplating the declaration of a dividend of ₹5 per share at the end of the current financial year. It expects to have a net income of ₹2,50,000 and has a proposal for making new investments of ₹5,00,000. Show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

Solution**(a) Value of the Firm, When Dividends Are Paid:**

(i) Price per share at the end of year 1,

$$P_0 = \frac{1}{(1 + k_e)} (D_1 + P_1)$$

$$₹100 = \frac{1}{1.10} (₹5 + P_1)$$

$$110 = ₹5 + P_1 \quad \text{or} \quad 105 = P_1$$

(ii) Amount required to be raised from the issue of new shares,

$$\begin{aligned} \Delta n P_1 &= I - (E - nD_1) \\ &= ₹5,00,000 - (₹2,50,000 - ₹1,25,000) = ₹3,75,000 \end{aligned}$$

(iii) Number of additional shares to be issued,

$$\Delta n = ₹3,75,000 / ₹105 = 75,000 / 21 \text{ shares}$$

(iv) Value of the firm,

$$\begin{aligned} nP_0 &= \frac{(n + \Delta n) P_1 - I + E}{(1 + k_e)} = \left[\frac{25,000}{1} + \frac{75,000}{21} \right] (₹105) - ₹5,00,000 \\ &\quad + ₹2,50,000 / 1.1 = ₹27,50,000 / 1.1 = ₹25,00,000 \end{aligned}$$

(b) Value of the Firm When Dividends Are Not Paid:(i) Price per share at the end of the year 1, $₹100 = \frac{P_1}{1.10}$, or $110 = P_1$

(ii) Amount required to be raised from the issue of new shares,

$$\Delta n P_1 = (₹5,00,000 - ₹2,50,000) = ₹2,50,000$$

(iii) Number of additional shares to be issued,

$$= ₹2,50,000 / ₹110 = 25,000 / 11 \text{ shares}$$

(iv) Value of the firm

$$\begin{aligned} &= \left[\frac{25,000}{1} + \frac{25,000}{11} \right] (₹110) - ₹5,00,000 + ₹2,50,000 / 1.1 \\ &= ₹27,50,000 / 1.1 = ₹25,00,000 \end{aligned}$$

Thus, whether dividends are paid or not, value of the firm remains the same.

The above example clearly demonstrates that the shareholders are indifferent between the retention of profits and the payment of dividend.

A Critique Modigliani and Miller argue that the dividend decision of the firm is irrelevant in the sense that the value of the firm is independent of it. The crux of their argument is that the investors are indifferent between dividend and retention of earnings. This is mainly because of the balancing nature of internal financing (retained earnings) and external financing (raising of funds externally) consequent upon distribution of earnings to finance investment programmes. Whether the MM hypothesis provides a satisfactory framework for the theoretical relationship between dividend decision and valuation will depend, in the ultimate analysis, on whether external and internal financing really balance each other. This, in turn, depends upon the critical assumptions stipulated by them. Their conclusions, it may be noted, under the restrictive assumptions, are logically consistent and intuitively appealing. But these assumptions are unrealistic and untenable in practice. As a result, the conclusion that dividend payments and other methods of financing exactly offset each other and, hence, the irrelevance of dividends, is not a practical proposition; it is merely of theoretical relevance. The validity of the MM Approach is open to question on two counts: **(i)** Imperfection of capital market, and **(ii)** Resolution of uncertainty.

Market Imperfection Modigliani and Miller assume that capital markets are perfect. This implies that there are no taxes; flotation costs do not exist and there is absence of transaction costs. These assumptions are untenable in actual situations.

Tax Effect An assumption of the MM hypothesis is that there are no taxes. It implies that *retention of earnings* (internal financing) and *payment of dividends* (external financing) are, from the viewpoint of tax treatment, on an equal footing. The investors would find both forms of financing equally desirable. The tax liability of the investors, broadly speaking, is of two types: **(i)** tax on dividend income, and **(ii)** capital gains. While the first type of tax is payable by the investors when the firm pays dividends, the capital gains tax is related to retention of earnings. From an operational viewpoint, capital gains tax is **(i)** lower than the tax on dividend income and **(ii)** it becomes payable only when shares are actually sold, that is, it is a deferred tax till the actual sale of the shares. The types of taxes, corresponding to the two forms of financing, are different, although the MM position would imply otherwise. The different tax treatment of dividend and capital gains means that with the retention of earnings the shareholders' tax liability would be lower or there would be tax saving for the shareholders. For example, a firm pays dividends to the shareholders out of the retained earnings. To finance its investment programmes, it issues rights shares. The shareholders would have to pay tax on the dividend income at rates appropriate to their income bracket. Subsequently, they would purchase the shares of the firm. Clearly, the tax could have been avoided if, instead of

paying dividend, the earnings were retained. If, however, the investors required funds, they could sell a part of their investments, in which case they will pay tax (capital gains) at a lower rate. There is a definite advantage to the investors owing to the **tax differential** in dividend and capital gains tax and, therefore, they can be expected to prefer retention of earnings. This line of reasoning is also supported by empirical evidence. Elton and Gruber⁹ have shown that investors in high income brackets have a preference for capital gains over dividends while those in low tax brackets favour dividends. In a more comprehensive study Brittain¹⁰ found an inverse relationship

between dividend payout ratios and the differential between tax rates on dividend income and capital gains. That is, *rising tax rates tend to depress dividends*. In brief, the investors are not, from the viewpoint of taxes, indifferent between dividends and retained earnings. The MM assumption is, therefore, untenable.

With effect from financial year 2003-4, dividend income from Indian corporate firms, and mutual funds is exempt from tax. However, the companies paying dividend are required to pay dividend distribution tax. Currently the effective dividend distribution tax rate in India works out at 16.61 per cent.

Flotation Costs Another assumption of a perfect capital market underlying the MM hypothesis of dividend irrelevance is the absence of flotation costs. The term '**flotation cost**' refers to the cost

involved in raising capital from the market, for instance, underwriting commission, brokerage and other expenses. The presence of flotation costs affects the balancing nature of internal (retained earnings) and external (dividend payments) financing. The MM position, it may be recalled, argues that given the investment decision of the firm, external funds would have to be raised, equal to the amount of dividend, through the sale of new shares to finance the investment programme. The two methods of

financing are not perfect substitutes because of flotation costs. The introduction of such costs implies that the net proceeds from the sale of new shares would be less than the face value of the shares, depending upon their size.¹¹ It means that to be able to make use of external funds, equivalent to

Tax differentials are the different rates of taxes applicable to dividend and capital gains.

Flotation cost is the cost involved in raising capital from the market.

the dividend payments, the firm would have to sell shares for an amount in excess of retained earnings. In other words, external financing through sale of shares would be costlier than internal financing *via* retained earnings. The smaller the size of the issue, the greater is the percentage flotation cost.¹² To illustrate, suppose the cost of flotation is 10 per cent and the retained earnings are ₹900. In case dividends are paid, the firm will have to sell shares worth ₹1,000 to raise funds equivalent to the retained earnings. That external financing is costlier is another way of saying that firms would prefer to retain earnings rather than pay dividends and then raise funds externally.

Transaction and Inconvenience Costs Yet another assumption which is open to question is that there are no transaction costs in the capital market. Transaction costs refer to costs associated with the sale of securities by the shareholder-investors. The *no-transaction costs postulate* implies that if dividends are not paid (or earnings are retained), the investors desirous of current income to meet consumption needs can sell a part of their holdings without incurring any cost, like brokerage and so on. This is obviously an unrealistic assumption. Since the sale of securities involves cost, to get current income equivalent to the dividend, if paid, the investors would have to sell securities in excess of the income that they will receive. Apart from the transaction cost, the sale of securities, as an alternative to current income, is inconvenient to the investors. Moreover, uncertainty is associated with the sale of securities. For all these reasons, an investor cannot be expected, as MM assume, to be indifferent between dividend and retained earnings. The investors interested in current income would certainly prefer dividend payment to ploughing back of profits by the firm.

- **Transaction costs**
- are costs
- involved in selling securities by the shareholders.

Institutional Restrictions The dividend alternative is also supported by legal restrictions as to the type of ordinary shares in which certain investors can invest. For instance, the life insurance companies are permitted in terms of section 27-A (1) of the Insurance Act, 1938, to invest in only such equity shares on which a dividend of not less than 4 per cent including bonus has been paid for 7 years or for at least 7 out of 8 or 9 years immediately preceding. To be eligible for institutional investment, the companies should pay dividends. These legal impediments, therefore, favour dividends to retention of earnings. A variation of the legal requirement to pay dividends is to be found in the case of mutual funds. They are required in terms of the stipulations governing their operations, to distribute at least 90 per cent of its net income to investors. The point is that the eligible securities for investment by the mutual funds are assumed to be those that are on the dividend-paying list.

To conclude the discussion of market imperfections, there are four factors which dilute the indifference of investors between dividends and retained earnings. Of these, flotation costs seem to favour retention of earnings. On the other hand, the desire for current income and, the related transaction and inconvenience costs, legal restrictions as applicable to the eligible securities for institutional investment and tax exemption of dividend income imply a preference for payment of dividends. In sum, therefore, market imperfections imply that investors would like the company to retain earnings to finance investment programmes. The dividend policy is not irrelevant.

Resolution of Uncertainty Apart from the market imperfection, the validity of the MM hypothesis, insofar as it argues that dividends are irrelevant, is questionable under conditions of uncertainty. MM hold, it would be recalled, that dividend policy is as irrelevant under conditions of uncertainty as it is when perfect certainty is assumed. The MM hypothesis is, however, not tenable as investors cannot be indifferent between dividend and retained earnings under conditions of uncertainty. This can be illustrated with reference to four aspects: **(i)** near vs distant dividend; **(ii)** informational content of dividends; **(iii)** preference for current income; and **(iv)** sale of stock at uncertain price/underpricing.

Near Vs Distant Dividend One aspect of the uncertainty situation is the payment of dividend now or at a later date. If the earnings are used to pay dividends to the investors, they get 'immediate' or 'near' dividend. If, however, the net earnings are retained, the shareholders would be entitled to receive a return after some time in the form of an increase in the price of shares (capital gains) or bonus shares and so on. The dividends may, then, be referred to as 'distant' or 'future' dividends. The crux of the problem is: are the investors indifferent between immediate and future dividends? Or would they prefer one over the other? According to Gordon¹³, investors are not indifferent; rather, they would prefer near dividend to distant dividend. The payment of dividend is uncertain;

Bird-in-hand argument is the belief that current dividend payments reduce uncertainty and result in higher value of shares of a firm.

how much dividend and when it would be paid by the firm to the investors cannot be precisely forecast. The longer the distance in future dividend payment, the higher is the uncertainty to the shareholders. The uncertainty increases the risk of the investors. The payment of dividend is not associated with any such uncertainty. In other words, payment of immediate dividend resolves uncertainty. The argument that near dividend implies resolution of uncertainty is referred to as the '**bird-in-hand argument**'. This argument is developed in some detail in the later part of this chapter. In brief, since current dividends are less risky than future/distant dividends, shareholders would favour dividends to retained earnings.

Informational Content of Dividends Another aspect of uncertainty, very closely related to the first (i.e. resolution of uncertainty or the 'bird-in-hand' argument) is the '**informational content of dividend**' argument. According to the latter argument, as the name suggests, the

Informational content is the information provided by dividends of a firm with respect to future earnings which causes owners to bid up or down the price of shares.

dividend contains some information vital to the investors. The payment of dividend conveys to the shareholders information relating to the profitability of the firm. If, for instance, a firm has been following a stable dividend policy in the sense of, say, ₹4 per share dividend, an increase in the amount to, say, ₹5 per share will signify that the firm expects its profitability to improve in future or *vice-versa*. The dividend policy is likely to cause a change in the market price of the shares. The significance of this aspect of current dividend payments is expressed by Ezra Solomon in these words:¹⁴ In an uncertain world in which verbal statements can be ignored or misinterpreted, dividend action does provide a clear-cut means of 'making a statement' that speaks louder than a thousand words.

Modigliani and Miller also concede the possibility of the effect of the informational content. But they still maintain that dividend policy is irrelevant as dividends do not determine the market price of shares. They contend that value is determined by the investment decision of the firm. All that the informational content of dividends implies is that dividends reflect the profitability of the firm. They cannot by themselves determine the market price of shares. The basic factor, therefore, is not dividend, but, **expectation of future profitability**.

The informational content argument finds support in some empirical evidence.¹⁵ It is contended that changes in dividends convey more significant information than what earnings announcements do. Further, the market reacts to dividend changes—prices rise in response to a significant increase in dividends and fall when there is a significant decrease or omission.

Preference for Current Income The third aspect of the uncertainty question relating to dividends is based on the desire of investors for current income to meet consumption requirements. The MM hypothesis of irrelevance of dividends implies that in case dividends are not paid, investors who prefer current income can sell a part of their holdings in the firm for the purpose. But, under

uncertainty conditions, the two alternatives are not on the same footing because **(i)** the prices of shares fluctuate so that the selling price is uncertain, and **(ii)** selling a small fraction of holdings periodically is inconvenient. That selling shares to obtain income, as an alternative to dividend, involves uncertain price and inconvenience, implies that investors are likely to prefer current dividend. The MM proposition would, therefore, not be valid because investors are not indifferent.

Underpricing Finally, the MM hypothesis would also not be valid when conditions are assumed to be uncertain because of the prices at which the firms can sell shares to raise funds to finance investment programmes consequent upon the distribution of earnings to the shareholders. The irrelevance argument would be valid provided the firm is able to sell shares to replace dividends at the current price. Since the shares would have to be offered to new investors, the firm can sell the shares only at a price below the prevailing price. It is rightly contended by Lintner¹⁶ that the equilibrium price of shares will decline as the firm sells additional stock to replace dividends. The **underpricing** or sale of shares at prices lower than the current market price implies that the firm will have to sell more shares to replace the dividend. The firm would be better off by retaining the profits as opposed to paying dividends.

- **Underpricing**
- implies sale of
- shares at prices
- lower than the
- current market
- price.

Under conditions of uncertainty, therefore, the MM doctrine of irrelevance does not hold good.

To recapitulate the preceding discussion, in the context of market imperfections and uncertainty situations, shareholders are not indifferent between retained earnings and current dividends. The considerations that support the proposition that investors have a systematic preference for current dividend relative to retained earnings are **(i)** desire for current income, **(ii)** resolution of uncertainty and the allied aspect of informational content of dividends, **(iii)** transaction and inconvenience costs, and **(iv)** underpricing of new shares. The more favourable tax treatment of dividend income relative to capital gains favours distribution of earnings. The empirical evidence regarding the effect of dividends on the market price of shares is only suggestive.¹⁷ Yet, it is indicative of the fact that companies behave as if dividends are relevant. The MM hypothesis, therefore, is untenable.

LO 29.2 RELEVANCE OF DIVIDENDS

In sharp contrast to the MM position, there are some theories that consider dividend decisions to be an active variable in determining the value of a firm. The dividend decision is, therefore, relevant. We critically examine below two theories representing this notion: **(i)** Walter's Model and **(ii)** Gordon's Model.

- **Dividend**
- **relevance**
- implies that
- shareholders prefer
- current dividends
- and there is no
- direct relationship
- between dividend
- policy and market
- value of a firm.

Walter's Model

Proposition Walter's model¹⁸ supports the doctrine that dividends are relevant. The investment policy of a firm cannot be separated from its dividends policy and both are, according to Walter, interlinked. The choice of an appropriate dividend policy affects the value of an enterprise.

The key argument in support of the relevance proposition of Walter's model is the relationship between the return on a firm's investment or its internal rate of return (r) and its cost of capital or the required rate of return (k). The firm would have an optimum dividend policy which will be determined by the relationship of r and k . In other words, if the return on investments exceeds the cost of capital, the firm should retain the earnings, whereas it should distribute the earnings to the shareholders in case the required rate of return exceeds the expected return on the firm's investments. The rationale is that if $r > k$, the firm is able to earn more than what the shareholders could

The first part of the history of the world is the history of the human race. It is a story of struggle and progress, of triumph and defeat. It is a story of the human mind, of its power and its limitations. It is a story of the human heart, of its joys and its sorrows. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The second part of the history of the world is the history of the human mind. It is a story of discovery and invention, of knowledge and wisdom. The third part of the history of the world is the history of the human heart. It is a story of love and hate, of joy and sorrow. It is a story of the human emotions, of their power and their limitations. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The fourth part of the history of the world is the history of the human spirit. It is a story of hope and despair, of faith and doubt. It is a story of the human soul, of its power and its limitations. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The fifth part of the history of the world is the history of the human soul. It is a story of the human mind, of its power and its limitations. It is a story of the human heart, of its joys and its sorrows. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The sixth part of the history of the world is the history of the human race. It is a story of the human mind, of its power and its limitations. It is a story of the human heart, of its joys and its sorrows. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The seventh part of the history of the world is the history of the human spirit. It is a story of the human mind, of its power and its limitations. It is a story of the human heart, of its joys and its sorrows. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

The eighth part of the history of the world is the history of the human soul. It is a story of the human mind, of its power and its limitations. It is a story of the human heart, of its joys and its sorrows. It is a story of the human spirit, of its hopes and its dreams. It is a story of the human race, of its past and its future.

by reinvesting, if the earnings are paid to them. The implication of $r < k$ is that shareholders can earn a higher return by investing elsewhere.

Walter's model, thus, relates the distribution of dividends (retention of earnings) to available investment opportunities. If a firm has adequate profitable investment opportunities, it will be able to earn more than what the investors expect so that $r > k$. Such firms may be called *growth firms*. For growth firms, the optimum dividend policy would be given by a D/P ratio of zero. That is to say, the firm should plough back the entire earnings within the firm. The market value of the shares will be maximised as a result.

In contrast, if a firm does not have profitable investment opportunities (when $r < k$), the shareholders will be better off if earnings are paid out to them so as to enable them to earn a higher return by using the funds elsewhere. In such a case, the market price of shares will be maximised by the distribution of the entire earnings as dividends. A D/P ratio of 100 would give an optimum dividends policy.

Finally, when $r = k$ (normal firms), it is a matter of indifference whether earnings are retained or distributed. This is so because for all D/P ratios (ranging between zero and 100) the market price of shares will remain constant. For such firms, there is no optimum dividend policy (D/P ratio).

Assumptions The critical assumptions of Walter's Model are as follow:

1. All financing is done through retained earnings: external sources of funds like debt or new equity capital are not used.
2. With additional investments undertaken, the firm's business risk does not change. It implies that r and k are constant.
3. There is no change in the key variables, namely, beginning earnings per share, E , and dividends per share, D . The values of D and E may be changed in the model to determine results, but, any given value of E and D are assumed to remain constant in determining a given value.
4. The firm has perpetual (or very long) life.

Formula Walter has evolved a mathematical formula to arrive at the appropriate dividend decision. His formula is based on a share valuation model which states:

$$P = \frac{D}{k_e - g} \quad (29.7)$$

where P = Price of equity shares,
 D = Initial dividend,
 k_e = Cost of equity capital, and
 g = Expected growth rate of earnings

To reflect earnings retentions, we have

$$P = \frac{D}{k_e - rb} \quad (29.8)$$

where r = Expected rate of return on firm's investments, and b = Retention rate $(E - D)/E$

Thus, rb measures growth rate in dividends, which is the product of the rate of profitability of retained earnings (r) and the earnings retention percentage (b).

From Eq. 29.7, we derive an equation for determining k_e

$$k_e = \frac{D}{P} + g \quad (29.9)$$

since $g = \frac{\Delta P}{P}$ we have,

$$k_e = \frac{D}{P} + \frac{\Delta P}{P}$$

and since $\Delta P = \frac{r}{k_e} (E - D)$,

substituting the value of ΔP , we have

$$k_e = \frac{D + \frac{r}{k_e} (E - D)}{P}$$

or
$$P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} \quad (29.10)$$

where P = The prevailing market price of a share,
 D = Dividend per share,
 E = Earnings per share, and
 r = The rate of return on the firm's investment

Equation 29.10 shows that the value of a share is the present value of all dividends plus the present value of all capital gains. Walter's model with reference to the effect of dividend/retention policy on the market value of shares under different assumptions of r (return on investments) is illustrated in Example 29.3.

Example 29.3

The following information is available in respect of a firm:

Capitalisation rate (k_e) = 0.10

Earnings per share (E) = ₹10

Assumed rate of return on investments (r): (i) 15, (ii) 8, and (iii) 10.

Show the effect of dividend policy on the market price of shares, using Walter's model.

Solution

- (i) When r is 0.15, that is, $r > k_e$: The effect of different D/P ratios depicted in Table 29.2.
 (ii) When r = 0.08 and 0.10, that is, $r < k_e$ and $r = k_e$ respectively: The effect of different D/P ratios on the value of shares is shown in Table 29.3.

TABLE 29.2 Dividend Policy and Value of Shares (Walter's Model)

(a) D/P ratio = 0 (Dividend per share = zero)

$$P = \frac{0 + \left[\frac{0.15}{0.10} \right] (10 - 0)}{0.10} = ₹150$$

(b) D/P ratio = 25 (Dividend per share = ₹2.5)

$$P = \frac{2.5 + \left[\frac{0.15}{0.10} \right] (10 - 2.5)}{0.10} = ₹137.50$$

(c) D/P ratio = 50 (Dividend per share = ₹5)

$$P = \frac{5 + \left[\frac{0.15}{0.10} \right] (10 - 5)}{0.10} = ₹125$$

(d) D/P ratio = 75 (Dividend per share = ₹7.5)

$$P = \frac{7.5 + \left[\frac{0.15}{0.10} \right] (10 - 7.5)}{0.10} = ₹112.50$$

(Contd.)

[Illegible text]

(Contd.)

(e) D/P ratio = 100 (Dividend per share = ₹10)

$$P = \frac{10 + \left[\frac{0.15}{0.10} \right] (10 - 10)}{0.10} = ₹100$$

TABLE 29.3 Dividend Policy and Value of Shares (Walter's Model)

	(A) $r = 0.8$ ($r < k_e$)	(B) $r = 0.10$ ($r = k_e$)
(a) D/P ratio = Zero	$P = \frac{0 + \left[\frac{0.08}{0.10} \right] (10 - 0)}{0.10} = ₹80$	$P = \frac{0 + \left[\frac{0.10}{0.10} \right] (10 - 0)}{0.10} = ₹100$
(b) D/P Ratio = 25	$P = \frac{2.5 + \left[\frac{0.08}{0.10} \right] (10 - 2.5)}{0.10} = ₹85$	$P = \frac{2.5 + \left[\frac{0.10}{0.10} \right] (10 - 2.5)}{0.10} = ₹100$
(c) D/P Ratio = 50	$P = \frac{5 + \left[\frac{0.08}{0.10} \right] (10 - 5)}{0.10} = ₹90$	$P = \frac{5 + \left[\frac{0.10}{0.10} \right] (10 - 5)}{0.10} = ₹100$
(d) D/P Ratio = 75	$P = \frac{7.5 + \left[\frac{0.08}{0.10} \right] (10 - 7.5)}{0.10} = ₹95$	$P = \frac{7.5 + \left[\frac{0.10}{0.10} \right] (10 - 7.5)}{0.10} = ₹100$
(e) D/P Ratio = 100	$P = \frac{10 + \left[\frac{0.08}{0.10} \right] (10 - 10)}{0.10} = ₹100$	$P = \frac{10 + \left[\frac{0.10}{0.10} \right] (10 - 10)}{0.10} = ₹100$

Interpretation The calculations of the value of shares according to Walter's formula in Tables 29.2 and 29.3 yield the following conclusions:

1. When the firm is able to earn a return on investments exceeding the required rate of return that is, $r > K_e$, the value of shares is inversely related to the D/P ratio: as the payout ratio increases, the market value of shares declines. (Table 29.1). Its value is the highest when the D/P ratio is zero. If, therefore, the firm retains its entire earnings, it will maximise the market value of shares (₹150). When all earnings are distributed, its value is the lowest. In other words, the optimum payout ratio (dividend policy) is zero.
2. It is clear from Table 29.2 that when $r < k_e$ that is, when the firm does not have ample profitable investment opportunities, the D/P ratio and the value of shares are positively correlated: as the payout ratio increases, the market price of the shares also increases. The dividend policy is optimum when the D/P ratio = 100 per cent. In other words, when $r < k_e$, the firm would be well advised to distribute the entire earnings to the shareholders.

3. For a situation in which $r = k_e$, the market value of shares is constant irrespective of the D/P ratio (Table 29.2); there is *no optimum dividend policy (D/P) ratio*. In other words, the market price of shares is not affected by the *D/P ratio*. Whether the firm retains the profits or distributes dividends is a matter of indifference. *This is a hypothetical situation*. In actual practice, the two values (r and k_e) are different and Walter concludes that dividend policy does matter as a variable in maximising share prices.

Limitations The Walter's model, one of the earliest theoretical models, explains the relationship between dividend policy and value of the firm under certain simplified assumptions. Some of the assumptions do not stand critical evaluation. In the first place, the Walter's model assumes that the firm's investments are financed exclusively by retained earnings; no external financing is used. The model would be only applicable to all-equity firms. Secondly, the model assumes that r is constant. This is not a realistic assumption because when increased investments are made by the firm, r also changes. Finally, as regards the assumption of constant, k_e , the *risk complexion* of the firm has a direct bearing on it. By assuming a constant k_e , Walter's model ignores the effect of risk on the value of the firm.

Gordon's Model

Another theory which contends that dividends are relevant is Gordon's model.¹⁹ This model, which opines that dividend policy of a firm affects its value, is based on the following assumptions:

1. The firm is an all-equity firm. No external financing is used and investment programmes are financed exclusively by retained earnings.
2. r is constant, k_e increases with retention rate.
3. The firm has perpetual life.
4. The retention ratio, once decided upon, is constant. Thus, the growth rate, ($g = br$) is also constant.
5. $k_e > br$.

Arguments It can be seen from the assumptions of Gordon's model that they are similar to those of Walter's model. As a result, Gordon's model, like Walter's, contends that dividend policy of the firm is relevant and that investors put a positive premium on current incomes/dividends. The crux of Gordon's arguments is a two-fold assumption: **(i)** investors are risk averse, and **(ii)** they put a premium on a *certain* return and discount/penalise *uncertain* returns.

As investors are rational, they want to avoid risk. The term risk refers to the possibility of not getting a return on investment. The payment of current dividends *ipso facto* completely removes any chance of risk. If, however, the firm retains the earnings (i.e. current dividends are withheld), the investors can expect to get a dividend in future. The future dividend is uncertain, both with respect to the amount as well as the timing. The rational investors can reasonably be expected to prefer current dividend. In other words, they would discount future dividends, that is, they would place less importance on it as compared to current dividend. The retained earnings are evaluated by the investors as a risky promise. In case the earnings are retained, therefore, the market price of the shares would be adversely affected.

The above argument underlying Gordon's model of dividend relevance is also described as a *bird-in-the-hand argument*.²⁰ That a bird in hand is better than two in the bush is based on the logic that *what is* available at present is preferable to *what may* be available in the future. Basing his model on this argument, Gordon argues that the future is uncertain and the more distant the future is, the more uncertain it is likely to be. If, therefore, current dividends are withheld to retain

$$\frac{1}{x^2} = x^{-2}$$

$$\frac{d}{dx} x^{-2} = -2x^{-3}$$

$$= -2x^{-3}$$

$$= -\frac{2}{x^3}$$

Example: Find the derivative of $y = x^{-2}$ with respect to x .

Solution: Let $y = x^{-2}$. Then $\frac{dy}{dx} = -2x^{-3} = -\frac{2}{x^3}$.

Example: Find the derivative of $y = x^{-2}$ with respect to x .

Solution: Let $y = x^{-2}$. Then $\frac{dy}{dx} = -2x^{-3} = -\frac{2}{x^3}$.

Example 2

Find the derivative of $y = x^{-2}$ with respect to x .

Solution: Let $y = x^{-2}$. Then $\frac{dy}{dx} = -2x^{-3} = -\frac{2}{x^3}$.

Example: Find the derivative of $y = x^{-2}$ with respect to x .

Solution: Let $y = x^{-2}$. Then $\frac{dy}{dx} = -2x^{-3} = -\frac{2}{x^3}$.

Example: Find the derivative of $y = x^{-2}$ with respect to x .

Solution: Let $y = x^{-2}$. Then $\frac{dy}{dx} = -2x^{-3} = -\frac{2}{x^3}$.

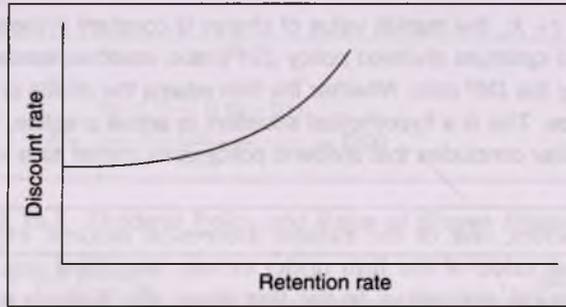

FIGURE 29.1 Retention Rate and Discount Rate

profits, whether the investors would at all receive them later is uncertain. Investors would naturally like to avoid uncertainty. In fact, they would be inclined to pay a higher price for shares on which current dividends are paid. Conversely, they would discount the value of shares of a firm which postpones dividends. The discount rate would vary, as shown in Figure 29.1, with the *retention rate* or level of retained earnings. The term retention ratio means the percentage of earnings retained. It is the inverse of D/P ratio. The omission of dividends, or payment of low dividends, would lower the value of the shares.

Dividend Capitalisation Model According to Gordon, the market value of a share is equal to the present value of future streams of dividends. A simplified version of Gordon's model can be symbolically²¹ expressed as

$$P = \frac{E(1-b)}{k_e - br} \quad (29.11)$$

where P = Price of a share,
 E = Earnings per share,
 b = Retention ratio or percentage of earnings retained,
 $1 - b$ = D/P ratio, i.e. percentage of earnings distributed as dividends,
 k_e = Capitalisation rate/cost of capital, and
 $br = g$ = Growth rate = rate of return on investment of an all-equity firm.

The implications of dividends policy according to Gordon's model are illustrated in Example 29.4.

Example 29.4

The following information is available in respect of the rate of return on investment (r), the capitalisation rate (k_e) and earnings per share (E) of Hypothetical Ltd.

$r = 12$ per cent
 $E = ₹20$

Determine the value of its shares, assuming the following:

	D/P ratio ($1 - b$)	Retention ratio (b)	k_e (%)
(a)	10	90	20
(b)	20	80	19
(c)	30	70	18
(d)	40	60	17
(e)	50	50	16
(f)	60	40	15
(g)	70	30	14

Solution

The value of shares of Hypothetical Ltd for different D/P and retention ratios is depicted in Table 29.4.

TABLE 29.4 Dividend Policy and Value of Shares of Hypothetical Ltd (Gordon's Model)

(a) D/P ratio	10	(Retention ratio 90)	$br(g) = 0.9 \times 0.12 = 0.108$
			$P = \frac{₹20(1-0.9)}{0.20-0.108} = \frac{₹2}{0.092} = ₹21.74$
(b) D/P ratio	20	(Retention ratio 80)	$br = 0.8 \times 0.12 = 0.096$
			$P = \frac{₹20(1-0.8)}{0.19-0.096} = ₹42.55$
(c) D/P ratio	30	(Retention ratio 70)	$br = 0.7 \times 0.12 = 0.084$
			$P = \frac{₹20(1-0.7)}{0.18-0.084} = ₹62.50$
(d) D/P ratio	40	(Retention ratio 60)	$br = 0.6 \times 0.12 = 0.72$
			$P = \frac{₹20(1-0.6)}{0.17-0.072} = ₹81.63$
(e) D/P ratio	50	(Retention ratio 50)	$br = 0.5 \times 0.12 = 0.060$
			$P = \frac{₹20(1-0.5)}{0.17-0.072} = ₹100$
(f) D/P ratio	60	(Retention ratio 40)	$br = 0.4 \times 0.12 = 0.048$
			$P = \frac{₹20(1-0.4)}{0.15-0.048} = ₹117.65$
(g) D/P ratio	70	(Retention ratio 30)	$br = 0.3 \times 0.12 = 0.036$
			$P = \frac{₹20(1-0.3)}{0.14-0.036} = ₹134.62$

Gordon, thus, contends that the dividend decision has a bearing on the market price of the share. The market price of the share is favourably affected with more dividends. (Table 29.4).

SUMMARY

There are divergent views regarding the impact of dividend policy (dividend payout, D/P ratio) on the market price of the share and the value of the firm.

The residual theory of dividends suggests that the dividends paid by a corporate should be viewed as a residual – the amount left over from corporate earnings after taxes after meeting the requirement of all profitable investment projects, while maintaining a target debt-equity ratio. Cash dividends can be paid only if its available earnings are more than the required amount of funds to meet the desired debt-equity ratio.

LO 29.1

It results in fluctuating dividend payments, as earnings of a firm as well as profitable investment opportunities available to it are likely to vary from year to year.

The dividend payment ratio may vary in the size range of zero to one-hundred depending on the size of earnings, capital expenditure requirements and the desired debt-equity ratio.

Since stable dividend policy is desirable, a firm may smooth out actual dividend payments by creating a dividend equalisation fund.

The other view, led by Modigliani and Miller (MM), takes a diametrically opposite position and contends that the dividend policy of a firm has no effect on its value.

MM's proof in support of their argument is depicted in the following equation:

$$nP_0 = \frac{nD_1 + (n + \Delta n)p_1 - I + E - nD_1}{(1 + k_e)}$$

Since nD_1 in numerator of the equation cancels nD_1 and dividends (D) are not found, MM conclude that dividends do not count and the dividend policy has no effect on the share price.

The arguments in support of MM do not stand the test of scrutiny under real world/business situations. Investors, in general, prefer current dividends to retained earnings. The major factors affecting the validity of MM model are: (i) tax effect, (ii) flotation cost, (iii) transaction and inconvenience costs, (iv) preference for current dividend and (v) resolution of uncertainty.

According to yet another view represented by Walter, Gordon and others, the D/P ratio is relevant and it certainly affects the market price of shares.

The key argument in support of the relevance of Walter's model is the relationship between the return on a firm's investment (r) and its cost of capital/required rate of return (k). If $r > k$, the firm should retain the earnings (or D/P ratio should be zero) as it is able to earn higher than what the shareholders could by investing on their own. In case $r < k$, it implies that shareholders can earn a higher return by investing elsewhere. Therefore, the entire earnings (D/P ratio should be 100 per cent) should be distributed to them. By following such a policy, the market price of share is maximised.

According to Walter, the value of the firm, as measured by the market price per share (P) is given by the following equation:

$$P = \frac{D + \frac{r}{k}(E - D)}{k}$$

The value of P is maximum when D is zero (in situations of $r > k$); when $r < k$, the value of $E = D$ gives maximum P .

Gordon's proposition that dividend policy of the firm is relevant is based on two tenable assumptions: (i) investors are risk averse, and (ii) they put a positive premium on current incomes/dividends. The retained earnings are evaluated by the investors as a risky promise as the future dividend receipts are perceived by them as uncertain, both with respect to the amount as well as the timing.

According to Gordon, the market value of a share is equal to the present value of future streams of dividend. Symbolically,

$$P = \frac{E(1 - b)}{k_e - b_r}$$

The value of P increases with the increase in the D/P ratio, and is maximum when there are no retentions.

The available empirical evidence seems to support the view that dividend policy is relevant. A firm should try to follow an optimum dividend policy which maximises the shareholder's wealth in the long run.

SOLVED PROBLEMS

P.29.1 (a) X company earns ₹5 per share, is capitalised at a rate of 10 per cent and has a rate of return on investment of 18 per cent.

LO 29.1,2	LOD M
-----------	----------

According to Walter's model, what should be the price per share at 25 per cent dividend payout ratio? Is this the optimum payout ratio according to Walter?

(b) Omega company has a cost of equity capital of 10 per cent, the current market value of the firm (V) is ₹20,00,000 (@ ₹20 per share). Assume values for I (new investment), Y (earnings) and D (dividends) at the end of the year as $I = ₹6,80,000$, $Y = ₹1,50,000$ and $D = ₹1$ per share. Show that under the MM assumptions, the payment of dividend does not affect the value of the firm.

Solution

$$(a) P = \frac{D + \frac{r}{k_e}(E - D)}{k_e} = \frac{\text{₹}1.25 + \left[\frac{0.18}{0.10} \right] (\text{₹}5.0 - \text{₹}1.25)}{0.10} = \text{₹}80$$

This is not the optimum dividend payout ratio because Walter suggests a zero per cent dividend payout ratio in situations where $r > k_e$ to maximise the value of the firm. At this ratio, the value of the share would be maximum, that is, ₹90.

(b) Value of the firm, when dividends are paid (MM assumptions):

$$(i) \text{ Market price of the share at the end of the year: } P_0 = \frac{1}{(1 + k_e)} (P_1 + D_1)$$

$$\text{₹}20 = \frac{(P_1 + \text{₹}1)}{1.10} = \text{₹}21 = P_1$$

$$(ii) \text{ Amount required for new financing: } I - (Y - nD_1) = \text{₹}6,80,000 - (\text{₹}1,50,000 - \text{₹}1,00,000) = \text{₹}6,30,000$$

$$(iii) \text{ Number of shares to be issued: } = \frac{\text{₹}6,30,000}{\text{₹}21} = 30,000 \text{ shares}$$

$$(iv) \text{ Value of the firm: } = \frac{1}{(1 + k_e)} [nD_1 + (n + \Delta n)P_1 - I + Y - nD_1]$$

$$\frac{\text{₹}1,00,000 + [(1,00,000 + 30,000) \times \text{₹}21] - \text{₹}6,80,000 + \text{₹}1,50,000 - \text{₹}1,00,000}{1.10} = \text{₹}20,00,000$$

(c) Value of the firm when dividends are not paid:

$$(i) \text{ Market price of the share at the end of the year: } \text{₹}20 = \frac{P_1 + \text{Zero}}{1.10}, \text{₹}22 = P_1$$

$$(ii) \text{ Amount required for new financing: } I - (Y - nD_1) = \text{₹}6,80,000 - \text{₹}1,50,000 = \text{₹}5,30,000$$

$$(iii) \text{ Number of new shares to be issued } = \frac{\text{₹}5,30,000}{\text{₹}22} \text{ shares}$$

$$(iv) \text{ Value of the firm: } = \frac{1}{1 + k_e} [(n + \Delta n)P_1 - I + Y]$$

$$= \frac{\left[1,00,000 + \frac{5,30,000}{22} \right] \text{₹}22 - \text{₹}6,80,000 + \text{₹}1,50,000}{1.10} = \text{₹}20,00,000$$

Since the value of the firm is ₹20,00,000, in both the situations when dividends are paid and when dividends are not paid, dividend does not affect the value of the firm.

P.29.2 The Apex Company which earns ₹5 per share, is capitalised at 10 per cent and has a return on investment of 12 per cent. Using Walter's dividend policy model, determine optimum dividend pay out ratio and the price of the share at this pay out. It currently has 1,00,000 shares selling at ₹100 each. The firm is contemplating the declaration of ₹5 as dividend at the end of the current financial year, which has just begun. What will be the price of the share at the end of the year, if a dividend is not declared? What will it be if it is paid? Answer these on the basis of Modigliani and Miller model and assume no taxes.

LO 29.2 **LOD E**

Solution

(a) (i) According to Walter's formula, the optimum dividend payout ratio would be zero as $r > k_e$ because the value of the share of the firm would be maximum.

$$(ii) \quad P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} = \frac{(0.12 / 0.10) (\text{₹}5)}{0.10} = \text{₹}60$$

(b) (i) Price of the share when dividends are declared (MM assumptions): $P = \frac{1}{(1 + k_e)} (D_1 + P_1)$

$$\text{₹}100 = \frac{1}{1.10} (\text{₹}5 + P_1), \text{₹}105 = P_1$$

(ii) Price of share when dividends are not declared: $\text{₹}100 = \frac{(\text{₹}0 + P_1)}{1.10}$ or $P_1 = \text{₹}110$

P.29.3 Expandent Ltd had 50,000 equity shares of ₹10 each outstanding on January 1. The shares are currently being quoted at par in the market. The company now intends to pay a dividend of ₹2 per share for the current calendar year. It belongs to a risk class whose appropriate capitalisation rate is 15 per cent. Using Modigliani-Miller model and assuming no taxes, ascertain the price of the company's share at it is likely to prevail at the end of the year (a) when dividend is declared, and (b) when no dividend is declared. (c) Also, find out the number of new equity shares that the company must issue to meet its investment needs of ₹2 lakh, assuming a net income of ₹1.1 lakh and also assuming that the dividend is paid.

LO 29.1 LOD E

Solution

(a) Price of the share, when dividends are paid: $P_0 = \frac{D_1 + P_1}{(1 + k_e)}, \text{₹}10 = \frac{\text{₹}2 + P_1}{1.15}, \text{₹}9.5 = P_1$

(b) Price of the share, when dividends are not paid: $\text{₹}10 = \frac{P_1}{1.15}, \text{₹}11.5 = P_1$

(c) Number of new equity shares to be issued:

$$\Delta n = \frac{I - (E - nD_1)}{P_1} = \frac{\text{₹}2,00,000 - (\text{₹}1,10,000 - 1,00,000)}{\text{₹}9.5} = 20,000 \text{ shares}$$

P.29.4 The Asbestos Company belongs to a risk class of which the appropriate capitalisation rate is 10 per cent. It currently has 1,00,000 shares selling at ₹100 each. The firm is contemplating the declaration of a ₹6 dividend at the end of the current fiscal year, which has just begun. Answer the following questions based on Modigliani and Miller model and the assumptions of no taxes.

LO 29.1 LOD E

(a) What will be the price of the shares at the end of the year, if a dividend is not declared? What will it be if it is declared?

(b) Assuming that the firm pays dividend, has a net income of ₹10,00,000 and makes new investments of ₹20,00,000 during the period, how many new shares must be issued?

Solution

(a) (i) Price of the share, when dividend is declared: $\frac{D_1 + P_1}{(1 + k_e)}, \text{₹}100 = \frac{P_1 + \text{₹}6}{1.10}, \text{₹}104 = P_1$

(ii) Price of the share, when dividends are not paid: $\text{₹}100 = \frac{P_1 + 0}{1.10}, \text{₹}110 = P_1$

(b) Number of new shares to be issued: $= \frac{I - (E - nD_1)}{P_1}$
 $= \frac{\text{₹}20,00,000 - (\text{₹}10,00,000 - 6,00,000)}{\text{₹}104} = 15,385 \text{ shares}$

P.29.5 From the following information supplied to you, determine the theoretical market value of equity shares of a company as per Walter's model:

Earnings of the company	₹5,00,000
Dividends paid	3,00,000
Number of shares outstanding	1,00,000
Price earning ratio	8
Rate of return on investment	0.15

Are you satisfied with the current dividend policy of the firm? If not, what should be the optimal dividend payout ratio in this case?

Solution

$$P = \frac{D + \frac{r}{k_e} (E - D)}{k_e} = \frac{₹3 + \left[\frac{0.15}{0.125} \right] (₹5 - ₹3)}{0.125} = ₹43.20$$

No, we are not satisfied with the current dividend policy. The optimal dividend payout ratio, given the facts of the case ($r > k_e$), should be zero.

Working Notes

- (i) k_e is the reciprocal of P/E ratio = $1/8 = 12.5$ per cent
- (ii) E = Total earnings + Number of shares outstanding
- (iii) D = Total dividends + Number of shares outstanding

P.29.6 The earnings per share of a company is ₹8 and the rate of capitalisation applicable is 10 per cent. The company has before it, an option of adopting (i) 50, (ii) 75 and (iii) 100 per cent dividend pay out ratio. Compute the market price of the company's quoted shares as per Walter's Model if it can earn a return of (a) 15, (b) 10 and (c) 5 per cent on its retained earnings.

LO 29.2 **LOD M**

Solution

(i) D/P ratio = 0.50	(ii) D/P ratio = 0.75	(iii) D/P ratio = 1
(a) Price of shares if $r = 0.15$		
$P = \frac{₹4 + \frac{0.15}{0.10} (₹8 - ₹4)}{0.10}$	$P = \frac{₹6 + \frac{0.15}{0.10} (₹8 - ₹6)}{0.10}$	$P = \frac{₹8 + \frac{0.15}{0.10} (₹8 - ₹8)}{0.10}$
= ₹100	= ₹90	= ₹80
(b) Price of share if $r = 0.10$		
$P = \frac{₹4 + \frac{0.10}{0.10} (₹8 - ₹4)}{0.10}$	$P = \frac{₹6 + \frac{0.10}{0.10} (₹8 - ₹6)}{0.10}$	$P = \frac{₹8 + \frac{0.10}{0.10} (₹8 - ₹8)}{0.10}$
= ₹80	= ₹80	= ₹80
(c) Price of share if $r = 0.05$		
$P = \frac{₹4 + \frac{0.05}{0.10} (₹8 - ₹4)}{0.10}$	$P = \frac{₹6 + \frac{0.05}{0.10} (₹8 - ₹6)}{0.10}$	$P = \frac{₹8 + \frac{0.05}{0.10} (₹8 - ₹8)}{0.10}$
= ₹60	= ₹70	= ₹80

P.29.7 A closely-held plastic manufacturing company has been following a dividend policy which can maximise the market value of the firm as per Walter's model. Accordingly, each year at dividend time, the capital budget is reviewed in conjunction with the earnings for the period and alternative investment opportunities for the shareholders. In the current year, the firm reports net earnings of ₹5,00,000. It is estimated that the firm can earn ₹1,00,000 if the amounts are retained. The investors have alternative investment opportunities that will yield them 10 per cent. The firm has 50,000 shares outstanding. What should be the D/P ratio of the company if it wishes to maximise the wealth of the shareholders? Also state minimum MPS.

LO 29.2 **LOD M**

Solution D/P ratio of the company should be zero because at this ratio, market price of the share would be the maximum as shown by the following calculations:

$$P = \left[D + \left(\frac{r}{K_e} \right) (E - D) \right] / K_e = [0 + 0.20/0.10 (\text{₹}10 - 0)]/0.10 = \text{₹}20/0.10 = \text{₹}200$$

$$\text{Minimum MPS} = [\text{₹}10 + 0.2/0.1 (\text{₹}10 - \text{₹}10)]/0.10 = \text{₹}10/0.1 = \text{₹}100$$

Working Notes

$$r = (\text{₹}1,00,000/\text{₹}5,00,000) \times 100 = 20 \text{ per cent}$$

$$E = \text{₹}5,00,000/50,000 = \text{₹}10$$

P.29.8 (i) From the following information supplied to you, ascertain whether the firm's D/P ratio is optimal according to Walter. The firm was started a year ago with an equity capital of ₹20 lakh.

Earnings of the firm	₹2,00,000
Dividend paid	1,50,000
P/E ratio	12.5

Number of shares outstanding, 20,000 @ ₹100 each. The firm is expected to maintain its current rate of earnings on investment.

LO 29.2 **LOD**
D

(ii) What should be the P/E ratio at which the dividend payout ratio will have no effect on the value of the share?

(iii) Will your decision change if the P/E ratio is 8, instead of 12.5?

Solution

$$(i) P = [\text{₹}7.5 + (0.10/0.08) \times (\text{₹}10 - \text{₹}7.5)]/0.08 = \text{₹}10.625/0.08 = \text{₹}132.81.$$

The firm's D/P ratio is not optimal. At 75 per cent D/P ratio, the price per share is ₹132.81. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown in the following calculations:

$$P = [0 + (0.10/0.08) \times (\text{₹}10 - 0)]/0.08 = \text{₹}12.50/0.08 = \text{₹}156.25.$$

Working Notes

(a) K_e is the reciprocal of P/E ratio = $1/0.125 = 8$ per cent

(b) $\text{EPS} = \text{₹}2,00,000 + 20,000 = \text{₹}10$

(c) $\text{ROI}(r) = (\text{₹}2,00,000 + \text{₹}20,000) \times 100 = 10$ per cent

(ii) At P/E ratio of 10 times, D/P ratio would have no effect on the value of the share because at this rate $K_e = r$.

(iii) Yes, the decision would change if the P/E ratio is 8. This implies that K_e is 12.5 per cent. Since $K_e > r$, the 100 per cent dividend payout ratio would maximise the value of the share: $P = [10 + (0.10/0.125) \times (\text{₹}10 - \text{₹}10)]/0.125 = \text{₹}80$. At all other D/P ratios, the value would be lower.

P.29.9 The following figures are collected from the current year annual report of XYZ Ltd:

LO 29.2 **LOD**
D

Earnings of firm	₹18 lakh
Number of equity shares	3 lakh
Return on investment	22.5%
Cost of equity	15%

What should be dividend payout ratio so as to keep the share price at ₹42 by using Walter Model? Also, determine the optimum dividend payout ratio. Determine the market price of share at optimum D/P ratio. What will be the minimum and maximum price under this model? When D/P ratio will be irrelevant under Walter's proposition?

Solution

Earnings of the firm	18 lakh
Number of equity shares	3 lakh
EPS	₹6

UNITED STATES DEPARTMENT OF THE ARMY
HEADQUARTERS
WASHINGTON, D. C.

MEMORANDUM FOR THE RECORD

MEMORANDUM FOR THE RECORD

1. [Illegible text]

2. [Illegible text]

3. [Illegible text]

4. [Illegible text]

5. [Illegible text]

6. [Illegible text]

7. [Illegible text]

8. [Illegible text]

$$P = (D + r/k (E - D))/k$$

For $P = ₹42$

$$42 = x + 1.5 (6 - x) = (x + 9 - 1.5x)/0.15 = (9 - 0.5x) / 0.15$$

$$6.3 = 9 - 0.5x$$

$$X = ₹5.4 (2.7/0.5)$$

$$D/P \text{ ratio} = ₹5.4 / 6 = 0.9 = 90\%$$

The company's D/P ratio is not optimal. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown below:

$$P = [0 + (22.5\%/15\%) (₹6-0)]/15\% = ₹60$$

Minimum price under this model will be at 100% D/P ratio:

$$P = [6 + (22.5\%/15\%) (₹6 - ₹6)]/15\% = ₹40$$

Maximum price (₹60, already computed) under this model will be at zero per cent D/P ratio.

D/P ratio would be irrelevant when $k_e = r$.

P.29.10 A textile company belongs to a risk-class for which the appropriate P/E ratio is 10. It currently has 50,000 outstanding shares selling at ₹100 each. The firm is contemplating the declaration of ₹8 dividend at the end of the current fiscal year which has just started. Given the assumption of MM, answer the following questions.

LO 29.1 LOD M

- (i) What will the price of the share be at the end of the year: (a) if dividend is not declared, and (b) if it is declared?
- (ii) Assuming that the firm pays the dividend, has a net income (y) of ₹5,00,000 and makes new investments of ₹10,00,000 during the period, how many new shares must be issued?
- (iii) What will the value of the firm be: (a) if dividend is declared, and (b) if dividend is not declared?

Solution

- (i) (a) Price, P_1 , when dividend is not declared
 $P_0 = (D_1 + P_1)/(1 + K_e)$ or $₹100 = 0 + P_1/(1 + 0.10) = ₹110 = P_1$
- (b) When dividend is declared
 Price, $P_0 = (D_1 + P_1)/(1 + K_e) = ₹100 = (₹8 + P_1)/0.10 = ₹102$
- (ii) (a) Amount required for new financing
 $= I - (Y - nD_1) = ₹10,00,000 - (₹5,00,000 - ₹4,00,000) = ₹9,00,000$
- (b) New shares to be issued
 $Dn = ₹9,00,000/102$
- (iii) (a) Value of the firm (V) when dividend is declared
 $V = [nD_1 + (n + n)P_1 - I + Y - nD_1]/(1 + K_e)$
 $= [(₹4,00,000 + 102 \times (50,000 + ₹9,00,000/102)) - 10,00,000 + 5,00,000 - 4,00,000]/1.10$
 $= ₹55,00,000/1.10 = ₹50,00,000.$
- (b) Value, when dividend is not declared
 $V = [(n + \Delta n)P_1 - I + Y]/(1 + K_e)$
 $= [(50,000 + ₹5,00,000/100) \times 110 - ₹10,00,000 + ₹5,00,000]/1.1$
 $= [₹60,00,000 - ₹10,00,000 + ₹5,00,000]/1.10 = ₹50,00,000.$

P.29.11 The following information is supplied to you, about a company:

LO 29.2 LOD M

Earnings of the company	₹15,00,000
Dividends paid	5,00,000
Number of issued shares	1,00,000
Price earnings ratio	10
Rate of return on investment (%)	15

- (i) Determine the theoretical market price of the share.
- (ii) Are you satisfied with the current dividend policy of the Firm? If not, what should be the optimal dividend payment ratio in this case?

Solution

$$(i) P = \frac{[₹5 + (0.15/0.10) (15 - 5)]}{0.10} = \frac{₹5 + 1.5 (10)}{0.10} = \frac{₹20}{0.10} = ₹200$$

- (ii) The Company's D/P ratio is not optimal. At 33.33 per cent D/P ratio, the price per share is ₹200. The zero per cent D/P ratio would be optimum, as at this ratio the value of the share would be maximum as shown below:

$$P = \frac{[0 + 0.15/0.10][₹15 - 0]}{0.10} = \frac{1.5 [₹15]}{0.10} = ₹225$$

Working Notes

- (a) K_e is the reciprocal of P/E ratio = $1/0.10 = 10$ per cent.
 (b) EPS = ₹15,00,000 ÷ 1,00,000 = ₹15.
 (c) DPS = ₹5,00,000 ÷ 1,00,000 = ₹5.

P.29.12 X Limited just declared a dividend of ₹14 per share. Mr. B is planning to purchase the share of X Limited, anticipating increase in growth rate from 8% to 9%, which will continue for three years. He also expects the market price of this share to be ₹360 after three years. You are required to determine: (i) the maximum amount Mr. B should pay for shares, if he requires a rate of return of 13% per annum. (ii) the maximum price Mr. B will be willing to pay for share, if he is of the opinion that the 9% growth can be maintained indefinitely and 13% is his rate of return per annum, (iii) the price of share at the end of three years, if 9% growth rate is achieved and assuming other conditions remaining same as in (i) above. Calculate rupee amount up to two decimal points.

LO 29.2 LOD D

	Year-1	Year-2	Year-3
FVIF @ 9%	1.090	1.188	1.295
FVIF @ 13%	1.130	1.277	1.443
PVIF @ 13%	0.885	0.783	0.693

Solution

- (i) **Expected dividend for next 3 years.**

Year 1 (D_1) ₹14.00 (1.09) = ₹15.26

Year 2 (D_2) ₹14.00 (1.09)² = ₹16.63

Year 3 (D_3) ₹14.00 (1.09)³ = ₹18.13

Required rate of return = 13% (K_e)

Market price of share after 3 years = (P_3) = ₹360

The present value of share

$$P_0 = \frac{D_1}{(1 + K_e)} + \frac{D_2}{(1 + K_e)^2} + \frac{D_3}{(1 + K_e)^3} + \frac{P_3}{(1 + K_e)^3}$$

$$P_0 = \frac{15.26}{(1 + 0.13)} + \frac{16.63}{(1 + 0.13)^2} + \frac{18.13}{(1 + 0.13)^3} + \frac{360}{(1 + 0.13)^3}$$

$$P_0 = 15.26(0.885) + 16.63(0.783) + 18.13(0.693) + 360(0.693) = ₹288.56$$

- (ii) If 9% growth rate is achieved for indefinite period, then maximum price of share Mr. B should be willing to pay is:

$$P_0 = D_1 / (K_e - g) = ₹15.26 / 0.13 - 0.09 = ₹381.50$$

- (iii) Assuming that conditions mentioned above remain same, the price expected after 3 years will be:

$$P_3 = D_4 / K_e - g = D_3 (1.09) / (0.13 - 0.09) = 18.13 \times 1.09 / 0.04 = ₹494$$

P.29.13 The following information is available in respect of Hypothetical Ltd: Dividend per share (D) at dividend payout ratio of 20% = ₹2. As per Gordon's model, equity capitalisation rate is 15% (at D/P ratio of 20%). Company earns ₹10 on every ₹100 invested. Determine the value of its shares (as per Gordon's approach).

[Faint text]	[Faint text]	[Faint text]
[Faint text]	[Faint text]	[Faint text]

[Faint, illegible text]

Solution

Retention ratio (b) = $1 - 0.20 = 0.80 = 80\%$

EPS = DPS + D/P ratio = $₹2/0.20 = ₹10$

Rate of return (r) = $₹10/₹100 = 10\%$

As per Gordon model,

$$\begin{aligned} P &= [E(1 - b)] / (k_e - br) \\ &= [₹10(1 - 0.8)] / [0.15 - (0.8 \times 0.1)] \\ &= ₹2 / 0.07 = ₹28.57 \end{aligned}$$

P.29.14 The following information is available for the Hypothetical Ltd: EPS = ₹5.00, D/P ratio = 40%, K_e at D/P ratio of 40% is 16%. Assuming that Gordon valuation model holds true, what rate of return should be earned on investments to ensure that the market price per share is ₹50? LO 29.2 LO D

Solution

$$\begin{aligned} P &= E(1 - b) / (k_e - br) \\ ₹50 &= ₹5(1 - 0.6) / (0.16 - 0.6r) \\ ₹50 &= ₹2 / (0.16 - 0.6r) \\ ₹50(0.16 - 0.6r) &= ₹2 \\ ₹8 - 30r &= ₹2 \\ ₹6 &= 30r \end{aligned}$$

Or $r = 6/30 = 0.2 = 20$ per cent

P.29.15 Assume the Hypothetical Ltd expects a potential earnings after taxes of ₹200 lakh next year. Its target debt ratio is 30 per cent. The capital budgeting department of the company projects the likely capital expenditure next year amounting to (i) ₹100 lakh (ii) ₹200 lakh and (iii) ₹400 lakh. Determine the cash dividends likely to be paid and dividend payout ratio at varying levels of investment requirement under the residual dividend policy. LO 29.1 LO D

Solution

Dividends Paid and Dividend Payout Ratio Under Residual Dividend Policy (Amount in ₹ lakh)

Particulars	Size of Capital Budget		
	(1)	(2)	(3)
Capital expenditure	₹100	₹200	₹400
Projected earnings after taxes	200	200	200

REVIEW QUESTIONS**LOD: Easy****RQ.29.1** Give appropriate answers for the following:**[LO 29.1,2]**

- (i) Which of the following is not an assumption of the MM theory for irrelevance of dividends?
 - (a) Irrational investors (b) No tax discrimination on capital gains and dividends (c) No transaction costs (d) No flotation costs
- (ii) According to Walter's model, the value of the share is _____ proportion to the D/P ratio
 - (a) in inverse (b) in direct (c) not related at all (d) in linear
- (iii) The test of adequate acceptable opportunities for the firm while considering its dividend policy is the relation between _____ and _____
- (iv) If the cost of capital of the firm (k) is higher than the rate of return (r), the firm will retain its earnings as it would lead to the reduction of its cost of capital. (True/False)
- (v) MM theory of irrelevance of dividends is applicable only to firms which have a constant investment policy. (True/False)
- (vi) According to MM theory, the market price of the share will remain unchanged even after the payment of dividends (True/False)
- (vii) The arbitrage process implies that the market value plus current dividends of two firms which are alike in all respects except _____ ratio will be identical.
 - (a) D/P (b) P/E (c) debt/equity
- (viii) Investors can be expected to prefer _____ to _____ owing to the tax differential between the dividend and capital gains tax.

- (ix) Under what condition is the Walter model similar to the MM hypothesis with regards to the payment of dividends?
(a) $r > k$ (b) $r = k$ (c) $r < k$
- (x) Walter's model and Gordon's model are applicable to firms in which all financing is done through _____ and with _____ leverage.
- (xi) According to the Gordon model, the discount rate used by the investors exhibits _____ relationship with the retention rate.
(a) a directly proportional (b) an inversely proportional (c) no relationship at all
- (xii) The market price of the share, according to Gordon model, is _____ affected with the increasing payment of dividends.
(a) favourably (b) unfavourably (c) unaffected

[Answers: (i) Irrational investors (ii) Not related at all (iii) Return on investment and Cost of capital (iv) False (v) True (vi) True (vii) D/P Ratio (viii) Retention of earnings Payment of dividend (ix) $r = k$ (x) Retained earnings, zero (xi) Directly proportional, and (xii) Favourably]

RQ.29.2 What is 'informational content' of dividend payments? Explain. [LO 29.2]

RQ.29.3 The cost of capital and the rate of return on investments of WM Ltd is 10 per cent and 15 per cent respectively. The company has 10 lakh equity shares of ₹10 each outstanding and its earnings per share is ₹5. [LO 29.2]

Calculate the value of the firm in the following situations using Walter's model: (i) 100 per cent retention; (ii) 50 per cent retention; and (iii) no retention. Comment on your result.

RQ.29.4 An engineering company has a cost of equity capital of 15 per cent. The current market value of the firm is ₹30,00,000 @ ₹30 per share. Assuming values for I (new investment), ₹9,00,000, E (earnings), ₹5,00,000, and D (total dividends), ₹3,00,000, show that under the MM assumptions, the payment of dividend does not affect the value of the firm. [LO 29.1]

RQ.29.5 X Ltd. has 8 lakh equity shares outstanding at the beginning of the current year. The current market price per share is ₹120. The Board of Directors of the company is contemplating ₹6.4 per share as dividend. The rate of capitalisation, appropriate to the risk-class to which the company belongs, is 9.6 per cent. [LO 29.1]

(i) Based on M-M approach, calculate the market price of the share of the company, when the dividend is – (a) declared; and (b) not declared.

(ii) How many new shares are to be issued by the company, if the company desires to fund an investment budget of ₹3.20 crore by the end of the year assuming net income for the year will be ₹1.60 crore?

LOD: Medium

RQ.29.6 In a world of no taxes and no transaction costs, a firm cannot be made more valuable by manipulating the dividend payout ratio. Examine the validity of the statement. [LO 29.1]

RQ.29.7 What are the assumptions and arguments used by Modigliani and Miller in support of the irrelevance of dividends? Are dividends really irrelevant? If not, what are the arguments for relevance of dividend policy? [LO 29.1.2]

RQ.29.8 Explain, giving suitable illustrations, the formula given by Walter for determining dividend policy. What are the merits and limitations of this formula in designing the dividend policy for a company? [LO 29.2]

RQ.29.9 How far do you agree with the proposition that dividends are irrelevant? [LO 29.1.2]

RQ.29.10 What is the rationale of the residual theory of dividends? What are the steps a corporate should take to implement it? [LO 29.1]

RQ.29.11 The EPS of a company is ₹16. The market capitalisation rate applicable to the company is 12.5 per cent. Retained earnings can be employed to yield a return of 10 per cent. The company is considering a pay-out of 25 per cent, 50 per cent and 75 per cent. Which of these would maximise the wealth of shareholders as per Walter's model. [LO 29.2]

RQ.29.12 Arvind Ltd belongs to a risk-class for which the appropriate capitalisation rate is 10 per cent. It currently has outstanding 25,000 shares selling at ₹100 each. The firm is contemplating the declaration of dividend of ₹5 per share at the end of the current financial year. The company expects to have a net income of ₹2.5 lakh and has a proposal for making new investments of ₹5 lakh.

Show that under the MM assumption, the payment of dividend does not affect the value of the firm. Is the MM model realistic with respect to valuation? What factors might mar its validity?

[LO 29.1,2]

LOD: Difficult

RQ.29.13 In what way can the residual theory of dividend be used to establish a long-run target dividend payout ratio instead of dividend payments of each year? Explain with an appropriate example.

[LO 29.1]

RQ.29.14 The following figures are collected from the annual report of XYZ Ltd.:

[LO 29.2]

Net profit	₹30 lakh
Outstanding 12% preference shares	100 lakh
Number of equity shares	3 lakh
Return on investment	20%

What should be the approximate dividend pay-out ratio so as to keep the share price at ₹42 by using Walter Model?

ANSWERS

- 29.3** (i) ₹750 lakh;
(ii) ₹625 lakh;
(iii) ₹500 lakh

If the firm earn a higher return than the shareholders, a 100 per cent retention is suggested and *vice-versa*.

29.4 Since the value of the firm remains at ₹30 lakh in both the situations when dividends are paid and when dividends are not paid, it can be concluded that the payment of dividend does not affect the value of the firm.

- 29.5** (i) (a) ₹125.12; (b) ₹131.52
(ii) 1,68,798; 1,21,655

- 29.11** Value of P at 25% ₹108.8;
at 50% ₹115.2;
at 75% ₹121.6;

None of the above D/P ratio would maximize the wealth of shareholders. The wealth will be maximum (₹128) when D/P ratio is 100.

29.12 Since the value of the firm is ₹25 lakh, in both the situations when dividends are paid and when dividends are not paid, it can be concluded that the payment of dividend does not affect the value of the firm.

The major factors affecting the validity of MM's model are (i) Tax effect, (ii) Flotation cost, (iii) Transaction cost and inconvenience costs, (iv) Preference for current dividend by investors and resolution of uncertainty.

- 29.14** 85 per cent

Determinants of Dividend Policy

LEARNING OBJECTIVES

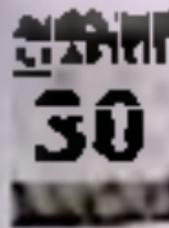

LO 30.1	Describe the general factors that affect dividend policy
LO 30.2	Contrast the basic features of bonus shares and share splits
LO 30.3	Explain share repurchase including the procedural aspects
LO 30.4	Understand the legal, procedural and tax aspects of dividend policy
LO 30.5	Summarise share split practices in India
LO 30.6	Outline bonus share practices in India
LO 30.7	Comprehend shares repurchase practices in India

INTRODUCTION

The previous Chapter has provided an overview of the relationship between the dividend decision of a firm and its total value. In the light of the conflicting and contradictory viewpoints as also the available empirical evidence, there appears to be a case for the proposition that dividend decisions are relevant in the sense that investors prefer them over retained earnings and they have a bearing on the firm's objective of maximising the shareholders' wealth. Given the relevance proposition of the dividend decision of the firm, the present Chapter is devoted to a discussion of the determinants of the dividend policy of a firm. Unlike the theoretical nature of the discussion in the previous Chapter, this aspect of dividend policy is more practical. The Chapter discusses the factors which determine the dividend policy of a firm. The issues of bonus shares (Stock dividends), share (stock) split and related issues are covered in the subsequent discussion. The legal, procedural and tax aspects of dividend payments are outlined subsequently. The main points are summarised by way of recapitulation.

LO 30.1 FACTORS AFFECTING DIVIDEND POLICY

The factors determining the dividend policy of a firm may, for purpose of exposition, be classified into: **(a)** Dividend payout (D/P) ratio, **(b)** Stability of dividends, **(c)** Legal, contractual and internal constraints and restrictions, **(d)** Owner's considerations, **(e)** Clientele effect, **(f)** Capital market considerations, and **(g)** Inflation.

Determinants of Demand Policy

TABLE 1

1. Supply	Availability of resources
2. Technology	State of knowledge and techniques
3. Government	Policy, regulation, and control
4. Consumer	Income, taste, and habit
5. Production	Cost of production
6. Substitution	Availability of substitutes

CONCLUSION

The demand curve is a downward-sloping curve that shows the relationship between the price of a good and the quantity demanded. It is a fundamental concept in economics that helps to explain consumer behavior and market equilibrium. The demand curve is derived from the law of demand, which states that as the price of a good falls, the quantity demanded increases, and vice versa. This relationship is influenced by various factors, including income, tastes, and the availability of substitutes. The demand curve is a key component of the supply and demand model, which is used to analyze market behavior and predict the outcome of changes in supply and demand.

APPENDIX

This appendix provides a detailed analysis of the factors that influence the demand curve. It discusses the role of income, tastes, and the availability of substitutes in determining the shape and position of the demand curve. It also examines the relationship between the demand curve and the supply curve, and how they interact to determine market equilibrium. The appendix includes a series of graphs and tables that illustrate the effects of changes in these factors on the demand curve and the market equilibrium.

Dividend Payout (D/P) Ratio

Dividend policy involves decision to pay out earnings or to retain them for re-investment.

A major aspect of the **dividend policy** of a firm is its dividend payout (D/P) ratio, that is, the percentage share of the net earnings distributed to the shareholders as dividends. The relevance of the **D/P ratio**, as a determinant of the dividend policy of a firm, has been examined at some length in the preceding chapter. It is briefly recapitulated here.

D/P (dividend payout) ratio indicates the percentage earnings distributed to shareholders in cash, calculated by dividing the cash dividend per share by its earnings per share.

Dividend policy involves the decision to pay out earnings or to retain them for reinvestment in the firm. The retained earnings constitute a source of financing. The payment of dividends results in the reduction of cash and, therefore, in a depletion of total assets. In order to maintain the asset level, as well as to finance investment opportunities, the firm must obtain funds from the issue of additional equity or debt. If the firm is unable to raise external funds, its growth would be affected. Thus, dividends imply outflow of cash and lower future growth. In other words, the dividend policy of the firm affects both the shareholders' wealth and the long-term growth of the firm. The optimum dividend policy should strike the balance between current dividends and future growth which maximises the price of the firm's shares.¹ The D/P ratio of a firm should be determined with reference to two basic objectives—maximising the wealth of the firm's owners and providing sufficient funds to finance growth. These objectives are not mutually exclusive, but interrelated.

Given the objective of wealth maximisation, the firm's dividend policy (D/P ratio) should be one which can maximise the wealth of its owners in the 'long run'. In theory, it can be expected that the shareholders take into account the long-run effects of D/P ratio, that is, if the firm is paying low dividends and having high retentions, they recognise the element of growth in the level of future earnings of the firm. However, in practice, they have a clear cut preference for dividends because of uncertainty and imperfect capital markets. The payment of dividends can, therefore, be expected to affect the price of shares: a low D/P ratio may cause a decline in share prices, while a high ratio may lead to a rise in the market price of the shares.

Making a sufficient provision for financing growth can be considered a *secondary* objective of dividend policy. Without adequate funds to implement acceptable projects, the objective of wealth maximisation cannot be achieved. The firm must forecast its future needs for funds, and taking into account the external availability of funds and certain market considerations, determine *both the amount of retained earnings needed and the amount of retained earnings available after the minimum dividends have been paid*. Thus, dividend payments should not be viewed as a residual, but rather a required outlay after which any remaining funds can be reinvested in the firm.²

The D/P ratio of the Reliance Industries Ltd. (RIL) is summarised in Exhibit 30.1.

EXHIBIT 30.1 D/P Ratio of RIL, 2005-2017

Years	DP ratio
2017	11.53
2016	11.28

2006	17.52
2005	15.79
Mean 2005-2017	13.51
Mean 2005-2008	14.22
Mean 2009-2017	13.20

Stability of Dividends

The second major aspect of the dividend policy of a firm is the stability of dividends. The investors favour a stable dividend as much as they favour the payment of dividends (D/P ratio).

The term **dividend stability** refers to the *consistency or lack of variability* in the stream of dividends. In more precise terms, it means that a *certain minimum amount of dividend* is paid out regularly. The *stability* of dividends can take any of the following three forms: (i) constant dividend per share, (ii) constant/stable D/P ratio, and (iii) constant dividend per share plus extra dividend.

- **Dividend stability**
- refers to the
- payment of a
- certain minimum
- amount of dividend
- regularly.

Constant Dividend Per Share According to this form of stable dividend policy, a company follows a policy of paying a certain fixed amount per share as dividend. For instance, on a share of face value of ₹100, a firm may pay a fixed amount of, say ₹15 as dividend. This amount would be paid year after year, irrespective of the level of earnings. In other words, fluctuations in earnings would not affect the dividend payments. In fact, when a company follows such a dividend policy, it will pay dividends to the shareholder even when it suffers losses. A stable dividend policy in terms of a fixed amount of dividend per share does not, however, mean that the amount of dividend is fixed for all times to come. The dividends per share are increased over the years when the earnings of the firm increase and it is expected that the new level of earnings can

- **Constant dividend per share policy**

- paying a certain
- fixed amount per
- share as dividend.

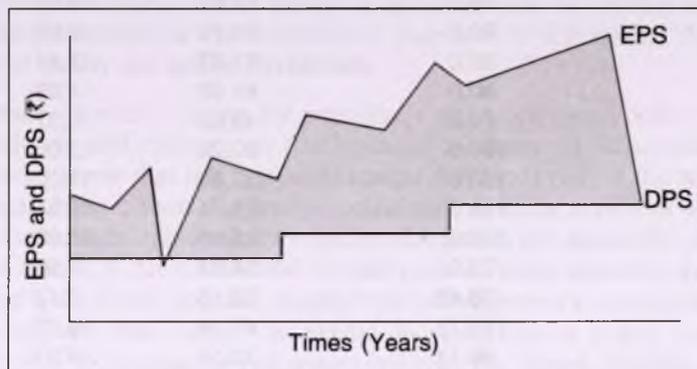

FIGURE 30.1 Stable Dividend Policy

be maintained. Of course, if the increase is expected to be temporary, the annual dividend remains at the existing level. The relationship between the earnings per share (EPS) and dividends per share (DPS) with a constant dividend policy per year is shown in Figure 30.1.

Constant/target payout ratio is a policy to pay a constant percentage of net earnings as dividend to shareholders in each dividend period.

It can, thus, be seen that while the earnings may fluctuate from year to year, the dividend per share is constant. To be able to pursue such a policy, a firm whose earnings are not stable would have to make provisions in years when earnings are higher for payment of dividends in lean years. Such firms usually create a '**reserve for dividends equalisation**'. The balance standing in this fund is normally invested in such assets as can be readily converted into cash.

Constant Payout Ratio With constant payout ratio, a firm pays a constant percentage of net earnings as dividend to the shareholders. In other words, a stable dividend payout ratio implies that the percentage of earnings paid out each year is fixed. Accordingly, dividends would fluctuate proportionately with earnings and are likely to be highly volatile in the wake of wide fluctuations in the earnings of the company. As a result, when the earnings of a firm decline substantially or there is a loss in a given period, the dividends, according to the target payout ratio, would be low or nil. To illustrate, if a firm has a policy of 50 per cent target payout ratios, its dividends will range between ₹5 and zero per share on the assumption that the earnings per share are ₹10 and zero respectively.

Stable rupee plus extra dividend is a policy based on paying a fixed dividend to shareholders supplemented by an additional dividend when earnings warrant it.

Stable Rupee Dividend Plus Extra Dividend Under this policy, a firm usually pays a fixed dividend to the shareholders and in years of marked prosperity additional or extra dividend is paid over and above the regular dividend. As soon as normal conditions return, the firm cuts the extra dividend and pays the normal dividend per share.

The EPS/DPS/RPS/equity dividend of RIL during 2005-17 are shown in Exhibit 30.2.

EXHIBIT 30.2 Equity Dividend, EPS, DPS, and Retention Per Share of RIL, 2005–2017

Years	Equity dividend (%)	EPS	DPS	Retention per share
2017	110.0	₹96.65	₹11.00	₹85.65
2016	105.0	84.61	10.50	74.11
2015	100.0	70.21	10.00	60.21

Mean 2009-2017	96.11	78.11	9.27	63.47

Evaluation An examination of the three variants of a stable dividend policy require addressing the following questions. What is their relative suitability? What are their implications to the shareholders and the firm? Which form would find favour with the investors?

The target payout ratio, as a form of stable dividend policy, commends itself insofar as it relates to the payment of actual dividend and to the ability of the firm to pay dividends: the higher the earnings, the higher is the dividend per share to the investors. It also implies that funds are automatically ploughed back to the extent of the retained earnings. It also guards against overpayment as well as underpayment of dividends³ because management cannot pay dividends if there are no profits and it cannot withhold them when profits are earned. But from the shareholder's viewpoint, this method involves *uncertainty* and *irregularity* in regard to the expected dividends. The policy of paying sporadic dividends may not find favour with them.

The alternative to the combination of a small regular dividend and an extra dividend is suitable for companies whose earnings fluctuate widely. With this method, a firm can regularly pay a fixed, though small, amount of dividend so that there is no risk of not being able to pay dividend to the shareholders. At the same time, the investors can participate in the prosperity of the firm. By calling the amount by which the dividends exceed the normal payments as *extra*, the firm, in effect, cautions the investors—both existing as well as prospective—that they should not consider it as a permanent increase in dividends. It may, therefore, be noted that, from the investor's viewpoint, the extra dividend is of a sporadic nature.

What the investors expect is that they should get an assured fixed amount as dividends which should gradually and consistently increase over the years. The most commendable form of stable dividend policy is the constant dividend per share policy. There are several reasons why investors would prefer a stable dividend policy and pay a higher price for a firm's shares which observes stability in dividend payments.

Desire for Current Income A factor favouring a stable policy is the desire for current income by some investors. Investors such as retired persons and widows, for example, view dividends as a source of funds to meet their current living expenses. Such expenses are fairly constant from period to period. Therefore, a fall in dividend will necessitate selling shares to obtain funds to meet current expenses and, conversely, reinvestment of some of the dividend income if dividends rise significantly. For one thing, many of the income-conscious investors may not like to 'dip into their principal' for current consumption. Moreover, either of the alternatives involves, inconvenience apart, transaction costs in terms of brokerage, and other expenses. These costs are avoided if the dividend stream is stable and predictable. Obviously, such a group of investors may be willing to pay a higher share price to avoid the inconvenience of erratic dividend payments which disrupt their budgeting. They would place **positive utility on stable dividends**.

Informational Contents Another reason for pursuing a stable dividend policy is that investors are thought to use dividends and changes in dividends as a source of information about the firm's profitability. If investors know that the firm will change dividends only if the management foresees a permanent earnings change, then the level of dividends informs investors about the company's expected earnings. Accordingly, the market views the changes in the dividends of such a company as of a semi-permanent nature. A cut in dividend implies poor earnings expectation; no change, implies earnings stability; and a dividend increase, signifies the management's optimism about earnings. On the other hand, a company that pursues an erratic dividend payout policy does not provide any such information, thereby increasing the risk associated with the shares. Stability of dividends, where such dividends are based upon long-run earning power of the company, is, therefore, a means of reducing share-riskiness and consequently increasing share value to investors.⁴

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Adding these two equations, we get $2x = 12$, so $x = 6$. Substituting $x = 6$ into the first equation, we get $6 + y = 10$, so $y = 4$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Subtracting the second equation from the first, we get $2y = 8$, so $y = 4$. Substituting $y = 4$ into the first equation, we get $x + 4 = 10$, so $x = 6$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Multiplying the second equation by -1 , we get $-x + y = -2$. Adding this to the first equation, we get $2y = 8$, so $y = 4$. Substituting $y = 4$ into the first equation, we get $x + 4 = 10$, so $x = 6$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Dividing the first equation by 2, we get $x + \frac{y}{2} = 5$. Subtracting the second equation from this, we get $\frac{y}{2} = 3$, so $y = 6$. Substituting $y = 6$ into the first equation, we get $x + 6 = 10$, so $x = 4$. Therefore, the two numbers are 4 and 6.

Equation	x	y
$x + y = 10$	6	4
$x - y = 2$	6	4
$x + y = 10$	4	6
$x - y = 2$	4	6

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Adding these two equations, we get $2x = 12$, so $x = 6$. Substituting $x = 6$ into the first equation, we get $6 + y = 10$, so $y = 4$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Subtracting the second equation from the first, we get $2y = 8$, so $y = 4$. Substituting $y = 4$ into the first equation, we get $x + 4 = 10$, so $x = 6$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Multiplying the second equation by -1 , we get $-x + y = -2$. Adding this to the first equation, we get $2y = 8$, so $y = 4$. Substituting $y = 4$ into the first equation, we get $x + 4 = 10$, so $x = 6$. Therefore, the two numbers are 6 and 4.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Dividing the first equation by 2, we get $x + \frac{y}{2} = 5$. Subtracting the second equation from this, we get $\frac{y}{2} = 3$, so $y = 6$. Substituting $y = 6$ into the first equation, we get $x + 6 = 10$, so $x = 4$. Therefore, the two numbers are 4 and 6.

Let x and y be the two numbers. We are given that $x + y = 10$ and $x - y = 2$. Dividing the second equation by 2, we get $\frac{x}{2} - \frac{y}{2} = 1$. Adding this to the first equation, we get $\frac{3x}{2} = 11$, so $x = \frac{22}{3}$. Substituting $x = \frac{22}{3}$ into the first equation, we get $\frac{22}{3} + y = 10$, so $y = \frac{8}{3}$. Therefore, the two numbers are $\frac{22}{3}$ and $\frac{8}{3}$.

Requirements of Institutional Investors A third factor encouraging stable dividend policy is the requirement of institutional investors like life insurance companies, general insurance companies, mutual funds and so on, to invest in companies which have a record of continuous and stable dividend. These financial institutions owing to the large size of their investible funds, represent a significant force in the financial markets and their demand for the company's securities can have an *enhancing effect* on its price and, thereby, on the shareholder's wealth. A stable dividend policy is a prerequisite to attract the investible funds of these institutions. One consequential impact of the purchase of shares by them is that there may be an increase in the general demand for the company's shares. Decreased **marketability risk**, coupled with decreased **financial risk**, will have a positive effect on the value of the firm's shares.

Apart from theoretical postulates for the desirability of stable dividends, there are also many empirical studies, classic among them being that of Lintner⁵, to support the viewpoint that companies pursue a stable dividend policy. In other words, companies, while taking decisions on the payment of dividend, bear in mind the dividend amount paid in the previous years. There is a resistance on the part of companies to reduce dividends below the amount paid in previous years. Actually, most firms seem to favour a policy of establishing a non-decreasing *dividend per share stream* over time, but firms seem to be specially careful not to raise dividends per share above a level than cannot be safely sustained in the future. **This cautious creep up of dividends per share results in stable dividend per share pattern during fluctuating earnings per share periods, and a rising step-function pattern of dividends per share during increasing earning per share periods**⁶.

According to John Lintner's study, dividends are 'sticky' in the sense that they are slow to change and lag behind shifts in earnings by one or more periods. Most firms, in addition to maintaining a stable rupee amount of dividend, also have target payout ratios (long-run dividend payout ratio) which they aim at. The firms may plan a high or low long-run target payout ratio regardless of their policy towards period-to-period dividend stability. The desire to maintain the present dividend level may conflict with strict adherence to any particular target payout ratio especially when earnings per share drop off, even temporarily. To avoid the necessity of reducing the dividend because of a lean year and to maintain progress towards the target payout ratio, firms raise their dividends per share gradually, as the earnings per share rise. Thus, Lintner concludes that dividends represent the primary active decision variable in most situations. Savings or retained earnings in a given period generally are largely a by-product of dividends action, taken in terms of well-established practices and policies. Dividends are seldom the residual decision.

According to Lintner, *dividend is a function of earnings of that year, existing dividend rate, target payout ratio and speed of adjustment*. In symbolic terms,

$$D_t - D_{t-1} = a_0 + c(D_t^* - D_{t-1}) \quad (30.1)$$

where D_t = Dividend amount under consideration,

D_{t-1} = Dividend paid in the previous year,

a_0 = A constant which may have value of zero, but never negative and generally has a positive value to reflect the greater reluctance to reduce than to raise dividends,

c = Speed of adjustment,

D_t^* = Target payout ratio (r) multiplied by profit after taxes (p) = rp , and

$D_t - D_{t-1}$ = Change in dividend payout (ΔD)

The right hand side of Equation 30.1 can be rewritten as:

$$a_0 + c(rp_t - D_{t-1}) = a_0 + crP_t - cD_{t-1}$$

Adding D_{t-1} on both sides of Eq. 30.1

$$D_t = a_0 + crP_t - cD_{t-1} + D_{t-1} = a_0 + crP_t + D_{t-1}(1 - c)$$

Let cr be represented by b_1 (short-run propensity to pay dividends) and $(1 - c)$ be represented by b_2 (long-run propensity to pay dividends), we have:

$$D_t = a_0 + b_1P_t + b_2D_{t-1} \quad (30.2)$$

Thus, dividends paid by an individual company are a function of a_0 (constant), short-run propensity to pay (b_1) and long-run propensity to pay dividends (b_2).

Bolten⁷ has also formulated a formula based on key variables suggested by Lintner:

$$D_{t+1} = D_t + a \left[P^* - \frac{D_t}{E_t} \right] E_t \quad (30.3)$$

where D_{t+1} = dividend amount under consideration,
 D_t = prevailing dividend,
 D_t/E_t = prevailing payout ratio,
 P^* = target payout ratio,
 E_t = latest earnings per share, and
 a = adjustment cushion.

Equation 30.3 suggests that the increase in dividends would be less than the increase in earnings owing to the speed of adjustment.

Suppose the target payout ratio of a company is 50 per cent and the present dividend is ₹2 per share. The firm would not immediately pay a dividend of ₹3 share if the earnings per share rose from ₹5 per share to ₹6, since that would expose the firm to the necessity of reducing the dividend in the following year, if the earnings per share fell below ₹6. Rather, the firm might decide to gradually move toward the 50 per cent target payout by declaring a ₹2.50 per share dividend. With ₹2.50 dividend, the firm's earnings per share could drop to ₹5 in the following year and still be at the 50 per cent target ratio, avoiding the necessity of reducing the dividend. Thus,

$$D_{t+1} = ₹2 + 0.50 \left[0.50 - \frac{₹2}{₹6} \right] (₹6) = ₹2.50$$

In summing up, it can be commended that a company should seek a stable dividend policy which avoids occasional reduction of dividends. Investors favourably react to the price of shares of such companies and there is a **price enhancing effect** of such a policy as it resolves the uncertainty from the minds of the investors regarding the anticipated stream of dividends. Above all, it projects the image of a stable operating environment. An increase in the dividend communicates the feeling of a firm entering a new period of prosperity.

Legal, Contractual, and Internal Constraints and Restrictions

The dividend decision is also affected by certain legal, contractual, and internal requirements and constraints. The legal factors stem from certain statutory requirements, the contractual restrictions arise from certain loan covenants and the internal constraints are the result of the firm's liquidity position.

Legal Requirements Legal stipulations do not require a dividend declaration but they specify the conditions under which dividends must be paid. Such conditions pertain to (i) capital impairment, (ii) net profits and (iii) insolvency.

Capital Impairment Rules Legal enactments limit the amount of cash dividends that a firm may pay. A firm cannot pay dividends out of its paid-up capital, otherwise there would be a reduction in the

capital adversely affecting the security of its lenders. The rationale of this rule lies in protecting the claims of preference shareholders and creditors on the firm's assets by providing a sufficient equity base since the creditors have originally relied upon such an equity base while extending credit. Any dividends that impair capital are illegal and the directors are personally held liable for the amount of illegal dividend. Therefore, the financial manager should keep in mind that payment of dividend is in order and does not violate capital impairment rules.

Net Profits The net profits requirement is essentially a corollary of the capital impairment requirement, in that it restricts the dividend to be paid out of the firm's current profits plus past accumulated retained earnings. Alternatively, a firm cannot pay cash dividends greater than the amount of current profits plus the accumulated balance of retained earnings. For instance, section 205 of the Indian Companies Act provides that dividends shall be paid only out of the current profits or past profits after providing for depreciation. The point to be recognised is that the company can count on the profits of previous years, if the current year's profits fall short of the required funds for maintaining a desired stable dividend policy. Likewise, if there are past accumulated losses, they should be first set off against current earnings before the payment of dividend.

Insolvency A firm is said to be insolvent in two situations: *first*, when its liabilities exceed the assets; and *second*, when it is unable to pay its bills. If the firm is currently insolvent in either sense, it is prohibited from paying dividends. Similarly, a firm would not pay dividends if such a payment leads to insolvency of either type. The rationale of the rule is to protect the creditors by prohibiting the liquidation of near-bankrupt firms through cash dividend payments to the equity owners.

Contractual Requirements Important restrictions on the payment of dividend may be accepted by a company when obtaining external capital either by a loan agreement, a debenture indenture, a preference share agreement, or a lease contract. Such restrictions may cause the firm to restrict the payment of cash dividends until a certain level of earnings has been achieved or limit the amount of dividends paid to a certain amount or percentage of earnings. Since the payment of dividend involves a cash outflow, firms are forced to reinvest the retained earnings within the firm. The restriction on dividends may take three forms. In the first place, firms may be prohibited from paying dividends in excess of a certain percentage, say, 12 per cent. Alternatively, a ceiling in terms of the maximum amount of profits that may be used for dividend payment may be laid down, say not more than 60 per cent of the net profits, or a given absolute amount of such profits can be paid as dividends. Finally, dividends may be restricted by insisting upon a minimum of earnings to be retained.⁸ Reinvestment leads to a lower debt/equity ratio and, thus, enhances the margin of cushion (safety) for the lenders.

Therefore, contractual constraints on dividend payments are quite common. The payment of cash dividend in violation of a restriction would amount to default in the case of a loan and the entire principal would become due and payable. Keeping in view the severity of penalty, the financial manager must ensure that the amount of dividend is within the covenants already committed to lenders.

Internal Constraints Such factors are unique to a firm and include (i) liquid assets, (ii) growth prospects, (iii) financial requirements, (iv) availability of funds, (v) earnings stability and (iv) control.

Liquid Assets Once the payment of dividend is permissible on legal and contractual grounds, the next step is to ascertain whether the firm has sufficient cash funds to pay cash dividends. It may well be possible that the firm's earnings are substantial, but the firm may be short of funds. This

situation is common for **(a)** growing companies; **(b)** companies which have to retire past loans as their maturity year has come; and **(c)** companies whose preference shares are to be redeemed. Such companies may not like to borrow at exorbitant rates because of the increased financial risk especially if their existing leverage ratio is already very high. Moreover, lenders may be reluctant to lend money for dividend payments since they produce no tangible or operating benefits that will help the firm to repay the loan. Thus, the firm's ability to pay cash dividends is largely restricted by the level of its liquid assets. On the other hand, if excess cash is available, the firm can have a more liberal dividend policy.

Growth Prospects Another set of factors that can influence dividend policy relates to the firm's growth prospects. The firm is required to make plans for financing its expansion programmes. In this context, the availability of external funds and its associated cost together with the need for investment funds would have a significant bearing on the firm's dividend policy.

Financial Requirements Financial requirements of a firm are directly related to its investment needs. The firm should formulate its dividends policy on the basis of its foreseeable investment needs. If a firm has abundant investment opportunities, it should prefer a low payout ratio, as it can usually reinvest earnings at a higher rate than the shareholders can. Such firms, designated as 'growth' companies, are constantly in need of funds. Their financial requirements may be characterised as large and immediate. That retention of earnings is less costly than selling a new issue of equity needs no reiteration. Moreover, retention of earnings provides the base upon which the firm can borrow additional funds. Therefore, it provides flexibility in the company's capital structure, that is, it make room for **unused debt capacity**. The importance of creation of debt raising potentials for a growing firm is overwhelming.

On the other hand, if the firm has little or no growth opportunities, it will probably prefer low retention and relatively high dividend payouts. This is so for two vital reasons. First, the shareholders can reinvest earnings at a higher rate than the firm can do, and, secondly, such firms may need funds largely to replace or modernise assets. In many instances, these outlays may not be required immediately but after two or three years. Therefore, the need for funds is small and periodic *vis-a-vis* large and fast growing companies. The nature of the firm's needs, therefore, is an important factor in determining the destination of the firm's fund—retention or distribution.

Availability of Funds The dividend policy is also constrained by the availability of funds and the need for additional investment. In evaluating its financial position, the firm should consider not only its ability to raise funds but also the cost involved in it and the promptness with which financing can be obtained. In general, large, mature firms have greater access to new sources for raising funds than firms which are growing rapidly. For this reason alone, the availability of external funds to the growing firms may not be sufficient to finance a large number of acceptable investment projects. Obviously, such firms have to depend on their retained earnings so as to amount of maximum number of available profitable projects. Therefore, large retentions are necessary for such firms.

Earnings Stability The stability of earnings also has a significant bearing on the dividend decision of a firm. Generally, the more stable the income stream, the higher is the dividend payout ratio. Such firms are more confident of maintaining a higher payout ratio. Public utility companies are classic examples of firms that have relatively stable earnings pattern and high dividend payout ratio. Growing firms, characterised by stable earnings, can muster debt funds at a relatively lower cost because of a smaller total risk (business and financial). This is unlike the experience of other firms which, though growing, suffer from fluctuating earnings.

However, the financial manager should remember that dividends have information value. Withholding the payment of dividends will raise the required rate of return of the investors and, therefore, depress the market price of the shares. The increase in earnings should be such that it can offset the unfavourable effect of the increased cost of equity (k_e).

Control Dividend policy may also be strongly influenced by the shareholders' or the management's control objectives. That is to say, sometimes management employs dividend policy as an effective instrument to maintain its position of command and control. The management, in order to retain control of the company in its own hands, may be reluctant to pay substantial dividends and would prefer a smaller dividend payout ratio. This will particularly hold good for companies which require funds to finance profitable investment opportunities when an outside group is seeking to gain control of the firm. Added to this, if a controlling group of shareholders either cannot or does not wish to purchase new shares of equity, under such circumstances, by the issue of additional shares to finance investment opportunities, management may lose its existing control. Conversely, if management is securely in control, either through substantial holdings or because the shares are widely held, and the firm has a good image, it can afford to have a high dividend payout ratio. If it requires funds later, the firm can easily raise additional funds owing to its reputation.

Owner's Considerations

The dividend policy is also likely to be affected by the owner's considerations of (a) the tax status of the shareholders, (b) their opportunities of investment, and (c) the dilution of ownership. It is well-nigh impossible to establish a policy that will maximise each owner's wealth. The firm must aim at a dividend policy which has a beneficial effect on the wealth of the majority of the shareholders.

Taxes The dividend policy of a firm may be dictated by the income tax status of its shareholders. If a firm has a large percentage of owners who are in high tax brackets, its dividend policy should seek to have higher retentions. Such a policy will provide its owners with income in the form of capital gains as against dividends. Since capital gains are taxed at a lower rate than dividends, they are worth more, after taxes, to the individuals in a high tax bracket. On the other hand, if a firm has a majority of low income shareholders who are in a lower tax bracket, they would probably favour a higher payout of earnings because of the need for current income and the greater certainty associated with receiving the dividend now, instead of the less certain prospects of capital gains later. With effect from financial year 2003-4, dividend income from Indian corporate firms, mutual funds and Unit Trust of India is fully exempt from tax in the hands of the shareholders/investors/unit-holders.

Opportunities The firm should not retain funds if the rate of return earned by it would be less than one which could have been earned by the investors themselves from external investments of funds. Such a policy would obviously be detrimental to the interests of shareholders. It is difficult to ascertain the alternative investment opportunities of each of its shareholders and, therefore, the alternative investment opportunity rate. However, the firm should evaluate the rate of return obtainable from external investments in firms belonging to the same risk class. If evaluation shows that the owners have better opportunities outside, the firm should opt for a higher D/P ratio. On the other hand, if the firm's investment opportunities yield a higher rate than that obtained from similar external investment, a low D/P is suggested. Therefore, in formulating dividend policy, the evaluation of the external investment opportunities of owners is very significant.

Dilution of Ownership The financial manager should recognise that a high D/P ratio may result in the dilution of both control and earnings for the existing equity holders. The control aspect has already been discussed. Dilution in earnings results because low retentions may necessitate the issue of new equity shares in the future, causing an increase in the number of equity shares outstanding and ultimately lowering earnings per share and their price in the market. By retaining a high percentage of its earnings, the firm can minimise the possibility of dilution of earnings.

Thus, in framing the dividend policy of a firm, consideration must be given to the requirements of equity-holders.

Although the ultimate dividend policy depends on numerous factors, the avoidance of shareholders' discontent is important. If the shareholders become dissatisfied with the existing dividend policy, they may sell their shares, increasing the possibility that control of the firm will be seized by some outside group. The 'takeover' of a firm by outsiders is more likely when owners are dissatisfied with its dividend policy. It is the 'financial manager's responsibility to keep in touch with the owner's general attitude toward dividends.⁹

Clientele Effect

It is a well established fact that all the groups of investors do not have identical preferences for dividend payout policies. For example, wealthy/young investors in their peak earning years have a marked preference for low or zero dividend payment. They have less need for current income from investments and would simply reinvest dividends received net of taxes. They would be put to disadvantage if the firm pursues a high dividend payout policy. Since they are 'savers' and, 'not-spenders' of dividends, they would be first paying taxes on dividends received and then reinvesting after-tax dividends, incurring in the process brokerage cost, besides inconvenience. Such investors prefer firms with low dividend payout policies. Profits are ploughed back in the business to yield higher share price in future, resulting in higher capital appreciation.

In sharp contrast, other groups like retired individuals, widows, pensioners, endowment funds related to colleges, Universities, hospitals, and so on generally have a marked preference for higher dividend payout. Such investors are more often in need of current incomes from their investment to support their current spendings. They do not prefer low dividend paying firms. The value of their equity shares might increase, but they would be in many situations forced to sell their shares incurring brokerage costs to obtain cash to cater to their current consumption needs. While individual investors have an option to liquidate their holdings, this option may not be available with many trustees of endowment funds. They may be legally prevented to do so as it amounts to reduction of 'funds'. Therefore, such class of investors prefer shares of high dividend payout firms.

Evidently, companies with high dividend payouts would attract one class of investors and low dividend payout companies would attract another. These different groups are called **clienteles**. The **clientele effect** argument states that different groups of investors desire different levels of dividends. When a company chooses to pursue a particular dividend policy, it has chosen a policy to attract a particular clientele. If a firm changes its dividend policy, then it just attracts a different clientele.¹⁰

- Clientele effect
- argues that
- different group of
- investors desire
- different levels of
- dividend payment.

The clientele effect indicates that one clientele is as good as another. The existence of a clientele effect does not necessarily imply that one dividend policy is better than another.¹¹ The clientele effect also helps to bring in the **supply and demand** argument pertaining to share prices of different categories. For example, if the equity shares of dividend-payment firms are in short supply, their

prices would rise. If there is more demand for low dividend payout shares, that is, **growth shares**, their share prices would tend to rise. In other words, changes in share prices can be explained not only in terms of financial fundamental factors of earnings, growth, investment policy and so on, but also by demand and supply of shares at a point in time.

Capital Market Considerations

Yet another set of factors that can strongly affect dividend policy is the extent to which the firm has access to the capital markets. In case the firm has easy access to the capital market, either because it is financially strong or large in size, it can follow a liberal dividend policy. However, if the firm has only limited access to capital markets, it is likely to adopt low dividend payout ratios. Such firms are likely to rely more heavily on retained earnings as a source of financing their investments.

Firms which lean heavily on financial institutions for procuring funds, declare a minimum dividend so that they can remain on the 'eligible' list of these institutions. It is because, in general, most financial institutions are prohibited by their charter from buying shares in companies which pay no dividends. A company should be paying dividends at a certain minimum rate for at least some specified number of year (say, 5 years). Since such institutions are significant buyers of corporate securities, some firms that would otherwise have not paid any amount of dividend, would pay some dividend so that they remain on the eligible list.

Inflation

Finally, inflation is another factor which affects the firm's dividend decision. With rising prices, funds generated from depreciation may be inadequate to replace obsolete equipments. These firms have to rely upon retained earnings as a source of funds to make up the shortfall. This aspect becomes all the more important if the assets are to be replaced in the near future. Consequently, their dividend payout tends to be low during periods of inflation.

DIVIDEND POLICY IN INDIA

The main features of the corporate dividend policy in India are summarised below.

- Most of the corporates have a policy of long-run dividend pay-out ratio.
- Dividend changes follow shift in the long-term sustainable earnings.
- Dividend policy as a residual decision after meeting the desired investment needs is endorsed by about 50 per cent of the sample corporates. The corporates which are creating shareholders value (EVA) significantly rescind dividend increase in the event of growth opportunities available to them. Large firms are significantly less willing to rescind dividend increases.
- Dividend policy provides a signalling mechanism of the future prospects of the corporate and, to that extent, affects its market value.
- Investors have different relative risk perceptions of dividend income and capital gains and are not indifferent between receiving dividend income and capital gains. Management should be responsive to the shareholders preferences regarding dividend and the share buy back programme should not replace the dividend payments of the corporates.
- Dividend payments provide a bonding mechanism so as to encourage manager to act in the best interest of the shareholders.

- The corporate enterprises in India seem to have a tendency to pay relatively less dividends. In fact, a fairly large number of them hardly pay any dividend. The foreign controlled companies seem to follow a policy of larger distribution of profits relative to the domestic companies. Retained earnings are a significant source of corporate finance.
- The vast majority of the Indian corporates follows a stable dividend policy in the sense that they pay either constant dividend per share in the following year with fluctuating EPS or increased dividend with increase in EPS.
- An overwhelming majority of corporates have a long-run target D/P ratio. The dividend changes follow shift in long-run sustainable earnings. Their dividend policy is in agreement with the findings of Lintner's study on dividend policy.
- The empirical evidence from 11-year (2001-2011) period suggests that the sample firms have dividend payout ratio of much less than 25 per cent and these ratios have been gradually decreasing during the period of the study, indicating perhaps better growth opportunities for companies, necessitating more retentions.
- There are wide industry variations in the D/P ratios. For instance, the fast moving consumer goods (FMCG) and health care sectors had high D/P ratios whereas sectors like metals and diversified reported low D/P ratios during 2001-2011 period of the study.
- Firms which are creating shareholder value are significantly more willing to rescind dividend increase in the event of growth opportunities available to them. The larger firms are significantly less willing to rescind dividend increase than the small firms.
- Dividend policy provides a signalling mechanism of the future prospects of the firm and thus affects its market value. The investors are not indifferent between receiving dividend income and capital gains.
- The survey findings (undertaken in 2011-12) indicate that dividend policy is guided by the consideration of returns to shareholders in the case of two-fifths of the respondent companies. Cash flow constraints was the consideration affecting dividend policy for more than one-fourth companies.

LO 30.2 BONUS SHARES (STOCK DIVIDEND) AND STOCK (SHARE) SPLITS

An integral part of dividend policy of a firm is the use of **bonus shares** and stock splits. Both involve issuing new shares on a *pro rata* basis to the current shareholders while the firm's assets, its earnings, the risk being assumed and the investors percentage ownership in the company remain unchanged. The only definite result from either a bonus share or share split is the increase in the number of shares outstanding. Table 30.1 illustrates their effect on the capitalisation of the firm. Part one of the table shows the equity of the balance sheet before the bonus issue and part two after the issue. The effect of **share splits** is shown in part three.

- **Bonus shares**
 - involve payment
 - to existing owners
 - of dividend in the
 - form of shares.
- **Stock splits**
 - is a method
 - commonly used to
 - lower the market
 - price of shares
 - by increasing the
 - number of shares
 - belonging to each
 - shareholder.

TABLE 30.1 Effect of Bonus Shares and Share Splits

(I) Equity portion before the bonus issue:	
Equity share capital (30,000 share of ₹100 each)	₹30,00,000
Share premium (@ ₹25 per share)	7,50,000
Retained earnings	62,50,000
Total equity	1,00,00,000
(II) Equity portion after the bonus issue (1 : 2 ratio):	
Equity share capital (45,000 shares of ₹100 each)	45,00,000
Share premium (45,000 shares × ₹25)	11,25,000
Retained earnings (₹62,50,000 – 15,000 shares × ₹125)	43,75,000
Total equity	1,00,00,000
(III) Equity portion after the share splits (10 : 1 ratio):	
Equity share capital (3,00,000 shares of ₹10 each)	30,00,000
Share premium	7,50,000
Retained earnings	62,50,000
Total equity	1,00,00,000

From Table 30.1 it is clear that a share split is similar to bonus issue from the economic point of view though there are some differences from the accounting point of view. In the equity portion of the firm, a bonus issue reduces the retained earnings and correspondingly increases paid-up equity and share premium, if any, whereas stock/share split has no such effect. The economic effect of both is to increase the number of equity shares outstanding.

Reverse Stock Splits

Reverse stock split reduces the number of outstanding shares. Instead of increasing the number of shares outstanding, a company may like to reduce it through a reverse split. There is no impact of the reverse split on corporate earnings and shareholders' wealth. Reverse split reflects an aversion on the part of many companies to see the prices of their shares falling below a certain amount. Whatever be the reasons for decrease of price, it can be increased with a reverse split.¹²

In the case of **straight stock split**, the number of outstanding shares increases, but it decreases when the company chooses reverse split. The reverse split of 1:5 implies that for each five shares held by a shareholder, he would receive one share in exchange. The company L.G. Balakrishnan & Brothers Limited has gone for reserve split of 1:10 in March 2010.

Rationale

As pointed out earlier, no major economic benefit results from bonus shares and share splits. Yet, certain advantages are associated with them. In the first place, the issue of bonus shares/share splits would have the effect of bringing the market price of shares within more popular range as a result of larger number of shares outstanding. The larger number of outstanding shares will also promote more active trading in the shares due to availability of floating stock. Yet another advantage might relate to the *informational content of bonus/split* announcement. The announcement is perceived as favourable news by the investors in that with growing earnings, the company has bright prospects and the investors can reasonably look for increase in future dividends. Moreover, it enables the conservation of corporate cash. If the bonus share is an effort to conserve cash for profitable investment opportunities, the share prices will tend to rise and the shareholders benefit. However, if the move to conserve cash relates to financial difficulties within the firm, the market

price will most likely react adversely. Finally, bonus/split announcements improve the prospect of raising additional funds particularly through the issue of convertible debentures.

As pointed out earlier, no major economic benefits result from bonus shares and share splits. For this reason, they are, by and large, considered as 'cosmetic' corporate events. Yet, certain advantages are associated with them.

Various hypothesis have been put forward to explain the rationale for issuing bonus shares and share splits. These hypotheses are not mutually exclusive and are normally considered in an integrated manner. The major hypotheses are: (1) Signalling hypothesis, (2) Trading range hypothesis, (3) Liquidity hypothesis, (4) Tax-timing hypothesis, (5) Cash substitution hypothesis, and (6) Attention hypothesis.¹³

Signalling Hypothesis This hypothesis suggests that announcement of bonus shares conveys/signals about the optimistic future of the issuing firm to the market as there is information asymmetry between managers and investors. Managers, as company insiders, usually have better estimates about the future prospects of their company than the current and the prospective shareholders do. Therefore, bonus shares announcements convey positive signals about the company to the investors. The announcement is perceived as favourable news by the investors in that with growing earnings, the company has bright prospects and the investors can reasonably look for increase in future dividends.

- Signalling hypothesis
- conveys/signals optimistic future prospects about the issuer.

Trading Range Hypothesis The hypothesis suggests that the issue of bonus shares and share splits would have the effect of bringing the market price of shares within a more popular range as a result of larger number of shares outstanding. This would enable more investors to trade in the share, thereby increasing liquidity.

- Trading range hypothesis
- would bring market price of shares within optimum range.

Liquidity Hypothesis This hypothesis is a logical corollary of trading range hypothesis. The issue of bonus shares and stock splits brings the share price in an optimum trading range, making the stock more attractive to the new individual investors. This, in turn, enhances liquidity by increasing the volume of shares traded and decreasing the bid-ask spread.

- Liquidity hypothesis
- suggests enhanced liquidity.

Tax-timing Hypothesis This hypothesis consider, the taxation aspect. The benefit of bonus shares is that the tax is deferred till such time the shareholders sell their shares. Thus, shareholders have an advantage of delaying taxes.

Cash Substitution Hypothesis This hypothesis suggest, that the issue of bonus shares enables the conservation of corporate cash. If the bonus share is an effort to conserve cash for profitable investment opportunities, the share prices will tend to rise and the shareholders benefit. However, if the move to conserve cash relates to financial difficulties, the market price will most likely react adversely.

- Cash substitution hypothesis
- enables conservation of cash.

Attention Hypothesis This hypothesis suggest that managers use bonus shares to attract attention from the professional analysts to revalue their future cash flows. This, in turn, is likely to augment valuation of the firm in the market.

Tables 30.2 and 30.3 respectively list selected companies which have issued bonus shares and share splits during 1999–2018.

LO 30.3 SHARE REPURCHASE (SHARE BUYBACK)

Share repurchase implies that a company buys back its own shares. It is an alternative method to pay cash dividends. Share repurchases reduce the number of equity shares outstanding in the market. Given no change in corporate earnings and price-earning ratio, share repurchase would

result in higher (i) EPS and (ii) market price of a share. Moreover, such repurchases not only convey a positive signal to shareholders that management believes that the share is under-valued but also helps in preventing decline in the firm's share prices.¹⁴ Example 30.1 illustrates that share repurchases is similar to the payment of cash dividends.

Example 30.1

Assume the earnings available to the equityholders of the Hypothetical Ltd is ₹50 lakh. Since there are not sufficient profitable investment projects available, the Hypothetical wants to utilise ₹40 lakh of these earnings either to pay cash dividends or to repurchase shares. There are 20 lakh shares (of face value of ₹10) outstanding and the current market price is ₹20 per share. The company can pay cash dividend of ₹2 per share or can repurchase shares at ₹22 per share through a tender offer. Show the impact of repurchase on the EPS and MPS (market price per share) of the remaining shares assuming no change in total earnings and price-earning ratio.

Solution

Table 30.4 shows the impact of share repurchases.

TABLE 30.4 Effect of Share Repurchase on EPS and MPS

(1)	Current EPS = ₹50 lakh ÷ 20 lakh shars = ₹2.5
(2)	Current P/E ratio [₹20, MPS ÷ ₹2.5, EPS] = 8 times
(3)	Number of shares repurchased [₹40 lakh ÷ ₹22] = 1,81,818 shares
(4)	EPS after repurchasing 1,81,818 shares = [₹50 lakh ÷ the shares left (20 lakh - 1,81,818 = 18,18,182)] = ₹2.75
(5)	Expected MPS after repurchase (EPS x P/E ratio) [₹2.75 x 8 times] = ₹22
(6)	Expected receipts per share to equity shareholder
	(a) When cash dividends are paid = MPS remains unchanged at ₹20 + ₹2, cash dividend = ₹22
	(b) When shares are repurchased = MPS rises to ₹22 + zero dividend = ₹22
(7)	Conclusion: In both situations, the shareholder receives ₹22 per share

It may be noted that if shares are repurchased at less than ₹22, it would be advantageous to the holders of the remaining shares. Given the assumptions of no change in corporate earnings and P/E ratio, the price of the share would tend to exceed ₹22. They would suffer a loss, if the shares are repurchased at a price higher than ₹22 per share.

Equilibrium Formula Out of the various methods of repurchase of shares, fixed-price tender offer provides all shareholders equal treatment. Further, a company may also like to set repurchase price at a level which puts the remaining shareholders at the same level as the outgoing shareholders. This is referred to as equilibrium share repurchase price (P^*)¹⁵. It is determined as per Equation 30.4.

$$P^* = (N_c \times MPS_c) \div (N_c - RS) \quad (30.4)$$

Where

N_c = the number of equity shares outstanding prior to the repurchase operation

MPS_c = current market price per share prior to the repurchase activity

RS = the number of shares to be repurchased.

Applying Equation 30.4 to data in Example 30.1.

$$P^* = (20 \text{ lakh shares} \times ₹20) \div (20 \text{ lakh shares} - 1,81,818 \text{ shares}) = ₹22 \text{ per share.}$$

This was the equilibrium price in Example 30.1.

Advantage of Share Repurchase¹⁶ The major advantages of share repurchases are as follows:

(1) Signalling Effect Share repurchases may have a positive signalling effect on the investors. Since shares are repurchased, by and large, at a price higher than the market price prevailing at that point in time, it is indicative of the management's belief that the firm's shares are undervalued.

(2) Tax Advantage The market price enhancement resulting from a share repurchase is subject to capital gains tax. Dividends are taxed as ordinary income; capital gains are taxed at a lower rate compared to ordinary income. Due to favourable tax treatment, equity shareholders prefer share repurchase in lieu of cash dividend. Moreover, the shareholders have no choice whether or not to receive dividend. In other words, a shareholder is to receive dividends and pay taxes. Whereas, in the case of share repurchase, a shareholder pays taxes only when he actually sells his shares and has a capital gain on the sale. Thus, he can defer tax payments. Finally, there is an option to sell shares for those shareholders who want cash and for others who want to retain the shares. In a way, share repurchases provides 'win-win' situations for all the shareholders.

(3) Price-enhancing Effect Share repurchase results in the availability of lesser number of shares in the market. This, in turn, tends to increase the EPS. Assuming no change in price-earning ratio, the market price of the firm's shares increases (Example 30.1).

(4) Helps in Maintaining Stable Dividend Policy Firms following a stable dividend policy (**as per Lintner's approach**) are most often reluctant to reduce the dividends on decrease in their earnings. The reduction conveys a negative signal to the market. Therefore, in situations when excess cash earnings are perceived by management as temporary in nature, share repurchase mode of dividend distribution is preferred to the alternative increased cash dividend which is most unlikely to be maintained in future years.

(5) Flexibility in Dividend Payment Flexibility is the added virtue of share repurchase as a form of dividend payment. The reason is repurchases can be varied from year to year without conveying adverse signals to the investors. Therefore, corporates with wide variations in their corporate earnings, given their volatile level of sales, should resort to repurchase of shares.

(6) Facilitates Desired Debt-Equity Ratio Share repurchase facilitates firms with very low debt ratio to increase it so that either it conforms to the target or approaches towards the target level. The firms may be reluctant to increase borrowings to achieve the desired D/E ratio as it raises interest burden.

(7) Useful for Employee Stock Option Plan Companies, which follow stock option plan as an important means of employee compensation, can use repurchased shares when employees exercise their options. It is beneficial to the firm and its shareholders as it enables the firm to avoid the issuance of new shares, causing a dilution in EPS which, in turn, decreases MPS.

Disadvantage of Repurchases The two major disadvantages of share repurchases are:

- (1) The shareholders selling their shares, may not be aware of the full implications of a repurchase. They may not have access to all the relevant information about the future prospects and outlook of the firm's operations and business activities. In the case of bright prospects, the share repurchase turns to be more profitable for the "**remaining**" shareholders who do not sell their shares than the "**outgoing**" shareholders. The reverse holds true when prospects turn out to be bleak. Therefore, there is an uneven share of prosperity and adversity between these two categories of shareholders. Cash dividend payments do not cause any such discrimination.

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

(2) The companies may repurchase shares at an unwarranted high premium to the disadvantage of the remaining shareholders. This again raises an ethical problem of fair play and equity. There is no issue of unfairness to any shareholders when dividends are paid in cash.

Considering all the pros and cons of share repurchases, there appears to be a net advantage of share repurchases mode of dividend distribution.

Issue Procedure

The procedure involved in bonus issues and buy-back of shares are outlined below.

Issue of Bonus Shares The main elements of the issue procedure of bonus issues in terms of the SEBI's Issue of Capital and Disclosure Requirements Regulation, 2009 are: conditions for issue, restrictions and completion of the issue.

Conditions Subject to the provisions of the Companies Act/any other applicable law, a listed company can issue bonus shares, if it **(i)** is authorised by its articles of association, **(ii)** has not defaulted in payment of interest/principal in respect of fixed deposits/debt securities issued by it, **(iii)** has sufficient reasons to believe that it has not defaulted in respect of the payment of statutory dues of the employees such as contribution to the provident fund/gratuity/bonus, and **(iv)** the outstanding partly paid shares are made fully paid up. The issuer would have to pass a resolution at its general body meeting for capitalisation of reserves if its articles of association do not have a provision in this respect.

Restrictions An issuer can issue bonus shares in case it has outstanding fully/partly convertible debt instruments (CDIs) only if reservation of (equity) shares of the same class is made in their favour in proportion to the convertible portion. These reserved shares should be issued at the time of the conversion of the CDIs on the same terms/proportions on which the bonus shares were issued.

Bonus shares can be issued by capitalising the **(i)** genuine profits and **(ii)** securities premium collected in cash only. Any reserves created by revaluation of fixed assets should not be capitalised for this purpose. Similarly, bonus shares should not be issued in lieu of dividends.

Completion The bonus issue should be completed/implemented within 15 days from the date of its approval by the Board of Directors of the issuer. It should be implemented within two months from the date of the meeting of the Board of Directors wherein the decision to announce the issue was taken subject to the shareholders' approval in case their approval for capitalisation of profits/reserves is required. Once the decision to issue bonus shares is announced, it cannot be withdrawn.

Buy-back of Securities (Stock Repurchase) The buy-back of securities by listed companies has to conform to **(i)** the provisions of the Companies Act and **(ii)** SEBI's buy-back regulations for listed companies.

Companies Act Requirement The Companies Act permits buy-back of shares/specified securities, from out of the reserves/securities premium account and the proceeds of an earlier issue other than a fresh issue made specifically for buy-back purposes. The stipulations for buy-back are: the articles of association must permit it, authorisation by a special resolution in a general meeting, ceiling of 25 per cent of paid-up capital and free reserves, ratio of debt to equity should not exceed 2:1, fully paid-up shares/specified securities and in conformity with SEBI regulations.

Companies are not allowed to buy-back securities **(i)** through subsidiary/investment companies and **(ii)** if default subsists in respect of repayment of deposits/term loans/redemption of debentures/preference shares.

The buy-back may be from **(i)** the existing securityholders on a proportionate basis, **(ii)** open market, **(iii)** odd lots, and **(iv)** employees, pursuant to a scheme of stock option/sweat equity issued for considerations other than cash.

All listed companies have to file with the Registrar of Companies (ROCs)/SEBI, a declaration of solvency. The securities purchased under the buy-back arrangement should be extinguished and physically destroyed within seven days of the last date of completion of buy-back. Within 30 days of the completion of the buy-back, a return containing all the particulars must be filed with the ROCs/SEBI.

SEBI Regulations The main elements of the SEBI Buy-Back of Securities Regulations are: conditions of buy-back, buy-back through tender offer, buy-back from the open-market, general obligations and penalties.

Conditions To buy-back securities, a listed company should be authorised to do so by a special resolution in a general meeting of the shareholders or through a resolution by its Board of Directors. A copy of the special resolution should be filed with the SEBI/concerned stock exchange(s) within seven days from the date of passing the resolution. In the case of a Board resolution, public announcement should be preceded by a notice within two days, in at least one English national daily, one Hindi daily and a regional language daily. A copy of the resolution should be filed with the SEBI in case of a Board resolution and the explanatory statement annexed to the notice for general meeting in case of the special resolution would be the same.

Tender Offer A tender offer means an offer by a company to buy-back through a letter of offer, from the holders of shares or other specified securities, on a proportionate basis. The explanatory statement/public announcement should also discuss the maximum price at which the buy-back would be made and the quantum proposed to be tendered by the promoters, together with details of their transactions and holdings for the last six months, including information about the number of shares/securities acquired, and the price and the date of acquisition. The offer should remain open for a minimum of 15 days and a maximum of 30 days. The date of opening of the offer should not be earlier than seven days or later than 30 days from the specified date. The letter of offer should reach the securityholders before the opening of the offer. The company should deposit in an escrow account, 25 per cent on or before the opening of the offer. In case of non-fulfilment of obligations by the company, the escrow account may be forfeited by the SEBI. The company should pay the consideration within seven days of the time specified for accepted offers. The security certificates should be extinguished and destroyed within 15 days of acceptance of the shares/securities. A certificate of compliance should be furnished to the SEBI.

The provisions pertaining to buy-back through a tender offer are also applicable to odd-lot shares/other specified securities.

Open Market A buy-back from the open market may be through a stock exchange and book-building process.

Stock Exchange The buy-back through a stock exchange can be made only on a stock exchange with nation-wide trading terminals and through the order matching mechanism. The maximum price at which the buy-back would be made should be specified. Information on a daily basis regarding purchases for the buy-back should be given to the stock exchange and published in a national daily on a fortnightly basis and every time an additional five per cent of the buy-back has been completed. The provisions pertaining to the extinguishment of certificates in the case of a tender offer are also applicable in this method.

Book Building The public announcement in case of buy-back through book building should contain a detailed methodology of the book building process, the manner of acceptance, the details of the bidding centres and so on. The offer should remain open for 15-30 days. The final (highest) buy-back price, based on the acceptances received, should be paid to all holders whose shares/securities have been accepted for buy-back. The provisions pertaining to the verification of acceptances, opening of a special account, payment of consideration and extinguishment of certificates, applicable to a tender offer, are also applicable to this method.

Obligations The company and the merchant banker have to ensure compliance with the obligations prescribed by the SEBI. On a failure to comply with the obligations or to observe due diligence, the SEBI may initiate action against the merchant banker in terms of the relevant SEBI regulations. Similarly, it can initiate action against the registrar to the issue or the broker, in terms of the SEBI regulations applicable to them.

Panalties The SEBI may order an investigation in respect of the conduct of affairs of any person associated with the process of buy-back, to ascertain any contravention of the SEBI regulations. It can also issue directions as it deems fit. Any person guilty of insider trading or market manipulation would be dealt with according to the provisions of the SEBI Insider Trading Regulations and the Prohibition of Fraudulent and Unfair Trading Practices, relating to securities regulations.

Table 30.5 lists select companies which have gone for shares buyback during 2003-18.

TABLE 30.5 Shares Buyback of Select Companies, 2003-2018

LO 30.4 LEGAL, PROCEDURAL AND TAX ASPECTS

Legal Aspects

The amount of dividend that can be legally distributed is governed by company law, judicial pronouncements in leading cases, and contractual restrictions.¹¹ The important provisions of company law pertaining to dividends are described below.

1. Companies can pay only cash dividends (with the exception of bonus shares). Apart from cash, dividend may also be remitted by cheque or by warrant. The same may also be transmitted electronically to shareholders after obtaining their consent in this regard to the bank account number specified by them. The step has been proposed by the Department of Company Affairs to avoid delay in the remittance of dividend.
2. Dividends can be paid only out of the profits earned during the financial year after providing for depreciation and after transferring to reserves such percentage of profits as prescribed by law. The Companies (Transfer to Reserve) Rules, 1975, provide that before dividend delcarnation, a percentage of profit as specified below should be transferred to the reserves of the company.
 - (a) Where the dividend proposed is upto 10 per cent of the paid up capital, no amount of the current profits needs to be transferred.

- (b) Where the dividend proposed exceeds 10 per cent but not 12.5 per cent of the paid-up capital, the amount to be transferred to the reserves should not be less than 2.5 per cent of the current profits.
- (c) Where the dividend proposed exceeds 12.5 per cent but not 15 per cent, the amount to be transferred to reserves should not be less than 5 per cent of the current profits.
- (d) Where the dividend proposed exceeds 15 per cent but not 20 per cent, the amount to be transferred to reserves should not be less than 7.5 per cent of the current profits.
- (e) Where the dividend proposed exceeds 20 per cent, the amount to be transferred to reserve should not be less 10 per cent.
- (f) A company may voluntarily transfer a percentage higher than 10 per cent of the current profits to reserves in any financial year provided the following conditions are satisfied:
 - (i) It ensures that the dividend declared in that financial year is sufficient to maintain average rate of dividend declared by it over three years immediately preceding the financial year.
 - (ii) In case, it has issued bonus shares in the year in which dividend is declared or in the three years immediately preceding the financial year, it maintains the amount of dividend equal to the average amount of dividend declared over the three years immediately preceding the financial year.

However, maintenance of such minimum rate or quantum of dividend is not necessary if the net profits after tax in a financial years are lower by 20 per cent or more than the average profits after tax of the two immediately preceding financial years.

- (g) A newly incorporated company is prohibited from transferring more than ten per cent of its profits to reserves. The 'current profit' for the purpose of transfer to reserves will be profits after providing for statutory transfer to the Development Rebate Reserve and arrears of depreciation if any.
3. Due to inadequacy or absence of profits in any year, dividend may be paid out of the accumulated profits of previous years. In this context, the following conditions, as stipulated by the Companies (Declaration of Dividend out of Reserves) Rules, 1975, have to be satisfied.
 - (a) The rate of the declared dividend should not exceed the average of the rates at which dividend was declared by the company in 5 years immediately preceding that year or 10 per cent of its paid-up capital, whichever is less.
 - (b) The total amount to be drawn from the accumulated profits earned in previous years and transferred to the reserves¹⁸ should not exceed an amount equal to one-tenth of the sum of its paid-up capital and free reserves and the amount so drawn should first be utilised to set off the losses incurred in the financial year before any dividend in respect of preference or equity shares is declared.
 - (c) The balance of reserves after such *drawal* should not fall below 15 per cent of its paid-up capital.
 4. Dividends cannot be declared for past years for which accounts have been adopted by the shareholders in the annual general meeting.
 5. Dividend declared, interim or final, should be deposited in a separate bank account within 5 days from the date of declaration and dividend will be paid within 30 days from such a date.
 6. Dividend including interim dividend once declared becomes a debt. While the payment of interim dividend cannot be revoked, the payment of final dividend can be revoked with the consent of the shareholders.

Procedural Aspects

The important events and dates in the dividend payment procedure are:

1. **Board Resolution:** The dividend decision is the prerogative of the board of directors. Hence, the board of directors should in a formal meeting resolve to pay the dividend.
2. **Shareholder Approval:** The resolution of the board of directors to pay the dividend has to be approved by the shareholders in the annual general meeting. However, their approval is not required in the case of declaration of interim dividend. Further, it should be noted that the shareholders in the annual general meeting have neither the power to declare the dividends (if the Board of Directors do not recommend it) nor to increase the amount of dividend. However, they can reduce the amount of the proposed dividend.
3. **Record Date:** The dividend is payable to shareholders whose names appear in the register of members as on the record date.
4. **Dividend Payment:** Once a dividend declaration has been made, dividend warrant must be posted within 30 days. Within a period of 7 days, after the expiry of 30 days, unpaid dividends must be transferred to a special account opened with a scheduled bank.

In case the company fails to transfer the unpaid dividend to the 'unpaid dividend account' within 37 days of the declaration of dividend, an interest of 12 per cent per annum on the unpaid amount is to be paid by the company. The interest so accruing is to be paid to the shareholders in the proportion of the dividend amount remaining unpaid to them.

The dividend will be paid to the registered shareholder or to his order or to his banker or in case a share warrant has been issued to the bearer of such a share warrant. In the case of joint-holders, the dividends should be paid to be first joint-holder.

In the case of dividend payable to non-resident shareholders, authorised dealers are empowered to remit payment of dividend. For the purpose, they are empowered to devise their own documentation to comply with Section 10(5) of FEMA 1999.

Further, as per the notification issued by the Department of Company Affairs, the payment of dividend to the shareholders involving the fraction of 50 paise and above be rounded off to the rupee and the fraction of less than 50 paise may be ignored.

In the case of dematerialised shares (i.e., the shares held in electronic form), the corporate firms are required to collect the list of members holding shares in the depository and pay them the dividend.

5. **Unpaid Dividend:** if the money transferred to the 'unpaid dividend account' in the scheduled bank remains unpaid/unclaimed for a period of 7 years from the date of such transfer, the company is required to transfer the same to the 'Investor. Education and Protection Fund' established for the purpose.

- **Record date**
- is the specified
- future date set by
- the Directors on
- which all persons
- whose names
- are recorded as
- shareholders
- receive the declared
- dividend.

Tax Aspects

With effect from financial year 2003-4, dividend income from domestic companies and mutual funds is exempt from tax in the hands of the shareholders/investors/unit-holders. However, the domestic companies will be liable to pay dividend distribution tax at the effective rate of 16.995 per cent on dividends paid after April 1, 2007.

LO 30.5

SHARE SPLITS IN INDIA

- Managers view stock splits as a tool to enhance trading liquidity. At a time when share prices are high, the issue of stock splits brings the share price to a preferred trading range, making the share more attractive to the investors.
- Issue of stock splits prior to the public offer also improves the marketability of the shares.
- Lowering of the face value through stock splits decision prior to the public offer seems to be a common practice.
- High face value of the share results in high issue price leading to the reduced number of potential participants, especially retail investors, in the public offer.
- Managers prefer a wider distribution of shares as it increases the trading liquidity in the secondary market also, besides in the new issue market.
- While issuing the stock splits, the managers consider that the face value of the share and its market price should be comparable with other companies in the same industry.
- Stock splits do not provide any positive signals about the future prospects of a firm.

Source: Based on the survey carried out by Dr Chhavi Mehta as a part of her doctoral dissertation at Department of Management Studies, IIT Delhi.

LO 30.6

ISSUE OF BONUS SHARES IN INDIA

- Bonus shares attract the attention of the investors, send positive signal about the firm's future prospects and bring the share price in a popular trading range, making the stock more attractive to the investors.
- The primary motive for issuing bonus shares is to increase the total returns for the shareholders.
- The secondary motive is to improve liquidity.
- The tertiary motive for issuance of bonus shares is to attract more investors.
- Managers believe that even though the issue of bonus shares is only a cosmetic corporate event, it has a positive psychological impact on the shareholders, providing positive signal about the firm's future prospects.

Source: Mehta, Chhavi, P K Jain and S S Yadav, *op. cit.*, pp. 28-39.

LO 30.7

SHARES REPURCHASE PRACTICES IN INDIA

The shares repurchase practices by corporate enterprises in India are summarized below:

- The majority of the Indian firms undertaking repurchases are from the capital goods, chemical and petrochemical, consumer durables, oil and gas, healthcare and housing sectors.
- A substantial majority of the Indian finance managers believe that shares repurchases enable investors to express confidence in the firm and are an attractive means of obtaining a sound capital structure.
- Shares repurchase convey positive information possessed by management to the market, creates favorable effect on firm's stock price and signals that the stock is undervalued.
- Indian finance managers strongly support the undervaluation hypothesis. The primary motive in India for announcing shares repurchases is to signal the management's confidence in the future; the secondary motive is to signal undervaluation of shares and the tertiary motive is to return excess cash to the shareholders.

- Indian companies utilise available cash balances for the purpose of repurchases rather than raising externally by debt or other sources.
- Managers view open-market as the popular method of shares repurchase followed by the fixed price offer.
- Indian managers have expressed a sudden increase in stock prices as the primary reason for the companies not completing their shares repurchase programs. Since, the share prices have increased, the repurchases decision has served its purpose. This may, therefore, be the major reason for non-completion of the shares repurchase program in the case of some of the corporates.

Source: Based on the survey carried out by Dr. Sadaf Anwar as a part of her Doctoral Thesis (2018), Impact of Cash Dividend and Shares Repurchase Announcements on Returns, Liquidity and Risk: An Empirical Evidence from Indian Corporates, Department of Management Studies, IIT Delhi.

SUMMARY

The determinants of the dividend policy of a firm are dividend payout (D/P) ratio, stability of dividends, legal, contractual and internal constraints and restrictions, owners' considerations, capital market considerations and inflation.

The D/P ratio indicates the percentage share of the net earnings distributed to the shareholders as dividends. Given the objective of wealth maximisation, the D/P ratio should be such as can maximise the wealth of its owners in the 'long-run'. In practice, investors, in general, have a clear cut preference for dividends because of uncertainty and imperfect capital markets. Therefore, a low D/P ratio may cause a decline in share prices, while a high ratio may lead to a rise in the market price of the shares.

A stable dividend policy refers to the consistency or lack of variability in the stream of dividends, that is, a certain minimum amount of dividend is paid out regularly. Of the three forms of stability of dividend, namely, constant dividend per share, constant D/P ratio and constant dividend per share plus extra dividend, the first one is the most appropriate. The investors prefer a stable dividend policy for a number of reasons, such as, desire for current income their, informational contents, institutional requirement, and so on.

There are many empirical studies, (e.g. Lintner) to support the contention that companies pursue a stable dividend policy.

According to John Lintner's study, dividends are 'sticky' in the sense that they are slow to change and lag behind shifts in earnings by one or more periods. This leads to the pattern of stable dividend per share during the periods of fluctuating earnings per share and a rising step-function pattern of dividends per share during increasing earnings per share periods.

A firm should seek a stable dividend policy which avoids occasional reductions in dividends. Investors favourably react to the price of shares of such companies and there is a price enhancing effect of such a policy.

The legal restrictions on payment of dividends stipulate conditions pertaining to capital impairment, net profits, insolvency and illegal accumulation of excess profits. The contractual restrictions on payment of dividends are imposed by loan agreements. The internal constraints impinging on the dividend restrictions relate to growth prospects, availability of funds, earnings stability and control. The dividend policy is also likely to be affected by the owners' consideration of (a) tax status of the shareholders, (b) their opportunities for investment and (c) dilution of ownership.

While a firm which has easy access to the capital market can follow a liberal dividend policy, a firm having only limited access to the capital markets is likely to adopt low dividend payout ratio as they are likely to rely, to a greater extent, on retained earnings as a source of financing their investments.

With rising prices, funds generated from depreciation may be inadequate to replace obsolete equipments. As a result, the D/P ratio tends to be low during periods of inflation.

LO 30.2

Apart from cash dividend, a firm can also reward its investors by paying bonus shares. The bonus shares/share splits do not have any economic impact on the firm in that its assets, earnings and investors' proportionate ownership remain unchanged. As a result, the number of shares outstanding increases. The increased number of shares outstanding tends to bring the market price of shares within more popular range and promote more active trading in shares. Moreover, bonus/split announcements have informational content to the investors. It will also enable the conservation of corporate cash and further enable a firm to raise additional funds particularly through the issue of convertible securities.

With effect from financial year 2003-4, dividend income from domestic companies, mutual funds and UTI is exempt from tax in the hands of the shareholders/investors/unitholders. However, the domestic companies will be liable to pay dividend distribution tax.

While the number of shares outstanding increases in the case of normal split, the reverse split decreases it. Like the normal split, there is no economic impact of the reverse split on (i) corporate earnings and (ii) shareholders' wealth.

LO 30.3

Share repurchase implies that a company buys its own shares. It is an alternative method to pay cash dividends. In India, the companies are allowed to buy back their shares. They are to conform to (i) the provisions of the Companies Act and (2) SEBI's buy-back regulations of listed companies.

The major advantages of share repurchases are (1) Positive signaling effect, (2) Preferential tax treatment, (3) Price-enhancing effect on shares due to increased earnings per share, (4) Help in maintaining stable dividend policy, (5) Flexibility in dividend payment compared to the requirements of regular dividend policy, (6) Facilitates desired debt-equity ratio and (7) Useful for employee stock option plan. The only major drawback of the buyback is that it may sometimes cause discrimination between the shareholders who sell their shares and those who do not.

is to be declared and in computing the said amount, and the appropriations out of the amount transferred from the Developments Rebate Reserve at the expiry of the period specified under the Income Tax Act, 1961 (43 of 1961 should be included and all items of capital) reserves including reserves created by revaluation of assets shall be excluded.

SOLVED PROBLEMS

P.30.1 Royal Industries has for many years enjoyed a moderate but stable growth in sales and earnings. In recent years, it is facing a stiff competition in its plastic product line and, consequently, its sales have been declining. Apprehending further decline in its sales, its management is planning to move eventually out of plastic business altogether and develop new diversified product line in growth-oriented industries. To execute the proposed investment plan of this year, a capital outlay of ₹12 crore is necessary to purchase new facilities to start manufacturing a new product; the estimated rate of return on fresh investment is 20 per cent.

LO 30.1 **LOD E**

The company has been paying a dividend of ₹1.50 per share on 4 crore outstanding equity shares. The dividend policy has been to maintain a stable rupee dividend, raising it only when it appears that earnings have reached a new, permanently higher level. The directors may change such a policy if there are compelling reasons to do so. Total earnings of the current year are ₹10 crore. The current market price of the equity share is ₹15 and the firm's current leverage ratio (debt/assets) is 40 per cent. Current costs of various forms of financing are:

Debentures, 13 per cent

New equity shares sold at ₹15 to yield, ₹14.

Required rate of return on equity, 10 per cent

- (a) What would be an appropriate dividend policy for Royal Industries?
- (b) What assumptions, if any, do you make in your answer about investors' preference for dividends versus capital gains?

Solution (a) The management of Royal Industries should recognise that it will be in constant need of more funds owing to its intended policy of moving into new diversified product lines in growth-oriented industries. This could be done immediately by reducing the current dividend, or by, over time, maintaining the current dividends as earnings rise. To the extent the shareholders have strong expectations about maintenance of the current dividend, the current policy (of maintaining current dividend at ₹1.50 per share) might be appropriate.

The company through advertisement should make the investors aware of the new growth prospects and the greater investment opportunities ahead. Such an announcement would help to prevent the share prices from falling on reduction of the dividend paid, if the company adopts a policy of immediate dividend cut. A better policy, perhaps, would be to maintain the current dividend of ₹1.50 per share and not allow to increase until earnings are so much higher that ₹1.50 represents a lower percentage of earnings.

(b) As discussed in part (a), it might perhaps be appropriate for the management to reduce its dividend payout ratio. This would tend to decrease the dividend yield (D_1/P_0) component of the investors' required rate of return in relation to the growth component. This assumes that the shareholders are basically indifferent between returns earned by them either in the form of dividend or capital gains. However, the investors are not indifferent between payment of dividends or retentions; they have a preference for current dividends as dividends are totally exempt from tax; the equity capitalisation rate would go up if current dividends are reduced.

P.30.2 X Cement Ltd requires you, as their financial consultant, to advise them with respect to the dividend policy they have to follow for the current year. The cement industry has been through a very trying period in the last five years and the constraints on operations have been removed in the early part of the year. The company hopes to improve its position in the years to come and has plans to put up an additional plant in the neighbourhood of the present factory. The increased profits, due to expansion in capacity, are expected to be 25 per cent of the additional capital investment after meeting interest charges but before depreciation on the additional plant installed. The shares of X Cement Ltd are

What recommendations would you make? Give reasons for your answers.

Solution The company appears to be following a stable dividend policy, that is, a policy of maintaining a stable rupee dividend, decreasing it only when it appears that earnings have reached a new, permanently low level or *vice-versa* in that although the EPS has declined from ₹6 in Year 1 to ₹4.50 in Year 3, no corresponding decrease was effected in the DPS. However, when the declining trend of earnings continued in subsequent years too, the dividends had been lowered inasmuch as no dividends were paid in year 5. Consequently, its share prices fell from ₹80 in Year 1 to ₹60 in Year 5. The decline in market prices is less pronounced in the context of much distressing profitability and dividend record of the company during the period as a whole. The rate of return of 6 per cent on equity capital in Year 1 was the maximum. Even this modest amount consistently declined to eventually a very low figure of 4 per cent by current year; the dividend yield was still smaller. The only off-setting factor was the stable dividend policy.

Given the improved record of earnings in the current year and the trend which is likely to continue in future years, coupled with favourable liquidity position, a rise in dividend is commended for the undermentioned reasons.

(a) The investors would receive dividend income free of tax, especially if this category of investors includes retired persons who need the current income for living expenses and do not wish to sell even a small portion of their shares either because of transaction costs involved or because they are reluctant to 'eating their own capital'.

(b) The investors must be expecting a substantial rise in dividend in the light of the current market price of ₹140 compared to ₹60 last year. Failure to pay dividend commensurate to the shareholder's expectation will have an adverse effect on share prices.

(c) Cement industry with stable sales and earnings can afford high leverage ratios. The company is not likely to encounter any major difficulty in raising funds to finance an additional plant due to bright future prospects.

(d) The payment of dividend resolves uncertainty; investors in general are risk averters; they prefer *current* dividends to larger *deferred* dividends.

The payment was 50 per cent in Year 1; the payment of 60 per cent is recommended this year, assuming that target dividend payout ratio is 75 per cent. Moreover, the company through advertisements should make the investors aware of the growth prospects and the investment opportunities ahead which would have a positive effect on share prices.

P.30.3 X and Y are two fast growing companies in the engineering industry. They are close competitors and their assets composition, capital structure, and profitability records have been very similar for several years. The primary difference between them from a financial management perspective is their dividend policy. The company X tries to maintain a non-decreasing dividend per share, while the company Y maintains a constant dividend payout ratio. Their recent earnings per share (EPS), dividend per share (DPS), and share price (P) history are as follows:

Year	Company X			Company Y		
	EPS	DPS	P (range)	EPS	DPS	P (range)
1	₹9.30	₹2	₹75-90	₹9.50	₹1.90	₹60-80
2	7.40	2	55-80	7.00	1.40	25-65
3	10.50	2	70-110	10.50	2.10	35-80
4	12.75	2.25	85-135	12.25	2.45	80-120
5	20.00	2.50	135-200	20.25	4.05	110-225
6	16.00	2.50	150-190	17.00	3.40	140-180
7	19.00	2.50	155-210	20.00	4.00	130-190

In all calculations below that require a share price, use the average of the two prices given in the share price range.

- (a) Determine the dividend payout ratio (D/P) and price to earnings (P/E) ratio for both companies for all the years.
- (b) Determine the average D/P and P/E for both the companies over the period 1 through 7.
- (c) The management of Company Y is puzzled as to why their share prices are lower than those of Company X, in spite of the better profitability record particularly of the past three years. As a financial consultant, how would you explain the situation?

Solution

(a) and (b)

D/P and P/E Ratios

Year	Company X					Company Y				
	EPS	DPS	D/P ratio (DPS+EPS)	P	P/E ratio (P+EPS) (Number of times)	EPS	DPS	D/P ratio	P	P/E ratio (P+EPS) (Number of times)
1	₹9.30	₹2.00	21.5	₹82.50	8.87	₹9.50	₹1.90	20	₹70	7.37
2	7.40	2.00	27.0	67.50	9.12	7.00	1.40	20	45	6.43
3	10.50	2.00	19.0	90.00	8.57	10.50	2.10	20	57.50	5.48
4	12.75	2.25	17.6	110.00	8.63	12.25	2.45	20	100.00	8.16
5	20.00	2.50	12.5	167.50	8.37	20.25	4.05	20	167.50	8.27
6	16.00	2.50	15.6	170.00	10.62	17.00	3.40	20	160.00	9.41
7	19.00	2.50	13.2	182.50	9.6	20.00	4.00	20	160.00	8.00
	94.95	15.75	16.6	870.00	9.16	96.50	19.30	20	760.00	7.88

(c) Company X is following a stable dividend policy whereas company Y is following a stable dividend payout ratio. In the latter type of policy, sporadic dividend payments occur which make its owners very uncertain about the returns they can expect from their investment in the firm and, therefore, generally depress the share prices. It is probably for this reason that the company X's average price per share exhibited a consistent increase compared to company Y, volatile pattern of earnings of both companies (during the last three years) notwithstanding. Company Y is advised to follow a stable dividend policy.

P.30.4 The shareholders' funds of XYZ Ltd for the year ending March 31 are as follows:

LO 30.1 **LOO**
M

The earnings available for equity shareholders from this period's operations are ₹1,50,000, which have been included as part of the ₹3,00,000 retained earnings.

- (i) What is the maximum dividend per share (DPS) the firm can pay?
- (ii) If the firm has ₹60,000 in cash, what is the largest DPS it can pay without borrowing?
- (iii) Indicate what accounts, if any, will be affected if the firm pays the dividends indicated in (ii) above?

12% Preference share capital	₹1,00,000
Equity share capital (₹100 each)	4,00,000
Share premium	40,000
Retained earnings	3,00,000
	<u>8,40,000</u>

Solution

- (i) Maximum DPS = Total distributable profits/Number of equity shares outstanding = ₹3,00,000/4,000 (₹4,00,000 ÷ 100) = ₹75
- (ii) Maximum DPS (without borrowing) = Cash available/Number of equity shares outstanding = ₹60,000/4,000 = ₹15
- (iii) Accounts relating to retained earnings and cash will be affected. Retained earnings balance will decline by ₹60,000, that is the amount of dividend paid. Cash will be reduced to zero.

Note: It is assumed that preference share dividends have been paid in full.

P.30.5 Following is the EPS record of AB Ltd over the past 10 years:

LO 30.1 **LOD M**

Year	EPS	Year	EPS
10	₹20	5	₹12
9	19	4	6
8	16	3	9
7	15	2	(2)
6	16	1	1

- (i) Determine the annual dividend paid each year in the following cases:
- (a) If the firm's dividend policy is based on a constant dividend payout ratio of 50 per cent for all years.
- (b) If the firm pays dividend at ₹8 per share, and increases it to ₹10 per share when earnings exceed ₹14 per share for the previous two consecutive years.
- (c) If the firm pays dividend at ₹7 per share each year except when EPS exceeds ₹14 per share, when an extra dividend equal to 80 per cent of earnings beyond ₹14 would be paid.
- (ii) Which type of dividend policy will you recommend to the company and why?

Solution

- (i) (a) Dividend per share, DPS paid in years, 10 – 1

Year	EPS	DPS	Year	EPS	DPS
10	₹20	₹10	5	₹12	₹6
9	19	9.5	4	6	3
8	16	8	3	9	4.5
7	15	7.5	2	(2)	Nil
6	16	8	1	1	0.5

- (b) Dividend per share, DPS, years 10 – 1

Year	EPS	DPS	Year	EPS	DPS
10	₹20	₹10	5	₹12	₹8
9	19	10	4	6	8
8	16	10	3	9	8
7	15	8	2	(2)	8*
6	16	8	1	1	8

* It is assumed that the company has past accumulated earnings which are not only enough to write-off current year's losses, but also can meet the dividend payment needs (number of equity shares outstanding × ₹8) of this year.

(c) Dividend per share, DPS, years 10 – 1

Years	EPS	DPS	Year	EPS	DPS
10	₹20	₹11.8	5	₹12	₹7
9	19	11	4	6	7
8	16	8.6	3	9	7
7	15	7.8	2	(2)	7
6	16	8.6	1	1	7

(ii) What the investors expect is that they should get an assured fixed amount as dividend which should gradually and consistently increase over the years, that is, a stable dividend.

Stable dividend policy [(i) (b) above] is commended. There are several reasons why investors would prefer a stable dividend, and pay a higher price for firm's shares which observes stability in dividend payments.

Dividend policy on pattern [(i) (a)] involves uncertainty and irregularity in regard to the expected dividends. The policy of paying sporadic dividends may not find favour with them.

Likewise, dividend policy on pattern [(i) (c)] has some element of uncertainty. By calling the amount by which the dividends exceed the normal payments as extra, the firm, in effect, cautions the investors, both existing as well as prospective, that they should not consider it as a permanent increase in dividends. Obviously, such increase in dividends will not have much price-enhancing effect.

In the light of these facts, the dividend policy [(i) (b)] is the most appropriate among all the alternatives.

P.30.6 From the following financial statistics of Infosys Ltd for the period 1993-94 to 2001-02 (along with Sensex), comment on its dividend policy. Are its shares overvalued?

LO 30.1 LOD M

Year	MPS	Networth (₹ lakh)	Equity dividend (₹ lakh)	EAT (₹ Lakh)	EPS	NWPS	D/P (%)	DPS	Sensex
1993-94	₹343	2,870	117	809	₹24.15	₹85.67	14.46	₹3.49	4,485
1994-95	607	6,247	231	1,332	19.88	93.24	17.34	3.45	4,385
1995-96	458	7,984	363	2,101	28.94	109.97	17.28	5.00	3,259
1996-97	731	11,284	399	3,698	50.94	155.43	10.79	5.50	3,440
1997-98	1,493	17,296	703	6,036	39.53	113.28	11.65	4.60	3,770
1998-99	2,597	57,443	1,211	13,526	84.43	358.57	8.95	7.56	3,286
1999-00*	6,891	83,330	2,976	29,352	91.64	260.16	10.14	9.29	4,543
2000-01	7,173	1,38,964	6,615	62,881	196.32	433.86	10.52	20.65	4,355
2001-02	3,606	2,08,031	13,236	80,796	244.32	629.06	16.38	40.02	3,336

* Company issued bonus shares in the ratio of 1:1.

Solution The Infosys Ltd appears to be following a stable dividend policy. The dividend per share (DPS) have consistently increased from ₹3.5 in 1993-94 to ₹7.56 in 1998-99 and, further, to ₹40.02 in 2001-02. Though the DPS has shown a significant increase over the years, the dividends paid are low in relation to the market price of its share (MPS). The dividend yield (DPS/MPS) is less than one per cent in most of the years. In 2001-02, when dividends paid were maximum, the dividend yield was 1.1 per cent only. The dividend payout (D/P) ratios is also a pointer towards the same, varying in the range of 8.95 per cent (1993-94) and 17.34 per cent (2001-02). The D/P ratios of less than 20 per cent, for a software/information technology company is below the mark.

The DPS are also not commensurate with the pronounced increase in the EAT as well as the EPS over the years particularly since 1998-99. For instance, while EPS was ₹196.32 and ₹244.32 in 2001 and 2002 respectively, the corresponding DPS in these years were ₹20.65 and ₹40.02 only. However, Infosys has virtually doubled the payment of DPS in 2002 over 2001. Given the improved record of earnings, particularly since 1998-99 and the trend which is likely to continue in future years in view of increased level of projects from the US, Infosys would be well advised to pay higher dividend.

All along the period under reference, the market price of its shares seem to be over-valued as reflected in the market price/book value (net worth) ratio (P/B ratio) as shown below:

... ..

...
...
...
...

... ..

...
...
...
...

...
...
...
...

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

Year	MPS	NWPS	P/B ratio
1993-94	₹343	₹85.67	4.00
1994-95	607	93.24	6.51
1995-96	458	109.97	4.16
1996-97	731	155.43	4.70
1997-98	1,493	113.28	13.18
1998-99	2,597	358.57	7.24
1999-00	6,891	260.16	26.49
2000-01	7,173	433.86	16.53
2001-02	3,606	629.06	5.73

The P/B ratio indicates that the MPS of Infosys' shares is substantially overvalued. It was maximum (26.49 times) in 1999-2000. The reason may be higher expected of growth of software industry by the investors in view of large number of project and service outsourcing done from India by the USA. However, the MPS is not warranted by the fundamental factors such as EPS, DPS, NWPS, P/B ratio and so on.

P 30.7 The following financial statistics is available in respect of a listed company:

LO 30.1,3 LO D

Price-earnings (P/E) ratio	8 times
Number of equity shares	4 lakh
Earnings available to equity shareholders	₹40 lakh
Earnings per share	10
Market price per share	80

The company is currently considering whether it should use ₹20 lakh of its earnings to pay cash dividends or to repurchase shares at ₹85 per share.

Required:

- How many equity shares can be repurchased, using the funds that would have been disbursed to pay the cash dividend?
- Determine the EPS after the proposed share repurchase.
- Assuming no change in the current P/E ratio, compute the market price after share repurchase.
- Compare and contrast the shareholders' positions under the dividend and repurchase alternatives.
- Is ₹85 the equilibrium share repurchase price?
- In case share repurchase price is higher than ₹85, which category of shareholders—those who have sold their shares or those who have not—are financially better off?

Solution

- $₹20,00,000 \div ₹85 = 23,529$ shares
- Shares outstanding after repurchase = $4,00,000 - 23,529 = 3,76,471$ shares.
EPS after proposed repurchase $(₹40 \text{ lakh} \div 3,76,471) = ₹10.625$.
- $\text{MPS} = ₹10.625 \times 8 \text{ times} = ₹85$
- Under the dividend alternative, the shareholders receive ₹5 per share. Given the market price of ₹80, their total receipts per share are ₹85. Under the repurchase alternative, the MPS is ₹85. In both cases, the effective receipts per share are identical.
- Yes, ₹85 is the equilibrium share repurchase price as the effective receipts per share are identical under dividend and repurchase alternatives. It can be computed also:

$$P^* = (N_c \times \text{MPS}_c) + (N_c - \text{RS}) = (4,00,000 \times ₹80) + (4,00,000 - 23,529)$$

$$= ₹320 \text{ lakh} + 3,76,471 \text{ shares} = ₹85 \text{ per share.}$$
- The shareholders who have sold the shares are at an advantage because the expected MPS after repurchase is likely to be lower than the repurchase price.

MINI CASES

30.C.1 Short Circuit Electric Company (SCEC) is one of the market leaders in electric product manufacturing. Its market share in the same sector is more than 34 percent and is way ahead of its competitors. The performance of the SCEC has been eye catching for the past 15 years. Its earnings per share (EPS) have been impressive at more than ₹2 during the last ten years (given face value of the equity share as ₹10). The management had been satisfaction of paying adequate dividends to its shareholders which, in turn, has boosted the share prices and the market value of SCEC.

EPS, DPS and D/P ratio of SCEC, 2003–12

Particulars	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
EPS (₹)	2.62	3.11	3.20	3.30	3.42	3.52	2.86	2.48	2.32	2.1
DPS(₹)	1.8	1.8	2.0	2.0	2.0	2.2	2.2	2.2	2.2	2.2
D/P Ratio (%)	68.7	57.9	62.5	60.6	58.5	62.5	76.9	88.7	95.7	104.8

However, the past four years' (2009-12) have been the cause of concern to management due to a downward trend and sharp decline in EPS from ₹3.52 in 2008 to ₹2.2 by 2012. In spite of this decrease, SCEC maintained high DPS of ₹2.2 (increased in 2008) in years 2009-2012 and has adhered to a stable dividend policy. This policy, in turn, has arrested the decline in its MPS. However, the position had worsened during 2010-2012 inasmuch as dividend payments in 2012 were higher than EPS in 2012.

The CEO, Mr. Wireman, when analysed the situation with his Financial Manager, Mr. Cable, concluded that the reasons for such a downward trend were two-fold:

- (i) Increasing competition in the electric product manufacturing market. Few small firms offered products at lower prices; which, in turn, has caused dent in its profit margins.
- (ii) Decline in technological upgradation of its R&D unit, which has resulted in lagging behind of SCEC in developing newer and more advanced products in comparison with its competitors.

At this juncture, SCEC is confronted with a choice whether to cut down on the payment of dividends or to continue with the same dividend payment of ₹2.2 per share. The CEO also wants to evaluate the option of having stock repurchase concurrently with decrease in DPS.

In order to analyse the same, the CEO asked his Chief Financial Analyst, Mr. Switch, to give recommendations regarding his prospective action, taking into account all the pros and cons of the action and its impact.

Solution

First, Switch attempted to analyse the impact that the dividend decision may have on the market position of SCEC.

He observes that the company has been following a stable dividend policy. The investors immensely value DPS of ₹2.2 (at a face value of ₹10). He also notes that the sales of the company have shown an upward trend and the capital expenditures have shown reduction. Mr. Switch also believes that the shareholders are the owners of the firm, and good dividend payments induce shareholders to continue investing in the company rather than investing elsewhere in the market. The advantage of paying dividends is that, the adequate dividend payment signals the firm's financial stability and soundness. Dividends not only encourage current shareholders to retain their investment in the firm, but also increase the firm's attractiveness to potential investors.

However, on the other hand, cutting down on the dividend would allow SCEC to both reinvest a significant portion of its earnings in capital investment projects and R&D (which he finds has shown a decline). This helps meet the challenges of increased competition in the company's future and offer higher rates of dividend growth in subsequent years. Therefore, cutting down on dividend payment may help the same. However, cutting dividends would impact the shareholders who expected to receive at least the same dividend as last year (2012).

Maintaining the stable dividend policy would, therefore, require a trade-off between the need to reinvest earnings in order to expand and the need to satisfy shareholders who expect no decrease in DPS. The dividend payout decision must be consistent with the future goals of SCEC also.

In a meeting that Mr. Switch arranged with the Board of Directors of the company, he received varied opinions on the subject. Some of them were:

- The dividend payout ratio had been in the range of 58-69% from 2003-08, but it has gone up to more than 95% in the recent years (2011–2012).
- The firm has successfully followed stable dividend policy till date. Although many of the promoters believed that the firm should continue with the stable dividend policy, many of them favoured the share repurchase programme, saying that it might lead to greater EPS and market value of the share. The justifications given by them were:
 - (i) The negative signal sent by the action of cutting down on the dividends (if any) would be somewhat offset by the positive action of the share repurchase.
 - (ii) A repurchase programme provides flexibility in distributing capital to investors in case the earnings were not as high as expected.
 - (iii) Further, some board members also contended that the stable dividend policy has a price-enhancing effect and should continue.
 - (iv) Above all, many promoters were of the Modigliani and Miller school of thought and believed that dividend decisions were irrelevant and share prices are unaffected due to them.

On the basis of recommendations on the above analysis and the current market position of SCEC, Mr Switch summarised that cutting down on dividend payment for the year 2013 (say, to ₹1.1) and share repurchase will provide SCEC with the following advantages:

- (i) Give a positive signalling effect offsetting the negative signalling effect of reduction dividend payment.
- (ii) Provide SCEC with a tax advantage (as there is a dividend payment tax).
- (iii) Keeping the *P/E* ratio constant, a change in EPS is likely to have a positive impact on market value of the share.
- (iv) Provide SCEC with greater flexibility in terms of cash reserves.
- (v) Insulate SCEC from the impact of lost earnings due to increased competition. This would also enable SCEC to carry out pending investment projects and invest in R&D.

In view of the above, Switch suggested that SCEC should go for a reduction in dividend payment and simultaneously go for share repurchase. The policy can be published in annual report and also highlighted in annual general meeting.

SCEC's dividend decision for the year 2013, based on Mr. Switch's recommendation was as follows:

- 50% reduction in dividend payment.
- Dividend payout targeted at 65-70%.
- Repurchase of 5 million shares over 2 years

Market Observations

- On April 3rd, 2013 SCEC suggested that it would be difficult to maintain the dividend.
- Then on May 9th, 2013 SCEC announced that the dividend cut with the stock repurchase programme and the stock price fell by ₹4.30, coming down to ₹27.50.
- Then on May 31st, 2013 SCEC's stock closed at ₹32.17, or about ₹0.30 higher than the pre-announcement price (₹31.87).
- By Dec'31st 2013, SCEC's stock price closed at ₹37.75, giving stockholders a return of 23.8%.
- Finally, on January 1, 2014 SCEC's stock was trading at ₹45.25, which provided stockholders with a post announcement return of 52.9%.

Explanation for volatility The volatility in market behaviour on SCEC's dividend decision can have the following possible explanations:

- (i) One explanation would be that, the market over-punished the shares of SCEC when it announced both a stock repurchase programme and a dividend cut. Then, once the market realised that the

company made a strategic move, and signalled to the public that the company's basic earning power was still strong the share prices again rose.

- (ii) The other explanation can be attributed to clientele effect. When the company reduced the dividend, the clientele of investors who desired a high dividend payout sold their shares and the share prices dropped. Soon after the old clientele left, a new clientele that desired a lower dividend payout (and have a preference for capital appreciation) replaced them, and as a result the share prices increased.

REVIEW QUESTIONS

LOD: Easy

RQ.30.1 Give appropriate answer for the following:

[LO 30.1-4]

- (i) In a stock split, the par value of the share is _____ (reduced/increased) and the number of shares is proportionately _____ (reduced/increased).
- (ii) _____ involves payment to existing owners of dividend in the form of shares.
- (iii) Dividends can only be paid out of the current years earnings (True/False)
- (iv) A company is free to choose whatever dividends it must pay. It does not have restrictions from any of the stakeholders. (True/False)
- (v) Stock repurchases increase during boom times when firms accumulate excess cash. (True/False)
- (vi) The effective wealth of shareholders does not change with the issue of bonus shares. (True/False)
- (vii) An optimum dividend policy should strike a balance between _____ and _____ in order to maximize the wealth of the shareholders.
- (viii) A new firm can pay dividends to its shareholders out of its paid-up capital as it may not have enough profits to pay dividends but has strong growth prospects in the future. (True/False)
- (ix) A firm cannot pay dividends out of its accumulated balance of retained earnings. (True/False)
- (x) Firms with more stable income streams generally tend to retain a majority of their earnings so as not to impair the stability of their income (True/False)
- (xi) Share splits tend to dilute the ownership of the firm as more shares are offered to shareholders. (True/False)

[Answers: (i) Reduced, Increased (ii) Bonus shares (iii) False (iv) False (v) False (vi) True (vii) Current dividends, Future growth (viii) False (ix) False (x) False (xi) False]

RQ.30.2 X Ltd and Y Ltd are two fast growing companies in the engineering industry. They are close competitors, and their asset composition, capital structure, and profitability records have been very similar for several years. The primary difference between the companies, from a financial management perspective, is their dividend policy. The X Ltd tries to maintain a non-decreasing dividend per share, while Y Ltd maintains a constant dividend pay-out ratio. Their recent EPS, DPS, and share price (P) history are as follows:

[LO 30.1]

Year	X Ltd			Y Ltd		
	EPS	DPS	P (range)	EPS	DPS	P (range)
1	₹9.3	₹2	₹75-90	₹9.5	₹1.9	₹60-80
2	7.4	2	55-80	7	1.4	25-65
3	10.5	2	70-110	10.5	2.1	35-80
4	12.75	2.25	85-135	12.25	2.45	80-120
5	20	2.5	135-200	20.25	4.05	110-225
6	16	2.5	150-190	17	3.4	140-180
7	19	2.5	155-210	20	4	130-190

In all calculations below that require a share price, use the average of the two prices given in the share price range.

- (i) Determine the dividend pay-out (D/P), and P/E ratios for both companies for all the years.
- (ii) Determine the average D/P and P/E for both the companies over the period 1 through 7.
- (iii) The management of Y Ltd is puzzled as to why their share prices are lower than those of X Ltd, in spite of the fact that its profitability record is slightly better (particularly of past 3 years). As a financial consultant, how would you explain the situation?

RQ.30.3 The structure of equity funds of Sound Technologies Limited is given below (₹ lakh): [LO 30.2]

Authorised equity share capital (50 lakh shares of ₹10 each)	₹500 lakh
Paid-up equity shares capital (20 lakh equity shares of ₹10 each)	200
Share premium (@ ₹15 each)	300
Retained earnings	650

The current market price of the company's share is ₹60. Show the impact on equity funds in the following situations:

- (a) Issue of bonus shares in the ratio of 1:5. Shares would be issued at premium.
- (b) Share split in the ratio of 5:1.

LOD: Medium

RQ.30.4 What are the determinants of the dividend policy of corporate enterprises? Also, explain the terms bonus shares and share splits. What is their rationale? [LO 30.1.2]

RQ.30.5 What are the factors that determine the dividend policy of a company? Do you believe it will be justifiable for a company to obtain a short-term loan from a bank to allow payment of a dividend? [LO 30.1]

RQ.30.6 What is stable dividend policy? Why should a firm follow such a policy? [LO 30.1]

RQ.30.7 What is the clientele effect? Explain how does it effect dividend policy? [LO 30.1]

RQ.30.8 What is the share repurchase? Enumerate its major advantages and disadvantages. [LO 30.3]

RQ.30.9 How is equilibrium share repurchase price determined? Explain your answer with an example. [LO 30.3]

RQ.30.10 From the following financial statistics of Hypothetical Ltd, compute the equilibrium share repurchase price: [LO 30.3]

Number of equity shares outstanding	50 lakh
Current market price of a share	₹40
Proposed number of shares to be repurchased	10 lakh

RQ.30.11 From the following financial statistics of Wipro Technologies for the period ending March 31, 2002 to March 31, 2008 (along with sensex), comment on its dividend policy. Are its shares overvalued? [LO 30.1]

Year (March -end)	MPS	Net worth (in crore)	Equity dividend (in crore)	EAT (in crore)	EPS	NWPS	D/P (%)	DPS	Sensex
2002	₹306	₹2,532.78	₹23.25	₹866.11	₹37.26	₹108.95	2.68	₹1.00	₹3,469

LOD: Difficult

- RQ.30.12** To what extent are firms able to establish definite long-run dividend policies? What factors would affect these policies? To what extent might these policies affect market value of a firm's securities? Explain. [LO 30.1]
- RQ.30.13** Explain how share repurchases can be of help in (1) changing capital structure and (2) employee stock option plan. [LO 30.3]
- RQ.30.14** You are working as a finance manager with Avon Chemicals Limited. The earnings available for its equity shareholders are ₹50 lakh. It has 5 lakh equity shares outstanding. Its share are currently sold at ₹60 per share. The company is currently contemplating the payment of ₹5 per share in cash dividend. The Board of Avon has asked you to determine the following: [LO 30.1, 3]
- The current EPS and the P/E ratio.
 - If the firm can repurchase shares at ₹65 per share, how many equity shares can be repurchased instead of cash dividend payment?
 - The EPS after the proposed share repurchase.
 - Assuming no change in the current P/E ratio, compute the market price after share repurchase.
 - Are the equity shareholders who have sold the shares better off than the shareholders who have not sold their shares?
- RQ.30.15** Assuming everything to be the same as in RQ 30.14, state whether the shareholders who have not sold their shares are financially better off than those who have sold their shares when shares are repurchased at (a) ₹67, and (b) ₹62 per share. [LO 30.3]

ANSWERS

- 30.2 (i)** X Ltd : D/P ratio: 21.5; 27; 19; 17.6; 12.5; 15.6; 13.2;
P/E ratio: 8.87; 9.12; 8.57; 8.63; 8.37; 10.62; 9.6;
Y Ltd : D/P ratio: 20; 20; 20; 20; 20; 20; 20;
P/E ratio: 7.37; 6.43; 5.48; 8.16; 8.27; 9.41; 8.00;
- (ii)** X Ltd : average D/P 16.6 per cent
average P/E 9.16 per cent
Y Ltd : average D/P 20 per cent
average P/E 7.88
- (iii)** X Ltd is following a stable dividend policy, whereas Y Ltd is following constant D/P ratio policy. In the latter policy, sporadic dividend payments occur, which make its owners very uncertain about the returns they can expect from their investment in the firm and, therefore, generally depress the share prices. It is probably for this reason that X Ltd's average price per share exhibited a stable increasing behaviour *vis-a-vis* that of Y Ltd, volatile pattern of earnings of both companies (during the last three years), notwithstanding. Company Y is advised to follow a stable dividend policy
- 30.3 (a)** Retained earnings would reduce to ₹550 lakh.
(b) Number of issued shares would increase to 100 lakh.
- 30.10** ₹50 per share.
- 30.11** Shares are over-valued.

PART

9

VALUATION AND CORPORATE RESTRUCTURING

Chapter 31

BUSINESS VALUATION

Chapter 32

CORPORATE RESTRUCTURING

It is important for the finance managers, in particular, and other managers, in general, to understand the process and methods of valuing a business/firm. The term 'business' is more comprehensive than the assets deployed in it. The reason is that the valuation of business is to reckon all types of assets (tangible and intangible) as well as all liabilities (recorded and contingent). Irrespective of this difference in scope, the business valuation exercise is akin to the valuation of an asset/a security and is dependent on basic financial concepts of time value of money, risk and return and future cash flows. The subject of business valuation assumes special significance in the case of mergers and acquisitions with a view to, firstly, determining the price that the acquiring firm should be willing to pay for the acquisition of a business and, secondly, deciding 'fair' exchange ratio between the shareholders of the two companies. Part 9 focuses on business valuation (Chapter 31) and corporate restructuring (Chapter 32).

VALUATION AND CORPORATE RESTRUCTURING

It is important to know whether, in particular, and other matters, in order to understand the process and methods of using a business valuation. The first step is to know the valuation process deployed in a firm. The reason is that the valuation of a firm is not a simple task. It is a complex and multi-faceted process, and it is important to know the process and the methods of valuation. The process of valuation is not a simple task. It is a complex and multi-faceted process, and it is important to know the process and the methods of valuation. The process of valuation is not a simple task. Business Valuation

LEARNING OBJECTIVES

LO 31.1	Explain the basic valuation framework in terms of different concepts of value—book value, market value, intrinsic/economic value, liquidation value, replacement value, salvage value and fair value
LO 31.2	Describe the four major approaches to valuation of business—asset-based, earnings-based, market-value-based and fair value-based
LO 31.3	Discuss market value added (MVA) and economic value added (EVA) approaches to measure value with focus on shareholders

INTRODUCTION

This Chapter dwells on business valuation. It outlines the conceptual framework of valuation first. The various methods/approaches used/recommended for the purpose of business valuation are also delineated. The valuation techniques relevant to measure value accretion in share-holders wealth are covered subsequently. The main points are summarised by way of recapitulation.

LO 31.1 CONCEPTUAL FRAMEWORK OF VALUATION

The term 'valuation' implies the task of estimating the worth/value of an asset, a security or a business. The price an investor or a firm (buyer) is willing to pay to purchase a specific asset/security would be related to this value. Obviously, two different buyers may not have the same valuation for an asset/business as their perception regarding its worth/value may vary; one may perceive the asset/business to be of higher worth (for whatever reason) and hence may be willing to pay a higher price than the other. A seller would consider the negotiated selling price of the asset/business to be greater than the value of the asset/business he is selling.

Evidently, there are unavoidable subjective considerations involved in the task and process of valuation. *Inter-se*, the task of business valuation is more awesome than that of an asset or an individual security. In the case of business valuation, the valuation is required not only of tangible assets (such as plant and machinery, land and buildings, office equipments, and so on) but also of intangible assets (like, goodwill, brands, patents, trademark and so on) as well as human resources

that run/manage the business. Likewise, there is an imperative need to take into consideration recorded liabilities as well as unrecorded/contingent liabilities so that the buyer is aware of the total sums payable, subsequent to the purchase of business. Thus, the valuation process is affected by subjective considerations. In order to reduce the element of subjectivity, to a marked extent, and help the finance manager to carry out a more credible valuation exercise in an objective manner, the following concepts of value are explained in this Section: **(i)** book value, **(ii)** market value, **(iii)** intrinsic value, **(iv)** liquidation value, **(v)** replacement value, **(vi)** salvage value, **(vii)** value of goodwill and **(viii)** fair value.

Book Value

Book value is the value at which assets are shown in balance sheet. The **book value** of an asset refers to the amount at which an asset is shown in the balance sheet of a firm. Generally, the sum is equal to the initial acquisition cost of an asset less accumulated depreciation. Accordingly, this mode of valuation of assets is as per the going concern principle of accounting. In other words, book value of an asset shown in balance does not reflect its current sale value.

Book value of a business refers to total book value of all valuable assets (excluding fictitious assets, such as accumulated losses and deferred revenue expenditures, like advertisement, preliminary expenses, cost of issue of securities not written off) less all external liabilities (including preference share capital). It is also referred to as **net worth**.

Market Value

In contrast to book value, market value refers to the price at which an asset can be sold in the market. The market value can be applied with respect to tangible assets only; intangible assets (in isolation), more often than not, do not have any sale value. Market value of a business refers to the aggregate market value (as per stock market quotation) of all equity shares outstanding. The market value is relevant to listed companies only.

Intrinsic/Economic Value

Intrinsic (economic) value is the present value of incremental future cash inflows using an appropriate discount rate. The **intrinsic value** of an asset is equal to the present value of incremental future cash inflows likely to accrue due to the acquisition of the asset, discounted at the appropriate required rate of return (applicable to the specific asset intended to be purchased). It represents the maximum price the buyer would be willing to pay for such an asset. The principle of valuation based on the discounted cash flow approach (economic value) is used in capital budgeting decisions.

In the case of business intended to be purchased, its valuation is equivalent to the present value of incremental future cash inflows after taxes, likely to accrue to the acquiring firm, discounted at the relevant risk adjusted discount rate, as applicable to the acquired business. The economic value indicates the maximum price at which the business can be acquired.

Liquidation value is the price at which an asset can be sold if the firm is liquidated. **Liquidation Value** As the name suggests, liquidation value represents the price at which each individual asset can be sold if business operations are discontinued in the wake of liquidation of the firm. In operational terms, the liquidation value of a business is equal to the sum of **(i)** realisable value of assets and **(ii)** cash and bank balances minus the payments

required to discharge all external liabilities. In general, among all measures of value, the liquidation value of an asset/or business is likely to be the least.

Replacement Value

The replacement value is the cost of acquiring a new asset of equal utility and usefulness. It is normally useful in valuing tangible assets such as office equipment and furniture and fixtures, which do not contribute towards the revenue of the business firm.

- **Replacement value**
- is the cost of acquisition of a new asset of equal utility.

Salvage Value

Salvage value represents realisable/scrap value on the disposal of assets after the expiry of their economic useful life. It may be employed to value assets such as plant and machinery. Salvage value should be considered net of removal costs.

Value of Goodwill

The valuation of goodwill is conceptually the most difficult. A business firm can be said to have 'real' goodwill in case it earns a rate of return (ROR) on invested funds higher than the ROR earned by similar firms (with the same level of risk). In operational terms, goodwill results when the firm earns excess ('super') profits. Defined in this way, the value of goodwill is equivalent to the present value of super profits (likely to accrue, say for 'n' number of years in future), the discount rate being the required rate of return applicable to such business firms.

The value of goodwill in terms of the present value of super profits method can serve as a useful benchmark in terms of the amount of goodwill the firm would be willing to pay for the acquired business. In the case of mergers and acquisition decisions, the value of goodwill paid is equal to the net difference between the purchase price paid for the acquired business and the value of assets acquired net of liabilities the acquiring firm has undertaken to pay for.

Fair Value

The concept of 'fair' value draws heavily on the value concepts discussed above, in particular, book value, intrinsic value and market value. The fair value is hybrid in nature and often is the average of these three values. In India, the concept of fair value has evolved from case laws (and hence is more statutory in nature) and is applicable to certain specific transactions, like payment to minority shareholders.

- **Fair value**
- is the average of book value, market value and intrinsic value.

It may be noted that most of the concepts related to value are 'stock' based in that they are guided by the worth of assets at a point of time and not the likely contribution they can make towards earnings/cash flows of the business in the future. Ideally, business valuation should be related to the cash flow generating ability of acquired business. The intrinsic value reflects the firm's capacity to generate cash flows over the long-run and, hence, seems to be more aptly suited for business valuation.

In fact, in general, business firms are not acquired with the intent to sell their assets in the post-acquisition period. They are to be deployed primarily for generating more earnings. However, from the conservative point of view, it will be useful to know the realisable value, market value, liquidation value and other values, if the acquiring firm has to resort to liquidation. In brief, the finance manager will find it useful to know business valuation from different perspectives. For instance, the book value may be very relevant for accounting/tax purposes; the market value may be useful in determining share exchange ratio and liquidation value may provide an insight into the maximum loss, if the business is to be wound up.

L0 31.2 APPROACHES/METHODS OF VALUATION

The various approaches to valuation of business with focus on equity share valuation are examined below. These approaches should not be considered as competing alternatives to the dividend valuation model. Instead, they should be viewed as providing a range of values, catering to varied needs, depending on the circumstances. The major approaches, namely, the **(i)** asset based approach to valuation, **(ii)** earnings based approach to valuation, **(iii)** market value based approach to valuation and **(iv)** the fair value method to valuation are described below.

Asset-Based Approach to Valuation

Asset-based approach focuses on determining the value of *net assets* from the perspective of equity share valuation. What should the basis of assets valuation be, is the central issue of this approach.

It should be determined whether the assets should be valued at book, market, replacement or liquidation value. More often than not, they are (and should be) valued at *book value*, that is, original acquisition cost minus accumulated depreciation, as assets are normally acquired with the intent to be used in business and not for resale. Thus, the valuation of assets is based on the going concern concept. Some other value measure may be used depending on circumstances of the case. For instance, if the plant and machinery has outlived its economic useful life (earlier than its initial estimated period), and is not in use for production, it will be in order to value the machinery at liquidation value.

Apart from tangible assets, intangible assets, such as goodwill, patents, trademark, brands, know how, and so on, also need to be valued satisfactorily. It may be useful to adopt the super profit method to value some of these assets.

To arrive at the net assets value, total external liabilities (including preference share capital) payable are deducted from total assets (excluding fictitious assets). The company's net assets are computed as per Equation 31.1.

$$\text{Net assets} = \text{Total assets} - \text{Total external liabilities} \quad (31.1)$$

The value of net assets is also known as net worth or equity/ordinary shareholders funds. Assuming the figure of net assets to be positive, it implies the value available to equity shareholders after the payment of all external liabilities. Net assets per share can be obtained, dividing net assets by the number of equity shares issued and outstanding. Thus,

$$\text{Net assets per share} = \text{Net assets} / \text{Number of equity shares issued and outstanding} \quad (31.2)$$

The value of net assets is contingent upon the measure of value adopted for the purpose of valuation of assets and liabilities. In the case of book value, assets and liabilities are taken at their balance sheet values. In the market value measure, assets shown in the balance sheet are revalued at the current market prices. For the purpose of valuing assets and liabilities, it will be useful for a finance manager/valuer to accord special attention to the following points¹:

- (i)** While valuing tangible assets, such as plant and machinery, he should consider aspects related to technological obsolescence and capital improvements made in the recent years. Depreciation adjustment may also be needed in case the company is following unsound depreciation policy in this regard.
- (ii)** Is the valuation of goodwill satisfactory, given the amount of profits, capital employed and average rate of return available on such businesses?

- (iii) With respect to current assets, are additional provisions required for “unrealisability” of debtors? Likewise, are adjustments required for “unsaleable” stores and stock?
- (iv) With respect to liabilities, there is a need for careful examination of ‘contingent liabilities’, in particular when there is mention of them in the auditor’s report, with a view to assess what portion of such liabilities may fructify. Similarly, adjustments may be required on account of guarantees invoked, income tax, sales tax and other tax liabilities that may arise.

The net assets valuation based on book value is in tune with the going concern principle of accounting. In contrast, liquidation value measure is guided by the realisable value available on the winding up/liquidation of a corporate firm.

Liquidation value is the final net asset value (if any) per share available to the equity shareholder. The value is given as per Equation 31.3.

$$\text{Net assets per share} = (\text{Liquidation value of assets} - \text{Liquidation expenses} - \text{Total external liabilities}) / \text{Number of equity shares issued and outstanding. (31.3)}$$

In the case of liquidation, assets are likely to be sold through an auction. In general, they are likely to realise much less than their market values. This apart, sale proceeds from assets are further dependent on whether the company has been forced to go into liquidation or has voluntarily liquidated. In the case of the ‘former’ type of liquidation, the realisable value is likely to be still lower.

The net asset value (NAV) per share will be the lowest under the liquidation value measure (Example 31.1).

Example 31.1

Following is the balance sheet of Hypothetical Company Limited as on March 31, current year:

		(₹ lakh)	
Liabilities	Amount	Assets	Amount
Share capital		Fixed assets	₹150
40,000 11% Preference shares of ₹100 each, fully paid-up	40	Less: Depreciation	30
1,20,000 Equity shares of ₹100 each, fully paid-up	120	Current assets:	
Profit and loss account	23	Stocks	100
10% Debentures	20	Debtors	50
Trade creditors	71	Cash and bank	10
Provision for income tax	8	Preliminary expenses	2
	282		282

Additional Information:

- (i) A firm of professional valuers has provided the following market estimates of its various assets: fixed assets ₹130 lakh, stocks ₹102 lakh, debtors ₹45 lakh. All other assets are to be taken at their balance sheet values.
- (ii) The company is yet to declare and pay dividend on preference shares.
- (iii) The valuers also estimate the current sale proceeds of the firm’s assets, in the event of its liquidation: fixed assets ₹105 lakh, stock ₹90 lakh, debtors ₹40 lakh. Besides, the firm is to incur ₹15 lakh as liquidation costs.

You are required to compute the net asset value per share as per book value, market value and liquidation value bases.

Solution**Determination of Net Asset Value per Share**

(₹ lakh)

(i) Book value basis			
Fixed assets (net)			₹120
Current assets:			
Stock	₹100		
Debtors	50		
Cash and bank	10		160
Total assets			280
Less: External liabilities:			
10% Debentures	20		
Trade creditors	71		
Provision for taxation	8		
11% Preference share capital	40		
Dividend on preference shares (0.11 × ₹40 lakh)	4.4		143.4
Net assets available for equityholders			136.6
Divided by the number of equity shares (<i>in lakh</i>)			1.2
Net assets value per share (₹)			113.83
(ii) Market value basis			
Fixed assets (net)			130
Current assets:			
Stock	102		
Debtors	45		
Cash and bank	10		157
Total assets			287
Less: External liabilities (as per details given above):			143.4
Net assets available for equityholders			143.6
Divided by the number of equity shares (<i>in lakh</i>)			1.2
Net assets value per equity share (₹)			119.67
(iii) Liquidation value basis			
Fixed assets (net)			105
Current assets:			
Stock	90		
Debtors	40		
Cash and bank	10		140
Total assets			245
Less: External liabilities (listed above):			143.4
Less: Liquidation costs			15.0
Net assets available for equityholders			86.6
Divided by the number of equity shares (<i>in lakh</i>)			1.2
Net assets value per equity share (in ₹)			72.17

The asset based approach is intuitively appealing in that it indicates the net assets backing per equity share. However, the approach ignores the future earnings/cash flow generating ability of the company's assets. In fact, the assets acquisition by business firms are not an end in themselves; they are means to an end. The end is value maximisation and firms acquire assets for the purpose of creating value². The earning based approach reckons this perspective.

Earnings Based Approach to Valuation

The earnings approach is essentially guided by the economic proposition that business valuation should be related to the firm's potential of future earnings or cash flow generating capacity. This approach overcomes the limitation of assets-based approach, which ignores the firm's prospects of

future earnings and ability to generate cash in business valuation. Earnings can be expressed in the sense of accounting as well as financial management. Accordingly, there are two major variants of this approach: **(i)** earnings measure on accounting basis and **(ii)** earnings measure on cash flow (financial management) basis.

Earnings Measure Based on Accounting—Capitalisation Method As per this method, the earnings approach of business valuation is based on two major parameters, that is, the earnings of the firm and the capitalisation rate applicable to such earnings (given the level of risk) in the market. Earnings, in the context of this method, are the normal expected annual profits. Normally to smoothen out the fluctuations in earnings, the average of past earnings (say, of the last three to five years) is computed.

Apart from averaging, there is an explicit need for making adjustments, to the profits of the past years, in extraordinary items (which are not likely to occur in the future), with a view to arriving at credible **future maintainable profits**. The notable examples of extraordinary/non-recurring items include profits from the sale of land, losses due to sale of plant and machinery, abnormal loss due to major fire, theft or natural calamities, substantial expenditure incurred on the voluntary retirement scheme (not to be repeated) and abnormal results due to strikes and lock-outs of major competing firm(s). Obviously, their non-exclusion will cause distortion in determining sustainable future earnings.

Above all, it will be useful to understand the profile of the business, focussing on identifying the major growth and income drivers. Are such drivers likely to continue in future years? If not, projected profits need to be discounted. Finally, additional income expected in the coming years—say, due to launch of a new product—should also be considered. In brief, the valuer should try to familiarise himself or herself with all major factors/events that had affected the profits of the business in the past year(s) and are likely to affect them in the future years too.

Determination of appropriate capitalisation rate is another major requirement of this approach. Capitalisation rate, normally expressed in percentages, refers to the investment sum, that an investor is willing to make to earn a specified income. For instance, 12.5 per cent capitalisation rate implies that an investor is prepared to invest ₹100 to earn an income of ₹12.5 or an acquiring firm is prepared to invest ₹100 to buy the expected profits of ₹12.5 of another business.

Given the risk return framework of financial decision making, businesses that exhibit (or are exposed to) higher business and financial risks obviously warrant a higher capitalisation factor. Conversely, businesses carrying a low degree of risk are subject to lower capitalisation factor. There are a host of factors that affect the risk complexion including fluctuation in sales/earnings, degree of operating leverage, degree of financial leverage, nature of competition, availability of substitute products and their prices, pace of change in technology and the level of governmental regulations. Thus, there are a number of internal and external factors associated with a business that can influence the risk and, hence, the capitalisation factor.

The determination of the capitalisation factor is not an easy task in practice. A few guidelines/principles may, however, be helpful to the valuer in its quantification. First, the capitalisation factor for a business firm should be higher than that of a government security (normally considered riskless). Secondly, the capitalisation factor should match/hover around the one that is used for other firms operating in similar type of businesses. In case the valuer wants to apply different capitalisation rate, there should be weighty and convincing reasons to do so. For instance, firms having the potential and prospects of achieving abnormal growth rates (for reasons that are firm specific), *vis-à-vis* other firms in the industry, managed by a well known management team (having a good track record), may have low capitalisation factor and *vice versa*.

Having determined the two major inputs, Equation 31.4, can be used to compute the value of business, V_B (from the perspective of share owners).

$$V_B = \text{Future maintainable profits} + \text{Relevant capitalisation factor} \quad (31.4)$$

Example 31.2

In the current year, a firm has reported a profit of ₹65 lakh, after paying taxes @ 35 per cent. On close examination, the analyst ascertains that the current year's income includes: (i) extraordinary income of ₹10 lakh and (ii) extraordinary loss of ₹3 lakh. Apart from existing operations, which are normal in nature and are likely to continue in the future, the company expects to launch a new product in the coming year.

Revenue and cost estimates in respect of the new product are as follows: (₹ lakh)

Sales	₹60
Material cost	15
Labour cost (additional)	10
Allocated fixed costs	5
Additional fixed costs	8

From the given information, compute the value of the business, given that capitalisation rate applicable to such business in the market is 15 per cent.

Solution

TABLE 31.1 Valuation of Business

			(₹ lakh)
Profit before tax (₹65 lakh/(1 - 0.35))			₹100
Less: Extraordinary income (not likely to accrue in future)			(10)
Add: Extraordinary loss (non-recurring in nature)			3
Add: Incremental income expected from the launch of the new product:			
Sales			₹60
Less: Incremental costs:			
Material costs	₹15		
Labour costs	10		
Fixed costs (additional)	8	33	27
Expected profits before taxes			120
Less: Taxes (0.35)			42
Future maintainable profits after taxes			78
Relevant capitalisation factor			0.15
Value of business (₹78 lakh/0.15)			520

Some useful insights into estimate of capitalisation rate can be made by referring to the *Price earnings (P/E) ratio*. The reciprocal of the P/E ratio is indicative of the capitalisation factor employed for the business by the market. In Example 31.2, the P/E ratio is approximately 6.67 (1/0.15). The product of future maintainable profits, after taxes, ₹78 lakh and the P/E multiple of 6.67 times, yield ₹520 lakh. Given the fact that P/E ratio is a widely used measure, it is elaborated below.

Price Earnings (P/E) Ratio The P/E ratio (also known as the P/E multiple) is the method most widely used by finance managers, investment analysts and equity shareholders to arrive at the market price of an equity share. The application of this method primarily requires the determination of earnings per equity share (EPS). The EPS is computed as per Equation 31.5.

$$\text{EPS} = \frac{\text{Net earnings available to equity shareholders during the period/}}{\text{Number of equity shares outstanding during the period.}} \quad (31.5)$$

The net earnings/profits are after deducting taxes, preference dividend, and after adjusting for exceptional and extraordinary items (related to both incomes and expenses/losses) and minority interest. Likewise, appropriate adjustments should be made for new equity issues or buybacks of equity shares made during the period to determine the number of equity shares.

The EPS is to be multiplied by the P/E ratio to arrive at the market price of equity share (MPS).

$$\text{MPS} = \text{EPS} \times \text{P/E ratio} \quad (31.6)$$

A high P/E multiple is suggested when the investors are confident about the company's future performance/prospects and have high expectations of future returns; high P/E ratios reflect optimism. On the contrary, a low P/E multiple is suggested for shares of firms in which investors have low confidence as well as expectations of low returns in future years; low P/E ratios reflect pessimism.

The P/E ratio may be derived given the MPS and EPS.

$$\text{P/E ratio} = \text{MPS/EPS} \quad (31.7)$$

The future maintainable earnings/projected future earnings should also be used to determine EPS. It makes economic sense in that investors have access to future earnings only. There is a financial and economic justification to compute forward or projected P/E ratios with reference to projected future earnings, apart from historic P/E ratios. This is all the more true of present businesses that operate in a highly turbulent business environment. Witness in this context, the following: "In a dynamic business world, a firm's past earnings record may not be an appropriate guide to its future earnings. For example, past earnings may have been exceptional due to a period of rapid growth. This may not be sustainable in the future..."³

The P/E ratios should, however, be used with caution as the published P/E multiples are normally based on the published financial statements of corporate enterprises. Obviously, earnings are not adjusted for extraordinary items and, therefore, to that extent, may be distorted. Besides, all financial fundamentals are often ignored in published data. Finally, they reflect market sentiments, moods and perceptions. For instance, if investors are upbeat about retail stocks, the P/E ratios of these stocks will be higher to reflect this optimism. This can be viewed as a weakness as well, in particular when markets make systematic errors in valuing entire sector. Assuming retail stocks have been overvalued, this error has to be built into the valuation also⁴.

In spite of these limitations attributed to the P/E ratio, it is the most widely used measure of valuation. The major plausible reasons are: **(i)** It is intuitively appealing in that it relates price to earnings. **(ii)** It is simple to compute and is conveniently available in terms of published data. **(iii)** It can be a proxy for a number of other characteristics of the firm, including risk and growth.⁵

Example 31.3

For facts in Example 31.2, determine the market price per equity share (based on future earnings). Assuming:

- (i)** The company has 1,00,000 11% Preference shares of ₹100 each, fully paid-up.
- (ii)** The company has 4,00,000 Equity shares of ₹100 each, fully paid-up.
- (iii)** P/E ratio is 8 times.

Solution**Determination of Market Price of Equity Share**

Future maintainable profits after taxes	₹78,00,000
Less: Preference dividends (1,00,000 × ₹11)	11,00,000
Earnings available to equity-holders	67,00,000
Divided by number of equity shares	4,00,000
Earnings per share (₹67 lakh/4 lakh)	16.75
Multiplied by P/E ratio (times)	8
Market price per share (₹16.75 × 8)	134

To conclude, the P/E ratios should be used/interpreted with caution and care. In particular, the investors should focus on prospective/future P/E ratios, risk and growth attributes of business and comprehensive company analysis with a view to have more authentic and credible valuation.

Earnings Measure on Cash Flow Basis (DCF Approach) The P/E ratio approach, as a measure of valuation of equity shareholders wealth, is essentially based on accounting profits/earnings. Normally, such earnings are either of the current year or prospective earnings of the next year. The single year earnings can be camouflaged by either recording revenues earlier or by postponing expenses. Ideally, valuation should be based on the likely earnings of all the future years. The cash flow approach is superior to the accounting profit approach. The discounted cash flow method is also driven by the firm's cash flow generating ability in future years.

Discounted cash flow approach is used to evaluate capital expenditure proposals in terms of their potential for creating net present value for the firm. The DCF approach is applied to the entire business, which may consist of individual capital budgeting projects. Accordingly, the value of business/firm is equal to the present value of expected future cash flows (CF) to the firm, discounted at a rate that reflects the riskiness of the cash flows (k_0). In equation terms:

$$\text{Value of firm}_0 = \sum_{t=1}^{\infty} \frac{\text{CF to Firm}_t}{(1 + k_0)^t} \quad (31.8)$$

To use the DCF approach, accounting earnings (as shown by the firm's income statement) are to be converted to cash flow figures as shown in Format 31.1.

FORMAT 31.1 Computation of Cash Flows

After tax operating earnings*
Plus: Depreciation
Plus: Other non-cash items (say, amortisation of non-tangible asset, such as patents, trade marks, etc and loss on sale of long-term assets)

* The interest costs are included as a part of the discount rate (K_0).

However, analysts/valuers prefer to discount expected *future free cash flows* (FCFF) to operating cash flows (as per Format 31.1) for the purpose of firm valuation. The reason is that firms, in general, are required to make investments in long-term assets as well as in working capital to generate/earn future cash flows; hence, the need for adjusting operating cash flows to free cash flows.

Format 31.2 shows computation of operating free cash flows (OFCF) for the purpose of valuation of a business.

FORMAT 31.2 Determination of Operating Free Cash Flows to Firm (OFCFF)

After tax operating earnings*
 Plus: Depreciation, amortisation and other non-cash items
 Less: Investments in long-term assets
 Less: Investments in operating net working capital**
 Operating free cash flows to firm (OFCFF)

*Exclusive of income from (i) marketable securities and non-operating investments and (ii) extraordinary incomes or losses.

**Addition is to be made in the event of decrease of net working capital.

The free cash flow (FCFF) is the legitimate cash flow for the purpose of business valuation in that it reflects the cash flows generated by a company's operations for all the providers (debt and equity) of its 'capital'⁶. The FCFF is a more comprehensive term as it includes cash flows due to after tax non-operating income as well as adjustments for non-operating assets. Format 31.3 exhibits the procedure of determining FCFF.

FORMAT 31.3 Determination of Free Cash Flows to Firm (FCFF)

Operating free cash flows (as per Format 31.2)
 Plus: After tax non-operating income/cash flows*
 Plus: Decrease (minus increase) in non-operating
 Assets, say marketable securities
 Free cash flows to Firm (FCFF)

* Non-operating income (1 - tax rate)

Since the FCFFs are available to all the capital providers of a corporate enterprise, the discount rate to be applied to such cash flows should be indicative of the opportunity cost of the funds made available by them, weighted by their relative contribution to the total capital of a corporate enterprise. The opportunity cost is equivalent to the rate of return the investors expect to earn on other investments of equivalent risk. The cost to the firm equals the investors' cost less any tax benefits received by the company itself (say, tax advantage on the payment of interest)⁷ plus any tax payments required to be made (say, dividend payment tax).

The value of the firm is given by Equation 31.9

$$\text{Value of firm}_0 = \sum_{t=1}^{\infty} \frac{\text{FCFF to all investors}_t}{(1 + K_0)^t} \quad (31.9)$$

Thus, the value of a firm is the present value of FCFF through infinity. The equity valuation can be deduced by subtracting the total external liabilities (debtholders and preference shareholders) from the value of the firm. Alternatively, the value of equity can be obtained, straight way, by discounting future free cash flows available to equity-holders, (FCFE), after meeting interest, preference dividends and principal payments, the discount rate being rate of return required by equity investors, that is, cost of equity (k_e)

$$\text{Valuation of equity}_0 = \sum_{t=1}^{\infty} \frac{\text{FCFE to equityholders}_t}{(1 + k_e)^t} \quad (31.10)$$

Thus, there are varying connotations of FCFF to serve different needs. However, while the valuation of a firm and equity use different definitions of FCFF as well as of discount rates, they provide identical answers as long as the same set of assumptions is used in both the equations. Example 31.4 illustrates it.

Example 31.4

Suppose a firm has employed a total capital of ₹1,000 lakh (provided equally by 10 per cent debt and 5 lakh equity shares of ₹100 each), its cost of equity is 14 per cent and it is subject to corporate tax rate of 40 per cent. The projected free cash flows to all investors of the firm for 5 years are given in the table:

	(₹ lakh)
Year-end 1	₹300
2	200
3	500
4	150
5	600

Compute (i) valuation of firm and (ii) valuation from the perspective of equityholders. Assume 10 per cent debt is repayable at the year-end 5 and interest is paid at each year-end.

Solution**(i) Computation of Overall Cost of Capital**

Source of capital	After tax cost (%)	Weights	Total cost (%)
Equity	14	0.5	7
Debt	6*	0.5	3
Weighted average cost of capital (K_0)			10

* 10% (1 - 0.4 tax rate) = 6 per cent

(ii) Valuation of Firm, Based on K_0

Year-end	FCFF	PV factor (0.10)	Total present value
1	₹300	0.909	₹272.70
2	200	0.826	165.20
3	500	0.751	375.50
4	150	0.683	102.45
5	600	0.621	372.60
Total present value/Valuation of firm			1,288.45
Less: Value of debt			500.00
Value of equity			788.45

(iii) Valuation of Equity, Based on K_e

Year-end	FCFF to all investors	After tax payment to debtholders	FCFE to equityholders	PV factor (0.14)	Total present value
1	₹300	₹30*	₹270	0.877	₹236.79
2	200	30	170	0.769	130.73
3	500	30	470	0.675	317.25
4	150	30	120	0.592	71.04
5	600	530**	70	0.519	36.33
Total present value					792.14

* Interest on ₹500 lakh @ 10% = ₹50 lakh; ₹50 lakh (1 - 0.4) = ₹30 lakh

** Inclusive of debt repayment of ₹500 lakh at year-end 5.

Thus, the valuation of equity by both the methods is virtually the same (₹788.45 lakh and ₹792.14 lakh). The minor difference of ₹3.69 lakh can be attributed primarily to rounding-off the present value figures.

Total present value of the projected free cash flows to equityholder can be used to compute free cash flows per equity share FCFE as per Equation 31.11.

$$\text{FCFE per equity share} = \frac{\text{PV of FCFE to equityholders}}{\text{Number of equity shares outstanding}} \quad (31.11)$$

$$\text{In Example 31.4, FCFE per equity share is} = \frac{\text{₹792.14 lakh}}{5 \text{ lakh}} = \text{₹158.428}$$

In Example 31.4, for the sake of simplicity, we have assumed the life of the corporate firm as 5 years. In practice, firms have perpetual long-term existence/indefinite life. Evidently, the indefinite life of business/corporate firms, in general, is an additional aspect to be reckoned in a firm's valuation. Ideally, one approach is to forecast future FCFF for a very long period of time, say 30-40 years and ignore all subsequent year's FCFF. The reason is the discounted value of such FCFF in such distant years will be insignificant. However, there are genuine difficulties in explicitly forecasting decades of performance. In fact, it is virtually impossible to make reasonably accurate forecasts of profits/cash flows beyond a certain period (say 7-10 years) in most of the businesses.

To overcome the problem Copeland *et al*⁸ suggest that the exercise related to valuation of business can be segregated into two periods, during and after an explicit forecast period. The value of a business/firm is:

$$\text{Present value of cash flows during explicit forecast period} + \text{Present value of cash flows after explicit forecast period.} \quad (31.12)$$

What constitutes an ideal explicit forecast period? This question is not easy to answer. The following guidelines may be relevant and useful in selecting such a period. Whereas in cyclical businesses, the period can correspond to one full business cycle, in other businesses, the period can match with the number of years during which they are likely to perform well. In operational terms, the period should not be very short, say 2-3 years, and given the current turbulent dynamic business world, the period, in general, should not be very long also, say 10-15 years.

The explicit forecast period is the period in which the firm grows at a rapid pace; it is said to be at saturation point at the end of the explicit forecast period, so far as growth rate is concerned (the economic premise is that firms, in general cannot sustain abnormal rates of growth for an indefinite period). The firm is expected to have attained a steady rate (at the end of explicit forecast period) and starts growing at a stable growth rate, which is likely to continue in future years. The value determined after the explicit forecast period is referred to as the **continuing value**. According to Copeland *et al*,⁹ the continuing value can be estimated as per Equation 31.13.

$$\text{Continuing value} = \frac{\text{NOPLAT}_{T+1} (1 - g/\text{ROIC}_1)}{k_0 - g} \quad (31.13)$$

Where NOPLAT_{T+1} = The normalised level of net operating profits less adjusted taxes in the first year after the explicit forecast period.

g = The expected growth rate in NOPLAT in perpetuity.

ROIC_1 = The expected rate of return on the net new investment.

The derivation of the formula as per Equation 31.13 to compute continuing value is as follows:

$$\text{Continuing value} = \frac{\text{FCFF}_{T+1}}{k_0 - g} \quad (31.13.1)$$

Where $FCFF_{T+1}$ refers to the normalised level of free cash flow in the first year after the explicit forecast period.

Free cash flows (FCFF) can be defined in terms of *NOPLAT* and investment rate, *IR* (that is, the percentage of *NOPLAT* reinvested in the business each year).

$$FCFF = NOPLAT (1-IR) \quad (31.13.2)$$

We know, growth rate, *g* is the product of return on invested capital, $ROIC_t$ and *IR*, i.e.,

$$g = ROIC_t \times IR \quad (31.13.3)$$

$$\text{or} \quad IR = g/ROIC_t \quad (31.13.4)$$

Incorporating value of *IR* in *FCFF* definition

$$FCFF = NOPLAT (1 - g/ROIC_t) \quad (31.13.5)$$

$$\text{Continuing value} = \frac{NOPLAT (1 - g/ROIC_t)}{k_0 - g}$$

Equation 31.13 is termed as a value driven formula. Since Equations 31.13 and 31.13.1 provide the same answer of continuing value, it is logistically more convenient to compute continuing value based on Equation 31.13.1.

The major simplifying *assumptions* made in determining continuing value are: **(i)** the firm earns a constant return on the existing invested capital; **(ii)** the firm's *NOPLAT* grows at a constant rate and it invests the same proportion of its gross cash flow in business each year and **(iii)** the firm earns a constant return on all new investments.

All the items in equation 31.13 are self explanatory, except the term *adjusted taxes*. Adjusted taxes is the increase in the estimated tax liability due to the exclusion of the tax shield provided by interest charges. This is illustrated in Example 31.5.

Example 31.5

Following is the summarised income statement of Hypothetical Ltd:

	(₹ lakh)
Sales revenues	₹100
Less: Cost of goods sold	42
Less: Administrative expenses	8
Less: Selling and distribution expenses	20
Earnings before interest and taxes (EBIT)	30
Less: Interest	10
Earnings before taxes	20
Less: Taxes (0.40)	8
Earnings after taxes	12

Solution

Determination of NOPLAT

	(₹ lakh)
Net operating profit or EBIT	₹30
Less: Taxes as per income statement	8
Less: Adjusted taxes (interest, ₹10 lakh × 0.4, tax rate)	4
Net operating profit less adjusted taxes*	18
Alternatively, it can be determined as EBIT less taxes	
EBIT	30
Less: Taxes (0.40 × ₹30 lakh, EBIT)	12
NOPLAT	18

*Adjusted taxes = (Taxes as per income statement, ₹8 lakh + Tax shield on interest, i.e., ₹10 lakh × 0.4 = ₹4 lakh). The rationale for enhancing tax liability is that the weighted average cost of capital uses the after tax cost of debt. Advantage of tax savings on interest should not be counted twice.

According to Copeland, the firm's value is the aggregate of (i) the present value (PV) of FCFF during the explicit forecast period, (ii) PV of continuing value (of FCFF/NOPLAT) and (iii) value of non-operating assets (if any) at the end of explicit forecast period (say, marketable securities).

Among the various variants of the earnings approach, the DCF approach (that is, free cash flows) seems to be conceptually superior for business valuation as well as equity valuation. The computation of FCFF and continuing value is illustrated in Example 31.6.

Example 31.6

Sagar Industries deals in production and sales of consumer durables. Its expected sales revenues for the next 8 years (in ₹ million) are given in the table:

Year	Sales revenue
1	₹ 80
2	100
3	150
4	220
5	300
6	260
7	230
8	200

Its condensed balance sheet as on March 31, current year is as follows:

(₹ million)

Liabilities	Amount	Assets	Amount
Equity funds	120	Current assets	30
12% Debt	80	Long-term assets (net)	170
	200		200

Additional information:

- (i) Its variable expenses will amount to 40 per cent of sales revenue. Fixed cash operating costs are estimated to be ₹16 million per year for the first 4 years and at ₹20 million for years 5 – 8. In addition, an extensive advertisement campaign will be launched, requiring annual outlays as follows:
- (ii) Long-term assets are subject to 15 per cent rate of depreciation on diminishing balance method.
- (iii) The company has planned the following capital expenditure (assumed to have been incurred in the beginning of each year) for the next 8 years.
- (iv) Working capital in terms of investment in current assets are estimated at 20 per cent of sales revenue.
- (v) It is expected to have non-operating assets in terms of investments in marketable securities in the initial year. The expected after tax non-operating cash flow in year 1 = ₹0.5 million.

	(₹ million)
1	₹ 5
2 – 3	15
4 – 6	30
7 – 8	10

- (vi) Given the tax benefits available to Sagar, the effective tax rate estimated is 30 per cent.
- (vii) The corporate equity capital is estimated at 16 per cent.
- (viii) The free cash flow of the firm are expected to grow at 5 per cent per annum, after 8 years.

Year	(₹ million)
1	₹5
2	8
3	20
4	25
5	35
6	25
7	15
8	10

Determine the discounted cash flow (DCF) value of the (i) firm and (ii) equity.

6	25	52	77	60	17
7	15	46	61	52	9
8	10	40	50	46	4

*including marketable securities

**Balance of CA in year 1: ₹30 million – Capital expenditure incurred in year 1, ₹5 million

(iv) Determination of Present Value for Explicit Period Projections (years 1 – 8) (₹ million)

Particulars	Years								
		1	2	3	4	5	6	7	8
A Sales revenue		₹80	₹100	₹150	₹220	₹300	₹260	₹230	₹200
B Less: Expenses									
Variable costs		32	40	60	88	120	104	92	80
Fixed cash operating costs		16	16	16	16	20	20	20	20
Advertisement		5	15	15	30	30	30	10	10
Depreciation		26.25	23.51	22.99	23.29	25.04	25.04	23.53	21.50
C EBIT (A – B)		0.75	5.49	36.01	62.71	104.96	80.96	84.47	68.50
D Less: Taxes (0.30)		0.22	1.65	10.80	18.81	31.49	24.29	25.34	20.55
E NOPAT		0.53	3.84	25.21	43.90	73.47	56.67	59.13	47.95

(Contd.)

(Contd.)

F Non-operating income	0.50	—	—	—	—	—	—	—
G Gross cash flow (E + F + Depreciation)	27.28	27.35	48.20	67.19	98.51	81.71	82.66	69.45
H Less: Investment in (capital expenditure plus current assets)	—	3	30	39	51	17	9	4
I Free cash flow (G – H)	27.28	24.35	18.20	28.19	47.51	64.71	73.66	65.45
J PV factor (0.13)	0.885	0.783	0.693	0.613	0.543	0.480	0.425	0.376
K Total PV (I × J)	24.14	19.07	12.61	17.28	25.80	31.06	31.31	24.61
Total present value = ₹185.88 million								

(v) Determination of PV in Respect of Continuing Value (CV)

$$CV_g = FCF_g / (k_0 - g) = ₹65.45 \text{ million} (1.05) / (13\% - 5\%) = 68.7225 \text{ million} / 8\% = ₹68.7225 / 0.08 = ₹859.03 \text{ million}$$

$$PV \text{ of } CV_0 = ₹859.03 \text{ million} / (1.13)^0 = ₹859.03 \times 0.376 = ₹323 \text{ million}$$

(vi) Total Value of the Firm, Based on the DCF Approach of Free Cash Flows: (₹ million)

PV of free cash flows during explicit period	₹185.88
PV of free cash flows after explicit period (known as CV)	323
Total value	508.88

(vii) Value of Equity: (₹ million)

Total value of firm	₹508.88
Less: Value of debt	80.00
Value of equity	428.88

Market Value Based Approach to Valuation

The market value, as reflected in the stock market quotations, is another method for estimating the value of a business. The market value of securities used for the purpose can be either (i) twelve months average of the stock exchange prices or (ii) the average of the high and low values of securities during a year. Alternatively, some other fair and equitable method of averaging (on the basis of the number of months/years) can be worked out. The justification of market value as an approximation of the true worth of a firm is derived from the fact that market quotations by and large indicate the consensus of investors as to the firm's earning potentials and the corresponding risk. The market value approach is one of the most widely-used in determining value, in particular of large listed firms.

The major problem with this method is that the market value of a firm is influenced not only by financial fundamentals but also by speculative factors. As a result, this value can change abruptly due to speculative influences, market sentiments and personal expectations. Market makers as well as other 'willing buyers or sellers' (interested in purchases or sales) can at times significantly influence these prices. Another limitation of this approach is that this approach cannot be applied if the shares are unlisted or are not actively traded.

Apart from the limited applicability of this method only to listed corporate enterprises, whose shares/securities are actively traded, the valuation of a business is not in tune with the going concern concept. Nevertheless, it may be/is of immense usefulness in deciding swap ratios of shares in merger decisions. In fact, the market prices of the two companies can be the objective of the decision. Alternatively, a certain percentage of premium, above the market price may be offered

Table 1

Income Statement for the Year Ended December 31, 19XX

Account	Debit	Credit

Operating Cash Flow		69,000
Investing Activities:		
Purchase of Property, Plant, and Equipment	50,000	
Sale of Other Assets		5,000
Investing Cash Flow	50,000	5,000
Financing Activities:		
Issuance of Notes Payable		10,000
Payment of Dividends	5,000	
Financing Cash Flow	5,000	5,000
Change in Cash		24,000
Cash, 1/1		10,000
Cash, 12/31		34,000

The following table shows the changes in the various accounts during the year. The total change in cash is \$24,000, which is the sum of the changes in the cash account and the changes in the other accounts. The total change in the other accounts is \$24,000, which is the sum of the changes in the other accounts and the changes in the cash account.

The following table shows the changes in the various accounts during the year. The total change in cash is \$24,000, which is the sum of the changes in the cash account and the changes in the other accounts. The total change in the other accounts is \$24,000, which is the sum of the changes in the other accounts and the changes in the cash account.

as an inducement to the shareholders of the acquired company to convince them to agree to sell their shares or to make them agree to the merger decisions.

Fair Value Method

The fair value method is not an independent method of share valuation like those discussed above. This method uses the average/weightage average or one or more of the above methods. Since this method uses the average concept, its virtue is that it helps in smoothening out wide variations in estimated valuations as per different methods. In other words, this approach provides, in a way, the 'balanced' figure of valuation.

In general, this method has limited application for business valuation. For instance, this method of valuation of shares had been used till the early 1990's, by the erstwhile Controller of Capital Issues (CCI) in India, for fixing the price of new equity issues. In case the equity shares were to be issued at a premium, the amount of premium was based as the CCI guidelines.

To sum up, no one method is appropriate for all circumstances/situations/requirements. Therefore, it is important to recognise that the different methods are based on different assumptions and depending on the circumstances, some methods may be more appropriate than others. For instance, where there is paucity of information about profits, say **(i)** in the case of new companies whose accounts do not serve as a guide to future profits, **(ii)** in the case of companies operating at a loss with no prospects of earning profits in the near future and **(iii)** in the case of companies having unreliable statistics of profits owing to factors such as disruption of business, the net asset method of valuation seems would be more appropriate. In normal situations, the DCF (based on free cash flows) method would be suitable. In the event of wide variations in the valuations as per these two methods, the fair value method may be used. In fact, it is useful for the finance manager/investor/valuer/analyst to know a range of values from various perspectives.

LO 31.3 OTHER APPROACHES TO VALUE MEASUREMENT

In recent years, a number of new approaches/techniques/methods to measure value (with focus on shareholders) have been developed and practised. The two major approaches are market value added (MVA) and economic value added (EVA). They are explained below.

Market Value Added Approach (MVA)

The **MVA** approach measures the change in the market value of the firm's equity vis-à-vis equity investment (consisting of equity share capital and retained profits). Accordingly,

$$\text{MVA} = \text{Market value of firm's equity} - \text{Equity capital investment/funds} \quad (31.14)$$

Though the concept of MVA is normally used in the context of equity investment (and, hence, is of greater relevance for equity shareholders), it can also be adapted (like other previous approaches) to measure value from the perspective of providers of all invested funds (ie, including preference share capital and debt).

$$\text{MVA} = [\text{Total market value of firm's securities} - (\text{Equity shareholders funds} + \text{Preference share capital} + \text{Debentures})] \quad (31.15)$$

The MVA approach cannot be used for all types of firms. It is applicable to only firms whose market prices are available. In that sense, the method has limited application. Besides, the value provided by this approach may exhibit wide fluctuations, depending on the state of the capital market/stock market in the country.

Example 31.7

Suppose, Supreme Industries has an equity market capitalisation of ₹3,400 crore in current year. Assume further that its equity share capital is ₹2,000 crore and its retained earnings are ₹600 crore. Determine the MVA and interpret it.

Solution

$$\text{MVA} = (\text{₹}3,400 \text{ crore} - \text{₹}2,600 \text{ crore}) = \text{₹}800 \text{ crore.}$$

The value of ₹800 crore implies that the management of Supreme Industries has created wealth/value to the extent of ₹800 crore for its equity shareholders.

Well managed companies (engaged in sunrise businesses), having good growth prospects, and perceived so by the investors, have positive MVA. Investors may be willing to pay more than the net worth. In contrast, companies relatively less known or engaged in businesses that do not hold future growth potentials may have negative MVA.

Example 31.8

Suppose, Hypothetical Limited has equity market capitalisation of ₹900 crore in the current year. Its equity share capital and accumulated losses are of ₹1,200 crore and ₹200 crore respectively. Determine the MVA of the firm.

Solution

$$\text{MVA} = (\text{₹}900 \text{ crore} - \text{₹}1,000 \text{ crore}) = (-\text{₹}100 \text{ crore}).$$

The firm has negative MVA of ₹100 crore. The investors discount its value/worth, as it is loss incurring firm.

The market value added approach reflects market expectations and is essentially a future-oriented and forward looking approach. The investors, willing to pay a different price (other than one suggested by book value), are guided by the individual company's future prospects, future growth rates, risk complexion of the firm, industry to which the firm belongs, required rate of return and so on.

Economic Value Added (EVA)

The EVA method is based on the past performance of the corporate enterprise. The underlying economic principle in this method is to determine whether the firm is earning a higher rate of return on the entire invested funds than the cost of such funds (measured in terms of the weighted average cost of capital, WACC). If the answer is positive, the firm's management is adding to the shareholders value by earning extra for them. On the contrary, if the WACC is higher than the corporate earning rate, the firm's operations have eroded the existing wealth of its equity shareholders. In operational terms, the method attempts to measure economic value added (or destroyed) for equity shareholders, by the firm's operations, in a given year.

Since WACC takes care of the financial costs of all sources of providers of invested funds in a corporate enterprise, it is imperative that *operating profits after taxes* (and not *net profits after taxes*) should be considered to measure EVA. The accounting profits after taxes, as reported by the income statement, need adjustments for interest costs. The profits should be the net operating profits after taxes and the cost of funds will be product of the total capital supplied (including retained earnings) and WACC.

$$\text{EVA} = [\text{Net operating profits after taxes} - (\text{Total capital} \times \text{WACC})] \quad (31.16)$$

$$\text{or} \quad \text{EVA} = \text{Earnings after taxes} - (\text{Cost of shareholders funds}) \quad (31.17)$$

The computation of EVA is illustrated in Example 31.9.

Example 31.9 Following is the condensed income statement of a firm for the current year: (₹ lakh)

Sales revenue	₹500
Less: Operating costs	300
Less: Interest costs	12
Earnings before taxes	188
Less: Taxes (0.40)	75.2
Earnings after taxes	112.8

- Economic value
- added (EVA)
- implies the
- difference between
- operating profits
- after taxes and total
- cost of funds.

The firm's existing capital consists of ₹150 lakh equity funds, having 15 per cent cost and of ₹100 lakh 12 per cent debt. Determine the economic value added during the year.

Solution**(i) Determination of Net Operating Profit After Taxes**

(₹ lakh)

Sales revenue	₹500
Less: Operating costs	300
Operating profit (EBIT)	200
Less: Taxes (0.40)	80
Net operating profit after taxes (NOPAT)*	120

*Alternatively, [EAT, ₹112.8 lakh + Interest ₹12 lakh – (Tax savings on interest, ₹12 lakh × 0.4 = ₹4.8 lakh)]

(ii) Determination of WACC

Equity (₹150 lakh × 15%)	= ₹22.5 lakh
12% Debt (₹100 lakh × 7.2%)*	= 7.2
Total cost	29.7
WACC (29.7 lakh/₹250 lakh)	11.88%

* Cost of debt = 12% (1 – 0.4 tax rate) = 7.2 per cent

(iii) Determination of EVA

EVA = NOPAT* – (Total capital × WACC)	
₹120 lakh – (₹250 lakh × 11.88%)	
₹120 lakh – ₹29.7 lakh = ₹90.3 lakh	
or EVA = EAT - cost of shareholders funds	
= ₹112.8 lakh – (₹150 lakh × 0.15 = 22.5) = ₹90.3 lakh	

During the current year, the firm has added an economic value of ₹90.3 lakh to the existing wealth of the equity shareholders. Essentially, the EVA approach is a *modified* accounting approach to determine profits earned after meeting all financial costs of all the providers of capital. Its major advantage is that this approach reflects the *true profit* position of the firm. What may happen is that the firm may exhibit positive profits after taxes (as per the conventional income statement) ignoring costs of shareholders funds, giving an impression to the owners as well as outsiders that the firm's operations are profitable. The profit picture, in fact, may be illusory. Consider Example 31.10.

Example 31.10

For Example 31.9, assuming sales revenues are ₹330 lakh, compute the earnings after taxes.

Solution**Income Statement (Conventional)**

(₹ lakh)

Sales revenue	₹330
Less: Operating costs	300
Less: Interest costs	12
Earnings before taxes	18
Less: Taxes (0.40)	7.2
Earnings after taxes	10.8

The firm has registered profits of ₹10.8 lakh during the current year on the equity funds of ₹150 lakh, which has financial costs of ₹22.5 lakh. Therefore, the firm has suffered a loss (of ₹11.7 lakh) as the opportunity costs of equity funds invested by equityholders is more than what has been earned by the firm for them. This point is brought to the fore by the EVA approach. It is for this reason that the EVA approach is getting more attention. It is superior to the conventional approach of determining profits.

Determination of EVA

(₹ lakh)

(a) Sales revenue	₹330
Less: Operating costs	300
Operating profits	30
Less: Taxes (0.4)	12
Net operating profits after taxes	18
(b) EVA = ₹18 lakh – (₹29.7 lakh, already computed above) = – ₹11.7 lakh	

Example 31.10 demonstrates that there may be a substantial difference between profits determined as per accounting approach and the EVA approach. Profits shown as per the EVA approach are conceptually realistic than shown by traditional accounting approach. In no way, the firm can be said to have earned profits without meeting financial costs of all sources of finance. The EVA approach is in tune with the basic financial tenet of cost-benefit analysis; financial benefits have to be more than financial costs to have true profits.

Though the MVA and EVA are two different approaches, the MVA of the firm (in a technical sense) can be conceived in terms of the present value of all the EVA profits that the firm is expected to generate in the future¹⁰.

SUMMARY

The term 'valuation' implies the estimated worth of an asset or a security or a business. The alternative approaches to value a firm/an asset are: (i) book value, (ii) market value, (iii) intrinsic value, (iv) liquidation value, (v) replacement value, (vi) salvage value and (vii) fair value.

While book value refers to the amount at which an asset is shown in the balance sheet of a firm, market value is the price at which an asset can be sold in the market. Intrinsic value is equal to the present value of incremental future cash inflows likely to accrue due to the acquisition of an asset, discounted at an appropriate discount rate. The fair value is the average of the book value, market value and intrinsic value.

There are 4 approaches to valuation of business (with focus on equity share valuation): (i) assets based, (ii) earnings based, (iii) market value based and (iv) the fair value method.

Assets-based method focuses on determining the value of net assets = (Total assets – Total external obligations).

Net assets per share can be obtained dividing total net assets by the number of equity shares outstanding. It indicates the net assets backing per equity share (also known as net worth per share).

Earnings based method relates the firm's value to its potential future earnings or cash flow generating capacity. Accordingly, there are two major variants of this approach (i) earnings measure on accounting basis and (ii) earnings measure on cash flow basis. As per the first method, the value of business = Future maintainable profits, excluding extraordinary items related to income and losses (+) Relevant capitalisation factor.

The second method makes use of the discounted cash flow technique to value the business. According to the DCF approach, the value of business/firm is equal to the present value of expected future operating cash flows (CF) to the firm, discounted at a rate that reflects the riskiness of the cash flows (k_0), that is,

$$\text{Value of firm}_0 = \sum_{t=1}^{\infty} \frac{\text{CF to Firm}_t}{(1 + k_0)^t}$$

Another variant of cash flow approach is to discount estimated free cash flows to the firm (FCFF) instead of operating cash flows. The FCFFs are computed by deducting incremental investments in long-term assets as well as investment in working capital from operating cash flows. The value of firm

is $= \sum_{t=1}^{\infty} \frac{FCFF_t}{(1+k_0)^t}$. The value of equity can be determined by subtracting the total external liabilities

from the value of the firm.

Alternatively, the value of equity can be determined directly by discounting the free cash flows available to equityholders (FCFE) after meeting interest, preference dividends and principal payments, the discount rate being k_e , that is,

$$V_E = \sum_{t=1}^{\infty} \frac{FCFE \text{ to equity-holders}_t}{(1+k_e)^t}$$

The value of the firm/business can be segregated into two sub-periods: (i) PV of cash flows during explicit forecast period and (ii) PV of cash flows after explicit forecast period.

In the context of cyclical businesses, the explicit forecast period can correspond to one full business cycle; in other businesses, the period can match with the number of years during which they are likely to perform well. The firm is said to have attained a steady state at the end of explicit period. Subsequent to this period, the firm grows at a steady rate (normal or less than normal) which is likely to continue in future years.

The value determined after the explicit forecast period ($T + 1$) is referred to as the continuing value. Its value can be determined as per the following equation:

$$\text{Continuing value} = \frac{FCFF_{T+1}}{k_0 - g}$$

The market value (reflected in the stock market quotations) is the most widely used approach to determine the value of a business, in particular of large listed firms. The market value indicates the price the investors are willing to pay for the firm's earning potentials and the corresponding risk. This method is particularly useful in deciding swap ratios in the case of merger decisions.

Fair value method is not an independent method of share valuation. The method uses the average/weighted average of two or more of the above methods. Therefore, such a method helps in smoothing out wide variations caused by different methods and indicates the 'balanced' figure of valuation.

The market value added (MVA) approach measures the change in the value of the firm from the perspective of all the providers of funds (i.e., shareholders as well as debentureholders).

$$MVA = [\text{Total market value of the firm's securities} - (\text{Equity shareholder funds} + \text{Preference share capital} + \text{Debentures})].$$

The MVA from the point of view of equity shareholders is = (Market value of firm's equity – Equity funds).

The EVA method measures economic value added (or destroyed) for equity-owners by the firm's operations in a given year. The underlying economic principle in this method is to determine whether the firm is earning a higher rate of return on the entire invested funds than the cost of such funds.

$$EVA = [\text{Net operating profits after taxes} - (\text{Total invested funds} \times \text{WACC})]$$

$$EVA = \text{Earnings after taxes} - (\text{Cost of shareholders funds})$$

Thus, the EVA approach measures the true profit position of the firm.

Though the MVA and EVA are two different approaches, the MVA of the firm can be conceived as the present value of all the EVA profits that the firm is expected to generate in the future years.

SOLVED PROBLEMS

P.31.1 (a) The following particulars are available in respect of a corporate:

LO 31.1

- (i) Capital employed, ₹500 million.
- (ii) Operating profits, after taxes, for last three years are: ₹80 million, ₹100 million, ₹90 million; current year's operating profit, after taxes, is ₹105 million.
- (iii) Riskless rate of return, 10 per cent.
- (iv) Risk premium relevant to the business of corporate firm, 5 per cent.

You are required to compute the value of goodwill, based on the present value of the super profits method. Super profits are to be computed on the basis of the average profits of 4 years. It is expected that the firm is likely to earn super profits for the next 5 years only.

(b) Assume that super profits in years 1-5 would be (in million ₹) as ₹18.75, ₹15.00, ₹11.00, ₹6.00, ₹2.00. Determine the value of goodwill. Assume no change in data inputs shown in (a).

Solution

(a) Determination of goodwill, using super profit method

(₹ million)

Average profits (₹80 million + ₹100 million + ₹90 million + ₹105 million = ₹375 million) / 4 years	₹93.75
Less: Normal profits (₹500 million × 0.15)	75.00
Super profits	18.75
Multiplied by the PV of annuity for 5 years at 15 per cent	(×) 3.352
PV of super profits/Value of goodwill	62.85

(b) Determination of goodwill

(₹ million)

Years	Super profits	PV factor (0.15)	Total PV
1	₹18.75	0.870	₹16.31
2	15.00	0.756	11.34
3	11.00	0.658	7.24
4	6.00	0.572	3.43
5	2.00	0.497	0.99
Total value of goodwill			39.31

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

P.31.2 The following is the balance sheet of a corporate firm as on March 31, current year.

LO 31.2 LOD M

(₹ lakh)

Liabilities	Amount	Assets	Amount
Share capital (of ₹100 each fully paid-up)	₹100	Land and buildings	₹40
Reserves and surplus	40	Plant and machinery	80
Sundry creditors and other liabilities	30	Marketable securities	10
		Stock	20
		Debtors	15
		Cash and bank balances	5
	<u>170</u>		<u>170</u>

Profit before tax for current year-end amount to ₹64 lakh, including ₹4 lakh as extraordinary income. Besides, the firm has earned interest income of ₹1 lakh in the current year from investments in marketable securities. It is not usual for the firm to have excess cash and invest in marketable securities. However, an additional amount of ₹5 lakh per annum, in terms of advertisement and other expenses, will be required to be spent for the smooth running of the business in the years to come.

Market values of land and buildings, and plant and machinery are estimated at ₹90 lakh and ₹100 lakh respectively. In order to match the revalued figures of these fixed assets, additional depreciation of ₹6 lakh is required to be taken into consideration. Effective corporate tax rate may be taken at 30 per cent. The capitalisation rate applicable to businesses of such risks is 15 per cent.

From the above information, compute the value of business, value of equity and price per equity share, based on the capitalisation method.

Solution

Valuation of business, value of equity and price per equity share (capitalisation method) (₹ lakh)

Profit before tax	64
Less: Extraordinary income	4
Less: Interest on marketable securities (not likely to accrue in future)	1
Less: Additional expected recurring expenses	5
Less: Additional depreciation	6
Expected earnings before taxes	<u>48</u>
Less: Taxes (0.30)	14.40
Future maintainable profits after taxes	<u>33.60</u>
Divided by relevant capitalisation factor	0.15
Value of business (₹33.60 lakh/0.15)	<u>224.00</u>
Value of equity (₹224 lakh – ₹30 lakh external liabilities)	<u>194.00</u>
Price per equity share (₹194 lakh/ 1 lakh)	<u>194</u>

P.31.3 Assume every thing to be the same as contained in P.31.2. Determine the expected market price of the share, given the P/E multiple of (i) 8 times and (ii) 5 times, and interpret the result.

LO 31.2 LOD M

Solution

Determination of market price per share (P/E basis) (₹ lakh)

Future maintainable profits after taxes (computed in P.31.2)	₹33.60
Divided by the number of equity shares issued and outstanding	1.00
Earnings per equity share, EPS, (₹33.60 lakh/1 lakh)	<u>33.60</u>
Multiplied by P/E ratio	8
(i) Market price per share (₹33.60 × 8 times)	<u>268.8</u>
Multiplied by P/E ratio	5
(ii) Market price per share (₹33.60 × 5 times)	<u>168</u>

Interpretation

(i) The P/E ratio of 8 times suggests that investors are confident about the company's future prospects; they have high expectations of future returns. It is for this reasons that they are prepared to pay a higher market price per equity share than warranted by the capitalisation method (ie, ₹194 per share). (ii) In contrast, the P/E multiple of 5 times suggests that investors are less optimistic about the company's future performance. They have low confidence as well as expectations of low returns in future years and therefore are willing to pay a lower price vis-à-vis the capitalised price.

P.31.4 For facts contained in **P.31.2**, determine the value of business as per the net assets method. Assets are to be valued at market value for this purpose. Value of goodwill is also to be considered to value assets. Its value is to be reckoned as an equivalent to the present value of super profits, which are likely to accrue for 4 years. For the purpose of determining super profits, normal profits are to be computed with reference to the year-end value of net assets/capital employed (excluding goodwill).

LO 31.2 LOD M

Also compute the market value of equity share as per this approach.

Solution

Determination of valuation of business and net asset value per share as per the net assets method
(assets are valued at market price)

	(₹ lakh)
Land and buildings	₹90
Plant and machinery	100
Goodwill ¹	6
Marketable securities	10
Stock	20
Debtors	15
Cash and bank balances	5
Total assets	246
Less: External liabilities	30
Net assets available for equity to shareholders	216
Divided by the number of equity shares issued and outstanding	1
Net assets value per share (₹216 lakh/1 lakh)	216

¹Valuation of goodwill

Future maintainable profits after taxes	₹33.60
Less: Normal profit (15% of capital employed, i.e., $0.15 \times ₹210 \text{ lakh}^*$)	31.50
Super profits	2.10
Multiplied by PV factor at 15% for annuity of 4 years	2.855
Value of goodwill (₹2.10 lakh \times 2.855)	6.0

* (Market value of assets, excluding goodwill, ₹240 lakh – External liabilities, ₹30 lakh).

P.31.5 Assume everything to be the same as given in **P.31.2**. Determine the fair price of an equity share. The fair price of an equity share is to be taken as an average of prices estimated according to the capitalisation method and the net assets method.

LO 31.2 LOD M

Solution

Determination of a fair price of an equity share (fair value method)

Price per equity share (capitalisation method)	₹194
Net assets value per equity share (net assets method)	216
Fair value per equity share $(₹194 + ₹216)/2$	205

P.31.6 Determine the continuing value of the firm from the following information: (₹ million)

Cash flow from business operations at the end of explicit forecast period (Year 6)	₹56
Investment required in capital expenditure and current assets during year 6	12
Expected annual growth rate in free cash flows to the firm, after forecast period (%)	8
Weighted average cost of capital (WACC) (%)	12
Cost of equity capital (%)	15

Solution

Determination of PV with respect to continuing value (CV)

$$CV_6 = \frac{FCFF_7}{WACC - g} = \frac{\text{₹}44 \text{ million} \times (1.08)}{12\% - 8\%} = \frac{\text{₹}47.52 \text{ million}}{4\%}$$

$$CV_6 = \text{₹}1,188 \text{ million}$$

$$CV_0 = \text{₹}1,188 \text{ million} \times \text{Present value factor at 12\% for 6 years}$$

$$CV_0 = \text{₹}1,188 \text{ million} \times 0.507 = \text{₹}602.316 \text{ million}$$

*(Gross cash flows ₹56 million – Investment required in capital expenditures and current assets ₹12 million = ₹44 million)

P.31.7 Hypothetical Limited is growing at an above average rate. It foresees a growth rate of 20 per cent per annum in free cash flows to equityholders in the next 4 years. It is likely to fall to 12 per cent in the next two years. After that, the growth rate is expected to stabilise at 5 per cent per annum. The amount of free cash flow (FCFE) per equity share at the beginning of current year is ₹10. Find out the maximum price at which an investor, follower of the free cash approach, will be prepared to buy the company's shares as on date, assuming an equity capitalisation rate of 14 per cent.

LO 31.2 LOD M

Solution Maximum price of the equity share will be the sum of (i) PV of FCFE during 1 – 6 years and (ii) PV of expected market price at the end of year 6, based on a constant growth rate of 5 per cent.

(i) Present value of FCFE (years 1 – 6)

Year	FCFE per share	PV factor (0.14)	Total PV
1	₹10 (1 + 0.20) ¹ = ₹12	0.877	₹10.52
2	10 (1 + 0.20) ² = 14.40	0.769	11.07
3	10 (1 + 0.20) ³ = 17.28	0.675	11.66
4	10 (1 + 0.20) ⁴ = 20.74	0.592	12.28
5	20.74 (1 + 0.12) = 23.23	0.519	12.06
6	23.23 (1 + 0.12) = 26.02	0.456	11.86
Total PV of FCFE			69.45

$$\text{Market price of share at year-end 6} = \frac{FCFE_7}{k_e - g} = \frac{\text{₹}26.02 (1.05)}{14\% - 5\%}$$

$$P_6 = \frac{\text{₹}27.321}{14\% - 5\%} = \text{₹}303.57$$

(ii) PV of ₹303.57 = ₹303.57 × 0.456 = ₹138.43

Maximum price of share = ₹69.45 + ₹138.43 = ₹207.88

P.31.8 The Chemicals and Fertilizer Limited is a growing company. Its free cash flows for equityholders (FCFE) have been growing at a rate of 25 per cent in recent years. This abnormal growth rate is expected to continue for another 5 years; then these FCFE are likely to grow at the normal rate of 8 per cent. The required rate of return on these shares, by the investing community, is 15 per cent; the firm's weighted average cost of capital is 12 per cent. The amount of FCFE per share at the beginning of the current year is ₹30. Determine the maximum price an investor should be willing to pay now ($t = 0$), based on free cash flow approach. The issue price of share is ₹500.

LO 31.2 LOD M

Solution

(i) Present value of FCFE (years 1 – 5)

Year	FCFE per share	PV factor (0.15)	Total PV
1	₹30 (1 + 0.25) ¹ = ₹37.50	₹0.870	₹32.62
2	30 (1 + 0.25) ² = 46.86	0.756	35.43
3	30 (1 + 0.25) ³ = 58.59	0.658	38.55
4	30 (1 + 0.25) ⁴ = 73.23	0.572	41.89
5	30 (1 + 0.25) ⁵ = 91.56	0.497	45.51
Total PV of FCFE			194.00

$$\text{Market price of share at year-end 5} = \frac{\text{FCFE}_6}{k_e - g} = \frac{₹91.56 (1.08)}{15\% - 8\%} = ₹1,412.64$$

$$\text{PV at } t = 0 = ₹1,412.64 \times 0.497 = ₹702.08$$

Investor will be prepared to pay the maximum price at $t = 0 = ₹194 + ₹702.08 = ₹896.08$

P.31.9 The most recent accounts of a corporate firm engaged in manufacturing business are summarized below:

LO 31.2 LOD M

(₹ million)

Income statement for the current year ended March 31	Amount
Sales revenue	₹93.5
EBIT	18.0
Less: Interest on loan	1.8
Earnings before taxes	16.2
Less: Corporate taxes (0.35)	5.67
Earnings after taxes	10.53

Balance sheet as at March 31, current year

(₹ million)

Liabilities	Amount	Assets	Amount
Equity share capital (1 lakh shares of ₹100 each)	₹10.0	Freehold land and buildings (net)	₹20.0
Reserves and surplus	32.5	Plant and machinery (net)	29.5
10% Loan	18.0	Current assets:	
Creditors and other liabilities	18.0	Stock	10.0
		Debtors	15.0
		Bank and cash balance	4.0
	78.5		78.5

Additional Information:

(1) The finance manager of the firm has estimated the future free cash flows of the company as follows:

(₹ million)

Year 1	₹22
2	23
3	24.5
4	26.0
5	30.0
6	32.0

Free cash flows in subsequent years, after year 6, are estimated to grow at 4 per cent. The company's weighted average cost of capital is 12 per cent.

- (ii) The current resale value of the following assets has been assessed by the professional valuer as follows:
- | | |
|-----------------------------|-------------|
| Freehold land and buildings | ₹60 million |
| Plant and machinery | 20 |
| Stock | 11 |

The current resale values of the remaining assets are as per their book values.

- (iii) A similar sized company (which is listed on Bombay Stock Exchange) and is engaged in the same business has a P/E ratio of 7 times.

You are required to compute the value of the firm as well as value of an equity share on the basis of the following methods: (i) Net assets method (book value and market value), (ii) Price-earnings ratio method and (iii) Free cash flows to the firm.

Solution

Determination of value of firm and value of equity share (using various methods) (₹ million)

(i) (a) Net asset method—book value basis:			
Freehold land and buildings			₹20.0
Plant and machinery			29.5
Stock			10.0
Debtors			15.0
Bank and cash balances			4.0
Total assets			78.5
<i>Less: External liabilities</i>			
10% Loan	₹18		
Creditors and other liabilities	18		36.0
Net assets available to equityholders			42.5
Divided by number of equity shares outstanding (lakh)			1
Net assets backing per share (₹42.5 million/1 lakh) (₹)			425
(b) Market value basis:			
Freehold land and buildings			60
Plant and machinery			20
Stock			11
Debtors			15
Bank and cash balances			4
Total assets			110
<i>Less: External liabilities</i>			
			36
Net assets at market value			74
Net assets backing per share (₹74 million/1 lakh shares)			740
(ii) Price-earnings ratio approach:			
Earnings after taxes (assumed to be normal and expected to be maintained in future years; no adjustment is made as there are no extraordinary items)			10.53
Earnings per share (₹10.53 million/1 lakh shares)			105.30
Multiplied by P/E multiple			7
Market price of equity share (₹105.30 × 7 times)			737.10

- (iii) Free cash flow basis:**

- (a) PV of FCFE during explicit forecast period:**

(₹ in million)

Year	FCFF	PV factor (0.12)	Total PV
1	₹22	0.893	₹19.646
2	23	0.797	18.331
3	24.5	0.712	17.444
4	26.0	0.636	16.536
5	30.0	0.567	17.010
6	32.0	0.507	16.224
Total present value			105.191

(b) PV of FCFF subsequent to explicit forecast period

$$CV_6 = \frac{₹32(1.04)}{0.12 - 0.04} = \frac{₹33.28}{0.08} = ₹416$$

$$PV_0 = ₹416, \text{ continuing value} \times \text{PV factor at 12\% for 6 years} \\ = ₹416 \times 0.507 = ₹210.912$$

(c) Total PV of FCFF (₹105.191 + ₹210.912) =	316.103 million	316.103
Less: External liabilities	36.000	36.00
FCFE available to equityholders	280.103	280.103
MPS (₹280.103 million/ 1 lakh shares) =	₹2801.03	280.10

P.31.10 Assume everything to be the same as given in P.31.9, determine the economic value added during the current year. Assume the long-term funds shown in the balance sheet as the total capital employed in the business. **LO 31.3** LOD E

Solution

Determination of economic value added (EVA)

(₹ in million)

Net operating profits before taxes	₹18
Less: Corporate taxes (0.35)	6.3*
Net operating profits after taxes	11.7
Less: Cost of capital employed (₹60.5 million** × 0.12 WACC)	7.26
Economic value added	4.44

*Alternatively, corporate taxes can be conceived as sum of (i) taxes as per income statement (₹5.67 million plus (ii) tax savings on interest (₹1.8 million × 0.35 = 0.63 million) = ₹6.3 million

**Equity share capital ₹10 million + Reserves and surplus ₹32.50 million + 10% loan ₹18 million = ₹60.5 million.

P.31.11 Determine EVA from the following data of a company: **LO 31.3** LOD M

EBIT	₹36 crore
Less interest on 12% Debt	6
Earnings before taxes	30
Less corporate taxes (30%)	9
Earnings after taxes	21
Less dividend on 13% Preference share capital (₹30 crore × 0.13)	3.9
Earnings for equity shareholders	17.1
Equity funds (having cost of 16%)	80.0

Also determine EVA as a percentage of total capital employed.

Solution

(i) Determination of EVA

Determination of weighted average cost of capital

(Amount in ₹ crore)

Particulars	Amount	After-tax cost (%)	Total cost
Equity funds	₹80	0.16	₹12.8
Preference share capital	30	0.13	3.9
Debt (₹6 crore/0.12)	50	0.84	4.2
Total	160		20.9

$$K_0 = (\₹20.9/\₹160) \times 100 = 13.06 \text{ per cent}$$

Determination of NOPAT

EBIT	₹36 crore
Less taxes (0.3)	10.8
NOPAT	25.2

$$\begin{aligned} \text{EVA} &= \text{NOPAT} - (\text{WACC} \times \text{Total capital employed}) \\ &= ₹25.2 \text{ crore} - ₹20.9 \text{ crore} = ₹4.3 \text{ crore} \end{aligned}$$

Alternatively,

	(Amount in ₹ crore)
Earnings after taxes	₹21.00
Less cost of shareholders funds	
Equity funds	(12.80)
Preference share capital	(3.90)
EVA	4.30

(ii) EVA as a percentage of total capital employed (₹4.3 crore/₹160 crore) \times 100 = 2.69 per cent

P.31.12 Assume every thing to be the same as given in P.31.9. Assume further that the equity shares of this company are currently quoted in the market at ₹500 per share. Determine the amount of market value added (MVA).

LO 31.3	LOD E
----------------	------------------------

Solution

Determination of market value added

A. Market value per equity share	₹500
B. Multiplied by number of equity shares outstanding (lakh)	1
C. Total market value (A \times B) (₹million)	50
D. Equity funds (₹10 million equity share capital plus ₹32.5 million reserves and surplus)	42.5
E. Market value added (₹50 million – ₹42.5 million)	7.5

MINI CASES

31.C.1 Economic Value Added Nova Chemicals Ltd manufactures a wide-range of high-quality and competitively-priced products including soda ash, sodium bicarbonate, salt, caustic soda and urea. Its products go into numerous end-use applications in a variety of industries such as glass, detergents, papers, textiles, agriculture, photography, pharmaceuticals, food tanning, ryon, pulp, paints, buildings and construction.

The most recent balance sheet of Nova Chemicals is summarised in Exhibit 31.C.1.

EXHIBIT 31.C.1 Balance Sheet of Nova Chemicals

(Amount ₹ Crore)

Liabilities	Amount	Assets	Amount
Borrowings:		Fixed Assets:	
15% term loan from banks	₹91.19	Net block	₹1,741.45
14.5% loan from financial institutions	239.95	Investments	626.94
Debentures®	98.47	Net current assets	871.38
Others (short-term)	336.03	Miscellaneous	3.14
Shareholder's equity:			
Share capital	215.16		
Reserves	1,820.18		
Deferred tax liability			
	2,035.34		
	442.03		
	3,242.91		3,242.91

ⒺDetails of Debentures:

- 13% debentures nineteenth series (2007), face value of ₹50,00,000 each redeemable at par in three equal yearly instalments commencing September 1, 2007, ₹46.67 crore.
- 11.15% secured redeemable non-convertible debentures, face value ₹1,00,00,000 each redeemable at par in the ratio of 33:33:34 in three monthly instalments commencing from January 2010 or earlier at the option of the company, ₹6.80 crore.
- 7.18% secured redeemable non-convertible debentures, face value ₹2,50,00,000 each redeemable at par in the ratio of 40:20:40 on March 31 2008, 2009 and 2010, ₹45 crore.

The most recent profit and loss account of Nova Chemicals is summarised in Exhibit 31.C.2.

EXHIBIT 31.C.2 Profit and Loss Account of Nova Chemicals (Amount in ₹ crore)

Income:		
Sales and operating income	₹2,544.15	
Investment income	38.85	
Interest on refund of taxes	38.26	₹2,621.26
Expenditure:		
Raw materials, stores, wages and other expenses	2,084.36	
Depreciation	144.15	
Interest (net)	50.91	2,279.42

Required Compute the Economic Value Added for Nova Chemicals.

Solution Economic Value Added = Net operating profit after taxes (NOPAT) – (Weighted average cost of capital × Capital employed)

Weight Average Cost of Capital = Net payments ÷ Capital employed (amount outstanding)

Computation of Weighted Average Cost of Capital

Sources of Funds	Outstanding amount (₹ crore)	Rate (%)	Amount paid (₹ crore)	Tax advantage on debt [Ⓔ] (₹ crore)	Net amount paid
(1)	(2)	(3)	(4)	(5)	(6)
Debt:					
13.25% Debentures	46.67	0.13	7.10*	2.485	4.615
11.15% redeemable debentures	6.80	0.1115	0.758	0.265	0.4927
7.18% Debentures	45.00	0.0718	3.23	1.1305	2.0995
15% term loans from banks	91.19	0.15	13.67	4.78	8.88
14.5% loan from financial institutions	239.95	0.145	34.79	12.18	22.61
Equity:	2,035.34	0.1885**	383.66	—	383.66
Total	2,464.95				413.47

Weighted average cost of capital = (₹413.47 ÷ ₹2,464.95) × 100 = 16.75%

EVA = –₹208.3 crore (₹413.47 crore – ₹205.17^{ⒺⒺ} crore)

[Ⓔ]Assumed tax rate, 35 per cent

^{ⒺⒺ}Total operating profit (₹2,544.15 crore, operating income – ₹2,084.36, crore, cost of raw materials, stores, wages, other expenses – ₹144.15 crore, depreciation) = ₹315.64 crore

Net operating profit after taxes [₹315.64 crore – ₹110.47 crore taxes (₹315.64 crore × 0.35)] = ₹205.17 crore

**Cost of Equity Capital:

Using CAPM approach and assuming the (i) yield on 10-year RBI bonds as the risk free rate of return

of 7.32%, (ii) long term rate of return on BSE-500 Index of 18 per cent (iii) beta of Nova Chemicals from the NSE, 1.08

$$\begin{aligned} K_e &= 0.0732 + 1.08 (0.18 - 0.0732) \\ &= 0.188544 = 18.85 \text{ per cent} \end{aligned}$$

*Interest paid:

$$PVIFA_{2,13} = 2.107$$

$$\text{Single instalment} = ₹46.67 + 2.107 = ₹22.15 \text{ crore}$$

$$\text{Total amount payable} = 3 \times ₹22.15 = ₹66.45 \text{ crore}$$

$$\text{Interest paid for 5 months} = (₹66.45 \text{ crore} \times 0.13 \times 5) + 12 = ₹3.56 \text{ crore}$$

$$\text{Interest paid for 7 months} = (₹46.67 \text{ crore} \times 0.13 \times 7) + 12 = ₹3.54 \text{ crore}$$

$$\text{Total interest paid} (₹3.65 \text{ crore} + ₹3.54 \text{ crore}) = ₹7.10 \text{ crore.}$$

31.C.2(EVA) The management of Infosys Technologies limited is desirous of determining economic value added (EVA) by its operations for its shareholders during 2001-05. Infosys has been a debt free company for the period –mentioned. The summarized income statement for the period under reference is as follows:

(a) Income Statement of Infosys Technologies Limited, 2001-05

(Amount in ₹ crore)

Particulars	2005	2004	2003	2002	2001
Income (Overseas and domestic)	6,859.66	4,760.89	3,622.69	2,603.59	1,900.56
Less: Expenses (Software development, selling, general, administrative)	4,534.55	3,177.24	2,350.65	1,565.96	1,135.72
Operating profit before interest,* depreciation and amortization	2,325.11	1,583.65	1,272.04	1,037.63	764.84
Less: Depreciation and amortization	268.22	230.90	188.95	160.65	112.89
Net operating profit before taxes	2,056.89	1,352.75	1,083.09	876.98	651.95
Less: Taxes**	325.58	227.54	201	135.43	72.71
	(15.8%)	(16.8%)	(18.6%)	(15.5%)	(11.2%)
Net operating profit after taxes (NOPAT)	1,731.31	1,125.21	882.09	741.55	579.24

*(i) Interest charge is zero in view of debt-free capital structure.

** (ii) It pays taxes on its income in the range of 11 to 19 per cent. The reason is it enjoys 100 per cent tax rebate on income accruing from its operations in software Technology Parks (STPs). STPs constitute the major source of revenue. In view of the fact that Infosys has its operations in various parts of the globe and is to pay taxes in those countries, its exact tax rate could not be known.

(b) Data Related to Average Equity Funds and Cost of Equity, 2001-05

Particulars	2005	2004	2003	2002	2001
Average equity funds (in ₹ Crore)	4,330.95	3,124.82	2,493.4	1,734.97	1,111.47
Risk free cost (%)	7.0	6.75	7.5	8.0	8.0
Return on market Portfolio (%)	15.0	16.0	16.5	14.0	14.0
Beta	0.98	1.27	1.57	1.41	1.54
Cost of equity* (Ke) (%)	14.84	18.30	21.63	16.46	17.24

$$*K_e = *R_f + b(R_m - R_f)$$

Required The CEO of Infosys Technologies has approached Apeksha Jain, a financial consultant to compute EVA and report to him for inclusion in the annual report.

Solution The EVA computation by Apeksha Jain are given in **Exhibit 31.C.3**.

EXHIBIT 31.C.3 Determination of Economic Value Added of Infosys Technologies Limited

(Amount in ₹ crore)

Particulars	2005	2004	2003	2002	2001
(I) NOPAT	1,731.31	1,125.21	882.09	741.55	579.24
(II) Less: Cost of funds					
a. Average equity funds	4,330.95	3,124.82	2,493.4	1,734.97	1,111.47
b. cost of equity	14.84%	18.30%	21.63%	16.46%	17.24%
Total cost [(II)a* (II)b]	624.71	571.84	539.32	285.58	191.62
EVA [I - II]	1088.60	553.37	342.77	455.97	387.62

EVA = NOPAT – (Average capital employed × WACC).

In the case of Infosys it is = NOPAT – (Average equity funds × Ke) as it is debt-free company.

Conclusion Infosys has been successful in adding significant value to its shareholders wealth.

31.C.3 Chemicals and Pesticides Mangalore Ltd (Business Valuation) Chemicals and Pesticides Mangalore Ltd (CPML) has had a phenomenal growth in the recent years. Its current balance sheet is summarised below (amount in ₹ lakh).

Liabilities	Amount	Assets	Amount
Share capital:		Fixed assets:	₹150.0
• 11% Preference shares (₹100 each)	₹40.0	Less Depreciation	30.0
• Equity shares (₹100 each)	120.0	Current assets:	
10% Debentures	20.0	Inventory	100.0
Profit and loss account	23.0	Debtors	50.0
Trade creditors	71.0	Cash and bank	10.0
Provisions for Tax	8.0	Preliminary expenses	2.0
	282.0		282.0

The CPML's free cashflows for equity holders (FCFEs) have been growing at a rate of 25 per cent in recent years. But it suffered a huge loss in the current year when the Centre for Science and Environment (CSE) published in one of its reports the harmful effect of the pesticide **Endosulfan** produced by the CPML. The report claimed that the studies done by the CSE have proved that the pesticides was responsible for serious health hazards in some of the districts in Kerala where the particular pesticides had been used extensively in the past. Acting on the report of the CSE, the Ministry of Environment and Forest imposed a ban on all the pesticides products of CPML. As a consequence of the CSE report and Government ban, the market sentiment for CPML suffered a serious setback. Owing moral responsibility, the CPML management has decided to pay due compensation to the victims for damage to their health. Meanwhile, it was also decided to sell the CPML. The CEO of CPML, Harpal Singh, hired Latha and Raveesh (LR) Associates as a financial consultant for valuation of its current business.

The market research team of LR Associates has estimated a projected growth rate of the CPML's FCFE of its chemicals business after the closure of the pesticides business for the next five years as listed below:

Year	FCFE growth (%)
1	15
2	12
3	10
4	9
5	7

The first part of the document discusses the general principles of the experiment. It describes the setup and the initial observations. The text is dense and contains many technical terms and numerical values.

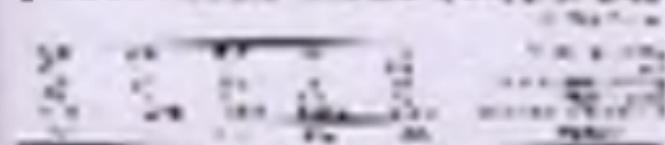

This section continues the discussion, providing more detailed data and analysis. It includes several tables and graphs that illustrate the results of the measurements.

Series	Value 1	Value 2	Value 3	Value 4
1	1.2	1.5	1.8	2.1
2	1.4	1.7	2.0	2.3
3	1.6	1.9	2.2	2.5
4	1.8	2.1	2.4	2.7
5	2.0	2.3	2.6	2.9

The final part of the left page summarizes the findings and discusses the implications of the data. It concludes with a statement about the overall results of the study.

The right page begins with a continuation of the text from the left page, providing further context and details about the experimental conditions.

This section contains more text and possibly a small table or graph, continuing the data analysis and discussion.

Series	Value 1	Value 2	Value 3	Value 4
1	1.1	1.3	1.5	1.7
2	1.3	1.5	1.7	1.9
3	1.5	1.7	1.9	2.1
4	1.7	1.9	2.1	2.3
5	1.9	2.1	2.3	2.5

The text on the right page continues to analyze the data, comparing it to theoretical models and discussing any discrepancies.

This section provides a more detailed look at the experimental results, including a discussion of the error margins and the reliability of the measurements.

The final part of the right page concludes the document, summarizing the key findings and providing a final statement on the work.

After five years, the FCFE are likely to grow at the normal rate of six per cent. The CPML's weighted average cost of capital is 12 per cent. The current per share FCFE is ₹7. The investors required rate of return may be assumed to be 15 per cent.

Required What is the value of CPML using (i) net-asset based and (ii) FCFEs approaches?

Solution The values of the CPML using the two approaches are given in Annexures 1 and 2.

Annexure 1 Net Asset Based Valuation (₹ lakh)

Fixed asset (net)		₹120.0	
Current assets:			
Inventory	₹100.0		
Debtors	50.0		
Cash and Bank	10.0		160.0
Total assets			280.0
Less external liabilities:			
11% Preference shares	40.0		
10% Debentures	20.0		
Trade creditors	71.0		
Provision for taxation	8.0		
Preference dividend	4.4		143.40
Net asset available for equity holders			136.60
÷ Number of equity shares (in lakh)			1.2
Net asset value per share (₹)			113.83

Annexure 2 Free Cash Flow-Based Valuation (₹ lakh)

Year	Free cash flow (FCFE)	Growth in FCFE (1 + g) ⁿ	FCFE per share (1 × 3)	PV factor (0.15)	Total present value (4 × 5)
(1)	(2)	(3)	(4)	(5)	(6)
1	7.0	1.150	8.050	0.870	7.000
2	8.05	1.12	9.016	0.756	6.816
3	9.016	1.10	9.918	0.658	6.526
4	9.918	1.09	10.811	0.572	6.184
5	10.811	1.07	11.568	0.497	5.749
					32.275

$$\begin{aligned} \text{Market price of share at year-end 5} &= \text{FCFE}_6 \div (K_e - g) \\ &= ₹11.568 (1.06) = ₹12.262 / 0.09 = ₹136.24 \\ \text{PV (t=0)} &= 136.24 \times 0.497 = ₹67.11 \end{aligned}$$

Maximum price investors would be prepared to pay = ₹32.275 + ₹67.711 = ₹99.986 (₹100)

Comment: The valuation of CPML based on net asset is higher compared to the FCFE approach. The former ignores the future earnings/cash flow generating ability of the assets. Considering the present scenario of the CPML when the pesticide business faces serious threat with virtual prospect of no future return, the FCFE-based value per share is more realistic (conservative).

31.C.4 (Business Valuation) SGA Ltd was set-up as a start-up company by three first-time-entrepreneurs – Sunny Kapoor, Gaurav Joshi and Abhishek Luthra. After initial difficulties, the SGA has grown into a successful company. IBM Ltd, which operates in the same business has offered to acquire majority stake in the SGA. The acquisition is likely to add considerable value to the combined entity with expanded client base and enhanced economies of scale. The top management of the SGA is favourably inclined to accept IBM's proposal. The CEO, Sunny Kapoor, asks the CFO, Gaurav Joshi and the COO, Abhishek Luthra, to determine the value of the SGA to take a final view on the IBM's proposal.

Gaurav and Abhishek decide to compute the value of the SGA based on free cash flow method. The forecasted investment expenditure during 2010-2016 is summarised in Annexure 1.

Annexure 1 Forecast Investment

Year	Gross investment in fixed assets (₹ crore)	Working capital requirement (₹ crore)	Total (2+3)
(1)	(2)	(3)	(4)
2010	4.26	1.39	5.65
2011	10.50	0.60	11.10
2012	3.34	0.28	3.62
2013	3.65	0.42	4.07
2014	4.18	0.93	5.11
2015	5.37	1.57	6.94
2016	6.28	2.00	8.28
Total	37.58	7.19	44.77

The projected profits and dividends during the same period are summarised in Annexure 2.

Annexure 2 Projected Profits/Dividends

(₹ crore)

Year	Cash flow	Depreciation	Profits before tax (2 - 3)	Tax (0.35)	Profit after tax (4 - 5)	Dividends	Retained profits (6 - 7)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
2010	10.48	2.40	8.08	2.83	5.25	2.00	3.25
2011	11.87	3.10	8.77	3.07	5.70	2.00	3.70
2012	7.74	3.12	4.62	1.62	3.00	2.50	0.50
2013	8.40	3.17	5.23	1.83	3.40	2.50	0.90
2014	9.95	3.26	6.69	2.34	4.35	2.50	1.85
2015	12.67	3.44	9.23	3.23	6.00	2.50	3.50
2016	15.37	3.68	11.69	4.09	7.60	3.00	4.60

@ Surplus operating cash flows

Gaurav and Abhishek project a 7.2 per cent growth rate after 2016. The cost of capital of SGA and IBM is 10 and 9 per cent respectively. The risk free rate of return is 6 per cent. The value of the SGA is determined in the Solution Table.

Solution Table

(Amount in ₹ crore)

Year	Profit after tax	Depreciation	Investments in fixed assets	Working capital investment	Free cashflows [2+3-4-5]	Discounted cashflow (7) [(6) × at 10% PVF]
(1)	(2)	(3)	(4)	(5)	(6)	(7)
2010	5.25	2.40	4.26	1.39	2.00	1.82
2011	5.70	3.10	10.50	0.60	(2.30)	(1.90)
2012	3.00	3.12	3.34	0.28	2.50	1.88
2013	3.40	3.17	3.65	0.42	2.50	1.71
2014	4.35	3.26	4.18	0.93	2.50	1.55
2015	6.00	3.44	5.37	1.57	2.50	1.41
2016	7.60	3.68	6.28	2.00	3.00	1.54

(b) PV of FCFF subsequent to explicit forecast period

$$CV_7 = ₹30 \text{ million}/0.12 = ₹250 \text{ m}$$

$$PV_0 = ₹250 \text{ million} \times \text{PV factor at 12\% for 7th year}$$

$$= ₹250 \text{ million} \times 0.452 = ₹113 \text{ million}$$

(c) Total PV of FCFF (₹109.667 million + ₹113 million)	₹222.67 million
Less External Liabilities (including contingent liabilities)	₹44.5 million
FCFE available to equity shareholders	₹178.17 million
MPS (₹178.17 m/1 lakh shares)	= ₹1781.7

Method II: Capitalisation method

Earnings before tax	₹20.50 million
Less extraordinary income	2.00
Recurring expenses	1.00
Expected earnings before tax	17.50
Less taxes	6.12
Future sustainable profits after taxes	11.38
Value of business (11.38/0.12)	₹94.83 m
Value of equity (less external liabilities and contingent liabilities) (94.83 m – 44.5 m)	₹50.33 m
Price per equity share (50.33 m/1 lakh)	₹503.30

Method III: Asset Based Approach

Fixed assets	₹90.0 million
Inventories	20.0
Trade receivables	15.0
Cash and cash equivalents	4.5
Goodwill	31.33
Total assets	160.83
Less External liabilities (including contingent liabilities)	44.5
Net assets at market value	116.33
Net assets backing per share (₹94.83 m /1 lakh)	₹1163.3

*Valuation of goodwill ₹million

Future maintainable profits after taxes	11.38
Less normal profit (12% (ko) × 63.5** (Long term capital employed)	7.62
Super profits	3.76
Value of goodwill (₹3.76 million/12% (ko))	31.33

**Long term capital employed

$$₹10.0 + 28.5 + 25.0 \text{ million} = ₹63.5 \text{ million}$$

Final value calculations:

(Amount in ₹ million)			
Method used	Value	Weight factor	Weighted value
Free cash flow	178.17	0.50	89.08
Capitalisation approach	50.33	0.20	10.07
Net assets based approach	116.33	0.30	34.90
Fair value approach			134.05

Conclusion: Mr. Sanuj observed that there were huge variations in the values calculated through different methods. By using fair value approach (based on weighted average), the impact of variations is minimised. He recommends the payment of ₹134.05 million to equityholders, apart from making payment to external liabilities and contingent liabilities of ₹44.5 million. In effect, the valuation of business is ₹178.55 million.

31.C.6 Herbal India Ltd is a renowned company that is emerging as an important growth engine in India's consumption market. It is the fourth largest FMCG company in India with revenue of over ₹6,146 crore, operating in various verticals like hair care, skin care, health care, home care and foods.

The cost of equity capital (calculated by capital asset pricing model) of the firm is 15.79 per cent, shown as follows:

$$K_e = R_f + b(R_m - R_f)$$

$$K_e = 9\% + 0.71(18.56\% - 9\%) = 15.79 \text{ per cent}$$

The before-tax cost of debt of the firm is 13.1% and after-tax cost of debt is $13.1 \times (1 - 0.35) = 8.5\%$. The cost of preference shares (including dividend payment tax) for the firm is 13%.

The company plans to expand its operations through the establishment of new vertical business units in rural areas. As a precautionary step, the CEO of the company, Mr. Gupta, suggested that the business be evaluated for the return being generated, before setting up the new vertical units. The CEO had learnt that the profit after taxes margin (PAT) had taken a downward trend from 14.8% for the year 2010 to 12.4% for the year 2013. But the sales showed a continuously increasing trend over the years, encouraging the business's further expansion into newer verticals. The CEO, Mr. Gupta, however, was not very confident with setting-up of the new vertical, and wanted a more detailed analysis of the trends. Hence, Mr. Gupta approached their firm's financial controller.

The Financial Controller of the firm, Mr. Manohar, then used the most popular yardstick of calculating the overall performance through 'Return on Investment' technique and came up with the following results:

TABLE 31.1 Calculation of Return on Investment (ROI) (₹ in crore)

Financial results	FY 2008	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013
Net sales	2361	2805	3391	4077	5283	6146
Other income	34	47	48	59	80	124
EBITDA	443	517	667	833	948	1124
PBT (Profit before tax)	384	445	601	708	791	953
Taxes @ 35%	134.4	155.75	201.35	247.8	276.85	333.55
PAT (Profit after tax)	249.6	289.25	399.65	460.2	514.15	619.45
Add back interest	8.42	19.55	15.22	89.34	90.87	97.72
NOPAT (Net operating profit after tax)	258.02	308.8	414.87	549.54	605.02	717.17
Average capital employed	1841	2573	2912	5855	7102	8265
Return on investment (%)	14.1%	12.0%	14.24%	9.4%	8.52%	8.667%

The results suggest that the return on investment has dipped to less than 10 per cent during (2011-2013) compared to 12-14 per cent (during 2008-2010) alarming the entire business unit. However, the only respite is that, the return on investment is still adequate for the business to sustain in the market. At this point, he recollects Ms Revathi (MBA in finance) has joined; her colleagues are appreciative of her work. He discussed the problem with her and explored the best way of determining financial returns earned by the company. She suggests use of EVA for measuring true/ credible financial performance. The rationale of EVA is that it is based on profits earned after meeting cost of all sources of finance (and not debt alone). The CEO was convinced and entrusted her task of determining EVA for 2008-13.

Solution

$$EVA = NOPAT - WACC \times \text{Capital Employed}$$

$$WACC = K_e \times (ESF / CE) + K_d \times (LTD / CE) + K_p \times (PSC/CE)$$

where

K_e = Cost of equity,

ESF = Equity shareholders fund,

CE = Capital employed,

K_d = Cost of debt,

LTD = Long term debt,

K_p = Cost of preference share,

PSF = Preference share capital.

Based on the annual financial statements for the past 6 years (2008-13), the book value weights for cost of equity, cost of debt and cost of preferential shares were obtained as follows:

TABLE 31.2 WACC based on book value method, 2008-13

Particulars	Proportions of equity, preference and debt for each year					
	2008	2009	2010	2011	2012	2013
Cost of equity (15.79%)	0.770	0.72	0.778	0.531	0.580	0.615
Cost of preference shares (13%)	0.107	0.076	0.072	0.066	0.058	0.050
Cost of debt (8.5%)	0.123	0.202	0.149	0.401	0.361	0.334
Weighted average cost of capital	14.6%	14.07%	14.48%	12.65%	12.98%	13.20%

Based on the values of average capital employed, profit after taxes, interest (as obtained from Table 31.1) and WACC (as obtained from Table 31.2), the economic value added was calculated by Ms. Revathi (shown in Table 31.3).

TABLE 31.3 Computation of EVA, 2008-13

(₹ in Crore)

Particulars	2008	2009	2010	2011	2012	2013
Average capital employed	1,841	2,573	2,912	5,855	7,102	8,265
WACC	14.6%	14.07%	14.48%	12.65%	12.98%	13.20%
Cost of capital employed	268.79	362.02	421.66	740.66	921.84	1090.98
Profit after tax	249.6	289.25	399.65	460.2	514.15	619.45
Interest	8.42	19.55	15.22	89.34	90.87	97.72
NOPAT	258.02	308.8	414.87	549.54	605.02	717.17
EVA	(10.766)	(53.22)	(6.78)	(191.12)	(316.82)	(373.81)

Ms. Revathi then submitted the report to the CEO of Herbal India Ltd and he gets startled on seeing the report. While he was hoping to expand his business and establish new vertical units, he realises that the business itself is at a stake.

The EVA on capital employed (%), shown in Table 31.3, very clearly shows that the surplus over and above the cost of capital is in effect negative during the years 2008-2010. It is even more worrying for Mr. Gupta, to realise that in the years 2011-2013 the business was suffering huge losses.

TABLE 31.4 Return on investment and EVA, 2008-13

Financial Year	2008	2009	2010	2011	2012	2013
Return on Investment (ROI %)	14.10	12.00	14.24	9.40	8.52	8.67
EVA on capital employed (%)	(0.58)	(2.07)	(0.23)	(3.26)	(4.46)	(4.52)

Table 31.4 shows that, divergence exists between the performance results given by traditional measure (based on ROI) and percentage of EVA on capital employed. The return on investment (ROI) does not reflect the real value addition to shareholders' wealth, but EVA based performance measurement system provides more credible information about the shareholders' value addition or value destruction. The company has not been able to create value for its shareholders during the period of 2011-2013.

Recommendation Therefore, Ms. Revathi suggests the CEO that expansion of the business unit should be kept on hold for the time being until the business ceases to have negative EVA.

Scan the QR Code given at the end of chapter to access comprehensive cases.

The following is a list of the names of the members of the Society for the year 1900. The names are arranged in alphabetical order of the surnames. The names of the members who have died since the last meeting are marked with a cross.

Name	Age	Sex	Profession	Residence

RQ.31.9 What is the major difference between the terms 'Free cash flow to the firm' and 'Free cash flow to equity'? Will these approaches provide identical answers of equity valuation? Explain. [LO 31.2]

RQ.31.10 What are the major factors that should be borne in mind while valuing a firm? [LO 31.2]

RQ.31.11 What is economic value added approach? In what respects it is considered superior to the accounting approach of determining profits? Explain with an appropriate example. [LO 31.3]

RQ.31.12 Distinguish between the following: [LO 31.1,2,3]

- (i) Market value added and economic value added
- (ii) Book value and market value
- (iii) Operating free cash flow and non-operating cash flow
- (iv) Weighted average cost of capital and cost of equity

RQ.31.13 The following particulars are available in respect of a corporate: (i) Profits after taxes (for the current year) ₹30 crore which include extraordinary gains of ₹8 crore. (ii) To maintain sales, the firm is to increase advertisement expenditure by ₹2 crore. (iii) Capitalisation rate applicable to business to which corporate belongs is 12 per cent. [LO 31.2]

From the above information, determine the value of business, value of equity (assume total external liabilities of ₹50 crore) and price per equity share (assume 1 crore equity shares of ₹100 each outstanding) based on the capitalisation method. Assume tax rate of 40 per cent.

RQ.31.14 Determine continuing value of a corporate from the following information: [LO 31.2]

	(₹ crore)
Cash flow from business operations at the end of the explicit forecast period (year 5)	₹20
Investment in current assets required in year 5	2
Expected annual growth rate in free cash flows after forecast period (%)	5
Weighted average cost of capital (%)	12
Cost of debt (%)	8

RQ.31.15 The finance manager of 'Mobile Fast' has estimated future free cash flows (FCFF) of the company for 6 years as follows: [LO 31.2]

	(₹ crore)
Year-end 1	400
2	800
3	1,050
4	1,400
5	950
6	600

The FCFF are expected to be constant at ₹600 crore after 6 years as the mobile scenario in the country is likely to be stabilised by then. You are required to compute the value of corporate as well as value of equity. Assume 13 per cent overall cost of capital and total external liabilities of ₹2,400 crore based on free cash-flow approach.

RQ.31.16 From the following condensed income statement of a corporate for the current year, determine the EVA added during the year. [LO 31.3]

		(₹ crore)
Sales revenue		100
Less: Cost of goods sold	₹40	
Administrative expenses	4	
Selling expenses	16	
Interest	10	
Earnings before taxes		70
Less: Taxes (0.40)		30
Earnings after taxes		12
		18

The firm's weighted average cost of total capital employed (consisting of equity and debt of ₹150 crore) is 12 per cent; its cost of equity capital is 15 per cent.

RQ.31.17 Calculate economic value added (EVA) with the help of the following information of Hypothetical Limited: [LO 31.3]

Financial leverage	1.4 times
Capital structure:	Equity capital, ₹170 lakh
	Reserves and surplus, ₹130 lakh
	10% Debentures, ₹400 lakh
Cost of equity	17.5%
Income tax rate	30%.

LOD: Difficult

RQ.31.18 What are the major weaknesses of P/E ratio as a technique of share valuation? In spite of such limitations, why is it so popular? What safeguards would you suggest to make them more credible? [LO 31.2]

RQ.31.19 Balance sheet of a corporate as on March 31, current year is as follows: [LO 31.2]

(Amount in ₹ crore)

Liabilities	Amount	Assets	Amount
Equity share capital (1 crore shares)	200	Plant and machinery	250
Reserves and surplus	180	Land and buildings	150
12% Debentures	150	Inventory	80
Total creditors	35	Receivables	60
Other current liabilities	15	Other current assets	40
	<u>580</u>		<u>580</u>

The market value of its assets as assessed by professional valuer is as follows: (₹ crore)

Plant and machinery	180
Land and building	300

The current resale value of the remaining assets are as per their book values.

You are required to compute the value of equity share on the basis of net assets method (book value and market value).

ANSWERS

31.4 Goodwill, ₹12.68 crore

31.13 Value of business, ₹200 crore

Value of equity, ₹150 crore

Price of equity share, ₹150

31.14 Continuing Value, ₹270 crore

31.15 Value of corporate, ₹5,585.48 crore

Value of equity, ₹3,185.48 crore

31.16 EVA, ₹6 crore

31.17 EVA, ₹17.5 lakh

31.19 Value of equity (book value), ₹380 crore
Value of equity (market value), ₹460 crore

Corporate Restructuring

LEARNING OBJECTIVES

LO 32.1	Explain the conceptual framework of mergers/acquisitions in terms of the meaning, types, economics and limitations
LO 32.2	Describe and illustrate how to determine the firm's value, financing techniques in merger and the evaluation of merger as a capital budgeting decision
LO 32.3	Understand the relevant tax provisions applicable to mergers and demergers
LO 32.4	Describe the legal and procedural aspects of mergers/amalgamation/takeovers
LO 32.5	Discuss financial restructuring and demerger/divestiture as other forms of corporate restructuring
LO 32.6	Outline the motives and assessment of mergers and acquisitions practices in India

INTRODUCTION

Activities related to expansion or contraction of a firm's operations or changes in its assets or financial or ownership structure are referred to as **corporate restructuring**¹. The most common forms of corporate restructuring are mergers/amalgamations and acquisitions/takeovers, financial restructuring, divestitures/demergers and buyouts. The focus of this chapter is on mergers and acquisitions. The different aspects of mergers and acquisitions, namely, conceptual framework, financial framework, taxation and legal and procedural compliances are covered first. Other forms of corporate restructuring, that is, financial restructuring, demerger and buyouts are discussed subsequently. The motives and financial assessment for corporate mergers in India are also outlined. The main points are summarised by way of recapitulation.

- **Corporate restructuring**
- implies activities related to expansion/contraction of a firm's operations or changes in its assets or financial or ownership structure.

LO 32.1 CONCEPTUAL FRAMEWORK

Profitable growth constitutes one of the prime objectives of most of the business firms. It can be achieved 'internally' either through the process of introducing/ developing new products or by

REVIEWS

This section contains reviews of articles published in the journal. The reviews are written by experts in the field and provide valuable insights into the strengths and weaknesses of the research.

REVIEWS

This section contains reviews of articles published in the journal. The reviews are written by experts in the field and provide valuable insights into the strengths and weaknesses of the research.

expanding/enlarging the capacity of existing product(s). Alternatively, the growth process can be facilitated 'externally' by acquisitions of existing business firms. This acquisition may be in the form of *mergers, acquisitions, amalgamations, takeovers, absorption, consolidation*, and so on. Although the legal procedure involved in these are different, in view of the perspective of economic considerations (motives and effect) these terms are used interchangeably here.

There are strengths and weaknesses of both the processes of promoting growth. For instance, internal expansion apart from enabling the firm to retain control with itself also provides flexibility in terms of choosing equipment, mode of technology, location, and the like which are compatible with its existing operations. However, internal expansion usually involves a longer implementation period and also entails greater uncertainties particularly associated with developing new product(s). Above all, there may be sometimes an added problem of raising adequate funds to execute the required capital budgeting projects involving expansion. Acquisition/merger obviates, in most of the situations, financing problems as substantial/full payments are normally made in the form of shares of the purchasing company. Further, it also expedites the pace of growth as the acquired firm already has the facilities or products (acceptable to the market) and, therefore, obviously, saves the time otherwise required in building up the new facilities from scratch in the case of internal expansion programme.

A growing firm may, therefore, be in constant search for identifying potential firms which may be merged. The finance manager's job is to evaluate such merger decisions. These decisions, in a way, are analogous to capital budgeting decisions in that the cost of present investment (purchase consideration paid for acquisition of an enterprise either through issuance of shares and/or cash) is to be compared with expected future benefits accruing to the merging firm. The firm will opt for merger if it adds to the wealth of shareholders, otherwise merger will not be a financially viable proposition.

However, merger evaluations are relatively more difficult *vis-a-vis* capital budgeting decisions, the two chief reasons being: **(i)** all benefits from merger are not easily quantifiable and so also all costs, for instance, benefits of less competition and economies of scale (technical, managerial, financial) are not easily measurable attributes; and **(ii)** buying a company is more complicated than buying a new machine in that the firm is to address itself to many tax, legal and accounting issues.

We describe below the conceptual aspects of mergers, acquisitions, amalgamations, takeovers, absorption and so on, in terms of their types, economics and limitations. Although the terms mergers, amalgamations and acquisitions are different, their economic impact is the same as far as the business firms involved are concerned. **For this reason, these terms are used interchangeably. The differences in these terms are explained later in this chapter.**

Horizontal merger

is a merger when two or more firms dealing in similar lines of activity combine together..

Types of Mergers

Notwithstanding terminological differences mergers can be usefully distinguished into the following three types: **(i)** horizontal, **(ii)** vertical and **(iii)** conglomerate.

Horizontal Merger Horizontal merger takes place when two or more corporate firms dealing in similar lines of activity combine together. Elimination or reduction in competition, putting an end to price-cutting, economies of scale in production, research and development, marketing and management are often motives underlying such mergers.

Vertical Merger Vertical merger occurs when a firm acquires firms 'upstream' from it and/or firms 'downstream' from it. In the case of an 'upstream' merger, it extends to the firms supplying raw materials and to those firms that sell eventually to the

Vertical merger is a merger that involves two or more stages of production/distribution that are usually separate.

consumer in the event of a 'downstream' merger. Thus, the combination involves two or more stages of production or distribution that are usually separate¹. Lower buying cost of materials, lower distribution costs, assured supplies and market, increasing or creating barriers to entry for potential competitors or placing them at a cost disadvantage are the chief gains accruing from such mergers.

Conglomerate Merger Conglomerate merger is a combination in which a firm established in one industry combines with a firm from an unrelated industry. In other words, firms engaged in two different/unrelated economic/business activities combine together. Diversification of risk constitutes the rationale for such mergers.

- **Corporate restructuring**
- implies activities related to expansion/contraction of a firm's operations or changes in its assets or financial or ownership structure.

Economics of Mergers

The major economic advantages of a merger are: **(i)** economies of scale, **(ii)** synergy, **(iii)** fast growth, **(iv)** tax benefits and **(v)** diversification.

Economies of Scale The operating cost advantage in terms of economies of scale is considered to be the primary motive for mergers, in particular, for horizontal and vertical mergers. They result in lower average cost of production and sales due to a higher level of operations. For instance, overhead costs can be substantially reduced on account of sharing central services such as accounting and finance, office, executive and top level management, legal, sales promotion and advertisement and so on.

Koutsoyiannis classifies these economies into two groups, namely, real and pecuniary. **Real economies** arise from a reduction in the factor inputs per unit of output, while **pecuniary economies** are realised from paying lower prices for factor inputs due to bulk transactions.²

In operational terms, real economies may arise from **(i)** the production activity of the firm, **(ii)** the research and development/technological activities, **(iii)** the synergy effects, **(iv)** marketing and distribution activities, **(v)** transport, storage, inventories, and **(vi)** managerial economies.

Cheaper finance is the most vital ingredient of pecuniary economies. A post-merger large firm is likely to raise finance at cheaper/lower rates either of the pre-merger units could have. The reason is that the larger the size of the firm, the more secured the investors consider their funds, resulting in lower risk of default/financial risk. Besides, the flotation cost (in making new issues) per unit decreases with the increase in the size of shares and debentures. Above all, the merger may bring about optimal debt capacity, in that, before the merger both firms may have had lopsided capital structures—one overextended and another underextended by debt. Both these firms will be undervalued firms.

Synergy Synergy results from complementary activities. For instance, one firm may have a substantial amount of financial resources while the other has profitable investment opportunities. Likewise, one firm may have a strong research and development (R & D) team whereas the other may have a very efficiently organised production department. Similarly, one firm may have well established brands of its products but lacks marketing organisation and another firm may have a very strong marketing organisation. The merged business unit in all these cases will be more efficient than the individual firms. And, hence, the combined value of the merged firms is likely to be greater than the sum of the individual entities (units). Symbolically,

Combined value = Stand alone value of acquiring firm, V_A + Stand alone value of acquired/target firm, V_T + Value of synergy, ΔV_{AT} (32.1)

Normally, the value of synergy is positive and this constitutes the rationale for the merger. In valuing synergy, costs attached with acquisitions should also be taken into account. These costs primarily consist of costs of integration and payment made for the acquisition of the target firm, in excess of its value, V_T . Therefore, the *net gain* from the merger is equal to the difference between the value of synergy and costs (Equation 33.2)

$$\text{Net gain} = \text{Value of synergy, } \Delta V_{AT} - \text{Costs} \quad (32.2)$$

Example 32.1

Assume Firm A has a pre-merger value of ₹320 lakh and Firm T has a pre-merger value of ₹90 lakh. It is estimated that the merger would yield cost savings with a present value of ₹40 lakh. For acquisition of Firm T, Firm A will be required to make payment of ₹100 lakh (consisting of issue of shares worth ₹80 lakh and cash of ₹20 lakh). Besides, it is to incur acquisition costs of ₹5 lakh. Determine the value of gain, costs and net gain from merger.

Solution

Gain = Value of synergy (in terms of present value of cost savings), $\Delta V_{AT} = ₹40$ lakh

Costs = Value of cash and shares paid + Other acquisition costs – Pre-merger value of Firm T
 = ₹100 lakh + ₹5 lakh – ₹90 lakh = ₹15 lakh

Net gain = $\Delta V_{AT} - \text{Costs} = ₹40 \text{ lakh} - ₹15 \text{ lakh} = ₹25 \text{ lakh}$.

In practice, the value of synergy, in well thought out mergers, is likely to be of higher value than the costs involved, yielding net gain.

Fast Growth A merger often enables the amalgamating firm to grow at a rate faster than is possible under the internal expansion route, via its own capital budgeting proposals, because the acquiring company enters a new market quickly, avoiding the delay associated with building a new plant and establishing a new line of products. 'Internal growth is time consuming, requiring research and development, organisation of the product, market penetration and in general a smoothly working organisation³. Above all, there may sometimes be an added problem of raising adequate funds to execute the required/profitable capital budgeting projects. A merger obviates all these obstacles and, thus, steps up the pace of corporate growth.

Tax Benefits Under certain conditions, tax benefits may turn out to be the underlying motive for a merger. These conditions relate to the tax laws allowing set off and carry forward of losses. It may be beneficial to merge a firm saddled with large tax carry forward losses with a firm having sufficient current earnings. The argument is that this tax loss carry forward will reduce the taxable income of the newly merged firm, with its obvious impact on the reduction of tax liability. The merged firm is taxed as if the two firms (acquiring and target) had always been together. In operational terms, the losses of target firm will be allowed to be set off against the profits of the acquiring firm.

Example 32.2

Firm A acquires Firm T. As of date Firm T has accumulated losses of ₹1,000 lakh. Firm A is a well managed company with a good profit record. The projected profits before taxes, of Firm A, for the next 3 years are given in the table:

Year	1	₹350
	2	500
	3	700

Assuming corporate tax rate of 35 per cent and discount rate of 12 per cent, determine the present value of tax gains likely to accrue on account of merger to A.

Solution**TABLE 32.1** Present Value (PV) of Tax Shield

Particulars	Years		
	1	2	3
(a) Profit before tax	₹350	₹500	₹700
(b) Less: Adjustment against loss of firm T/Reduction in taxable income	350	500	150*
(c) Reduction in tax payments ($b \times 0.35$)	122.5	175	52.5
(d) Multiple by PV factor at 12%	0.893	0.797	0.712
(e) Total PV of tax shield is ₹286.24 lakh [(c) \times PV factor]	109.39	139.47	37.38

* (₹1,000 lakh accumulated loss of Firm T—₹350 lakh and ₹500 lakh adjusted in years 1 and 2 respectively).

Firm A gains ₹286.24 lakh in terms of tax savings on acquisition of Firm T.

Diversification Diversification is yet another major advantage, especially in a conglomerate merger. The argument is that a merger between two unrelated firms would tend to reduce business risk, which, in turn, reduces the discount rate/required rate of return (k_e) of the firm's earnings (as investors are risk averse) and, thus, increases the market value. In other words, such mergers help stabilise or smoothen overall corporate income, which would otherwise fluctuate due to seasonal or economic cycles. In operational terms, the greater the combination of statistically independent, or negatively correlated income streams of the merged companies, the higher will be the reduction in the business risk factor and the greater will be the benefit of diversification or *vice versa*.

However, such diversification can also be attained by individual shareholders on their own. Therefore, the financial managers should ensure that the merger should not be at a cost higher than the one at which shareholders would have attained the same risk reduction by diversifying their individual investment portfolios; corporate diversification should be less expensive than personal diversification.

Limitations

However, merger suffers from certain weaknesses. First, a merger may not turn out to be a financially profitable proposition in view of non-realisation of potential economies in terms of cost reduction. Second, the management of the two companies may not go along because of friction. Third, dissenting minority shareholders may cause problems. Finally, it may attract Government antitrust action in terms of the Competition Act.

LO 32.2 FINANCIAL FRAMEWORK

The financial framework of a merger decision covers three inter-related aspects: **(i)** determining the firm's value, **(ii)** financing techniques in merger and **(iii)** analysis of the merger as a capital budgeting decision.

Determining the Firm's Value

One of the first problems in analysing a potential merger involves determining the value of the acquired firm. The value of a firm depends not only upon its earnings but also upon the operating

and financial characteristics of the acquiring firm. It is, therefore, not possible to place a single value for the acquired firm. Instead, a range of values is determined, which would be economically justifiable to the prospective acquirer. The final price within this range is negotiated by the two firms. To determine an acceptable price for a firm, a number of factors, quantitative as well as qualitative, are relevant. However, placing a value on qualitative factors, such as managerial talent, strong sales staff, excellent production department and so on, is difficult. Therefore, the focus of determining the firm's value is on several quantitative variables. The quantitative factors relate to **(i)** the value of the assets and **(ii)** the earnings of the firm. Based on the assets' values and earnings, these factors include book value, appraisal value, market value and earnings per share.

Book Value The book value of a firm is based on the balance sheet value of the owner's equity. It is determined dividing net worth by the number of equity shares outstanding. The book value, as the basis of determining a firm's value, suffers from a serious limitation as it is based on the historical costs of the assets of the firm. Historical costs do not bear a relationship either to the value of the firm or to its ability to generate earnings. Nevertheless, it is relevant to the determination of a firm's value for several reasons: **(i)** it can be used as a starting point to be compared and complemented by other analyses, **(ii)** in industries where the ability to generate earnings requires large investments in fixed assets, the book value could be a critical factor where especially plant and equipment are relatively new, **(iii)** a study of the firm's working capital is particularly appropriate and necessary in mergers involving businesses consisting primarily of liquid assets, for example, financial institutions.

Book value is the value of owner's equity determined dividing net worth by the equity shares outstanding.

Appraisal Value Appraisal value is another measure of determining a firm's value. Such a value is acquired from an **independent appraisal agency**. This value is normally based on the replacement cost of assets. The appraisal value has several merits. In the first place, it is an important factor in special situations such as in financial companies, natural resource enterprises or organisations that have been operating at a loss. For instance, the assets of a financial company largely consist of securities. The value of the individual securities has a direct bearing on the firm's earning capacity. Similarly, a company operating at a loss may only be worth its liquidation value, which would approximate the appraisal value. Secondly, appraisal by independent appraisers may permit reduction in accounting goodwill by increasing the recognised worth of specific assets. Goodwill results when the purchase price of a firm exceeds the value of the individual assets. Third, appraisal by an independent agency provides a test of the reasonableness of result obtained through methods based upon the going-concern concept. Further, the appraiser may identify strengths and weaknesses that otherwise might not be recognised, such as in the valuation of patents and partially completed research and development expenditure. On the other hand, this method of analysis is not adequate by itself since the value of individual assets may have little relation to the firm's overall ability to generate earnings and, thus, the going-concern value of the firm. In brief, the appraisal value procedure is useful if carried out in conjunction with other evaluation processes. In specific cases, it is an important instrument for valuing a firm.

Appraisal value is the value acquired from an independent appraisal agency.

Market Value The market value, as reflected in the stock market quotations, comprises yet another approach for estimating the value of a business. The justification of market value as an approximation of true worth of a firm is derived from the fact that market quotations by and large indicate the consensus of investors as to the firm's earning potentials and the corresponding risk. The market

value approach is one of the most widely used in determining value, specially of large listed firms. The market value of a firm is determined by investment as well as speculative factors. This value can change abruptly as a result of change not only in analytical factors but also due to purely speculative influences and is subject to market sentiments and personal decisions. Nevertheless, the market value provides a close approximation of the true value of a firm. In actual practice, a certain percentage premium above the market price is often offered as an inducement for the current owners to sell their shares.

Earnings Per Share According to this approach, the value of a prospective acquisition is considered to be a function of the impact of the merger on the earnings per share (EPS). In other words, the analysis could focus on whether the acquisition will have a positive impact on the EPS after the merger or if it will have the effect of diluting the EPS. The future EPS will affect the firm's share prices, which is a function of price-earnings (P/E) ratio and EPS. The effect of acquisition on the EPS is illustrated in Example 32.3.

Example 32.3

Company A is contemplating the purchase of Company B. Company A has 2,00,000 shares outstanding with ₹25 market value per share while Company B has 1,00,000 shares selling at ₹18.75. The EPS are ₹3.125 for Company A and ₹2.5 for Company B. Assuming that the two managements have agreed that the shareholders of Company B are to receive Company A's shares in exchange for their shares (i) in proportion to the relative earnings per share of the two firms or (ii) 0.9 share of Company A for one share of Company B (share exchange ratio of 0.9: 1), illustrate the impact of merger on the EPSc (earnings per share of the combined firm). Also, compute the EPS after merger on the assumption that the anticipated growth rate in earnings is 8 per cent for Company A and 14 per cent for Company B.

Solution

TABLE 32.2 Merger Effect on EPS (Exchange Ratio in Proportion to Relative Earnings Per Share, 0.8 that is ₹2.5/₹3.125)

Company	Original number of shares	EPS	Total earnings after taxes Col. 2 × Col. 3
1	2	3	4
A	2,00,000	₹3.125	₹6,25,000
B	1,00,000	2.50	2,50,000
Total post-merger earnings			8,75,000
Number of shares after the merger: 2,00,000 + 80,000 i.e. (1,00,000 × 0.8)			2,80,000
Earnings per share for Company A:			
1. Equivalent before the merger			3.125
2. After the merger (₹8,75,000/2,80,000)			3.125
Earnings per share for Company B:			
1. Before the merger			2.50
2. Equivalent EPS after the merger: (EPS after the merger × Share exchange ratio) i.e. ₹3.125 × 0.8			2.50

TABLE 32.3 Merger Effect on EPS (Exchange ratio, 0.9 : 1)

(1) Total post-merger earnings (EPSc)	₹8,75,000
(2) Number of shares after the merger: (2,00,000 + 90,000 i.e. $0.9 \times 1,00,000$)	2,90,000
(3) Earnings per share: ($\frac{₹8,75,000}{2,90,000}$)	3.017
(4) Company A's shareholders	
EPS before the merger	3.125
EPS after the merger	3.017
Dilution in EPS	(0.108)
(5) Company B's shareholders	
EPS before the merger	2.50
Equivalent EPS after the merger (EPS after the merger \times share exchange ratio), i.e. ($₹3.017 \times 0.9$)	2.715
Accretion in EPS	0.215

TABLE 32.4 Projections of Earnings Per Share

Year	Post-merger earnings			Post-merger EPS			Accretion (Dilution) in EPS	
	Company A (8% growth)	Company B (14% growth)	Total earnings (A + B)	Combined EPS Col. 4 + 2,90,000 ^a	Company A Col.2 + 2,00,000	Company B Col.3 + 90,000 ^b	Company A	Company B
1	2	3	4	5	6	7	8	9
1	₹6,25,000	₹2,50,000	₹8,75,000	₹3.02	₹3.13	₹2.78	₹(0.11)	₹0.24
2	6,75,000	2,85,000	9,60,000	3.31	3.38	3.17	(0.01)	0.20
3	7,29,000	3,24,900	10,53,900	3.63	3.65	3.61	(0.02)	0.02
4	7,87,320	3,70,386	11,57,706	3.99	3.94	4.11	0.05	(0.12)
5	8,50,306	4,22,240	12,72,546	4.39	4.25	4.69	0.14	(0.30)
6	9,18,330	4,81,354	13,99,684	4.83	4.59	5.34	0.24	(0.51)

a. 2,00,000 shares of Company A + 90,000 of Company B i.e. $(1,00,000 \times 0.9, \text{ exchange ratio})$.

b. $0.9 \times 1,00,000$ shares of Company B = 90,000 equivalent shares in Company A.

To summarise the discussion relating to earnings per share approach to determine the value of a firm, when the share exchange ratio is in proportion to the EPS, there is no effect on the EPS of the acquiring/surviving firm as well as on the acquired firm (Table 32.2). When, however, the share exchange ratio is different, it may result in dilution in the EPS of the acquiring firm and accretion in the EPS of the acquired firm (Table 32.3). For management of a firm considering acquiring another firm, a merger that results in dilution in EPS should be avoided. However, the fact that the merger immediately dilutes a firm's current EPS need not necessarily make the transaction undesirable. Such a criterion places undue emphasis upon the immediate effect of the prospective merger on the EPS. In examining the consequences of the merger upon the surviving concern's EPS, the analysis should be extended into future periods and the effect of the expected future growth rate in earnings should also be included in the analysis (Table 32.4) The dilution in the EPS of company A is more than offset by accretion in the EPS, with effect from year 4.

Financing Techniques in Mergers

After the value of firm has been determined on the basis of the preceding analysis, the next step is the choice of the method of payment of the acquired firm. The choice of financial instruments and techniques of acquiring a firm usually have an effect on the purchasing agreement. The payment may take the form of either cash or securities, that is, ordinary shares, convertible securities, deferred payment plans and tender offers.

Ordinary Share Financing When a company is considering the use of common (ordinary) shares to finance a merger, the relative price-earnings (P/E) ratios of two firms are an important consideration. For instance, for a firm having a high P/E ratio, ordinary shares represent an ideal method for financing mergers and acquisitions. Similarly, ordinary shares are more advantageous for both companies when the firm to be acquired has a low P/E ratio. This fact is illustrated in Table 32.5.

TABLE 32.5 Effect of Merger on Firm A's EPS and MPS

	Assuming share exchange ratio as	
	1: 2.5*	1:1
(a) Pre-merger Situation:		
	Firm A	Firm B
Earnings after taxes (EAT) (₹)	5,00,000	2,50,000
Number of shares outstanding (N)	1,00,000	50,000
EPS (EAT/N) (₹)	5	5
Price-earnings (P/E) ratio (times)	10	4
Market price per share, MPS (EPS × P/E ratio) (₹)	50	20
Total market value of the firm (N × MPS) or (EAT × P/E ratio) (₹)	50,00,000	10,00,000
(b) Post-merger Situation:		
	1: 2.5*	1:1
EAT _c of combined firm (₹)	7,50,000	7,50,000
Number of shares outstanding after additional shares issued	1,20,000	1,50,000
EPS _c (EAT _c /N) (₹)	6.25	5
P/E _c ratio (times)	10	10
MPS _c (₹)	62.50	50
Total market value (₹)	75,00,000	75,00,000

* Based on current market price per share

From a perusal of Table 32.5 certain facts stand out. The exchange ratio of 1:2.5 is based on the exchange of shares between the acquiring and acquired firm on their relative current market prices. This ratio implies that Firm A will issue 1 share for every 2.5 shares of Firm B. The EPS has increased from ₹5 (pre-merger) to ₹6.25 (post-merger). The post-merger market price of the share would be higher at ₹6.25 × 10 (P/E ratio) = ₹62.50.

When the exchange ratio is 1: 1 it implies that the shareholders of the Firm B demand a heavy premium per share ₹30 in this case i.e., (₹50 worth of share obtained in post-merger situation – ₹20 worth of equity share in pre-merger situation).

As shown in Table 32.6, at such an exchange ratio, the entire merger gain (of ₹15 lakh) accrues to the shareholders of Firm B. Evidently, this is the most favourable exchange ratio for shareholders of Firm B; the management of Firm A, in general, is not likely to agree to a more favourable exchange ratio (as it will cause decrease in shareholders' wealth of Firm A). This is the tolerable exchange ratio from the perspective of Firm A. Likewise, the management of Firm B is not likely to agree to a share exchange ratio that is detrimental to the wealth of its shareholders. Such an exchange ratio is 1: 3.25 (Table 32.7). At this ratio, the total gains accruing from the merger rests with the shareholders of Firm A. This is another set of tolerable exchange ratio from the viewpoint of Firm B. Thus, it may be generalised that *the maximum and the minimum exchange ratio should be between these two sets of tolerable exchange ratio.*

The exchange ratio eventually negotiated/agreed upon would determine the extent of merger gains to be shared between the shareholders of the two firms. This ratio would depend on the relative bargaining position of the two firms and the market reaction of the merger move.

TABLE 32.6 Apportionment of Merger Gains Between the Shareholders of Firms A and B

(1) Total market value of the merged firm	₹75,00,000
Less: Market value of the pre-merged firms:	
Firm A	₹50,00,000
Firm B	10,00,000
Total merger gains	<u>15,00,000</u>
(2) (a) Apportionment of gains (assuming share exchange ratio of 2.5:1)	
Firm A:	
Post-merger market value (1,00,000 shares × ₹62.50)	62,50,000
Less: Pre-merger market value	50,00,000
Gains for shareholders of Firm A	<u>12,50,000</u>
Firm B:	
Post-merger market value (20,000 shares × ₹62.50)	12,50,000
Less: Pre-merger market value	10,00,000
Gains for shareholders of Firm B	<u>2,50,000</u>
(b) Assuming share exchange ratio of 1:1	
Firm A:	
Post-merger market value (1,00,000 shares × ₹50)	50,00,000
Less: Pre-merger market value	50,00,000
Gains for shareholders of Firm A	<u>NIL</u>
Firm B:	
Post-merger market value (50,000 shares × ₹50)	25,00,000
Less: Pre-merger market value	10,00,000
Gains for shareholders of Firm B	<u>15,00,000</u>

TABLE 32.7 Determination of Tolerable Share Exchange Ratio for shareholders of Firms, Based on Total Gain Accruing to Shareholders of Firm A

(a) Total market value of the merged firm (Combined earnings, ₹7,50,000 × P/E ratio, 10 times)	₹75,00,000
(b) Less: Pre-merger or minimum post-merger value acceptable to shareholders of Firm B	10,00,000
(c) Post-merger market value of Firm A (a – b)	65,00,000
(d) Divided by the Number of equity shares outstanding in Firm A	1,00,000
(e) Desired post-merger MPS (₹65 lakh/1 lakh shares)	₹65
(f) Number of equity issues required to be issued in Firm A to have MPS of ₹65 and to have post-merger value of ₹10 lakh of Firm B, that is, (₹10 lakh/₹65)	15,385
(g) Existing number of equity shares outstanding of Firm B	50,000
(h) Share exchange ratio (g)/(h) i.e. 50,000/15,385 For every 3.25 shares of Firm B, 1 share in Firm A will be issued	<u>1 : 3.25</u>

Note: Share exchange ratio of 1:1 (shown in Table 32.6) can also be determined on the basis of procedure shown in Table 32.7.

Debt and Preference Shares Financing From the foregoing discussion it is clear that financing of mergers and acquisitions with equity shares is advantageous both to the acquiring firm and the acquired firm when the P/E ratio is high. However, since some firms may have a relatively lower P/E ratio as also the requirement of some investors might be different, other types of securities, in conjunction with/in lieu of equity shares, may be used for the purpose.

In an attempt to tailor a security to the requirements of investors who seek dividend/ interest income in contrast to capital appreciation/growth, convertible debentures and preference shares might be used to finance mergers. The use of such sources of financing has several advantages.

(i) Potential earning dilution may be partially minimised by issuing a convertible security. For example, assume that the current market price of the shares of an acquiring company is ₹50 and the value of the acquired firm is ₹50,00,000. If the merger proposal is to be financed with equity, 1,00,000 additional shares will be required to be issued. Alternatively, convertible debentures of the face value of ₹100 with conversion ratio of 1.8, which would imply a conversion value of ₹90 ($₹50 \times 1.8$), may be issued. To raise the required ₹50,00,000, 50,000 debentures convertible into 90,000 equity shares would be issued. Thus, the number of shares to be issued would be reduced by 10,000, thereby reducing the dilution in EPS, which could ultimately result, if convertible security was not resorted to in place of equity shares. (ii) A convertible issue might serve the income objectives of the shareholders of the target firm without changing the dividend policy of the acquiring firm. (iii) Convertible security represents a possible way of lowering the voting power of the target company. (iv) Convertible security may appear more attractive to the acquired firm as it combines the protection of fixed security with the growth potential of ordinary shares.

In brief, fixed income securities are compatible with the needs and purposes of mergers and acquisitions. The need for changing the financial leverage and the need for a variety of securities is partly resolved by the use of senior securities.

Deferred Payment Plan Under this method, the acquiring firm, besides making an initial payment, also undertakes to make additional payments in future years to the target firm in the event of the former being able to increase earnings consequent to the merger. Since the future payment is linked to the firm's earnings, this plan is also known as **earn-out plan**.

Adopting such a plan ensures several advantages to the acquiring firm: (i) It emerges to be an appropriate outlet for adjusting the differences between the amount of shares the acquiring firm is willing to issue and the amount the target firm is agreeable to accept for the business; (ii) In view of the fact that fewer number of shares will be issued at the time of acquisition, the acquiring firm will be able to report higher EPS immediately; (iii) There is a built-in cushion/protection to the acquiring firm as the total payment is not made at the time of acquisition; it is contingent on the realisation of the projected earnings after merger.

- **Earn-out plan**
- is a plan for
- payment to
- shareholders
- of target firm
- in merger that
- is linked to the
- earnings of the
- firm.

Notwithstanding the above benefits, there are certain problems in this mode of payment, the important ones being: (i) The target firm must be capable of being operated as an autonomous business entity so that its contribution to the total projects may be determined; (ii) There must be freedom of operation to the management of the newly acquired firm; (iii) On the part of the management of the acquiring firm, there must be willing cooperation to work towards the success and growth of the target firm, realising that only by this way the two firms can gain from the merger.

- **Base-period**
- **earnout**
- is the payment
- to shareholders
- of target firm in
- shares related to
- increase in firm's
- earnings in future
- years over the base
- period earnings.

There could be various types of deferred payment plans. The arrangement eventually agreed upon would depend on the imagination of the management of the two firms involved. One of the often used plans, for this purpose is the **base-period earnout**. Under this plan, the shareholders of the target firm are to receive additional shares for a specified number of future years, if the firm is able to improve its earnings *vis-à-vis* the earnings of the base period (the earnings in the previous year before the acquisition). The amount becoming due for payment, in shares, in the future years will primarily be a function of excess earnings, price-earnings ratio and the market price of the shares of the acquiring firm. The basis for determining the required number of shares to be issued is as per Equation 32.3.

$$(\text{Excess earnings} \times P/E \text{ ratio}) / \text{Share price of Acquiring firm}$$

Example 32.4

Company A has purchased Company B in the current year. Company B had its base year earnings of ₹3,00,000. At the time of merger, its shareholders received an initial payment of 75,000 shares of Company A. The market value of the Company A's shares is ₹30 per share and the P/E ratio is 8. The projected post-merger earnings of Company B for the next three years are ₹3,30,000, ₹3,90,000 and ₹4,14,000. Assuming no changes in share prices and P/E ratio of Company A, determine the number of shares required to be issued to the shareholders of Company B during these three years. As per the agreement with Company B, they will receive shares for 3 years only.

Thus, the shareholders of Company B will receive a total of 1,37,400 shares (75,000 initially + 62,400 in the subsequent three years). In financial terms, they have received Company A shares worth ₹41.22 lakh (1,37,400 shares × ₹30). This sum is higher than the shareholders would have received initially. Assuming the P/E ratio of Company B is 7 times (the assumption is reasonable in that the P/E ratio of Company A is 8 times; the P/E multiple of the acquiring firm is normally higher than that of the acquired firm), its valuation/purchase consideration would have been ₹21 lakh only (₹3 lakh × 7 times). Clearly, there is a substantial gain to the shareholders of Company B and this gain is not at the cost of the wealth of the shareholders of Company A. Evidently, the method is fair and equitable.

To conclude, the deferred plan technique provides a useful means by which the acquiring firm can eliminate part of the guesswork involved in purchasing a firm. In essence, it allows the merging management the privilege of hindsight.

$$\text{Year 1: } \frac{₹ 30,000 \times 8}{₹ 30} = 8,000 \text{ shares}$$

$$\text{Year 2: } \frac{₹ 90,000 \times 8}{₹ 30} = 24,000 \text{ shares}$$

$$\text{Year 3: } \frac{₹ 1,14,000 \times 8}{₹ 30} = 30,400 \text{ shares}$$

Tender Offer

An alternative approach to acquire another firm is the tender offer. A tender offer, as a method of acquiring a firm, involves a bid by the acquiring firm for controlling interest in the acquired firm. The essence of this approach is that the purchaser approaches the shareholders of the firm rather than the management to encourage them to sell their shares generally at a premium over the current market price.

Tender offer is a method to acquire control in another firm through bidding.

Since the tender offer is a direct appeal to the shareholders, prior approval of the management of the target firm is not required.

As a form of acquiring firms, the tender offer has certain advantages and disadvantages. The disadvantages are: **(i)** If the target firm's management attempts to block it, the cost of executing the offer may increase substantially and **(ii)** the purchasing company may fail to acquire a sufficient number of shares to meet the objective of controlling the firm.

The major advantages of acquisition through tender offer include: **(i)** If the offer is not blocked, say in 'friendly' takeover, it may be less expensive than the normal route of acquiring a company. This is so because it permits control by purchasing a smaller proportion of the firm's shares and **(ii)** The fairness of the purchase price is not questionable as each shareholder individually agrees to part with his shares at the negotiated price.

Free cash flows are after-tax operating earnings from acquisition plus non-cash expenses applicable to the target firm less expected additional investments in long-term assets and working capital.

Merger as a Capital Budgeting Decision

As a normative financial framework, the merger should be evaluated as a capital budgeting decision. The target firm should be valued in terms of its potential to generate incremental future cash inflows. As explained in the previous chapter, such cash flows should be incremental *future free cash flows* likely to accrue due to the acquisition of the target firm. Free cash flows, in the context of a merger, are equal

to after-tax operating earnings (expected from acquisition) plus non-cash expenses, such as depreciation and amortisation (applicable to the target firm), less additional investments expected to be made in the long-term assets and working capital of the acquired firm. These cash flows are then to be discounted at an appropriate rate that reflects the riskiness of target firm's business.

Like the capital budgeting decision, the present value of the expected benefits from the merger are to be compared with the cost of the acquisition of the target firm. Acquisition costs include the payment made to the target firm's shareholders and debenture-holders, the payment made to discharge the external liabilities, estimated value of the obligations assumed, liquidation expenses to be met by the acquiring firm and so on less cash proceeds expected to be realised by the acquiring firm from the sale of certain asset(s) of the target firm (not intended to be used in business subsequent to merger). The decision criterion is to 'go for the merger' if the net present value, NPV, is positive; the decision would be 'against the merger' in the event of the NPV being negative. Being a comprehensive measure of evaluation, it is not surprising to note that most of the merger decisions in America are evaluated in the capital budgeting framework⁴.

The following are the steps used to evaluate merger decisions as per the capital budgeting approach.

(i) Determination of Incremental Projected Free Cash Flows to The Firm (FCFF) These FCFF should be attributable to the acquisition of the business of the target firm. Format 32.1 contains constituent items of such cash flows.

FORMAT 32.1 Determination of FCFF

After-tax operating earnings

Plus: Non-cash expenses, such as depreciation and amortisation

Less: Investment in long-term assets

Less: Investment in net working capital

Note: All the financial inputs should be on incremental basis.

(ii) Determination of Terminal Value The firm is normally acquired as a going concern. It is worth recapitulating from chapter 32 that the projected FCFF in such situations are made in two segments, namely, during the explicit forecast period and after the forecast period. Terminal value, TV (also referred to as continuing value as explained in chapter 32) is the present value of FCFF, after the forecast period. Its value can be determined as per Equations 33.3 to 33.5.

(a) When FCFF are likely to be *constant till infinity*:

$$TV = FCFF_{T+1} / K_0 \quad (32.4)$$

Where $FCFF_{T+1}$ refers to the expected FCFF in the first year after the explicit forecast period.

(b) When FCFF are likely to *grow (g)* at a constant rate:

$$TV = FCFF_T (1 + g) / (K_0 - g) \quad (32.5)$$

(c) When FCFF are likely to *decline* at a constant rate:

$$TV = FCFF_T (1 - g) / (K_0 + g) \quad (32.6)$$

(iii) Determination of Appropriate Discount Rate/Cost of Capital In the event of the risk complexion of the target firm matching with the acquired firm (say in the case of horizontal merger and firms having virtually identical debt-equity ratio), the acquiring firm can use its own weighted average cost of capital (k_0) as discount rate. In case the risk complexion of the acquired firm is different, the appropriate discount rate is to be computed reflecting the riskiness of the projected FCFF of the target firm.

Handwritten text in the lower middle section of the right page.

Handwritten text in the lower section of the right page.

Handwritten text in the lower section of the right page.

Handwritten text at the bottom of the right page.

(iv) Determination of Present Value of FCFF The present value of FCFF during the explicit forecast period [as per step (i)] and of terminal value [as per step (ii)] is determined by using appropriate discount rate [as per step (iii)].

(v) Determination of Cost of Acquisition The cost of acquisition is determined as per Format 33.2.

FORMAT 32.2 Cost of Acquisition

Payment to equity shareholders (Number of equity shares issued in acquiring company × Market price of equity share)
Plus: Payment to preference shareholders
Plus: Payment to debenture-holders
Plus: Payment of other external liabilities (say creditors)
Plus: Obligations assumed to be paid in future
Plus: Dissolution expenses (to be paid by acquiring firm)
Plus: Unrecorded/contingent liability
Less: Cash proceeds from sale of assets of target firm (not to be used in business after acquisition)

Example 32.5 illustrates the application of capital budgeting approach to merger decision.

Example 32.5

The Hypothetical Limited wants to acquire Target Ltd. The balance sheet of Target Ltd. as on March 31 (current year) has the following assets and liabilities:

Liabilities	Amount	Assets	(₹ lakh)
			Amount
Equity share capital (4 lakh shares of ₹100 each)	₹400	Cash	₹10
Retained earnings	100	Debtors	65
10.50% Debentures	200	Inventories	135
Creditors and other liabilities	160	Plant and Equipment	650
	860		860

Additional information:

- (i) The shareholders of Target Ltd. will get 1.5 share in Hypothetical Ltd. for every 2 shares; the shares of the Hypothetical Ltd. would be issued at its current market price of ₹180 per share. The debenture-holders will get 11% debentures of the same amount. The external liabilities are expected to be settled at ₹150 lakh. Dissolution expenses of ₹15 lakh are to be met by the acquiring company.
- (ii) The following are projected incremental free cash flows (FCFF) expected from acquisition for 6 years (₹lakh):

Year-end 1	₹150
2	200
3	260
4	300
5	220
6	120

- (iii) The free cash-flow of Target limited is expected to grow at 3 per cent per annum, after 6 years.
 (iv) Given the risk complexion of Target limited, cost of capital relevant for Target limited cash flows has been decided at 13 per cent.
 (v) There is unrecorded liability of ₹20 lakh.
 Advise the company regarding financial feasibility of the acquisition.

Solution**TABLE 32.8** Financial Evaluation of Merger Decision

(i)		Cost of Acquisition ($t = 0$)		(₹ lakh)
	Share capital (3,00,000 shares × ₹180)			₹540
	11% Debentures			200
	Settlement of external liabilities			150
	Unrecorded liability			20
	Dissolution expenses of Target firm			15
				<u>925</u>

(ii)		PV of Free Cash Inflows (years = 1 – 6)		(₹ lakh)
Year-end	FCFF	PV factor (0.13)		Total PV
1	₹150	0.885		₹132.75
2	200	0.783		156.60
3	260	0.693		180.18
4	300	0.613		183.90
5	220	0.543		119.46
6	120	0.480		57.60
				<u>830.49</u>

(iii)		PV of FCFF After the Forecast Period (Referred to as Terminal Value, TV)	
	$TV_6 = FCFF_6 (1 + g)/(k_0 - g)$ $= ₹120 \text{ lakh } (1.03)/(0.13 - 0.03) = ₹123.6/0.1 = ₹1,236 \text{ lakh}$ PV of TV = ₹1,236 lakh × 0.480 = ₹593.28 lakh		

(iv)		Determination of Net Present Value	
	PV of Free cash flows (years 1 – 6)		₹830.49 lakh
	PV of Free cash flows subsequent to year 6		593.28
	Total PV of benefits/FCFF		<u>1,423.77</u>
	Less: Cost of acquisition		925.00
	Net present value		<u>498.77</u>

Recommendation As the NPV is positive, acquisition of Target limited is financially viable.

Example 32.6

Would your decision for acquiring Target limited (in **Example 32.5**) change, if FCFF after the forecast period are assumed to be (a) constant and (b) decline by 10 per cent per annum after 6 years.

Solution

TABLE 32.9 Determination of NPV, When FCFF are Constant after year-6

	(₹ lakh)
PV of FCFF (years 1 – 6)	₹830.49
PV of FCFF (subsequent to year 6)	443.08*
Total PV of benefits	1,273.57
Less: Cost of acquisition	925.00
Net present value	348.57

* Determination of PV related to TV:

$$TV = FCFF_6/k_0 = ₹120 \text{ lakh}/0.13 = ₹923.08 \text{ lakh}$$

$$PV = ₹923.08 \text{ lakh} \times 0.480 = 443.08 \text{ lakh}$$

TABLE 32.10 Determination of NPV when FCFF are Expected to Decline at 10 per cent after year 6

	(₹ lakh)
PV of FCFF (years 1 – 6)	₹830.49
PV of FCFF (subsequent to year 6)	225.39*
Total PV of benefits	1,055.88
Less: Cost of acquisition	925.00
Net present value	130.88

* Determination of PV related to TV:

$$TV = FCFF_6(1 - g)/(k_0 + g) = ₹108 \text{ lakh}/(0.13 + 0.10) = ₹469.57 \text{ lakh}$$

$$PV = ₹469.57 \text{ lakh} \times 0.480 = ₹225.39$$

Recommendation Since the NPV is positive in both the situations, the merger proposal continues to be financially viable.

The finance manager can use *sensitivity analysis* to have a range of NPV values within which acquisition price may vary. Sensitivity analysis can be carried out by making changes in the target firm's key financial parameters such as growth rate in FCFF (during the explicit forecast period as well as in subsequent years), sales, profit margins, investment in plant and machinery, investment in working capital and the period of growth itself⁵.

Adjusted Present Value (APV) Approach The APV approach is a variant of the DCF approach used to value the target firm. This approach is very appropriate for valuing companies with changing capital structures (such as leveraged buyout targets⁶) and for valuing target companies which are having capital structures substantially different from those of acquiring companies.

Adjusted present value a variant of DCF, is value of the target company if it were entirely financed by equity plus the value of the impact of debt financing in terms of the tax benefits as well as bankruptcy cost.

The approach values FCFF of target firm in two components: **(i)** the value of the target company if it were entirely equity financed and **(ii)** value the impact of debt financing both in terms of the tax benefit and bankruptcy costs.

The APV based valuation has its genesis in the Modigliani-Miller (MM) propositions on capital structure, according to which in a world of no taxes, the valuation of the firm (the sum of equity and debt) is independent of capital structure (change in debt/equity proportion). In other words, the capital structure can affect the valuation only through taxes and other market imperfections and distortions⁷.

The APV approach uses these concepts of MM to show the impact of debt financing in terms of tax shield on valuation. The approach, as stated earlier, first values the company as if it were wholly equity financed by discounting future FCFF at a

discount rate referred to as *unlevered cost of equity*. Since interest is a deductible item of expense to determine taxable income, it provides tax savings (assuming the firm has taxable income). The value of these tax savings are then added. Finally, to have the full impact of debt financing reflected in the valuation of the Target, adjustment is required to be made for incremental bankruptcy costs; the adjustment value may be determined subjectively or may be based on some suitable financial surrogate. Consider Example 32.7.

Example 32.7

For the facts in **Example 32.5**, compute the value of Target Limited based on the APV approach, given the cost of unlevered equity as 16 per cent, perpetual debentures and a corporate tax rate of 35 per cent. Ignore bankruptcy costs. Also estimate the NPV.

Solution**TABLE 32.11** (i) PV of FCFF, Discounted at Unlevered Cost of Equity (k_u) (₹ lakh)

Year-end	FCFF	PV factor (0.16)	Total PV
1	₹150	0.862	₹129.30
2	200	0.743	148.60
3	260	0.641	166.66
4	300	0.552	165.60
5	220	0.476	104.72
6	120	0.410	49.20
			764.08

(ii) PV of FCFF After the Forecast Period/Terminal Value (₹ lakh)

$$\begin{aligned} TV_6 &= FCFF_6 (1 + g)/(k_u - g) \\ &= ₹120 \text{ lakh } (1.03)/(0.16 - 0.03) = ₹950.77 \text{ lakh} \\ \text{PV of TV} &= ₹950.77 \text{ lakh} \times 0.410 = ₹389.82 \text{ lakh} \end{aligned}$$

(iii) PV of Tax Savings Due to Interest (₹ lakh)

Amount of Debt (11% Debentures)	₹200
Amount of interest (₹200 lakh × 0.11)	22
Tax savings (₹22 lakh per year × 0.35 tax rate)	7.7
Present value of tax shield (₹7.7 lakh/0.11)	70.0

TABLE 32.12 (iv) Adjusted Present Value and NPV of Target Limited (₹ lakh)

(i) PV of FCFF (years 1 – 6)	₹764.08
(ii) PV of terminal value	389.82
(iii) PV of tax shield	70.00
Total adjusted present value	1223.90
Less: Cost of acquisition	925.00
Net present value	298.90

The acquisition of Target limited is financially profitable according to the APV approach. However, the approach brings to fore the fact that the tax advantage of debt may not be sizable, particularly when viewed along with bankruptcy costs.

In valuing the present value of a tax shield, the cost of debt is used as a discount rate. One argument for using the cost of debt as discount rate is that the tax benefits are likely to be realised and are, therefore, subject to low risk. Another argument is that uncertainty about company's ability

General Ledger

Journal entries for the month of January, including sales, purchases, and expenses.

Income Statement

Summary of revenues and expenses for the month, showing a net profit.

Balance Sheet showing assets (Cash, Accounts Receivable, Inventory, etc.) and liabilities/equity.

Statement of Cash Flows showing cash inflows from operations and outflows for expenses.

Continuation of journal entries for the month of January.

Continuation of journal entries for the month of January.

Table with 4 columns: Date, Description, Debit, and Credit. Contains entries for Jan 1, Jan 5, Jan 10, Jan 15, Jan 20, Jan 25, and Jan 31.

Income Statement

Summary of revenues and expenses for the month, showing a net profit.

Balance Sheet showing assets (Cash, Accounts Receivable, Inventory, etc.) and liabilities/equity.

Statement of Cash Flows showing cash inflows from operations and outflows for expenses.

Final summary of financial results for the month.

to realise the tax shield is best measured by the rate at which the lenders are willing to lend to the company, that is, cost of debt⁸.

However, there is a counter argument for using higher discount rates (say, weighted average cost of capital or unlevered cost of equity) to value the tax shield. Tax shields are not certain in nature; future tax shields are tied to the business operations in future, that is, future profits. In other words, there will be a high correlation between the profits and cash flows and the interest tax shield. Hence, the risk will be similar. With similar risk, the interest tax shields should also be discounted at the same rate as the operations of the target firm, that is, the unlevered cost of equity⁹.

To sum up it may be said that the discount rate to value the tax shield will depend on the circumstances of each case. When the firm has a low target debt ratio and business prospects are very promising, there is a greater probability of realising tax shields in the future. Therefore, in such a situation, the cost of debt can be used as the discount rate. On the contrary, if the target debt ratio of the firm as well as its business risk is high, there is obviously a greater uncertainty in realising potential tax shields and, hence, they should be subject to a higher discount rate. Finally, the finance manager may also consider (say, in undecisive situations) a discount rate lying somewhere between the cost of debt and the weighted average cost of capital or unlevered cost of equity.

LO 32.3 TAX ASPECTS OF AMALGAMATION, MERGER AND DEMERGERS

The important and relevant tax provisions applicable to amalgamations, acquisitions, mergers and demergers are summarised below.

Tax Aspects Related to Amalgamation/Mergers

Amalgamation for the purposes of income tax is recognised only if the conditions given under Section 2 (1B) of the Income Tax Act, 1961 (ITA) are fulfilled. According to Section 2 (1B) 'amalgamation', in relation to companies, means the merger of one or more companies with another company or the merger of two or more companies to form one company (the company or companies that so merge are referred to as the amalgamating company or companies and the company with which they merge or which is formed as a result of the merger is the amalgamated company) in such a manner that:

- (i) all the property/liabilities of the amalgamating company(ies) immediately before the amalgamation, becomes the property/liabilities of the amalgamated company by virtue of the amalgamation;
- (ii) Shareholders holding not less than three-fourths (in value) of the shares in the amalgamating company(ies) (other than shares already held therein immediately before the amalgamation by the amalgamated company, its subsidiary or by a nominee of the said company) become shareholders of the amalgamated company by virtue of the amalgamation.

Tax Concessions to Amalgamated Company The following are the major tax benefits available to the amalgamated company.

1. Carry Forward and Set off of Business Losses and Unabsorbed Depreciation According to Section 72 A, the amalgamated company is entitled to carry forward accumulated losses as well as unabsorbed depreciation of the amalgamating company, provided the following conditions are fulfilled:

- (i) The amalgamated company continuously holds, for a minimum period of 5 years, from the date of amalgamation at least three-fourths of the above value of fixed assets of the amalgamating company, acquired in the scheme of amalgamation.

- (ii) The amalgamated company continues the business of the amalgamating company for a minimum period of 5 years from the date of amalgamation.
- (iii) The amalgamated company fulfils such other conditions as may be prescribed to ensure the revival of the business of the amalgamating company or to ensure that the amalgamation is for genuine business purposes.
- (iv) The amalgamation should be of a company owning an industrial undertaking or ship. Industrial undertaking, in this context, means an undertaking that is engaged in
 - the manufacture or processing of goods; or
 - the manufacture of computer software; or
 - the business of generation or distribution of electricity or any other form of power; or
 - the business of providing telecommunication services, whether basic or cellular, including radio paging, domestic satellite service, network of trunking, broadband network and internet services; or
 - mining or
 - the construction of ships, aircrafts or rail systems.

In case where any of the above conditions (i – iv) are not complied with, the set off of loss or allowance of depreciation made in any previous year in the books of the amalgamated company would be deemed to be the income of the amalgamated company and chargeable to tax for the year in which such conditions are not complied with.

2. Expenditure on Scientific Research Where an amalgamating company transfers any asset represented by capital expenditure on scientific research to the amalgamated Indian company, unabsorbed capital expenditure in the books of the amalgamating company would be eligible to be carried forward and set off in the hands of the amalgamated company.

3. Expenditure on Acquisition of Patent Rights or Copy Rights The expenditure on patents and copyrights not yet written off in the books of amalgamating company would be allowed to be written off by the amalgamated company in the same number of balance instalments.

Where such rights are later on sold by the amalgamated company, the profit/loss on such sales would be treated in the hands of the amalgamated company, in the same manner as it would have been allowed to be treated by the amalgamating company.

In case such expenditure has been incurred by the amalgamating company after March 31, 1998, such an expenditure would be eligible for depreciation, as intangible asset and provisions of depreciation would apply.

4. Expenditure on Know-how Regarding the expenditure incurred on know-how, the amalgamated company would be entitled to claim deduction with respect to the transferred undertaking, to the same extent and for the same residual period as otherwise would have been allowed to the amalgamating company, had such an amalgamation not taken place. Like patent rights, in case such an expenditure is incurred by the amalgamating company after March 31, 1998, such an expenditure will be eligible for depreciation as intangible asset and provisions of depreciation would apply.

5. Expenditure for Obtaining Licence to Operate Telecommunication Services When the amalgamating company transfers licence to the Indian amalgamated company, the expenditure on acquisition of licence, not yet written off, is allowed to the amalgamated company in the same number of balance instalments. When such licence is sold by the amalgamated company, the treatment of surplus/deficiency would be the same as would have been in the case of the amalgamating company.

6. Preliminary Expenses Deduction of preliminary expenses (to the extent not amortised) would be made in the books of the amalgamated company in the same manner as would have been allowed to the amalgamating company.

7. Expenditure on Prospecting of Certain Minerals Where an amalgamating company merges with the amalgamated company, the amount of expenditure on prospecting, etc, of certain minerals of the amalgamating company that are not yet written off, would be allowed as deduction to the amalgamated company in the same manner as would have been allowed to the amalgamating company.

8. Capital Expenditure on Family Planning The capital expenditure on family planning not yet written off would be allowed to the amalgamated company in the same number of balance instalments.

9. Bad Debts When the debts of amalgamating company have been taken over by the amalgamated company and subsequently such debt or part of debt becomes bad, they would be allowed as a deduction to the amalgamated company in the same manner as would have been allowed to the amalgamating company.

In brief, the Income tax Act for all types of business reorganisations/amalgamations/mergers has become **fully tax neutral**. Virtually all fiscal concessions/incentives/deductions (in respect of fixed assets, capital expenditures, intangible assets, deferred revenue expenditure and so on) that would otherwise have been available to the amalgamating company are made available to the amalgamated company as well. In other words, the unwritten off amount, with respect to all these items, is treated in the hands of the amalgamated company in the same manner as would have been treated by the amalgamating company. Thus, the amalgamated company is not put to any disadvantage as far as the income tax concessions and incentives are concerned. The present generous/favourable fiscal provisions are indicative/reflective of Government policy to facilitate, promote and create opportunities for more amalgamations and mergers.

Tax Concessions to Amalgamating Company The tax concessions to the amalgamating are summarised below.

(i) Free of Capital Gains Tax According to Section 47 (vi), where there is a transfer of any capital asset by an amalgamating company to any Indian amalgamated company, such transfer will not be considered as a transfer for the purpose of capital gain.

(ii) Free of Gift-Tax According to Section 45 (b) of the Gift Tax Act, where there is a transfer of any asset by an Indian amalgamating company, gift tax will not be attracted.

Tax Concessions to the Shareholders of an Amalgamating Company According to Section 47 (vii), where a shareholder of an Indian amalgamating company transfers his shares, such transaction will be disregarded for capital gain purposes, provided the transfer of shares is made in consideration of the allotment of any share to him or shares in the amalgamated company.

Further, for computing the period of holding of such shares, the period for which such shares were held in the amalgamating company would also be included so that the shareholders of the amalgamating company are not put to disadvantage.

Demerger is the transfer by a company one or more of its undertakings to another company.

Tax Aspects Related to Demergers

Meaning of Demerger Pursuant to a scheme of arrangement under Sections 391 to 394 of the Companies Act, a demerger means the transfer, by the demerged company, of one or more of its undertakings to any resulting company in such a manner that:

- (i) all the property/liabilities of the undertaking, being transferred by the demerged company, immediately before the merger becomes the property/liabilities of the resulting company by virtue of the demerger;
- (ii) the property and the liabilities of the undertaking(s) being transferred by the demerged company immediately before the demerger are transferred at values appearing in its books of account;
- (iii) the resulting company issues, in consideration of the demerger, its shares on a proportionate basis to the shareholders of the demerged company;
- (iv) shareholders holding not less than three-fourths in value of the shares in the demerged company (other than shares already held therein immediately before the demerger, or by a nominee for the resulting company or, its subsidiary) become shareholders of the resulting company or companies by virtue of the demerger;
- (v) the transfer of the undertaking is on a going concern basis;
- (vi) the demerger is in accordance with the conditions, if any, notified in this behalf under Section 72 A (5) by the Central Government.

The undertaking, in the present context, means any part of an undertaking or a unit or division of an undertaking or a business activity taken as a whole, but does not include individual assets or liabilities or any combination thereof not constituting a business activity.

Meaning of Demerged Company Demerged company means the company whose undertaking is transferred, pursuant to a demerger, to a resulting company.

Meaning of Resulting Company Resulting company means one or more companies (including a wholly owned subsidiary thereof) to which the undertaking of the demerged company is transferred in a demerger and the resulting company, in consideration of such transfer of undertaking, issues shares to the shareholders of the demerged company and may include any authority or body/local authority/public sector company/company established, constituted or formed as a result of demerger.

Tax Concessions to Resulting Company The resulting company is entitled virtually to all the tax concessions as are available to the amalgamated company. These are listed as follows.

(i) Carry Forward and Set off of Business Losses and Unabsorbed Depreciation of the Demerged Company The accumulated loss and unabsorbed depreciation 'in a demerger' should be allowed to be carried forward by the resulting company, if these are directly related to the undertaking proposed to be transferred. Where it is not plausible to relate these to the undertaking, such loss and depreciation would be apportioned between the demerged company and the resulting company in proportion of the assets coming to the share of each as a result of the demerger.

(ii) Expenditure on Acquisition of Patent Rights or Copyrights Where the patent or copyrights acquired by the demerged company is transferred to the resulting Indian company, the expenditure on patents or copyrights not written off would be allowed to be written off in the hands of the resulting company in the same number of balance instalments. On their subsequent sales, the treatment of deficiency/surplus in the resulting company would be the same as would have been in the case of the demerged company.

(iii) Expenditure on Know How

(iv) Expenditure for Obtaining Licence to Operate Telecommunication Services

(v) Expenditure on Prospecting, etc of Certain Minerals Where there is a transfer of items listed (iii to v) above by the demerged company to the resulting Indian company, the amount of expenditure not yet written off would be allowed to the resulting company in the same number of balance instalments. In the case of sales of any of these items, the treatment of the deficiency/surplus in the books of the resulting company would be the same as would have been in the case of a demerged company.

(vi) Preliminary Expenses Where the undertaking of an Indian company is transferred before the expiry of 10/5 years, to another company, the preliminary expenses of such an undertaking that are not yet written off would be allowed as deduction in the same manner as would have been allowed to the demerged company.

(vii) Bad Debts Where due to demerger, the debts of the demerged company have been taken over by the resulting company and subsequently such debt or part of debt becomes bad, such bad debts would be allowed as a deduction to the resulting company.

(viii) Expenditure Related to Demerger In the case of expenditures that are incurred after the April 1, 1999, wholly and exclusively for the purpose of the demerger of an undertaking, the resulting Indian company incurring such an expenditure would be allowed a deduction of an amount equal to one-fifth of such expenditure for five successive previous years beginning with the previous year in which the demerger takes place.

Tax Concessions for the Demerged Company The concessions for the demerged company are as follows.

(i) Free of Capital Gains Tax Where there is a transfer of any capital asset in a demerger, such transfer would not be regarded as a transfer for the purpose of capital gain.

(ii) Reserves for Shipping Business Where a ship acquired out of the reserve is transferred even within the period of eight years of acquisition, there would be no deemed profits to the demerged company.

Tax Concessions to the Shareholders

Any transfer or issue of shares by the resulting company to the shareholders of the demerged company would not be regarded as transfer if the transfer or issue is made in consideration of the demerger of the undertaking. In the case of demerger, the existing shareholders of the demerged company would hold shares in the resulting company as well as shares in the demerged company.

Further, for computing the period of holding of such shares in the resulting company, the period for which such shares were held in the demerged company would also be included.

LO 32.4 LEGAL AND PROCEDURAL ASPECTS OF MERGERS/ AMALGAMATIONS AND ACQUISITION/TAKEOVERS

Following the economic reforms in India in the post-1991 period, there is a discernible trend among promoters and established corporate groups towards consolidation of market share and diversification into new areas through acquisition/takeover of companies, and in a more pronounced manner through mergers/amalgamations. Although the financial evaluation and the economic considerations, in terms of motive and effect, of the above mentioned are similar, the legal procedures involved are different. The pre-entry scrutiny of mergers/combinations in India is presently carried out by the Competition Commission of India under the Competition Act 2002. The merger and amalgamation

of corporates constitutes the subject matter of the Companies Act. The acquisition/takeover bids fall under the purview of the SEBI. We first cover the framework of pre-entry scrutiny and mergers/amalgamations. The regulatory framework governing acquisition/takeovers is described subsequently.

Combination and Competition Act

Prior to 1991, pre-entry scrutiny of mergers/combinations in India was conducted by the Monopolies and Restrictive Practices (MRTP) Commission under the MRTP Act, 1969. Since 2003, the Competition Commission of India (CCI) is empowered under the Competition Act 2002 to scrutinise and clear combinations that may give rise to monopoly situations. The CCI is mandated, upon its own knowledge or information, to enquire within one year of its happening whether an acquisition/acquisition of control/amalgamation or merger has caused/is likely to cause an appreciable adverse effect on competition in India. The main feature of the regulation of combination by the CCI are discussed below.

Regulation of Combination Any combination entered into by any **person** (i.e. individual/Hindu Undivided Family/company/firm/association of person(s) incorporated in India or abroad/corporation or Government company/body corporate/cooperative society/local authority/every other artificial judicial person) or **enterprise** which causes or is likely to cause an **appreciable adverse effect** on competition within the **relevant market** in India would be void. Whether a combination would have the effect of/is likely to have appreciable adverse effect on competition in the relevant market, the CCI would have due regard to all/any of the factors listed below:

- Actual/potential level of competition through imports in the market;
- Extent of barriers to entry to the market;
- Degree of countervailing power in the market;
- Likelihood of the combination resulting in the concerned parties being able to significantly and sustainably increase price/profit margin;
- Extent of effective competition likely to sustain the market;
- Extent to which substitutes are/likely to be available in the market;
- Market share in the relevant market of the concerned person/enterprise individually/jointly;
- Likelihood of the combination resulting in the removal of a vigorous/effective competitor(s) in the market;
- Nature/extent of vertical integration in the market;
- Possibility of a failing business;
- Nature/extent of innovation;
- Relative advantage by way of contribution to economic development by any combination having/likely to have appreciable adverse effect on competition;
- The benefits of combination outweigh the adverse impact of combination.

The term **enterprise** means a person/department of Government who/which is/has been engaged in any activity relating to production/storage/supply/distribute/acquisition/ control of articles/goods or the provision of any kind of services or **investment or in the business of acquiring/holding/underwriting/dealing with shares/debentures/other securities of any other body corporate directly/indirectly through one of its units/divisions/subsidiaries.**

Relevant market means the market determined by the CCI with reference to the relevant (i) product, (ii) geographic market or both. While the geographic market refers to the area in which the

Relevant market means the market determined by the CCI with reference to the relevant (i) product, (ii) geographic market or both.

conditions of competition are homogeneous distinct from the neighbouring area, product market comprises all interchangeable/ substitute products/services.

Any person/enterprise proposing to enter into combination should give notice to the CCI containing the details of the proposal within 30 days of (a) approval of the mergers/amalgamation by the Board of Directors, (i.e. the individual himself/herself including sole proprietor, Karta in a HUF, Board of Directors of a company, body/person empowered in Government company/corporation, association of persons, body of individuals whether incorporated or not, body corporate incorporated in India/abroad, cooperative society, local authority, partners of a firm and person(s) competent to act in case of any other judicial person), (b) execution of any agreement/other documents for acquisition/acquiring control. The combination would be effective after 210 days from the date of the notice.

Combination The acquisition of an enterprise(s) by a person(s) or merger or amalgamation of enterprises would constitute their combination subject to the conditions **discussed later.**

Acquisition means directly/indirectly acquiring/agreeing to acquire (i) share/voting rights/assets or (ii) control over management/assets of an enterprise. Included in **control** is controlling

Combination is the acquisition of an enterprise(s) by a person(s) or merger or amalgamation of enterprises.

the affairs/management by an enterprise(s)/group(s) either jointly or singly over another enterprise/group. **Group** means two/more enterprises which directly/indirectly are in a position to (i) exercise at least 26 per cent of the voting rights or (ii) appoint more than 51 per cent of the Board of Directors or (iii) control the management/affairs of the other enterprise. The value of assets would be determined on the basis of their audited book value less depreciation in the financial year immediately preceding the financial year in which the date of merger falls. Such value will include the brand value, value of goodwill/copyrights/patents/permitted use/collective work/registered proprietor/trade mark/user/homogenous geographical indication/geographical indication/design/layout design/similar other commercial rights and so on.

Acquisition means directly/indirectly acquiring/agreeing to acquire (i) share/voting rights/assets or (ii) control over management/assets of an enterprise.

The conditions for pre-combination scrutiny by the CCI pertain to the value of assets and turnover, that is, value of goods and services.

Goods include (i) product manufactured/proceed/mined, (ii) debentures/stocks/shares after allotment and (iii) goods incorporated

Control is controlling the affairs/management by an enterprise(s)/group(s) either jointly or singly over another enterprise/group.

into India. **Service** means service of any description made available to potential users, including services in connection with business of any industrial/commercial matters such as banking/communication/education/financing/ insurance/chit funds/real estate/transport/storage/material treatment/processing/supply of electrical or other energy/boarding, lodging, entertainment, amusement/ construction/ repair/conveying of news or information and advertising.

Group means two/more enterprises which directly/indirectly are in a position to (i) exercise at least 26 per cent of the voting rights or (ii) appoint more than 51 per cent of the Board of Directors or (iii) control the management/affairs of the other enterprise.

Conditions To constitute combination, the following conditions must be satisfied in regard to (i) acquisition, (ii) acquiring control and (iii) merger/amalgamation:

The acquirer and the concerned enterprise jointly have in (a) India assets and turnover exceeding ₹1,000 crore and ₹3,000 crore, respectively, (b) India/outside India, the respective amounts are more than 500 million US dollars (including at least ₹500 crore in India), and 1,500 million US dollars (including at least ₹1,500 crore in India). The stipulations for the group to which the concerned enterprise belongs are that their joint holdings in India are/would be ₹4,000 crores (assets) and ₹12,000 crores (turnover). Such holdings in India/outside India should aggregate more than two billion US dollars (of which at least ₹500 crore in India) in terms of assets and six billion US dollars (including at least ₹1,500 crore in India) in terms of turnover.

Procedure for Investigation Where the CCI is of the *prima facie* opinion that a combination is likely to cause/has caused an appreciable adverse effect on competition within the relevant market in India or any person/enterprise has given a notice to the CCI proposing to enter into a combination, it would issue a show cause notice to the parties to the combination to respond within 30 days as to why an investigation should not be conducted. After receipt of their response, the CCI may call for a report from its Directors General within specified time. Within 7 days from the receipt of the response of the parties concerned or the report from the Director General whichever is later, the CCI would direct the parties to publish details of the combination within 10 days in a manner appropriate for bringing to the knowledge/information of the public/persons affected/likely to be affected by the combination. The CCI may invite any person/member of the public affected/likely to be affected to file written objections within 15 days of the publication of the details of the combination. Within 15 days of the expiry of the period for filing objection, additional/other information deemed fit by the CCI may be sought from the parties concerned to be furnished within the next 15 days. After receipt of all information, the CCI would proceed within 45 days to deal with the case in the manner specified below.

Orders of CCI On the basis of its assessment of the appreciable adverse effect of combination on competition, the CCI would (i) approve, (ii) disapprove, (iii) propose appropriate/suitable modification to eliminate the adverse effect within the specified period. In case of failure of parties who accept the suggested modification to carry it out, the combination would be deemed to have an appreciable adverse effect on competition and the CCI would deal with it according to the provisions of the Competition Act.

The parties concerned can within 30 days of the proposed modification submit an amendment to the modification and the CCI, if satisfied, would approve the combination. If, however, the CCI does not accept the amendment, the parties would have to accept the CCI-proposed modifications failing which the combination would be deemed to have an appreciable adverse effect on competition and deal with in accordance with the provisions of the Competition Act. The proposed acquisition/acquiring of control/merger or amalgamation by the parties concerned, without prejudice to the imposition of any penalty or initiation of any prosecution under the Competition Act, would not be given effect to after the CCI's direction/the combination being deemed to have an appreciable adverse effect or competition. The CCI can also frame a scheme to implement its order.

If, however, the CCI does not pass an order/issue direction on the expiry of the 210-day period from the date of the original notice by the parties, the combination would be deemed to have been approved by it. The limits of 210 days would not include the 60 days given to the parties to file an amendment to the modification proposed by the Commission (30 days) and accept the modification after rejection of their amendment (30 days). Similarly, any extension of time sought/granted by the parties/CCI would be deducted for reckoning the 210 day-period. Where a combination is ordered by the CCI to be void, the acquisition/acquiring of control/merger or amalgamation would be dealt with under any other law as if the combination had not taken place and the parties concerned dealt with accordingly.

Penalties The CCI may cause an inquiry into compliance of its orders/directions. Failure, without reasonable cause, to comply with its orders/directions would be punishable with a fine upto rupees one lakh for each day of non-compliance subject to a maximum of ₹10 crore. If any person fails to pay any monetary penalty imposed on him, the CCI would proceed to recover it in the specified manner, including under the Income Tax Act as assessee in default. Non-compliance with CCI's orders/directions or failure to pay the fine would be punishable with imprisonment up to 3 years or with fine up to ₹25 crore or with both. Any person can approach the Appellate Tribunal for recovery of compensation from any enterprise for any loss/damage suffered by him as a result of violation of CCI's directions or contravention without reasonable ground, of any decision/order of the CCI or any condition/restrictions subject to which any approval/sanction/direction/exemption in relation to any matter has been accorded/given/made/granted under the Competition Act or delay in carrying out such orders/directions of the CCI. Penalty for **(i)** failure to comply with directions of the CCI/Director General, fine up to Rupees one lakh for each day of failure subject to a maximum of ₹1 crore; **(ii)** non-furnishing of information on combination, up to 1 per cent of the highest of the total turnover or assets; **(iii)** making of false statements/omission to furnish material information, not less than ₹50 lakh and upto ₹1 crore, **(iv)** offences relating to furnishing of information, fine up to ₹1 crore and any other order deemed fit by the CCI. Included in these offences are **(1)** making of a statement/furnishing of a document knowing or having reasons to believe to be false in any material particular, **(2)** omission to state any material fact knowing it to be material, and **(3)** willfully altering/suppressing/destroying any document required to be furnished.

In case of contravention of provision(s) of the Competition Act/rules/regulations/order/direction by a company, the company as well as every person incharge of, and responsible for the conduct of its business would be deemed to be guilty of the contravention. In case of contravention with the consent/connivance of, or attributable to any neglect on the part of any director/manager/secretary/other officer, they would also be deemed to be guilty.

CCI Procedure in Regard to the Transactions of Business Relating to Combination of Regulations, 2011 According to the CCI's regulations 2011 in regard to the transaction of business relating to combination, an enterprise which proposes to enter into a combination should give/file a notice to the CCI in the specified format (ordinary Form I) together with the evidence of payment of fee of ₹50,000 by the concerned parties, including instances where:

- Parties are **(a)** not engaged **(i)** in the production/supply/distribution/storage, sale/trade or provisions of similar/identical/substitutible goods or services, **(ii)** at different stages/levels of the production chain in different markets in respect of production/supply/distribution/storage,

sale/trade in goods or provision of services in which another party to the combination is engaged; **(b)** continues to be predominantly engaged in export of goods/services from India after the combination takes effect. At least 75 per cent of its turnover should be derived from export and the market share of the combined entity should be less than 15 per cent in the relevant market in India.

- Acquisition/acquiring of control over an enterprise **(a)** is by a liquidator/ administrator/receiver appointed through **(i)** court proceeding or **(ii)** any scheme approved under the Securitisation and Reconstruction of Financial Assets and Enforcement of Security Interest (SRFAESI) Act/Sick Industrial Companies Act/any other law; **(b)** results from gift/inheritance; **(c)** is of a trustee company/arises from a change of trustees of a mutual fund.
- Parties are engaged **(a)** in production/supply/distribution/storage, sale/trade or provision of similar/identical/substitutable goods or services and their combined market share after combination is below 15 per cent in the relevant market; **(b)** at different stages/levels of the production chain in different markets in respect of production/supply/distribution/storage in goods or provision of services with their individual/combined share being less than 25 per cent in the relevant market.

Since the categories of combination listed below are not likely to cause an appreciable adverse on a competition in India, the requisite notice need not normally be filed:

- An acquisition of shares/voting rights **(i)** solely as an investment/in the ordinary course of business up to 15 per cent of the shares/voting rights of the company concerned, **(ii)** where the acquirer already holds 50 per cent or more shares/voting rights except where the transaction results in transfer from joint to sole control, **(iii)** pursuant to bonus issue/stock splits/consolidation of face value of shares or subscription to rights issue to the extent of entitled proportion not leading to acquisition of control, **(iv)** by a person acting as underwriter/stock broker on behalf of clients in the process of underwriting/in the ordinary course of business.
- An acquisition of assets not related to the business activity of the acquirer or made solely as an investment/in the ordinary course of business not leading to control except where the acquired assets represent substantial business operations in a particular location/for particular product/service irrespective of whether the assets are organised as a separate legal entity or not.
- An amended/renewed tender offer where a prior notice has been filed to CCI by the party concerned.
- An acquisition of stock-in-trade/raw materials/stores/spares/current assets in the ordinary course of business.
- An acquisition of control/shares/voting rights/assets by one person/enterprise of another person/enterprise within the same group.

However, parties to the combination may, at their option, annex additional supporting documents with **Form I** or file notice in **Form II**. During the course of the enquiry, the CCI may direct them to file any additional information. The time taken by the parties in filing the additional information would be excluded from the 210-day period after which the combination would be effective.

The CCI can direct the concerned parties to file the notice in Form II to form its *prima facie* opinion whether combination is likely to cause or has caused appreciable adverse effect on competition within the relevant market. The fee for filing the notice in Form II (₹10,00,000) would be reduced by the fee already paid while filing Form I (₹50,000). The additional time taken in filing the notice would also be excluded from the 210-day period.

The details of acquisition by a public financial institution/FII/bank/VCF should be filed without any fee in Form III.

Where the concerned parties fail to file the requisite notice, the CCI may upon its own knowledge/information inquire into whether a combination has caused/is likely to cause an appreciable adverse effect on competition within India. It may direct them to file notice in Form II along with the fee of ₹10,00,000 within 30 days of the communication/direction. In case of acquisition/acquiring of control of enterprises, the acquirer should file the notice in Form I/II. If the enterprise is being acquired without its consent, the acquirer should furnish the available information relating to the enterprise being acquired within 15 days of the notice. The CCI may direct the enterprise being acquired to furnish such information as it deems fit and the time taken by the acquirer/acquired enterprises would be excluded from the 210-day period. The parties should jointly file the notice in respect of merger/amalgamation.

The parties to the combination should inform the CCI of any change in the information provided in the notice at the earliest during the continuation of the proceedings. The CCI would assess the significance of information relating to that change and act accordingly.

The proceedings under the Competition Act relating to combination would be terminated upon **(i)** a notice from the parties filing the notice that the proposed combination would not take effect, **(ii)** passing of an order by the CCI to approve the combination or otherwise.

The CCI would form the *prima facie* opinion as to whether the combination is likely to cause/has already caused an appreciable adverse effect on competition within the relevant market in India within 30 days of the receipt of the notice. In forming *prima facie* opinion, it may require the parties to file additional information/accept modification. It may also call for information from any other enterprise. Within 4 days of the CCI's decision, its direction should be conveyed to the parties to publish the details of the combination within 10 days in all-India editions of four leading daily newspapers, including two business newspapers. The details should also be posted on the website of the CCI as well as the parties to the combination. The concerned parties should submit copies of the publications to the CCI within 15 days of the direction.

The CCI may propose appropriate modification to the combination to eliminate its adverse effect. The parties may proposed amendment to the modification. They should carry out within the specified time the modification as per the specified terms/conditions. If parties fail to accept the modification within the specified period/further period allowed, the combination would be deemed to have an appreciable effect on competition. The CCI would pass an order that it would not take effect. Any party aggrieved by any direction may prefer an appeal to the Competition Appellate Tribunal (CAT).

Combination and Companies Act

The provisions of the Companies Act, 2013 relating to combination contained in Sections 230–32 are summarised below.

- (1)** Merger can be by **(i)** absorption or **(ii)** formation of a new company. Merger by absorption involves the transfer of the undertaking, property and liabilities of the companies to another existing company. Their transfer to a new company is merger by formation of a new company. While absorption relates to the transferor and transferee companies, merger by formation of a new company is in relation to the transferor companies. Any proposal/scheme/arrangement for reconstruction of a company (or companies) involving merger/amalgamation under which the whole/part of the undertaking, property (includes assets/rights and interest of every description)/liabilities (includes debts and obligations of every description) of the transferor

company are required to be transferred to the transferee company or are proposed to be divided among and transferred to two/more companies would require sanction by the National Company Law Tribunal (NCLT). On receipt of the application of the company, any creditor or member, the NCLT would order a meeting of the creditors/members to be called/held/conducted in a manner directed by it. The notice for the meeting should be sent to all the creditors/members and debentureholders individually at their registered address accompanied by a statement disclosing, *inter-alia*, the details of the arrangement/scheme, a copy of the valuation report and explaining their effect on creditors, key managerial personnel, promoters/non-promoter members, debentureholders and any material interest of the directors/debenture trustees. The notice and other documents should also be **(i)** placed on the website of the company, **(ii)** sent to the SEBI/concerned stock exchanges for placing on their websites, and **(iii)** published in newspapers in the prescribed manner. The notice for the meeting issued by way of an advertisement should indicate the time within which copies of the scheme would be made available to the concerned persons free of charge from the registered office of the company.

The notice should, moreover, provide that the person to whom it is sent may vote in the meeting either themselves or through proxies or by postal ballot to the adoption of the proposal within one month only. Persons **(i)** holding at least 10 per cent of the shareholding or **(ii)** having a minimum 5 per cent of the total outstanding debt can make objections to the scheme.

Further, the notice with all the documents in the prescribed form should also be sent to the **(i)** Central Government, **(ii)** Income Tax authorities, **(iii)** RBI, **(iv)** SEBI, **(v)** Registrar of Companies, **(vi)** Respective stock exchanges, **(vii)** Official liquidator, **(viii)** Competition Commission of India and **(ix)** other sectoral regulators/authorities likely to be affected by the arrangement. Any representation by them should be made within 30 days from the receipt of the notice failing which it would be presumed that they have no representations to make on the proposal.

The scheme approved by three-fourths in value of creditors/members and sanctioned by the NCLT would be binding on the company/all creditors/members.

- (2)** The merging companies would have to circulate in the meeting ordered by the NCLT the following: **(i)** Draft of the proposed terms of the scheme drawn up and adopted by its directors, **(ii)** Confirmation that a copy of the draft scheme has been filed with the Registrar of Companies, **(iii)** A report adopted by its directors explaining the effect on each class of shareholders, key managerial personnel, promoter/non-promoter shareholders, laying out in particular the share exchange ratio, specifying any special valuation difficulties, **(iv)** Expert valuation report and **(v)** A supplementary accounting of the last annual accounts of any merging company related to the financial year ending more than six months before the first meeting of the company summoned for approving the scheme.
- (3)** On being satisfied that the above procedures have been complied with, the NCLT would sanction the scheme /arrangement. It would also make provision for the matters specified below:
 - (a)** Transfer to the transferee company of the whole/any part of the undertaking, property/liabilities of the transferor company from a date to be determined by the parties;
 - (b)** Allotment/appropriation by the transferee company of any shares/debentures, policies/other like instruments in the company which under the scheme are to be allotted/appropriated by the company to/or for any person. However, the transferee company cannot hold any

... the ... of ...

On ...

... the ... of ...

shares in its own name/in the name of any trust on its behalf/on behalf of any subsidiary/associate companies and such shares should be cancelled/extinguished.

- (c) Continuation by/against the transferee company of any legal proceedings pending by/against transferor company on the date of the transfer;
 - (d) Dissolution, without winding up, of transferor company;
 - (e) Provision to be made for any person who dissents from the arrangement;
 - (f) Allotment of shares of the transferee company to a non-resident shareholder;
 - (g) Transfer of employees of the transferor to the transferee company;
 - (h) In case the transferor company is a listed company and the transferee company is an unlisted company, (i) the transferee company would remain an unlisted company until it becomes a listed one, (ii) provision for payment of the value of shares held by shareholders of the transferor company who decide to opt of the transferee company and their other benefits according to a pre-determined price formula or after a valuation. However, the amount can in no case be less than what has been specified by any SEBI regulation;
 - (i) Set-off any dissolution fee paid by the transferor company against any similar fee paid by the transferee company subsequent to the amalgamation; and
 - (j) Such incidental/consequential/supplemental matters as deemed necessary to secure that the merger/amalgamation is fully/effectively carried out. However, the NCLT would sanction any scheme only if the auditors certify that the accounting treatment proposed in the scheme is in conformity with the accounting standards prescribed by the Government.
- (4) The property/liabilities of the transferor company would be by virtue of the sanction order of the NCLT transferred to the transferee company.
 - (5) Every concerned company should file a certified copy of the order with the Registrar of the Companies (ROCs) within 30 days of its receipt.
 - (6) The merger/amalgamation scheme should clearly indicate an appointed date from which it would be effective.
 - (7) The company concerned should, until the completion of the scheme, file a statement in the prescribed form/within prescribed time with the ROCs every year duly certified by a practicing Chartered/Cost Accountant /Company Secretary that the scheme is being complied with the orders of NCLT.
 - (8) Contravention of the above provisions by the transferor/transferee company would be punishable with a minimum fine of one lakh rupees which may extend to 25 lakh rupees. Every defaulting officer would be punishable with imprisonment upto one year or fine between 1-3 lakh rupees or with both.

Annexure 1 below contains the gist of the scheme of merger of Reliance Petrochemicals Ltd with Reliance Industries Ltd. The demerger scheme of DCM Ltd is outlined in Annexure 2 below.

Annexure 1 Merger of Reliance Petrochemicals Ltd (RPL) with Reliance Industries Ltd (RIL)

The merger of RPL with RIL in March 1992 was the biggest ever merger till date and resulted in the creation of the largest Indian corporate. RIL was engaged in the manufacture and sale of textiles, fibre and fibre intermediates and petrochemicals. In particular, it was engaged in the manufacture of polyester staple fibre (PSF), polyester filament yarn (PFY), purified terephthalic acid (PTA), linear alkyl benzene (LAB) and other products. Its paid-up capital (₹157.94 crore) consisted of (i) equity capital, ₹152.14 crore

(15.21 crore shares of ₹10 each) (ii) 11 per cent cumulative redeemable preference shares of ₹100 each, ₹30 lakh; and 15 per cent cumulative redeemable preference shares of ₹100 each, ₹5.5 crore.

The RPL was incorporated in November 1988 with the main objective of manufacturing poly vinyl chloride (PVC), mono ethylene glycol (MEG) and high density poly ethylene (HDPE). Its paid-up equity capital stood at ₹749.30 crore consisting of 74.93 crore shares of ₹10 each.

In terms of a scheme of amalgamation approved by the shareholders of the two companies and Mumbai and Gujarat High Courts in July/August 1992, the RPL was merged with the RIL with effect from March 2, 1992. The merger was aimed to enhance shareholders' value by realising significant synergies of both the companies. Liberalization of government policy and the accompanying economic reforms created this opportunity for the RIL's shareholders.

As per the scheme of amalgamation, the expected benefits of merger to the amalgamated entity, *inter-alia*, were:

- Benefit from diversification as the risks involved in the operation of different units would be minimised
- Business synergy due to economies of scale and integrated operations
- Higher retained earning leading to enhanced intrinsic values of shareholding to investors. The capital requirement would also be at manageable levels
- Strong fundamentals which would enhance its credit rating and resource raising ability in financial markets, both national and international

The exchange ratio was one equity share of ₹10 each in RIL for every 10 equity shares of RPL with a par value of ₹10 each. The exchange ratio was based on the expert valuation made by three reputed firms of chartered accountants, namely, S.B. Billimoria & Co, Choksi & Co and Heribhakthi & Co. Pursuant to the above, 7,49,26,428 equity shares of ₹10 each were issued as fully paid-up to the shareholders of RIL without payment being received in cash.

All the assets, liabilities and obligations of RPL were taken over by the merged entity—RIL. The excess of assets over liabilities takeover by RIL consequent on the amalgamation less the face value of the equity shares issued to the shareholders of the RPL represented amalgamation reserve. All the employees of RPL on the date immediately preceding the effective date became the employees of the RIL.

The post-merger scenario of the RIL is reflected in the increase in its capital, turnover, net profit and equity dividend. Compared to the pre-merger capital of ₹157.94 crore, the post-merger capital rose to ₹358.74 crore. The turnover increased from ₹2,298 crore in 1991–92 to ₹7,019 crore in 1994–95. Net profit of RIL stood at ₹10,651 crore in 1994–95 compared to ₹163 crore in 1991–92. The equity dividend rose phenomenally to 55 per cent (1994–95) from 30 per cent (1991–92). The RIL emerged post-merger as a mega corporation and became a global player. Its foreign exchange earnings in 1994–95 aggregated ₹174 crore.

Annexure 2 Demerger of DCM Ltd

DCM Ltd, promoted by Late Shri Ram in 1889, has become a conglomerate of 13 units with multifarious manufacturing activities in sugar, textile, chemicals, ryon tyre cord, fertilisers and so on. These units on their own being of the size of independent companies, the directors felt that greater focus on the operation of the various units of the company would result in substantial improvement in the results of their operations. The post-reorganisation slogan would be: "**The Trimmer We Are, The Faster We Are**".

On the basis of the various discussions, meetings, consultations between the members of the Board of Directors, financial institutions and consultants, it was decided to take appropriate steps to carry on the

business of various units more effectively and efficiently in the larger interest of shareholders, debentureholders, creditors, employees and in the general public interest. To achieve the objective of carrying the business of DCM Ltd more smoothly and profitably, DCM Ltd was reorganised by dividing its business among four companies having shareholders with the same interest *inter-se* in DCM but to be managed and operated independently (Exhibit 1).

EXHIBIT 1 Division of DCM Ltd.

1. **DCM Ltd** comprising DCM Mills (DCM Estate) DCM Engineering Products, DCM Data Products, Hissar Textiles Mills, Shri Ram Fibres Ltd, and DCM Toyota Ltd.
2. **DCM Shri Ram Industries Ltd** comprising Shri Ram Rayons, Daurala Sugar Works, and Hindon River Mills.
3. **DCM Shri Ram Consolidated Ltd** comprising Shri Ram Fertilises and Chemicals Industries Ltd, Shri Ram Cement Works Ltd, Swatantra Bharat Mills Ltd, and DCM Silk Mills Ltd.
4. **Shri Ram Industrial Enterprises Ltd** comprising Shri Ram Food and Fertilisers Ltd, and Mawana Sugar Works Ltd.

The division of DCM Ltd took place through the scheme of arrangement approved by the Delhi High Court on April 16, 1990 according to which three new companies were formed. The scheme of arrangement became effective from April 1, 1990. The four companies thereafter started operating independently, each with their respective Boards of Directors.

Some of the notable features of the scheme of reorganisation of the erstwhile DCM Ltd into four companies were:

- The total paid-up capital of ₹23 crore was divided equally.
- The allocation of various assets and liabilities among them was done as under:

	<i>DCM Shri Ram Industries Ltd</i>	<i>DCM Shri Ram Consolidated Ltd</i>	<i>Shri Ram Industrial Enterprises Ltd</i>	<i>DCM Ltd</i>
Fixed deposits	16%	33%	36%	15%
Debentures	16%	12%	36%	36%
Common assets/liabilities/ income/benefit	16.66%	16.66%	33.33%	33.33%
Expenses and cost of arrangement	16.66%	16.66%	33.33%	33.33%
Specific assets	(All at book value as on 1.4.1990 unit-wise)			

- Though the liability for debentures was divided, the debentures were physically retained in DCM Ltd. The mortgage of assets of various units already created with the trustees for debentureholders were modified to the effect that each group's assets would stand charged only for the liability allocated to it.
- For payment of interest and principal amount to debentureholders, Indian Bank, which was the debenture trustees was appointed a Registrar by all the four companies and they remitted their share of liabilities to the Registrar on due dates for onward payment to debentureholders. The cost of Registrar would be shared by all the companies.
- The fixed deposit receipts were split into four new receipts in the proportion in which the fixed deposits appeared in the books of account as on the effective date.

- Upon transfer of the undertakings to them, the new companies allotted one equity share each to the holders of four equity shares in DCM Ltd. The paid-up value of DCM equity share was thereupon reduced for ₹10 each to ₹2.5 each. Thereafter, the DCM equity shares were consolidated into equity shares of the face value of ₹10 each. Any fraction arising on allotment/consolidation of shares was disposed of and sales proceed distributed *pro rata* to the eligible shareholders.
- The equity shares of the four companies were subsequently listed in the stock exchange(s).
- Disputes with respect to the provisions of the scheme of arrangement were to be settled by two arbitrators and an umpire appointed by the arbitrators.

Thus, the demerger of DCM Ltd was completed with lots of innovation and practical solutions to the complex problem of reorganising a century-old company. After reorganisation, all the DCM Group companies have grown tremendously. From a non-dividend position prior to the demerger, all the companies have grown manifold adding value both to the shares as well as to the new entities.

Acquisition/Takeovers

Takeover implies acquisition of controlling interest in a company by another company. It does not lead to the dissolution of the company whose shares are being/have been acquired. It simply means a change of controlling interest in a company through the acquisition of its shares by another group. Takeovers can assume three forms: **(i)** negotiated/friendly, **(ii)** open market/hostile and **(iii)** bail out. The first type of takeover is organised by the incumbent management with a view to parting with the control of management to another group, through negotiation. The terms and conditions of the takeover are mutually settled by both the groups. Hostile takeovers are also referred to as raid on the company. In order to takeover the management of, or acquire controlling interest in, the target company, a person/group of persons acquire shares from the open market/financial institutions/mutual funds/willing shareholders at a price higher than the prevailing market price. Such takeovers are hostile to the existing management. When a profit earning company takes over a financially sick company to bail it out, it is known as **bail out takeover**. Normally, such takeovers are in pursuance of a scheme of rehabilitation approved by public financial institutions/scheduled banks. The takeover bids, in respect of purchase price, track record of the acquirer and his financial position, are evaluated by a leading financial institution. Corporate takeovers in the country are governed by the listing agreement with stock exchanges and the SEBI Substantial Acquisition of Shares and Takeover (SEBI Code) Code. The main elements of the regulatory framework for takeovers are briefly described below.

- **Takeover**
- implies acquisition
- of controlling
- interest in a
- company by
- another company/
- group.

- **Bail out**
- **takeover**
- is the takeover of
- a financially weak
- company by a
- profitable company.

Listing Agreement The takeover of companies listed on the stock exchanges is regulated by Clause 40-A and 40-B of the listing agreement. While Clause 40-A deals with minimum level of public shareholding, Clause 40-B contains the requirements to be met when a takeover offer is made.

Minimum Level of Public Shareholding In order to ensure availability of floating stock, every listed company should maintain, on a continuous basis, public shareholding of at least 25 per cent of the total number of issued shares of a class/kind of its listed shares. Public shareholding exclude shares held by **(1)** promoters/promoter group and **(2)** custodians against which depository receipts are issued overseas. The minimum level of public shareholding in a company **(a)** which offers/

had offered in the past a particular class/kind of shares to the public under Rule 19(2)(b) of the Securities Contracts (Regulation) Rules or (b) which has atleast two crore shares outstanding with a market capitalisation of atleast ₹1,000 crore, should be 10 per cent of the total number of issued shares. Market capitalisation means the average capitalisation for the previous financial year. The average should be computed as the sum of the daily market capitalisation over one year divided by the number of trading days. The market capitalisation would be considered for the succeeding four quarters.

Takeover Offer The company also agrees that it is a condition for continuous listing that whenever the takeover offer is made or there is any change in the control of the management of the company, the person who secures the control and the company whose shares have been acquired would comply with the relevant provisions of the SEBI Takeover Code.

The SEBI Substantial Acquisition of Shares and Takeover Code (SEBI Takeover Code) A takeover bid is generally understood to imply the acquisition of shares carrying voting rights in a company, in a direct or indirect manner, with a view to gaining control over the management of the company. Such takeovers could take place through a process of friendly negotiation or in a hostile manner, in which the existing management resists the change in control. Both the substantial acquisition of shares and change in the control of a listed company are covered by takeover bids. The main elements of the SEBI Code are: (i) Substantial Acquisition of Shares, Voting Rights/Control, (ii) Open Offer Process, (iii) Other Obligations, (iv) Disclosures of Shareholding and Control, and (v) Miscellaneous. However, these regulations do not apply to direct/indirect acquisition of shares/voting rights in, or control over a company, listed on the institutional trading platform of a stock exchange.

Acquisition means directly/indirectly acquiring/agreeing to acquire shares/voting rights in, or control over, a target company..

Substantial Acquisition of Shares, Voting Rights or Control Acquisition means to acquire shares voting rights in, or control over, a target company. Control includes

Control includes the right to appoint majority of directors or to control the management or policy decisions exercisable by a person(s) acting individually or in concert, directly/indirectly, including by virtue of their shareholding/management rights/shareholders agreement/voting agreements or in any other manner.

the right to appoint majority of directors or to control the management or policy decisions exercisable by a person(s) acting individually or in concert, directly/indirectly, including by virtue of their shareholding/management rights/shareholders agreement/voting agreements or in any other manner. **Shares** means shares/security carrying voting rights including depository receipts carrying an entitlement to exercise voting rights. **Target company** means a company listed on a stock exchange. **Person acting in concert** means persons who, with a common objective/purpose of acquisition of shares/voting rights in, or exercising control, over a target company, pursuant to a formal/informal agreement/understanding, directly/indirectly co-operate for acquisition of shares/voting rights in, or exercise of control over, the target company. The persons falling within the following categories would be deemed to be persons acting in concert with other persons within the same category, unless the contrary is established: (i) a company, its holding company, subsidiary company and any company under the same management/control; (ii) a company, its directors, and any person entrusted with the management of the company; (iii) directors of companies referred to

directly/indirectly acquire/agree to acquire shares voting rights in, or control over, a target company. **Control** includes

- Person(s) acting in concert
- means persons who, with a common objective/purpose of acquisition of shares/voting rights in, or exercising control, over a target company, pursuant to a formal/informal agreement/understanding, directly/indirectly co-operate for acquisition of shares/voting rights in, or exercise of control over, the target company.

above and associates of such directors. **Associate** of a person means (a) any immediate relative, (b) trust of which the person/immediate relative is a trustee, (c) firm in which he/immediate relative is a partner, and (d) member of a Hindu Undivided Family of which he is a coparcener. **Immediate relative** means his spouse including parents/brothers/ sisters/children or of the spouse; (iv) promoters and members of the promoter group; (v) immediate relatives; (vi) a mutual fund, its sponsor, trustee, trustee company, and asset management company; (vii) a collective investment scheme and its collective investment management company, trustees and trustee company; (viii) a venture capital fund and its sponsor, trustees, trustee company and asset management company; (ix) an alternate investment fund and its sponsor/trustee/manager; (x) a merchant banker and its client, who is an acquirer; (xi) a portfolio manager and its client, who is an acquirer; (xii) banks, financial advisors and stock brokers of the acquirer, or of the company which is a holding company or subsidiary of the acquirer, and where the acquirer is an individual, of the immediate relative of such individual. However, a bank whose sole role is that of providing normal commercial banking services or activities in relation to an open offer under these regulations would be excluded; (xiii) an investment company or fund and any person who has an interest in such investment company or fund as a shareholder or unitholder having not less than 10 per cent of the paid-up capital of the investment company or unit capital of the fund, and any other investment company or fund in which such person or his associate holds not less than 10 per cent of the paid-up capital of that investment company or unit capital of that fund. However, holding of units of mutual funds registered with the SEBI would be excluded.

- **Associate**
- means (a) any
- immediate relative,
- (b) trust of which
- the person/
- immediate relative
- is a trustee, (c)
- firm in which he/
- immediate relative
- is a partner, and (d)
- member of a Hindu
- Undivided Family
- of which he is a
- coparcener.

The main elements of the SEBI code relating to substantial acquisition of shares/voting rights/control: (i) substantial acquisition of shares/voting rights, (ii) acquisition of control, (iii) indirect acquisition of shares/control, (iv) voluntary offer, (v) offer size, (vi) offer price, (vii) mode of payment, (viii) general exemptions, and (ix) exemptions by the SEBI.

Substantial Acquisition of Shares/Voting Rights To acquire shares/voting rights in a target company which together with shares/voting rights already held by him and by persons acting in concert with him entitle them to exercise 25 per cent./more of the voting rights in the target company, an **acquirer** (i.e. person who directly/indirectly acquire/agrees to acquire by himself/through or with person(s) acting in concert with him shares/voting rights in or control over a target company), would have to make a public announcement of an open offer for acquiring the shares. Similar announcement would be required by an acquirer, who has already acquired/holds shares/voting rights entitling him to exercise 25 per cent./more of the voting rights but less than the permissible non-public shareholding, to acquire within any financial year additional shares/voting rights entitling him to exercise more than 5 per cent of the voting rights, subject to a ceiling of the maximum permissible non-public shareholding under the Securities Contracts (Regulation) Rules, namely, 75 per cent. For determining the quantum of acquisition of additional voting rights, only gross acquisition would be taken into account. In case of acquisition by way of issue of new shares by the target company or where it has issued new shares in any financial year, the difference between the pro- and post-allotment percentage voting rights would be regarded as the additional acquisition.

- **Acquirer**
- is a person who
- directly/indirectly
- acquire/agrees to
- acquire by himself/
- through or with
- person(s) acting in
- concert with him
- shares/voting rights
- in or control over a
- target company.

The acquisition of shares/voting rights of a company by the promoter/shareholders in control in terms of the SEBI ICDR regulations pertaining to conditions/manner of providing exit opportunity to dissenting shareholders should be exempt from these requirements.

Acquisition of Control Irrespective of acquisition/holding of shares/voting rights in a target company, no acquirer would directly/indirectly acquire, control over the target company unless he makes a public announcement of an open offer.

Indirect Acquisition of Shares/Voting Rights/Control Acquisition of shares/voting rights in/control over, any company/other entity, that would enable any person(s) acting in concert with him to exercise/direct the exercise of such percentage of voting rights in/control over, the acquisition of which would otherwise attract the obligation to make a public announcement of an open offer for acquiring shares, would be considered as an **indirect acquisition** of shares/voting rights in/control over the target company. In the case of an indirect acquisition where **(a)** the proportionate net asset value of the target company as a percentage of the consolidated net asset value of the entity or business being acquired, **(b)** the proportionate sales turnover of the target company as a percentage of the consolidated sales turnover of the entity or business being acquired, or **(c)** the proportionate market capitalisation of the target company as a percentage of the **enterprise value** for the entity or business being acquired, is in exercise of 80 per cent, on the basis of the most recent audited annual financial statements, such indirect acquisition would be regarded as a direct acquisition of the target company for all purposes including without limitation, the obligations relating to timing, pricing and other compliance requirements for the open offer. **Enterprise value** means market capitalisation of the company **plus** debt, minority interest and preference shares **minus** total cash and cash equivalents.

Delisting Offer The acquirer who makes a public announcement of an open offer for acquiring shares of a target company can delist the company in terms of the SEBI delisting of shares regulations. He should declare upfront his intention to do so at the time of the detailed public statement.

Enterprise value means market capitalisation of the company plus debt, minority interest and preference shares minus total cash and cash equivalents. Failure to delist should be announced within two working days in all the concerned newspapers. Within five working days from the date of the announcement of failure, the acquirer through the manager of the open should offer file with the SEBI a draft of the letter of offer and comply with all other applicable provisions. Moreover, the offer price should be enhanced by 10 per cent per annum for the period between the scheduled date and the actual date of payment of consideration to the shareholders.

In case of completing offer (**discussed** later), the acquirer would **(i)** not be entitled to delist the company, **(ii)** not be liable to pay interest to the shareholders on account of delay due to the competing offer and **(iii)** comply with all the applicable provisions and make an announcement within two working days from the date of public announcement regarding competing offer in all the newspapers in which the detailed public statement was made.

The shareholders who have tendered shares in acceptance of the unsuccessful offer can withdraw them within 10 working days from the date of its announcement. Those who have not tendered their shares would be entitled to tender their shares in acceptance of the offer made to them.

Voluntary Offer An acquirer, who holds shares or voting rights in a target company (**shares in brief**) entitling them to exercise 25 per cent or more but less than the maximum permissible non-public (75 per cent) shareholding, would be entitled to voluntarily make a public announcement of an open

offer for acquiring shares subject to their aggregate shareholding after completion of the open offer not exceeding the maximum permissible non-public shareholding. However, where an acquirer has acquired shares of the target company in the preceding 52 weeks without attracting the obligation to make a public announcement, he would not be eligible to voluntarily make a public announcement of an open offer. Moreover, during the offer period he would not be entitled to acquire any shares otherwise than under the open offer.

An acquirer who has made a public announcement to acquire shares would not be entitled to acquire any shares of the target company for a period of six months after completion of the open offer except pursuant to another voluntary open offer. However, such restriction would not prohibit him from making a competing offer upon any other person making an open. Shares acquired through bonus issue or stock splits would not be considered for purposes of this dis-entitlement. A **willful defaulter** (i.e. a [person/director/promoter/partner categorised by a bank/financial institution/their consortium in accordance with the RBI guidelines) cannot make a public announcement of an offer for acquiring shares/enter into any transaction that would attract the obligation to make an announcement of an open offer. He can make a competing offer.

Offer Size The open offer for acquiring shares to be made by the acquirer should be for at least 26 per cent of total shares of the target company, as of the tenth working day from the closure of the **tendering** period (i.e. period within which shareholders may tender their shares in acceptance of an open offer).

The total shares of the target company as of the tenth working day from the closure of the tendering period would take into account all potential increases in the number of outstanding shares during the **offer period** (i.e. period between the date of entering into a formal/informal agreement to acquire shares/voting right in, or control over, a target company requiring public announcement or the date of public announcement and the date on which the payment of consideration to shareholders who have accepted the open offer is made or the date on which open offer is withdrawn) contemplated as of the date of the public announcement. The offer size should also be proportionately increased in case of an increase in total number of shares, after the public announcement, which is not contemplated on the date of the public announcement.

The voluntary open offer should be for acquisition of at least such number of shares as would entitle their holder(s) to exercise an additional 10 per cent of the total shares of the target company, and would not exceed such number of shares as would result in the post-acquisition holding of the acquirer exceeding the maximum permissible non-public shareholding applicable to the target company. However, in the event of a competing offer, the acquirer who has voluntarily made a public announcement of an open offer would be entitled to increase the number of shares to such number as he deems fit. The increase in offer size be made within 15 working days from the public announcement, failing which the acquirer would not be entitled to increase the offer size. Upon an acquirer opting to increase the offer size, the such open offer would be deemed to be a voluntary offer. In the event of the shares accepted in the open offer were such that the shareholding of the acquirer(s) pursuant to completion of the open offer results in their shareholding exceeding the maximum permissible non-public shareholding, he would be required to bring down the non-public shareholding to the

- **Tendering period**
- is the period within which shareholders may tender their shares in acceptance of an open offer.

- **Offer period**
- is period between the date of entering into a formal/informal agreement to acquire shares/voting right in, or control over, a target company requiring public announcement or the date of public announcement and the date on which the payment of consideration to shareholders who have accepted the open offer is made or the date on which open offer is withdrawn.

The first of these is the fact that the population of the country has increased rapidly since the beginning of the century. This is due to a number of causes, including the discovery of gold in California and the opening of the West to settlement.

Another important factor is the immigration of large numbers of people from Europe and other parts of the world. This has led to a rapid increase in the number of people living in the country.

The third cause is the development of the mining industry. This has led to the discovery of many valuable minerals, including gold, silver, and copper.

The fourth cause is the opening of the West to settlement. This has led to the discovery of many fertile lands, which have been settled and cultivated.

The fifth cause is the development of the agricultural industry. This has led to the production of many valuable crops, including wheat, corn, and cotton.

The sixth cause is the development of the manufacturing industry. This has led to the production of many valuable goods, including iron, steel, and machinery.

The seventh cause is the development of the transportation industry. This has led to the construction of many roads, bridges, and railroads, which have made it easier to travel across the country.

The eighth cause is the development of the education system. This has led to the establishment of many schools and colleges, which have provided education for the people of the country.

The ninth cause is the development of the government. This has led to the establishment of many laws and regulations, which have provided for the good government of the country.

The tenth cause is the development of the culture. This has led to the creation of many works of art, literature, and music, which have enriched the lives of the people of the country.

The eleventh cause is the development of the economy. This has led to the growth of many industries and businesses, which have provided jobs and income for the people of the country.

The twelfth cause is the development of the social system. This has led to the establishment of many social programs and services, which have improved the lives of the people of the country.

The thirteenth cause is the development of the environment. This has led to the protection of many natural resources, which have provided for the well-being of the people of the country.

The fourteenth cause is the development of the international relations. This has led to the establishment of many treaties and agreements, which have provided for the peace and stability of the world.

The first of these is the fact that the population of the country has increased rapidly since the beginning of the century. This is due to a number of causes, including the discovery of gold in California and the opening of the West to settlement.

level specified and within the time permitted under Securities Contract (Regulation) Rules.^{@@} The acquirer whose shareholding exceeds the maximum permissible non-public shareholding, pursuant to an open offer, would not be eligible to make a voluntary delisting offer under the SEBI Delisting of Equity Shares Regulations, within 12 months from the date of the completion of the offer period. Any open offer should be made to all shareholders of the target company, other than the acquirer and the parties to any underlying agreement for the sale of shares of the target company.

Offer Price The open offer for acquiring shares should be made at a price not lower than the price determined in the manner specified below:

1. Direct Acquisition In the case of direct acquisition and indirect acquisition deemed to be

Volume-weighted average price is a product of number of equity shares bought and price of each share divided by the number of shares bought.

Volume-weighted average market price is a product of number of shares traded on a stock exchange and price of each share divided by the total number of shares traded.

direct acquisition of shares, the offer price should be the highest of: **(a)** the highest negotiated price per share of the target company for any acquisition under the agreement attracting the obligation to make a public announcement of an open offer; **(b)** the **volume-weighted average price** (i.e. product of number of equity shares bought and price of each share divided by the number of shares bought) paid/payable for acquisitions, by the acquirer during the 52 two weeks immediately preceding the date of the public announcement; **(c)** the highest price paid/payable for any acquisition by the acquirer during the 26 weeks immediately preceding the date of the public announcement; **(d)** the **volume-weighted average market price** (i.e. product of number of shares traded on a stock exchange and price of each share divided by the total number of shares traded) of such shares for a period of 60 trading days immediately preceding the date of the public announcement as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period, provided such shares are **frequently traded**. Frequently traded shares mean shares in which the traded turnover on any stock exchange during 12-calendar months preceding the calendar month in which the public announcement is made is at least 10 per cent of the total shares of the target company; **(e)** where the shares are not frequently traded, the price determined by the acquirer and the manager to the open offer taking into account valuation parameters including, book value, comparable trading multiples, and such other parameters

as are customary for valuation of shares of such companies; and **(f)** the per share value computed in case of indirect acquisition (**discussed later**).

2. Indirect Acquisition Deemed Direct Acquisition In the case of an indirect acquisition of shares, the offer price would be the highest of: **(a)** the highest negotiated price per share of the target company for any acquisition under the agreement attracting the obligation to make a public announcement; **(b)** the volume-weighted average price paid/payable for any acquisition, during the 52 weeks immediately preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain; **(c)** the highest price paid/payable for any acquisition by the acquirer during the 26 weeks immediately preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain; **(d)** the highest price paid/payable for any acquisition between the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public

^{@@}For an account refer to Khan, M.Y., *Indian Financial System*. McGraw Hill Education (India), 2018, Chapter 4.

domain, and the date of the public announcement of the open offer for shares of the target company; **(e)** the volume-weighted average market price of the shares for a period of 60 days earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain, as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period, provided such shares are frequently traded; and **(f)** the per share value in case of indirect acquisition (**discussed later**).

3. In case the offer price is incapable of being determined under any of the parameters above, the offer price should be the fair price of shares of the target company to be determined by the acquire and the manager to the open offer taking into account valuation parameters including, book value, comparable trading multiples, and such other parameters as are customary for valuation of shares of such companies.

4. Indirect Acquisition In the case of an indirect acquisition and open offers, where the proportionate **(a)** net asset value of the target company as a percentage of the consolidated net asset value; **(b)** sales turnover of the target company as a percentage of the consolidated sales turnover; or **(c)** market capitalisation of the target company as a percentage of the enterprise value for the entity or business being acquired is in excess of 15 per cent, the acquirer would be required to compute and disclose, in the letter of offer, the per share value of the target company taken into account for the acquisition, along with a detailed description of the methodology adopted for such computation. The **market capitalisation** of the target company would be taken into account on the basis of the volume-weighted average market price of the shares on the stock exchange for a period of 60 trading days preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain, as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period.

5. In respect of direct and indirect deemed direct acquisition, where the acquirer has any outstanding convertible instruments convertible into shares of the target company at a specific price, the price at which such instruments are to be converted into shares, would also be considered as a parameter. The price paid for shares of target company would include any price paid/agreed to be paid for the shares in the target company, in any form whatsoever, whether stated in the agreement for acquisition of shares or in any incidental, contemporaneous or collateral agreement, whether termed as control premium or as non-compete fees or otherwise.

6. Where the acquirer has acquired/agreed to acquire any shares in the target company during the **offer period** (i.e. period between the date of entering into formal/informal agreement to acquire shares/voting rights/control of a target company requiring public announcement and the date of public announcement and the date on which the payment of consideration to shareholders who have accepted the open offer is made or the date on which open offer is withdrawn) by subscription/purchase, at a price higher than the offer price, the offer price would stand revised to the highest price for any acquisition. However, no acquisition would be made after the third working day prior to the commencement and until the expiry of the tendering period.

7. The price parameters outlined above may be adjusted by the acquirer in consultation with the manager to the offer, for corporate actions such as issuances pursuant to rights issue, bonus issue, stock consolidations, stock splits, payment of dividend, de-mergers and reduction of capital, where the record date for effecting such corporate actions falls prior to three working days before the commencement of the tendering period. However, adjustment should be made for dividend declared

The following theorem is a special case of the more general theorem 13.17. It states that if a function f is continuous on the interval $[a, b]$ and if f is differentiable at every point in the interval, then f is differentiable at every point in the interval.

Theorem 13.16. Let f be a function defined on the interval $[a, b]$. If f is continuous on $[a, b]$ and if f is differentiable at every point in the interval, then f is differentiable at every point in the interval.

Proof. Let x_0 be a point in the interval $[a, b]$. We want to show that f is differentiable at x_0 . Since f is continuous on $[a, b]$, we have $\lim_{x \rightarrow x_0} f(x) = f(x_0)$. Since f is differentiable at every point in the interval, we have $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = f'(x_0)$.

Let $\epsilon > 0$ be given. Since f is continuous at x_0 , there is a $\delta_1 > 0$ such that $|f(x) - f(x_0)| < \epsilon/2$ whenever $|x - x_0| < \delta_1$. Since f is differentiable at x_0 , there is a $\delta_2 > 0$ such that $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon/2$ whenever $|x - x_0| < \delta_2$.

Let $\delta = \min\{\delta_1, \delta_2\}$. If $|x - x_0| < \delta$, then $|f(x) - f(x_0)| < \epsilon/2$ and $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon/2$. Therefore, $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon$.

Since $\epsilon > 0$ was arbitrary, we conclude that f is differentiable at x_0 . Since x_0 was arbitrary, we conclude that f is differentiable at every point in the interval $[a, b]$.

Example 13.1. Let $f(x) = x^2$. We show that f is differentiable at every point in the interval $[-1, 1]$. First, we show that f is continuous on $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} x^2 = x_0^2 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{x^2 - x_0^2}{x - x_0} = \lim_{x \rightarrow x_0} (x + x_0) = 2x_0 = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-1, 1]$. This completes the proof of Example 13.1.

Example 13.2. Let $f(x) = \sin x$. We show that f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. First, we show that f is continuous on $[-\pi/2, \pi/2]$. Let x_0 be a point in $[-\pi/2, \pi/2]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} \sin x = \sin x_0 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. Let x_0 be a point in $[-\pi/2, \pi/2]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{\sin x - \sin x_0}{x - x_0} = \cos x_0 = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. This completes the proof of Example 13.2.

Example 13.3. Let $f(x) = e^x$. We show that f is differentiable at every point in the interval $[-1, 1]$. First, we show that f is continuous on $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} e^x = e^{x_0} = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{e^x - e^{x_0}}{x - x_0} = e^{x_0} = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-1, 1]$. This completes the proof of Example 13.3.

Example 13.4. Let $f(x) = \ln x$. We show that f is differentiable at every point in the interval $(0, 1]$. First, we show that f is continuous on $(0, 1]$. Let x_0 be a point in $(0, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} \ln x = \ln x_0 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $(0, 1]$. Let x_0 be a point in $(0, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{\ln x - \ln x_0}{x - x_0} = \frac{1}{x_0} = f'(x_0)$.

The following theorem is a special case of the more general theorem 13.17. It states that if a function f is continuous on the interval $[a, b]$ and if f is differentiable at every point in the interval, then f is differentiable at every point in the interval.

Theorem 13.16. Let f be a function defined on the interval $[a, b]$. If f is continuous on $[a, b]$ and if f is differentiable at every point in the interval, then f is differentiable at every point in the interval.

Proof. Let x_0 be a point in the interval $[a, b]$. We want to show that f is differentiable at x_0 . Since f is continuous on $[a, b]$, we have $\lim_{x \rightarrow x_0} f(x) = f(x_0)$. Since f is differentiable at every point in the interval, we have $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = f'(x_0)$.

Let $\epsilon > 0$ be given. Since f is continuous at x_0 , there is a $\delta_1 > 0$ such that $|f(x) - f(x_0)| < \epsilon/2$ whenever $|x - x_0| < \delta_1$. Since f is differentiable at x_0 , there is a $\delta_2 > 0$ such that $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon/2$ whenever $|x - x_0| < \delta_2$.

Let $\delta = \min\{\delta_1, \delta_2\}$. If $|x - x_0| < \delta$, then $|f(x) - f(x_0)| < \epsilon/2$ and $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon/2$. Therefore, $|\frac{f(x) - f(x_0)}{x - x_0} - f'(x_0)| < \epsilon$.

Since $\epsilon > 0$ was arbitrary, we conclude that f is differentiable at x_0 . Since x_0 was arbitrary, we conclude that f is differentiable at every point in the interval $[a, b]$.

Example 13.1. Let $f(x) = x^2$. We show that f is differentiable at every point in the interval $[-1, 1]$. First, we show that f is continuous on $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} x^2 = x_0^2 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{x^2 - x_0^2}{x - x_0} = \lim_{x \rightarrow x_0} (x + x_0) = 2x_0 = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-1, 1]$. This completes the proof of Example 13.1.

Example 13.2. Let $f(x) = \sin x$. We show that f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. First, we show that f is continuous on $[-\pi/2, \pi/2]$. Let x_0 be a point in $[-\pi/2, \pi/2]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} \sin x = \sin x_0 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. Let x_0 be a point in $[-\pi/2, \pi/2]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{\sin x - \sin x_0}{x - x_0} = \cos x_0 = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-\pi/2, \pi/2]$. This completes the proof of Example 13.2.

Example 13.3. Let $f(x) = e^x$. We show that f is differentiable at every point in the interval $[-1, 1]$. First, we show that f is continuous on $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} e^x = e^{x_0} = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $[-1, 1]$. Let x_0 be a point in $[-1, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{e^x - e^{x_0}}{x - x_0} = e^{x_0} = f'(x_0)$.

Therefore, f is differentiable at every point in the interval $[-1, 1]$. This completes the proof of Example 13.3.

Example 13.4. Let $f(x) = \ln x$. We show that f is differentiable at every point in the interval $(0, 1]$. First, we show that f is continuous on $(0, 1]$. Let x_0 be a point in $(0, 1]$. Then $\lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} \ln x = \ln x_0 = f(x_0)$.

Next, we show that f is differentiable at every point in the interval $(0, 1]$. Let x_0 be a point in $(0, 1]$. Then $\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{\ln x - \ln x_0}{x - x_0} = \frac{1}{x_0} = f'(x_0)$.

if the per share dividend is more than 50 per cent higher than the average paid during the three financial years preceding the date of the public announcement.

8. Where the acquirer acquires shares of the target company during the period of 26 weeks after the tendering period at a price higher than the offer price, he would pay the difference between the highest acquisition price and the offer price, to all the shareholders whose shares were accepted in the open offer, within 60 days from the date of such acquisition.

9. Where the open offer is subject to a minimum level of acceptances, the acquirer may indicate a lower price, but not be less than the price determined under this regulation, for acquiring all the acceptances despite the acceptance falling short of the indicated minimum level of acceptance, in the event the open offer does not receive the minimum acceptance.

10. In the case of any indirect acquisition, the offer price would stand enhanced by an amount equal to a sum determined at the rate of 10 per cent per annum for the period between the earlier of the date on which the primary acquisition is contracted or the date on which the intention or the decision to make the primary acquisition is announced in the public domain, and the date of the detailed public statement, provided such period is more than five working days.

11. The offer price for partly-paid-up shares should be computed as the difference between the offer price and the amount due towards calls-in-arrears including calls remaining unpaid with interest.

12. The offer price for equity shares carrying differential voting rights should be determined by the acquirer and the manager to the open offer with full disclosure of justification for the price so determined, being set out in the detailed public statement and the letter of offer. However, the price should not be lower than the amount determined by applying the percentage rate of premium that the offer price for the equity shares carrying full voting rights represents to the price parameter computed above to the volume-weighted average market price of the shares carrying differential voting rights in the aforesaid provisions, subject to shares carrying full voting rights and the shares carrying differential voting rights, both being frequently traded shares.

13. In the event of any of the price parameters not being available or denominated in Indian rupees, the conversion of such amount into Indian rupees would be effected at the exchange rate as prevailing on the date preceding the date of public announcement and the acquirer should set out the source of such exchange rate in the public announcement, the detailed public statement and the letter of offer.

14. The SEBI may, at the expense of the acquirer, require valuation of the shares by an independent merchant banker other than the manager to the open offer or an independent practicing chartered accountant having a minimum experience of 10 years.

Mode of Payment The offer price may be paid **(a)** in cash; **(b)** by issue/exchange/transfer of listed shares **(i)** shares, **(ii)** secured debt instruments with a rating not below investment grade as rated by a SEBI-registered agency, **(iii)** convertible debt securities; **(c)** a combination of the mode of payment of consideration stated in Clauses **(a)** and **(b)**. However, where any shares have been acquired/agreed to be acquired by the acquirer and persons acting in concert with him during the 52 weeks immediately preceding the date of public announcement constitute more than ten per cent of the voting rights in the target company and has been paid for in cash, the open offer would entail an option to the shareholders to require payment of the offer price in cash, and a shareholder who has not exercised an option in his acceptance would be deemed to have opted for receiving the offer price in cash. In case of revision in offer price, the mode of payment of consideration may be altered subject to the condition that the component of the offer to be paid in cash prior to such revision is not reduced.

The shares sought to be **(i)** issued/exchanged/transferred or **(ii)** upon conversion of other securities, towards payment of the offer price, should conform to the following requirements: **(a)** they are listed for at least two years on a stock exchange preceding the date of public announcement and frequently traded at the time of the public announcement; **(b)** the issuer has redressed at least 95 per cent of the complaints received from investors by the end of the calendar quarter immediately preceding the calendar month in which the public announcement is made; **(c)** the issuer has been in material compliance with the listing agreement for at least two years immediately preceding the date of the public announcement. In case where the SEBI is of the view that a company has not been materially compliant with the provisions of the listing agreement, the offer price should be paid in cash only; **(d)** the impact of auditors' qualifications on the audited accounts of the issuer for three immediately preceding financial years does not exceed 5 per cent of the net profit or loss after tax for the respective years; and **(e)** the SEBI has not issued any direction against the issuer to access the capital market/to issue fresh shares.

Where the shareholders have been provided with options to accept payment in cash or by way of securities, or a combination, the pricing for the open offer may be different for each option subject to compliance with minimum offer price requirements. The detailed public statement and the letter of offer should contain justification for such differential pricing.

In the event the offer price consists of consideration to be paid by issuance of securities, which requires compliance with any applicable law, the acquirer should ensure that compliance before the commencement of the tendering period failing which the entire consideration should be paid in cash.

Where listed securities are offered as consideration, their value should be the higher of: **(a)** the average of the weekly high and low of their closing prices quoted on the stock exchange during **(i)** the six months **(ii)** 2 weeks preceding the **relevant** date (i.e. 30th day prior to the date on which the meeting of shareholders is held to consider the proposed issues of shares); **(b)** the volume-weighted average market price for a period of 60 trading days preceding the date of the public announcement, on the stock exchange where the maximum volume of trading in the shares of the company are recorded during the six-month period prior to the relevant date and the ratio of exchange of shares should be duly certified by an independent merchant banker (other than the manager of the open offer)/chartered accountant having a minimum experience of ten years.

General Exemptions

(1) The following acquisitions would be exempt from the obligation to make an open offer:

- (a)** Acquisition pursuant to *inter se* transfer of shares amongst qualifying persons, being **(i)** immediate relatives; **(ii)** persons named as promoters in the shareholding pattern for at least three years prior to the proposed acquisition; **(iii)** a company, its subsidiaries/holding company/ their other subsidiaries of such holding company, persons holding not less than 50 per cent of the equity shares of the company, other companies in which such persons hold not less than 50 per cent of the equity shares, and their subsidiaries subject to control over such qualifying persons being exclusively held by the same persons; **(iv)** persons acting in concert for not less than three years prior to the proposed acquisition, and disclosed under the listing agreement; **(v)** shareholders of a target company who have been persons acting in concert for a period of not less than three years prior to the proposed acquisition and are disclosed under the listing agreement, and any company in which the entire equity share capital is owned by such shareholders in the same proportion as their holdings in the target company without any differential entitlement to exercise

voting rights in such company. For purposes of availing of the exemption, **(i)** If the shares of the target company are frequently traded, the acquisition price per share should not be higher by more than 25 per cent of the volume-weighted average market price for a period of 60 trading days preceding the date of issuance of notice for the proposed *inter se* transfer on the stock exchange where the maximum volume of trading in these shares are recorded; and **(ii)** the transferor and the transferee should have complied with the applicable disclosure requirements (**discussed later in this Chapter**).

- (b)** Acquisition in the ordinary course of business by SEBI-registered **(i)** underwriter by way of allotment pursuant to an underwriting agreement of; **(ii)** stock broker on behalf of his client in exercise of lien over the shares purchased on behalf his client under the bye-laws of concerned the stock exchange; **(iii)** merchant banker/a nominated investor in the process of market making/subscription to the unsubscribed portion of an issue; **(iv)** any person acquiring shares pursuant to a scheme of safety net; **(v)** a merchant banker acting as a stabilising agent or by the promoter or pre-issue shareholder; **(vi)** by a market-maker of a stock exchange during the course of market making; **(vii)** a bank, acting as a escrow agent; and **(viii)** invocation of pledge by banks or public financial institution as a pledgee.
- (c)** Acquisition at subsequent stages, by an acquirer who has made a public announcement of an open offer for acquiring shares pursuant to an agreement of disinvestment provided: **(i)** both the acquirer and the seller are the same at all the stages of acquisition; and **(ii)** full disclosures of all the subsequent stages of acquisition have been made in the public announcement of the open offer/the letter of offer.
- (d)** Acquisition pursuant to a scheme: **(i)** made under the Sick Industrial Companies (Special Provisions) Act; **(ii)** of arrangement involving the target company as a transferor/a transferee company, or reconstruction of the target company, including amalgamation, merger/demerger, pursuant to an order of a court/competent authority under any law/regulation, Indian or foreign; or **(iii)** of arrangement not directly involving the target company as a transferor/transferee company, or reconstruction not involving the target company's undertaking, including amalgamation, merger/demerger, pursuant to an order of a court/competent authority under any law/regulation, Indian or foreign, subject to: **(1)** the component of cash and cash equivalents in the consideration paid being less than 25 per cent of the consideration paid under the scheme; and **(2)** where after implementation of the scheme of arrangement, persons directly/indirectly holding at least 33 per cent of the voting rights in the combined entity are the same as the persons who held the entire voting rights before the implementation of the scheme.
- (e)** Acquisition pursuant to the provisions of the Securitisation and Reconstruction of Financial Assets and Enforcement of Security Interest Act (SRFAESA);
- (f)** Acquisition pursuant to the provision of the SEBI Delisting of Equity Shares Regulations.
- (g)** Acquisition by way of transmission/succession/inheritance.
- (h)** Acquisition of voting rights/preference shares carrying voting rights arising out of the operation of Section 87(2) of the Companies Act.
- (i)** Acquisition of shares by the consortium of banks/financial institutions/other secured lenders on conversion of debt under strategic debt restructuring scheme in accordance with the RBI specified guidelines.
- (j)** Increase in voting rights/pursuant to forfeiture of shares by the target company in compliance with the provisions of the Companies Act.

- (2) The acquisition of shares not involving a change of control over the target company, pursuant to a scheme of corporate debt restructuring authorised by the shareholders by way of special resolution passed by postal ballot.
- (3) An increase in voting rights in a target company of any shareholder beyond the limit attracting an obligation to make an open offer pursuant to buy-back of shares by the target company provided he reduces his shareholding such that his voting rights fall below the threshold within 90 days from the date of the closure of the buy-back offer.
- (4) The following acquisition would be exempt from the obligation to make an open offer:
 - (a) Acquisition of shares by any shareholder of a target company, up to his entitlement, pursuant to a rights issue;
 - (b) Acquisition of shares by any shareholder of a target company, beyond his entitlement, pursuant to a right issue, subject to the fulfilment of the following conditions the: **(i)** acquirer has not renounced any of his entitlement; and **(ii)** price at which the rights issue is made is not higher than the *ex-rights* price of the shares of the target company, being the sum of: **(1)** the volume weighted average market price of the shares of the target company during a period of 60 trading days ending on the day prior to the date of determination of the rights issue price, multiplied by the number of shares outstanding prior to the rights issue, divided by the total number of shares outstanding after allotment under the rights issue. The volume weighted average market price should be determined on the basis of trading on the stock exchange where the maximum volume of trading in the shares is recorded during the period; and **(2)** the price at which the shares are offered in the rights issue, multiplied by the number of shares offered in the rights issue divided by the total number of shares outstanding after allotment under the rights issue.
 - (c) Increase in voting rights in a target company of any shareholder pursuant to buy-back of shares provided that: **(i)** the shareholder has not voted in favour of the resolution authorising the buy-back; **(ii)** in the case of a shareholder resolution, voting is by way of postal ballot; **(iii)** where a resolution of shareholders is not required for the buy-back, the shareholder, in his capacity as a director, or any other interested director has not voted in favour of the resolution of the Board of Directors authorising the buy-back; and **(iv)** the increase in voting rights does not result in an acquisition of control by the shareholder over the target company. Where, however, the aforesaid conditions are not met, in case the shareholder reduces his shareholding such that his voting rights fall below the level at which the obligation to make an open offer would be attracted within 90 days from the date of closure of the buy-back offer by the target company, the shareholder would be exempt from the obligation to make an open offer;
 - (d) Acquisition of shares in a target company by any person in exchange for shares of another target company tendered pursuant to an open offer for acquiring shares;
 - (e) Acquisition of shares from State-level financial institutions/their subsidiaries/companies promoted by them, by promoters of the target company pursuant to an agreement between the transferors and the promoter;
 - (f) Acquisition of shares in a target company from a SEBI-registered venture capital fund/category I alternative investment fund/foreign venture capital investor by promoters of the target company pursuant to an agreement between them.
- (5) In respect of acquisition **(i)** pursuant to *inter se* transfer of shares among qualifying persons, **(ii)** from state-level financial institutions and venture capital funds/foreign venture capital investor, the acquirer should intimate the stock exchanges the details of the proposed

acquisition in the specified form at least four working days prior to the proposed acquisition, and the stock exchange should forthwith disseminate the information to the public.

- (6) In respect of any acquisition made pursuant to exemption under these regulations, the acquirer should file a report with the stock exchanges where the shares of the target company are listed, in the specified form within four working days from the acquisition, and the stock exchange should forthwith disseminate such information to the public.
- (7) In respect of any acquisition of or increase in voting rights pursuant to exemption pursuant to (i) *inter se* transfer, (ii) court order, (iii) operation of the Companies Act, (iv) corporate debt restructuring, (v) buy-back and (vi) rights issue, the acquirer should, within 21 working days of the date of the acquisition, submit a report in the specified form along with supporting documents to the SEBI giving all details in respect of acquisitions, along with a non-refundable fee of ₹1,50,000.

Exemption by the SEBI The SEBI may, for reasons recorded in writing, grant (i) exemption from the obligation to make an open offer for acquiring shares, (ii) relaxation from strict compliance with any procedural requirement relating to open offer process and other obligations (**discussed later**) deemed fit in the interests of investors in securities/securities market on being satisfied that: (a) the Central/State Government/other regulatory authority has superseded the Board of Directors of the target company and has appointed new directors if the (i) Board of Directors has formulated a plan which provides for transparent, open, and competitive process for acquisition of shares/voting rights in, or control over, the target company to secure its smooth and continued operation in the interests of all its stakeholders and the plan does not further the interests of any particular acquirer; (ii) conditions and requirements of the competitive process are reasonable and fair and; (iii) process provides for details including the time when the open offer for acquiring shares would be made/completed and the manner in which the change in control would be effected; and (b) the provisions relating to open offer process and other obligations are likely to act as impediment to the implementation of the plan of the target company and exemption from strict compliance with one/more such provisions is in (1) public interest, (2) the interests of investors in securities/securities market. For seeking exemption/relaxation, the acquirer/target company should apply to the SEBI together with the non-refundable fee of ₹3,00,000 supported by an affidavit detailing the proposed acquisition and the grounds for the exemption.

Open Offer Process The main elements of the open offer process are: (i) manager to the offer, (ii) timing, (iii) publication, (iv) contents, (v) filing of letter with SEBI, (vi) provision of escrow, (vii) other procedures, (viii) conditional offer, (ix) competing offer, (x) payment of consideration, (xi) completion of acquisition, and (xii) withdrawal of open offer.

Manager to the Open Offer Prior to making a public announcement, the acquirer should appoint a SEBI-registered merchant banker, other than an associate, as the manager to the open offer who should make the public announcement.

Timing The public announcement in terms of its publication and contents should be made on the date of agreeing to acquire shares/voting rights in, or control over the target company. It should be made: (a) in the case of market purchases, prior to the placement of the purchase order with the stock broker to acquire the shares, that would take the entitlement to voting rights beyond the stipulated thresholds; (b) upon conversion of convertible securities without a fixed date of conversion/depository receipts for the underlying shares of the target company on the same days as the date of exercise of

the option to convert such securities into shares; **(c)** upon conversion of convertible securities with a fixed date of conversion on the second working day preceding the scheduled date of conversion of the securities into shares; **(d)** pursuant to a disinvestment on the same day as the date of executing the agreement for acquisition of shares/voting rights in, or control over the target company; **(e)** in the case of indirect acquisition of shares/voting rights in, or control over the target company at any time within four working days from the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain; **(f)** under preferential issue on the date on which the Board of Directors of the target company authorises the preferential issue; **(g)** the public announcement pursuant to an increase in voting rights consequential to a buy-back not qualifying for exemption not later than the ninetieth day from the date of closure of the buy-back offer by the target company; **(h)** pursuant to any acquisition of shares or voting rights in or control over the target company where the specific date on which the title to such shares, voting rights or control is acquired is beyond the control of the acquirer, not later than two working days from the date of receipt of intimation of having acquired the title.

The announcement should be made on the date of the first acquisition if the acquirer discloses in the public announcement the details of the proposed subsequent acquisitions.

The public announcement relating to voluntary offer should be made on the same day on which the acquirer takes the decision to voluntarily make a public announcement of an open offer. A detailed public statement should be published by the acquirer through the manager to the open offer, within five working days of the public announcement and in case of a public announcement relating to indirect acquisition within five working days of the completion of the primary acquisition. In the event the acquirer does not succeed in acquiring the ability to exercise or direct the exercise of voting rights in, or control over, the target company, a detailed public statement of an open offer for acquiring shares would not be required.

Publication The public announcement should be sent to all the concerned stock exchanges, who should forthwith disseminate the information to the public. A copy should be sent to the SEBI and the target company at its registered office within one working day of the date of the public announcement. The detailed public statement should also be published in all editions of any one English national daily with wide circulation, any one Hindi national daily with wide circulation, and any one regional language daily with wide circulation at the place where the registered office of the target company is situated and one regional language daily at the place of the stock exchange where the maximum volume of trading in the shares of the target company are recorded during the 60 trading days preceding the date of the public announcement. Simultaneously, with publication of such detailed public statement in the newspapers, a copy of the same should be sent to: **(i)** the SEBI through the manager to the open offer, **(ii)** all the stock exchange on which the shares of the target company are listed, who should forthwith disseminate the information to the public, and **(iii)** the target company at its registered office to be forthwith circulated to the members of its Board of Directors.

Contents The public announcement should contain the specified information including the following: **(a)** name and identity of the acquirer; **(b)** name and identity of the seller; **(c)** nature of the proposed acquisition such as purchase/allotment of shares, any other means of acquisition of shares/voting rights; **(d)** consideration for the proposed acquisition that attracted the obligation to make an open offer and the price per share; **(e)** the offer price, and mode of payment of consideration; and **(f)** offer size, and conditions as to minimum level of acceptance. The detailed public statement pursuant

The first part of the book is devoted to a general history of the world, from the beginning of time to the present day. It covers the various ages and periods of human history, and the progress of civilization and knowledge. The author discusses the different nations and empires, and the various events and revolutions that have shaped the world. The second part of the book is a more detailed account of the history of the British nation, from its early settlement to the present day. It describes the growth of the British Empire, the various wars and conflicts, and the political and social changes that have taken place. The third part of the book is a collection of essays and treatises on various subjects, including politics, philosophy, and literature. These essays are written by some of the most famous writers of the time, and they provide a valuable insight into the thoughts and opinions of the leading minds of the age.

The fourth part of the book is a collection of letters and speeches, which are also written by some of the most famous writers of the time. These letters and speeches provide a more personal view of the authors, and they show how they were involved in the events and controversies of the day. The fifth part of the book is a collection of biographies and memoirs, which describe the lives and careers of some of the most important figures of the time. These biographies provide a detailed account of the authors' lives, and they show how their experiences and influences shaped their work. The sixth part of the book is a collection of historical documents and records, which provide a more direct view of the events and actions of the time. These documents include treaties, laws, and official records, and they are essential for understanding the political and social context of the time.

The seventh part of the book is a collection of historical novels and romances, which are written in a more entertaining and imaginative style. These novels and romances provide a more vivid and detailed account of the events and actions of the time, and they are a valuable source of information for historians and scholars. The eighth part of the book is a collection of historical plays and dramas, which are also written in a more entertaining and imaginative style. These plays and dramas provide a more dramatic and emotional account of the events and actions of the time, and they are a valuable source of information for historians and scholars.

The ninth part of the book is a collection of historical poems and songs, which are also written in a more entertaining and imaginative style. These poems and songs provide a more poetic and lyrical account of the events and actions of the time, and they are a valuable source of information for historians and scholars. The tenth part of the book is a collection of historical paintings and illustrations, which provide a more visual and pictorial account of the events and actions of the time. These paintings and illustrations are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time.

The eleventh part of the book is a collection of historical maps and charts, which provide a more geographical and spatial account of the events and actions of the time. These maps and charts are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time. The twelfth part of the book is a collection of historical coins and medals, which provide a more numismatic and monetary account of the events and actions of the time. These coins and medals are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time. The thirteenth part of the book is a collection of historical seals and stamps, which provide a more heraldic and official account of the events and actions of the time. These seals and stamps are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time.

The fourteenth part of the book is a collection of historical records and documents, which provide a more detailed and accurate account of the events and actions of the time. These records and documents are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time. The fifteenth part of the book is a collection of historical letters and correspondence, which provide a more personal and intimate account of the events and actions of the time. These letters and correspondence are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time.

The sixteenth part of the book is a collection of historical treatises and essays, which provide a more theoretical and philosophical account of the events and actions of the time. These treatises and essays are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time. The seventeenth part of the book is a collection of historical speeches and orations, which provide a more public and formal account of the events and actions of the time. These speeches and orations are a valuable source of information for historians and scholars, and they provide a more detailed and accurate view of the events and actions of the time.

to public announcement should contain the specified information in order to enable shareholders to make an informed decision with reference to the open offer. The public announcement of the open offer, the detailed public statement, and any other statement, advertisement, circular, brochure, publicity material or letter of offer issued in relation to the acquisition of shares should not omit any relevant information, or contain any misleading information.

Filing of Letter of Offer with the SEBI Within five working days from the date of the detailed public statement, the acquirer should, through the manager to the open offer, file with the SEBI, a draft of the letter of offer, containing the specified information along with a non-refundable fee, as per the following scale:

<i>Consideration payable under the open offer</i>	<i>Amount</i>
Up to ten crore rupees	₹1,25,000
More than ten crore rupees, but less than or equal to one thousand crore rupees	₹1,25,000 plus 0.025 per cent of the portion of the offer size in excess of ten crore rupees
More than one thousand crore rupees, but less than or equal to five thousand crore rupees	₹1,25,00,000 plus 0.03125 per cent of the portion of the offer size in excess of one thousand crore rupees
More than five thousand crore rupees	₹2,50,00,000 plus 0.01 per cent of the portion of the offer size in excess of five thousand crore rupees subject to a maximum of three crore rupees

The consideration payable under the open offer should be calculated at the offer price, assuming full acceptance of the open offer, and in the event the open offer is subject to differential pricing, at the highest offer price, irrespective of mode of payment of the consideration. However, in the event of consideration being enhanced owing to a revision to the offer price/size, the payable fees would stand revised accordingly, and paid within five working days from the date of the revision. The manager to the open offer should provide soft copies of the public announcement, the detailed public statement and the draft letter of offer in accordance with the specified specifications and the SEBI would upload the same on its website.

The SEBI should give its comments on the draft letter of offer as expeditiously as possible but not later than fifteen working days of its receipt and in the event of no comments being issued within this period, it would be deemed that the SEBI does not have comments to offer. However, in the event the SEBI has sought clarifications/additional information, the period for issuance of comments would be extended to the fifth working days from the date of receipt of satisfactory reply. If SEBI specifies any changes, the manager to the open offer and the acquirer should carry them out in the letter of offer before dispatch to the shareholders. In the case of competing offers, the SEBI should provide its comments on the draft letter of offer in respect of each competing offer on the same day. In case the disclosures in the draft letter of offer are inadequate, the SEBI may call for a revised letter of offer.

Provision of Escrow Within two working days prior to the date of the detailed public statement of the open offer, the acquirer should create an escrow account towards security for performance of his obligations and deposit amount as per the following scale: **(a)** on the first 500 crore rupees, 25 per cent of the consideration, **(b)** an additional amount equal to 10 per cent of the balance consideration.

Where, however, an offer is made conditional upon minimum level of acceptance, the higher of 100 per cent of the consideration payable in respect of the minimum level of acceptance or 50 per cent under the open offer should be deposited in cash in the escrow account. In case of an upward revision of the offer price/size, the value of the escrow amount should be computed on

the revised consideration calculated at the revised offer price, and the additional amount brought into the escrow account prior to effecting the revision. The escrow account may be in the form of **(a)** cash at any bank; **(b)** bank guarantee issued in favour of the manager to the open offer; **(c)** deposit of frequently traded and freely transferable securities with appropriate margin. In case of escrow account by way of a bank guarantee/deposit of securities, the acquirer should also ensure that at least one per cent of the total payable consideration is in cash with a bank as a part of the escrow account. For the escrow account in the form of a cash deposit, the acquirer should empower the manager to the open offer to instruct the bank to issue a banker's cheque/demand draft/make payment of the amounts lying to the credit of the escrow account.

The escrow account in the form of a bank guarantee should be in favour of the manager to the open offer and kept valid throughout the offer period and for an additional period of 30 days after completion of payment of consideration to shareholders who have tendered their shares in acceptance of the open offer. Similarly, the acquirer should empower the manager to the open offer to realise the value of escrow account in the form of securities by sale or otherwise, and if there is any shortfall in the escrow account, he would be liable to make good such shortfall. The manager should not release the escrow account until the expiry of 30 days from the completion of payment of consideration to the concerned shareholders. In case of non-fulfilment of obligations by the acquirer, the SEBI may direct the manager to forfeit in full/part the escrow account/any amounts lying in the special escrow account.

The escrow account deposited with the bank in cash should be released only in the following manner: **(a)** the entire amount to the acquirer upon withdrawal of offer as certified by the manager to the open offer; **(b)** for transfer of an amount not exceeding 90 per cent of the escrow account to special escrow account (**discussed later**); **(c)** to the acquirer, the balance of the escrow account after transfer of cash to the special escrow account, on the expiry of 30 days from the completion of payment of consideration to the concerned shareholders; **(d)** the entire amount to the acquirer upon the expiry of 30 days from the completion of payment of consideration to the concerned shareholders, where the open offer is for exchange of shares/other secured instruments; **(e)** the entire amount to the manager to the open offer, in the event of forfeiture for non-fulfilment of any of the obligations, for distribution after deduction of expenses, if any, of registered market intermediaries associated with the open offer in the following manner: **(i)** one-third to the target company; **(ii)** one-third to the Investor Protection and Education Fund, and **(iii)** one-third to be distributed *pro rata* among the shareholders who have accepted the open offer.

Other Procedures Simultaneously with the filing of the draft letter of offer with the SEBI, the acquirer should send a copy to the target company at its registered office and to all the concerned stock exchanges. It should be dispatched to the shareholders whose names appear on the register of members of the target company as of the **identified date** (i.e. date falling on the tenth working prior to the commencement of the tendering period for the purpose of determining the shareholders to whom letter of offer would be sent), not later than seven working days from the receipt of comments from the SEBI or where no comments are offered within seven working days from the expiry of the period. However, where local laws/regulations of any jurisdiction outside India may expose the acquirer/the target company to material risk of civil, regulatory/criminal liabilities in the event the letter of offer in its final form were to be sent without material amendments or modifications into such jurisdiction, and the shareholders resident in such jurisdiction hold shares entitling them to less than 5 per cent of the voting rights of the target company, the acquirer may refrain from dispatch of the letter of offer into such jurisdiction. Moreover, every person holding shares, regardless of whether he held shares

The first part of the document discusses the general principles of the law and the various factors that influence the outcome of a case. It covers the scope of the law and the role of the courts in interpreting and applying it.

The second part of the document deals with the specific provisions of the law and the conditions under which they apply. It provides a detailed analysis of the legal text and its implications for the parties involved.

The third part of the document focuses on the procedural aspects of the law, including the rules of evidence and the process of trial and judgment. It outlines the steps that must be followed to ensure a fair and just trial.

The fourth part of the document discusses the remedies available to the parties and the consequences of a successful claim. It explains how the law provides a means of redress for wrongs and the types of damages that can be awarded.

The fifth part of the document addresses the enforcement of the law and the role of the state in ensuring that the legal system operates effectively. It discusses the powers of the courts and the measures taken to uphold the law.

The sixth part of the document examines the relationship between the law and other branches of government, such as the executive and the legislature. It explores the checks and balances that maintain the separation of powers.

The seventh part of the document discusses the role of the law in society and its contribution to the well-being of the community. It highlights the importance of a strong legal system in maintaining order and justice.

The eighth part of the document provides a summary of the key points discussed and offers conclusions based on the analysis. It reiterates the importance of the law and the need for a robust legal system.

The final part of the document contains a list of references and a bibliography, providing sources for further research and study. It includes books, articles, and other legal materials that have been consulted in the preparation of the document.

on the identified date or has not received the letter of offer, would be entitled to tender such shares in acceptance of the open offer. Simultaneously, the acquirer should send the letter of offer to the custodian of shares underlying depository receipts, if any, of the target company. Irrespective of whether a competing offer has been made, an acquirer may make upward revisions to the offer price/the number of shares sought to be acquired under the open offer, at any time prior to the commencement of the last three working days before the commencement of the tendering period. In case of any revision of the open offer (i.e. offer price/size), the acquirer should: **(a)** make corresponding increases to the amount kept in escrow account and make an announcement in respect of the revisions in all the newspapers in which the detailed public statement was made; and **(b)** simultaneously inform the SEBI, all the concerned stock exchanges and the target company at its registered office.

The acquirer should disclose during the offer period every acquisition made by him of any shares of the target company in the specified form to each of the concerned stock exchanges/ the target company at its registered office within 24 hours of the acquisition, and the stock exchanges should forthwith disseminate the information to the public. He should facilitate tendering of shares by the shareholders and its settlement through the SEBI specified stock exchange mechanism.

However, he would not acquire/sell any shares of the target company during the period between three working days prior to the commencement of, and until the expiry of, the tendering period.

The acquirer should issue an advertisement in the specified form one working day before the commencement of the tendering period, announcing the schedule of activities for the open offer, the status of statutory and other approvals, if any, whether for the acquisition attracting the obligation to make an open offer or for the open offer, unfulfilled conditions, if any, and their status, the procedure for tendering acceptances and such other specified material detail. The advertisement should be: **(a)** published in all the newspapers in which the detailed public statement was made; and **(b)** simultaneously sent to the SEBI, all the concerned stock exchanges and the target company at its registered office.

The tendering period should start within 12 working days from date of receipt of comments from the SEBI and remain open for 10 working days. Shareholders who have tendered shares in acceptance of the open offer would not be entitled to withdraw their acceptance during the tendering period.

The acquirer should, within 10 working days from the last date of the tendering period, complete all the legal requirements relating to the open offer including payment of consideration to the concerned shareholders. He would be responsible to pursue all required statutory approvals in order to complete the open offer without any default/neglect/delay. Where, however, the acquirer is unable to make the payment to the concerned shareholders within such period owing to non-receipt of statutory approvals, the SEBI may, where it is satisfied that such non-receipt was not attributable to any wilful default failure/neglect on the part of the acquirer to diligently pursue such approvals, grant extension of time for making payments, together with interest to the shareholders for the delay at the specified rate. Where the statutory approval extends to some but not all shareholders, the acquirer would have the option to make payment to shareholders in respect of whom no statutory approvals are required in order to complete the open offer.

The acquirer should issue a post-offer advertisement in the specified form within 5 working days after the offer period, giving details including aggregate number of shares tendered/accepted, date of payment of consideration. The advertisement should be: **(i)** published in all the newspapers in which the detailed public statement was made; and **(ii)** simultaneously sent to the SEBI, all the concerned stock exchanges and the target company at its registered office.

Conditional Offer An acquirer may make an open offer conditional as to the minimum level of acceptance. Where, however, the open offer is pursuant to an agreement, the agreement should contain a condition to the effect that in the event the desired level of acceptance of the open offer is not received, the acquirer would not acquire any shares and the agreement attracting the obligation to make the open offer stand rescinded. In case of conditional offer, the acquirer should not acquire, during the offer period, any shares in the target company except under the open offer and any underlying agreement pursuant to which the open offer is made.

- Conditional Offer
- is an open offer conditional as to the minimum level of acceptance.

Competing Offers Upon a public announcement of an open offer, any person would be entitled to make a public announcement of an open offer within 15 working days of the date of the detailed public statement made by the acquirer. The open offer should be for such number of shares which when taken together with shares held by such acquirer would be at least equal to the holding of the acquirer who has made the first public announcement. Such open offer would not be regarded as a voluntary open offer. Every open offer and open offer first made would be regarded as competing offers.

- Competing offers
- every open offer and open offer first made would be regarded as competing offers.

No person would be entitled to make a public announcement of an open offer enter into any transaction that would attract the obligation to make a public announcement of an open offer after 15 working days of the date of the detailed public announcement and until the expiry of the offer period for such open offer. Unless the open offer first made is conditional, an acquirer cannot make a competing offer conditional as to the minimum level of acceptances. A public announcement of an open offer to acquire shares, or enter into any transaction that would attract the obligation to make a public announcement of an open offer cannot be made until the expiry of the offer period where the open offer is **(a)** for acquisition of shares pursuant to disinvestment, **(b)** pursuant to a relaxation from strict compliance with the open offer process and other obligations granted by the SEBI. The schedule of activities and the tendering period for all competing offers should be carried out with identical timelines and the last date for tendering shares in acceptance of the every competing offer should stand revised to the last date for tendering shares in acceptance of the competing offer last made.

Upon the public announcement of the competing offers, an acquirer who had made a preceding competing offer would be entitled to revise his open offer with more favourable terms to the shareholders of the target company. The acquirers making the competing offers would be entitled to make upward revisions of the offer price at any time up to 3 working days prior to the commencement of the tendering period. Except for these variations, all the provisions of the SEBI code would apply to every competing offer.

Payment of Consideration In case of consideration payable in cash, the acquirer should open a special escrow account with a SEBI-registered banker to an issue and deposit therein, such sum as would, together with cash transferred to the escrow account, make up the entire sum due and payable to the shareholders as consideration payable under the open offer, and empower the manager to operate the special escrow account on his behalf. The acquirer should complete payment of consideration whether in the form of cash or by issue, exchange or transfer of securities, to the concerned shareholders, within 10 working days of the expiry of the tendering period. Unclaimed balances, if any, lying to the credit of the special escrow account at the end of 7 years from the date of deposit would be transferred to the Investor Protection and Education Fund.

Completion of Acquisition The acquirer should not complete the acquisition of shares or voting rights in, or control over, the target company, whether by way of subscription to shares or a purchase of shares

attracting the obligation to make an open offer for acquiring shares, until the expiry of the offer period. In case of an offer made pursuant to a preferential allotment, the offer should be completed within 15 days from the date of passing of the resolution for preferential allotment. In case of delisting offer, the acquirer should complete the acquisition of shares only after making the public announcement regarding the success of the delisting proposal. Subject to the acquirer depositing in the escrow account, cash of an amount equal to 100 per cent of the consideration payable under the open offer assuming full acceptance of the open offer, the parties to such agreement may after the expiry of 21 working days from the date of detailed public statement, act upon the agreement and the acquirer may complete the acquisition of shares/voting rights in, or control over, the target company as contemplated.

The acquirer should complete the acquisition contracted under any agreement attracting the obligation to make an open offer not later than 26 weeks from the expiry of the offer period. In the event of any extraordinary and supervening circumstances rendering it impossible to complete the acquisition within this period, the SEBI may, for reasons to be published, may grant an extension of time by such period as it may deem fit in the interests of investors in securities/securities market.

Withdrawal of Open Offer An open offer once made can not be withdrawn except under any of the following circumstances: **(a)** Refusal of statutory approvals required for the open offer to acquire shares or for effecting the acquisitions attracting the obligation to make an open offer; **(b)** the acquirer, being a natural person, has died; **(c)** any condition stipulated in the agreement for acquisition attracting the obligation to make the open offer is not met for reasons outside the reasonable control of the acquirer, and such agreement is rescinded provided such conditions were specifically disclosed in the detailed public statement and the letter of offer. However, the acquirer cannot withdraw the open offer even if the proposed acquisition through the preferential issue is not successful; and **(d)** such circumstances, as in the opinion of the SEBI, merit withdrawal.

In case of withdrawal of the open offer, the acquirer should through the manager to the open offer, within two working days: **(a)** make an announcement in the same newspapers in which the public announcement was published, providing the grounds and reasons for withdrawal of the open offer; and **(b)** simultaneously inform in writing: **(i)** the SEBI, **(ii)** all the concerned stock exchanges, who should forthwith disseminate the information to the public, and **(iii)** the target company at its registered office.

Other Obligations The other obligations relate to: **(i)** directors of the target company, **(ii)** acquirer, **(iii)** target company, and **(iv)** manager to the offer.

Directors of the Target Company During the offer period, no person representing the acquirer should be appointed as director on the board of directors of the target company. After an initial period of 15 working days from the date of detailed public statement, appointment of persons representing him on the Board of Directors may, however, be effected in case the acquirer deposits in the escrow account, 100 per cent of the consideration payable under the open offer in cash. Where the acquirer has made conditional offer, no director representing him may be appointed to the Board of Directors of the target company during the offer period unless he has waived/attained such conditions and complies with the requirement of deposits cash in the escrow account.

In case of conditional offer, the acquirer, regardless of the size of the cash deposited in the escrow account, would not be entitled to appoint any director representing during the offer period. During the pendency of competing offers, regardless of the size of the cash deposited by an acquirer in the escrow account, there would be no induction of any new director to the Board of Directors of the target company. In case of death or incapacitation of any director, the vacancy may be filled by any person subject to approval by shareholders of the target company by way of a postal ballot. In the

event the acquirer is already represented by a director, he would not participate in any deliberation of the Board of Directors of the target company/vote on any matter in relation to the open offer.

Obligations of the Acquirer Prior to making the public announcement, the acquirer should ensure that **(i)** firm financial arrangements have been made for fulfilling the payment obligations under the open offer and **(ii)** he is able to implement the open offer, subject to the necessary statutory approvals. In case he has not declared an intention in the detailed public statement and the letter of offer to alienate any material assets of the target company/its subsidiaries whether by way of sale, lease, encumbrance or otherwise outside the ordinary course of business, he would be debarred from causing such alienation after acquiring control for two years after the offer period. In the event the target company/its subsidiary(ies) is required to alienate the assets despite not expressing the intention to alienate by the acquirer, the alienation would require a special resolution passed by shareholders of the target company, by way of postal ballot and the notice for which should, *inter alia*, contain reasons as to why the alienation is necessary.

The acquirer should ensure that the contents of the public announcement, the detailed public statement, the letter of offer and the post-offer advertisement are true, fair and adequate in all material aspects and not misleading in any material particular, and are based on reliable sources, and state the source wherever necessary. He should not sell shares of the target company held by them, during the offer period. He would be jointly and severally responsible for fulfillment of applicable obligations.

Obligations of the Target Company Upon a public announcement of an open offer for acquiring shares of a target company being made, the Board of Directors of the target company should ensure that during the offer period, its business is conducted in the ordinary course consistent with past practice. Unless the approval of shareholders of the target company by way of a special resolution by postal ballot is obtained, the Board of Directors of the target company/any of its subsidiaries during the offer period would not **(A)** **(i)** alienate any material assets whether by way of sale, lease, encumbrance or otherwise or enter into any agreement; **(ii)** effect any material borrowings outside the ordinary course of business; **(B)** issue/allot any authorised but unissued securities entitling the holder to voting rights. However, the target company/its subsidiaries may issue/allot shares **(i)** **(a)** upon conversion of convertible securities issued prior to the public announcement of the open offer, in accordance with pre-determined terms of conversions, **(b)** pursuant to any public issue in respect of which the red herring prospectus has been filed with the Registrar of Companies prior to the public announcement of the open offer or **(c)** pursuant to any rights issue in respect of which the record date has been announced prior to the public announcement of the open offer **(C)** implement any buy-back of shares/effect any other change in the capital structure of the target company; **(D)** enter into, amend/terminate any material contracts to which the target company or any of its subsidiaries is a party, outside the ordinary course of business, whether such contract is with a related party, within the meaning of the term under applicable accounting principles, or with any other persons; and **(E)** accelerate any contingent vesting of a right of any person to whom the target company or any of its subsidiaries may have an obligation to acquire shares of the target company by way of employee stock options or otherwise.

In any general meeting of a subsidiary of the target company in respect of the above matters, the target company/its subsidiaries should vote in a manner consistent with the special resolution passed by the shareholders of the target company. The target company would be prohibited from fixing any record date for a corporate action on or after the third working day prior to the announcement of, and

until the expiry of, the tendering period. It should furnish to the acquirer within two working days from the identified date, a list of shareholders as per the register of its members containing names, addresses, shareholding and folio number, in electric form and a list of persons whose applications for registration of transfer of shares are pending. The acquirer should, however, reimburse reasonable costs payable by the target company to external agencies in order to furnish such information.

Upon receipt of the detailed public statement, the Board of Directors of the target company should constitute a committee of independent directors to provide reasoned recommendations on the open offer, and the target company should publish them. The committee would be entitled to seek external professional advice at the expense of the target company. The committee should provide its written reasoned recommendations on the open offer to the shareholders of the target company which should be published in the specified form, at least two working days before the commencement of the tendering period, in the same newspaper where the public announcement of the open offer was published, and simultaneously, a copy of the same should be sent to: **(i)** the SEBI, **(ii)** all the concerned stock exchanges, who should forthwith disseminate the information to the public, and **(iii)** to the manger to the open offer, and where there are competing offers, to the manager to the open offer for every competing offer.

The Board of Directors of the target company should **(i)** facilitate the acquirer in verification of shares tendered in acceptance of the open offer, **(ii)** make available to all acquirers making competing offers, any information and co-operation provided to any acquirer who has made a competing offer.

Upon fulfilment by the acquirer of the required conditions, the Board of Directors of the target company should without any delay register the transfer of shares acquired by him in physical form, whether under the agreement or from open market purchases, or pursuant to the open offer.

Obligations of the Manager to the Open Offer Prior to public announcement being made, the manager to the open offer should ensure that **(a)** the acquirer is able to implement the open offer; and **(b)** firm arrangements for funds through verifiable means have been made by him to meet the payment obligations under the open offer. He should also ensure that the contents of the public announcement, the detailed public statement, the letter of offer and the post-offer advertisement are true, fair and adequate in all material aspects, not misleading in any material particular, are based on reliable sources, state the source wherever necessary, and are in compliance with the requirements under these regulations. Further, he should **(i)** furnish to the SEBI a due diligence certificate along with the draft letter of offer, **(ii)** ensure that market intermediaries engaged for the purposes of the open offer are SEBI-registered, **(iii)** exercise diligence, care and professional judgment to ensure compliance with these regulations, **(iv)** not deal on his own account in the shares of the target company during the offer period, **(v)** file a report with the SEBI within 15 working days from the expiry of the tendering period, in the specified form, confirming status of completion of various open offer requirements.

Disclosure of Shareholding and Control These relate to **(i)** disclosure related provisions, **(ii)** continual disclosures and **(iii)** disclosure of encumbered shares.

Disclosure-related Provisions The disclosures should be of the aggregate shareholding/voting rights of the acquirer/promoter of the target company/every person acting in concert with him. The acquisition/holding of any convertible security should also be regarded as shares and disclosed accordingly. Upon receipt of these disclosures, the stock exchange(s) should forthwith disseminate them.

Disclosure of Acquisition and Disposal The acquirers should disclose their aggregate shareholding and voting rights in the target company in the specified form. He should disclose every acquisition/

disposal of its shares of representing 2 per cent or more of the shares/voting rights in the specified form. These disclosures should be made within two working days of the receipt of intimation of allotment of shares/the acquisition of shares/voting rights in the target company to **(a)** every concerned stock exchange; and **(b)** the target company at its registered office.

Shares taken by way of encumbrance including pledge/lien or any such transaction should be treated as an acquisition while shares given upon release of encumbrance should be treated as a disposal, and disclosures should be made accordingly in the specified form. However, such requirement would not apply to a bank/public financial institution as pledgee in connection with a pledge of shares for securing indebtedness in the ordinary course of business.

Continual Disclosures Every person, who together with persons acting in concert with him, holds shares or voting rights entitling him to exercise 25 per cent or more of the voting rights, should disclose their aggregate shareholding and voting rights as of the thirty-first day of March, in such target company in the specified form. The promoter of should together with persons acting in concert with him, disclose their aggregate shareholding and voting rights as of the thirty-first of March, in such target company in the specified form. These disclosure should be made within seven working days from the end of each financial year to **(a)** every concerned stock exchange; and **(b)** the target company at its registered office.

Disclosure of Encumbered Shares The promoter of every target company should disclose details of their shares encumbered by him/persons acting in concert with him in the specified form. He should also disclose details of any invocation/release of encumbrance of share in the specified form. These disclosures should be made within seven working days from the creation/invocation/release of encumbrance to, **(a)** every concerned stock exchange; and **(b)** the target company at its registered office.

Miscellaneous Power to Issue Direction The SEBI may, in interest of investors in securities/securities market, issue such directions for violation of these regulations as it deems fit including: **(a)** Disinvestment of shares acquired; **(b)** Transfer of the shares, or any proceeds of a directed sale of shares, to the Investor Protection and Education Fund; **(c)** The target company/any depository not to give effect to any transfer of shares acquired; **(d)** The acquirer/any person acting in concert/any nominee or proxy not to exercise any voting or other rights attached to the shares acquired; **(e)** Debarring any person from accessing the capital market or dealing in securities for such period as may be directed, having regard to the nature and gravity of the violations; **(f)** The acquirer to make an open offer for acquiring shares of the target company at such offer price as determined by the SEBI; **(g)** The acquirer not to cause, and the target company not to effect, any disposal of assets of the target company or any of its subsidiaries contrary to the contents of the letter of offer, where the conditions set out are not met; **(h)** The acquirer who has failed to make an open offer or has delayed making of an open offer, to make the open offer and to pay interest at such rate as considered appropriate by the SEBI along with the offer price; **(i)** The acquirer who has failed to make payment of the open offer consideration to shareholders, not to make any open offer or enter into any transaction that would attract the obligation to make an open offer in respect of shares of any target company for such period as the SEBI may deem fit; **(j)** The acquirer who has made an open offer but has delayed making payment of the consideration to shareholders, to pay interest at such rate as considered appropriate by the SEBI for the delayed period; **(k)** Any person to cease and desist from exercising control acquired over any target company without complying with the specified requirements; **(l)** Divestiture of such number of shares as would result in the

shareholding of an acquirer and persons acting in concert with him being limited to the maximum permissible non-public shareholding or below.

In any proceedings, the SEBI would comply with the principles of natural justice before issuing directions to any person. It may, for failure to carry out the requirements of these regulations by any registered intermediary, initiate appropriate proceedings in accordance with the applicable regulations.

Hostile Takeover

Strategies The acquirer company can use any of the following techniques aimed at taking over the target company.

Street Sweep This technique requires that the acquirer should accumulate large amounts of stock in a company before making an open offer. The advantage is that the target firm is left with no choice but to give in.

Bear Hug In this case, the acquirer puts pressure on the management of the target company by threatening to make an open offer. The board capitulates straightaway and agrees to a settlement with the acquirer for change of control.

Strategic Alliance This strategy involves disarming the opposition by offering a partnership rather than a buyout. The acquirer should assert control from within and takeover the target company.

Brand Power This implies entering into an alliance with powerful brands to displace the partner's brands and, as a result, buy out the weakened company.

Defensive Strategies The target company can also use one of the following strategies to defend itself against the attack mounted by the acquiring company in its bid for open market takeover.

Poison Pill This strategy involves issue of low price preferential shares to existing shareholders to enlarge the capital base. This would make hostile takeover too expensive.

Poison Put In this case, the target company can issue bonds that encourage holders to cash in at high prices. The resultant cash drainage would make the target unattractive.

Greenmail In this strategy, the target company should repurchase the shares cornered by the raider. The profits made by the raider are after all akin to blackmail and this would keep the raider at a distance from the target.

Pac-man Defence This strategy aims at the target company making a counter bid for the raider's company. This would force the raider to defend himself and consequently call off his raid.

White Knight In order to repel the move of the raider, the target company can make an appeal to a friendly company to buy the whole, or part, of the company. The understanding is that the friendly buyer promises not to dislodge the management of the target company.

White Squire This strategy is essentially the same as White Knight and involves sell out of shares to a company that is not interested in the takeover. As a consequence, the management of the target company retains its control over the company.

Evidently, hostile takeovers, as far as possible, should be avoided as they are more difficult to consummate; in other words, friendly takeovers are better forms of corporate restructuring.

LO 32.5 OTHER FORMS OF CORPORATE RESTRUCTURING

Financial restructuring, divestitures/demergers and buyouts are some of the other common forms used by firms for corporate restructuring. These forms of corporate restructuring are explained below.

Financial Restructuring

In the case of mergers/acquisitions/takeover and amalgamation types of corporate restructuring, the potential acquiring firm has to deal with the management and/or shareholders of the other firm(s). Financial restructuring, on the other hand, is carried out internally in the firm with the consent of its various stakeholders. This form of corporate restructuring is relatively more easy to put to ground.

Financial restructuring is a suitable mode of restructuring of corporate firms that have incurred/accumulated sizable losses for/over a number of years. As a sequel, the share capital of such firms, in many cases, gets substantially eroded/lost; in fact, in some cases, accumulated losses over the years may be more than share capital, causing negative net worth. Given such a dismal state of financial affairs, a vast majority of such firms are likely to have a dubious potential for liquidation. Can some of these firms be revived? Financial restructuring is one such a measure for the revival of only those firms that hold promise/prospects for better financial performance in the years to come. To achieve the desired objective, such firms warrant/merit a restart with a fresh balance sheet, which does not contain past accumulated losses and fictitious assets and shows share capital at its real/true worth.

Restructuring Scheme Financial restructuring is achieved by formulating an appropriate restructuring scheme involving a number of legal formalities (including consent of the court and consent of the affected stakeholders, say, creditors, lenders and shareholders). It is normal for equity shareholders to make the maximum sacrifice, followed by preference shares and debentureholders/lenders and creditors, respectively. The sacrifice is in terms of waiver of a part of the sum payable to various liability-holders. The sacrifice may also be in terms of acceptance of new securities with a lower coupon rate, with a view to reduce the future financial burden on the firm. The arrangement may also take the form of conversion of debt into equity; sometimes, creditors, apart from reducing their claim, may also agree to convert their dues into securities to avert pressure of payment. As a result of all these measures, the firm may have better liquidity to work with. Thus, financial restructuring implies a significant change in the financial/capital structure of firms, leading to a change in the payment of fixed financial charges and change in the pattern of ownership and control.

In brief, financial restructuring (also referred to as internal reconstruction) aims at reducing the debt/payment burden of the firm. The aggregate sum resulting **(a)** from the reduction/waiver in the claims from various liability-holders and **(b)** profit accruing from the appreciation of assets such as land and buildings is then utilised to write off accumulated losses and fictitious assets (such as preliminary expenses and cost of issue of shares and debentures) and create provision for bad and doubtful debts and downward revaluation of certain assets, say, plant and machinery, if they are overstated. In practice, the financial restructuring scheme is drawn in such a way so that all the above requirements of write-off are duly met. The financial restructuring scheme is illustrated in Example 32.8.

Example 32.8

Following is the balance sheet of Weak Limited as on March 31, current year

		(₹ lakh)	
Liabilities	Amount	Assets	Amount
Equity capital (5,00,000 shares)	500	Land and building	180
13% Preference shares (₹100 each)	100	Plant and machinery	220
12.5% Debentures	200	Furniture	30
Debenture interest payable	25	Stock	120
Bank loan	75	Sundry debtors	50
Trade creditors	300	Cash at bank	5
		Preliminary expenses	10
		Cost of issue of debentures	5
		Profit and loss account	580
	1,200		1,200

The company suffered heavy losses and was not getting on well. Now, it feels that the worst is over and that it holds the potential of earning profits in the future. To ensure better future functioning, the company adopts the following scheme of reconstruction:

- (i) Equity shares are to be reduced to ₹25 per share, fully paid up.
- (ii) Preference shares are to be reduced (with coupon rate of 11%) to equal number of shares of ₹50 each, fully paid up.
- (iii) Debentureholders agree to forgo outstanding interest. They have also agreed to accept new debentures carrying 10 per cent interest.
- (iv) Trade creditors have agreed to forgo 25 per cent of their existing claims.
- (v) To make payment of the bank loan and augment the working capital, the company issues 5 lakh equity shares at ₹25 each; payable on application. The existing shareholders have agreed to subscribe to the new issue.
- (vi) While land and building is to be revalued at ₹300 lakh, plant and machinery is to be written down to ₹175 lakh. A provision amounting to ₹5 lakh is to be made for bad and doubtful debts.

You are required to show the impact of financial restructuring/reconstruction. Also draw the new balance sheet assuming the scheme of reconstruction is executed.

Solution**Impact of Financial Restructuring**

(₹ lakh)

(I) Benefits to Weak Limited		
(a) Reduction of liabilities payable		
Reduction in equity share capital (5 lakh shares × ₹75 per share)		₹375
Reduction in preference share capital (1 lakh shares × ₹50 per share)		50
Waiver of outstanding debenture interest		25
Waiver from trade creditors (₹300 lakh × 0.25)		75
		525
(b) Revaluation of assets		
Appreciation of land and building (₹300 lakh – ₹180 lakh)		120
(c) Total sum available to write off fictitious assets and over-valued assets		645
(II) Amount (₹645 lakh) Utilised to Write off Losses, Fictitious Assets and Over-valued Assets		
Writing off profit and loss account		₹580
Cost of issue of debentures		5
Preliminary expenses		10
Provision for bad and doubtful debts		5
Revaluation of plant and machinery (₹220 lakh – ₹175 lakh)		45
		645

Balance Sheet of Weak Limited as at ... (After Reconstruction)

(₹ lakh)

Liabilities	Amount	Assets	Amount
Equity capital (₹25 each)	250	Land and building	300
11% Preference shares (₹50 each)	50	Plant and machinery	175
10% Debentures	200	Furniture	30
Trade creditors	225	Stock	120
		Sundry debtors	₹50
		Less: Provision	5
		Cash at bank	55*
	<u>725</u>		<u>725</u>

*Opening balance, ₹5 lakh + Sale proceeds from issue of new equity shares, ₹125 lakh – Payment of bank loan, ₹75 lakh.

In sum, financial restructuring is unique in nature and company specific. It is carried out, in practice, when all the stakeholders are prepared to sacrifice and are convinced that the restructured firm (reflecting true value of assets, capital and other significant financial parameters) can now be put back on the profit track. This type of corporate restructuring helps in the revival of firms that otherwise would have faced closure/liquidation.

Divestitures/Demergers

Unlike the merger in which all assets are sold, a **divestiture/demerger** involves selling of some of the assets only. These assets may be in the form of a plant, division, product line, subsidiary and so on. Although divestiture causes contraction from the perspective of selling firm, it may not, however, entail decrease in its profits. On the contrary, it is believed by the selling firm that its value will be enhanced by parting/divesting/demerging some of its assets/divisions/operating units (as they are either causing losses or yielding very low returns). By selling such unproductive/non-performing assets and utilising cash proceeds in expanding/rejuvenating other leftover assets/operating units, the firm is likely to augment the profits of the demerged/divesting firm. Evidently, the motive for demerger or divestiture is often positive. As Gitman aptly states, the motives for divestiture is to generate cash for the expansion of other product lines, to get rid of a poorly performing operation, to streamline the corporate firm, or to restructure the company's business consistent with its strategic goals¹⁰.

Evidently, divestiture enables the selling firm to have a more lean and focussed operation. This, in turn, is likely to augment its efficiency as well as profitability and help in creating more value for its shareholders. In other words, it implies that the operating units are worth much more to other firms than to the firm itself. In technical terms, it is aptly referred to as **reverse synergy** in that the value of the parts is greater than the whole.

- **Demerger (divestiture)**
- is a form of corporate restructuring which involves sale of only some assets of the firm.

- **Reverse synergy**
- implies that the assets/units which are demerged are of more worth to other firms than the firm itself.

Reverse capital budgeting is the capital budgeting in which cash inflows on account of demerger occur at time zero and the cash outflows are in terms of sacrifice associated with the transfer of the division/asset.

Financial Evaluation For the purpose of financial evaluation, the divestiture/demerger decision can be considered akin to **reverse capital budgeting** decision in that the selling firm receives cash by divesting an asset, say a division of the firm, and these cash inflows received are then compared with the present value of the CFAT sacrificed on account of parting of a division/asset. In other words, it has cash inflows in time zero period. For future years, it has been deprived of cash inflows after taxes (CFAT), which the division would have generated. Given

the basic conceptual framework of capital budgeting, Format 32.3 contains the steps involved in assessing whether the divestiture decision is profitable for the selling firm or not.

FORMAT 32.3 Financial Evaluation of Divestiture/Demerger Decision

(a) Decrease in CFAT due to sale of division (for years 1,2.....n)	_____
(b) Multiply by appropriate present value factor (as per cost of capital) relevant to division (given its risk level)	_____
(c) Decrease in present value of the selling firm ($a \times b$)	_____
(d) Less: Present value of obligations related to the liabilities of the division (assuming liabilities are also transferred with the sale of a division which is normal)	_____
(e) Present value lost due to sale of division ($c - d$)	_____

The decision criterion is that the selling firm should go for divestiture/demerger, if its divestiture proceeds received from selling the division are more than the present value the demerged division otherwise would have provided; in case the present value lost due to sale of division is greater than the sale proceeds obtained from it, the firm should not go for divestiture/demerger.

Methods of Demerger/Divestiture Demerger/divestiture is normally accomplished either by an outright sale of an operating unit/division/asset to another firm or through a **spin-off**. A spin-off requires

Spin-off is a method for demerger through creation of a separate firm.

creation of a new, separate, corporate firm; the shares of the newly created legal entity are distributed on a *pro rata* basis to existing shareholders of the parent company; such a distribution enables the existing shareholders to maintain the same proportion of ownership in the newly created firm as they had in the original firm¹¹. As a sequel, the newly created entity becomes an independent company, taking its own decisions and developing its own policies and strategies, which need not necessarily be the same as those of the parent company. In brief, the firm acts as a separate business entity. However, spin-off, like outright sale, does not bring any cash to the parent company.

Split-up is a method for demerger through breaking-up of the firm in a series of spin-offs.

A variation of spin-off is the **split-up**. In broad terms, the split-up involves the breaking up of the entire firm in a series of spin-offs (in terms of newly created separate legal entities) so that the parent firm no longer exists and only the new offspring survive¹². For instance, a corporate firm has 4 divisions, namely, A, B, C and D; a decision to split-up implies that four new corporate firms (with autonomous and separate legal status) are to be formed to takeover, say, one division each and the original corporate firm is to be wound up. Since demerged units are relatively smaller in size, they are logistically more conveniently managed. Therefore, it is expected that spin-offs and

split-ups are likely to enhance efficiency and may prove instrumental in achieving better performance.

Annexure 4 below contains the salient features of the scheme of reverse merger of ICICI Ltd with ICICI Bank Ltd.

Annexure 4 Reverse Merger of ICICI Ltd with ICICI Bank Ltd

The ICICI Ltd was one of the leading development/public financial institutions [D/P FIs]. It had sponsored a large number of subsidiaries including the ICICI Bank Ltd. The RBI permitted D/P FIs to transform themselves into banks in 2002. As a bank, ICICI Ltd would have access to low-cost (demand) deposits and could offer a wide range of products and services and greater opportunities for earning non-fund-based income in the form of fee/commission. The ICICI Bank Ltd also considered various strategic alternatives

in the context of the emerging competitive scenario in Indian banking. It identified a large capital base and size and scale of operations as key success factors. The ICICI Ltd and its two other subsidiaries, namely, ICICI Capital Services Ltd (ICICI Capital) and ICICI Personnel Financial Services Ltd (ICICI PFs) amalgamated in reverse merger with the ICICI Bank in view of its significant shareholding and the strong business synergies between them. As a financial institution, ICICI Ltd was offering a wide range of products and services to corporate and retail customers in India through a number of business operations, subsidiaries and affiliates. The ICICI PFs, a subsidiary of ICICI, was acting as a focal point for marketing, distribution and servicing the retail product portfolio of ICICI including auto/commercial vehicle loans, credit cards, consumer loans and so on. The ICICI Capital was engaged in sale and distribution of various financial and investment products like bonds, fixed deposits, Demat services, mutual funds and so on. The appointed date for the merger was March 30, 2002. The effective date of merger was May 3, 2002.

The (reverse) merger of ICICI Ltd and two of its subsidiaries with ICICI Bank has combined two organisations with complementary strengths and products and similar processes and operating structure. The merger has combined the large capital base of ICICI Ltd with strong deposit raising capacity of ICICI Bank, giving ICICI Bank improved ability to increase its market share in banking fee and commission while lowering the overall cost of funding through access to lower-cost retail deposits. The ICICI Bank would now be able to fully leverage the strong corporate relationship that ICICI has built seamlessly, providing the whole range of financial products and services to corporate clients. The merger has also resulted in the integration of the retail financial operations of the ICICI and its two merging subsidiaries and ICICI Banks into one entity, creating an optimum structure for the retail business and allowing the full range of assets and liability products to be offered to retail customers.

As per the scheme of amalgamation (reverse merger) approved by the High Court of Gujarat and the High Court of Mumbai in March/April 2002, the (consideration) exchange ratio for the merger was one fully paid-up equity share of ₹10 of ICICI Bank for two fully paid-up equity shares of the ICICI Ltd of the face value of ₹10 each. No shares were issued pursuant to the amalgamation of ICICI PFS and ICICI Capital. The exchange ratio was determined on the basis of a comprehensive valuation process incorporating international best practices, carried out by two separate financial advisors (JM Morgan Stanley and DSP Merrill Lynch) and an independent accounting firm (Deloitte, Haskins and Sells).

The equity shares of the ICICI Bank held by ICICI Ltd were transferred to a trust, to be divested by appropriate placement. The proceeds of such divestment would accrue to the merged entity.

The ICICI Bank has issued to the holders of preference shares of ₹1 crore each of ICICI, one preference share of ₹1 crore fully-paid up on the same terms and conditions.

With respect to stock options issued by the ICICI to its Directors/employees, which have not been exercised/are outstanding, the options in ICICI Bank in the ratio of one equity share of ₹10 each for every two equity shares of ₹10 each granted in ICICI Ltd would be issued. The exercise price would be twice the price paid by the directors/employees for the exercise of ICICI stock options.

As both ICICI Ltd and ICICI Bank were listed in India and U.S. markets, effective communication to a wide range of investors was a critical part of the merger process. It was equally important to communicate the rationale for the merger to domestic and international institutional lenders and to rating agencies. The merger process was required to satisfy legal and regulatory procedures in India, as well as to comply with the U.S. Securities and Exchange Commission requirements under U.S. securities laws.

The merger also involved significant accounting complexities. In accordance with the best practices in accounting, the merger has been accounted for under the purchase method of accounting under the Indian GAAPs. Consequently, ICICI's assets have been fair-valued for their incorporation in the books of accounts. The fair value of ICICI's loan portfolio was determined by an independent valuer while its equity and related investment portfolio was fair-valued by determining its mark-to-market value. The total additional provisions and write-offs required to reflect the fair value of the ICICI's assets have de-risked the loan and investment portfolios and created a significant cushion in the balance sheet while maintaining healthy levels of capital adequacy.

The merger was approved by the shareholders of both companies in January 2002, by the Gujarat and Mumbai High Courts in March/April 2002.

Buyouts

Buyouts constitute yet another form of corporate restructuring. In the corporate world, **Management buyouts** (MBOs) are the more usual modes of acquisition. The MBO involves the sale of the existing firm to the management. The management may be from the same firm or may be from outside (entrepreneurs) or may assume a hybrid form (i.e., the management may be of the existing firm as well as from outside).

Management buyout is sale of the existing firm to the management.

In general, when the potential acquiring management team may not/does not have adequate financial resources of its own to pay the acquisition price, it seeks financial support from other sources, say, investors, institutions, venture funds, banks and so on. When finance is made/arranged by outside investors, it is normal for them to secure representation on the board of the corporate. In cases when debt forms a substantial part of the total financing from outsiders, the buyout transaction is appropriately referred to as a leveraged buyout (LBO). According to Emery and Finnerty, a **leveraged buyout** is an acquisition that is financed principally, sometime more than 90 per cent, by borrowing on a secured basis¹³.

Leveraged buyout implies acquisition of a firm that is financed principally by borrowing on a secured basis.

Since LBOs cause substantial financial risk, it is desired that LBO acquisitions/firms should have a relatively low degree of operating/business risk. LBOs will not be a suitable form of corporate restructuring if the acquired firm already has a high degree of business risk. Further, to ensure the success of LBO, it is imperative that the acquiring management/firm should carry out the exercise to determine the maximum level of debt it should go for, based on its cash generating capacity to service the debt in future. This exercise would enable the firm to determine the maximum degree of financial leverage it can employ in a buyout.

LO 32.6

MOTIVES AND ASSESSMENT OF MERGERS AND ACQUISITIONS PRACTICES IN INDIA

Mergers and acquisitions practices by corporate enterprises in India are summarized below:

- The market, usually, reacts positively to the mergers and acquisitions (M&A) announcements. Market starts reacting prior to the announcement. The moment the announcement information becomes public, investors start reacting and the stock price jumps high, providing positive abnormal returns to the investors. This reaction clearly indicates that investors perceive synergies in mergers and acquisitions and they appear to be beneficial for them.
- The acquisitions, financed with cash, experience higher returns than the acquisitions financed with stock. This could be a signal in favour of 'asymmetric information hypothesis and free cash flow hypothesis'. "Issuance of stock is not good news" as per the findings.
- Cross-border as well as domestic acquisitions have created value for shareholders of the acquiring company on the announcement. The results indicate that value creation is higher for cross-border acquisitions vis-a-vis domestic acquisitions. The acquisitions of targets from non-US developed market outperform the return from the acquisition of US targets.
- The acquirers of unlisted target firms experience higher returns than the acquirers of listed target firms. The acquirer earns when target remains as a wholly-owned subsidiary. In contrast, the acquirer shareholder loses when the target firm is absorbed with the operations of the acquiring firm.
- The primary motive of mergers in India has been to take advantage of synergies. Operating economies, increased market share and financial economies (lower risk leading to lower cost of capital) have been indicated in order of importance as the desired synergies to be gained through corporate mergers and acquisitions in India.

- M&A appear to have been financially beneficial for the acquiring companies. The findings suggest that profitability of acquiring firms has improved during post-M&A phase. Better management of liquidity position during the post-M&A period has also been observed.
- M&A has no impact on the leverage of acquiring firms after M&A.
- Operating profit margin based on sales has improved post-M&A. The significantly higher post-M&A operating margin indicates that the acquirers appear to have generated higher operating profit per unit net sales, post-M&A. The better operating margin seems to be due to the lower costs as a result of economies of scale.
- The efficiency of utilisation of assets does not appear to have improved (as revealed by total assets turnover ratio) post-M&A.

SUMMARY

The growth of a firm can be achieved 'internally' either by developing new products and/or expanding the capacity of existing products or 'externally' by acquisitions, mergers, amalgamations, absorption and so on.

While a merger is a combination of two or more firms in which the resulting firm maintains the identity of one of the firms only, an amalgamation involves the combination of two or more firms to form a new firm. In the case of merger/absorption, the firm that has been acquired/absorbed is known as the target firm and the firm that acquires is known as the acquiring firm.

There are three types of mergers: (i) horizontal, (ii) vertical and (iii) conglomerate. Horizontal merger takes place when two or more firms dealing in similar lines of activity/business combine together. Vertical merger involves combination of two or more firms engaged in the various stages of production or distribution in the same business activity. Conglomerate merger is a combination of firms engaged in different/unrelated business activities.

The major economic advantages of a merger are: (i) economies of scale, (ii) synergy, (iii) fast growth, (iv) tax benefits and (v) diversification.

Synergy takes place as the combined value of the merged firm is likely to be greater than the sum of individual business entities. The combined value = value of acquiring firm, V_A + value of target firm, V_T + value of synergy, DV_{AT}

In ascertaining the gains from the merger, costs associated with acquisition should be taken into account. Therefore, the net gain from the merger is equal to the difference between the value of synergy and costs: Net gain = DV_{AT} - costs.

Set-off and carry forward of losses of an acquiring firm with the firm having profits reduce the taxable income of the newly merged firm and, hence, the reduction of tax liability. Thus, a merger can provide tax benefits.

Merger suffers from certain weaknesses also, the major ones being: (i) the management of the two firms may not go along because of friction and (ii) the dissenting minority shareholders may cause problems.

Section 100

Section 100 (1) A person who is a member of a company shall be deemed to have agreed to be bound by the provisions of the memorandum and articles of association of the company as if he had signed them.

Section 100 (2) A person who is a member of a company shall be deemed to have agreed to be bound by the provisions of the memorandum and articles of association of the company as if he had signed them.

Section 101

Section 101 (1) A person who is a member of a company shall be deemed to have agreed to be bound by the provisions of the memorandum and articles of association of the company as if he had signed them.

Section 102 (1) A person who is a member of a company shall be deemed to have agreed to be bound by the provisions of the memorandum and articles of association of the company as if he had signed them.

Section 103

Section 103 (1) A person who is a member of a company shall be deemed to have agreed to be bound by the provisions of the memorandum and articles of association of the company as if he had signed them.

The financial framework of merger covers three inter-related aspects: (i) determining the firm's value, (ii) financing techniques in merger and (iii) analysis of the merger as a capital budgeting decision.

The alternative approaches to value a firm are (i) book value, (ii) appraisal value, (iii) market value and (iv) earnings per share (EPS).

The alternative methods of financing mergers/payment to the acquired company are: (i) ordinary share financing, (ii) debt and preference share financing, (iii) convertible securities, (iv) deferred payment plan and (v) tender offers.

The extent of merger gains to be shared between the shareholders of the acquiring firm and the target firm depends on the exchange ratio. The ratio depends on the relative bargaining position of the two firms and the market reaction of the merger move. Normally, the exchange ratio is such in which the merger gains accrue to the shareholders of both firms.

Merger as a capital budgeting decision involves the valuation of the target firm in terms of its potentials to generate incremental future free cash flows (FCFF) to the acquiring firm. These cash flows are then to be discounted at an appropriate rate that reflects the riskiness of the target firm's business. The cost of acquisition is deducted from the present value of FCFF. The merger proposal is financially viable in case the NPV is positive. The finance manager can use sensitivity analysis to have a range of NPV values within which the acquisition price may vary.

Alternatively, the target firm can be valued according to the adjusted present value (APV) approach. The APV approach to value FCFF of target firm has two components: (i) the value of the target company if it were entirely equity financed discounting the FCFFs using the unlevered cost of equity and (ii) the value of impact of debt financing both in terms of tax shield and bankruptcy costs. The present value of tax shield is determined, discounting tax savings by pre-tax cost of debt. The incremental bankruptcy costs (due to debt financing) are subtracted. The proposal is financially viable in case the NPV is positive.

The following are the major tax benefits available to the amalgamated/resulting company: (i) carry forward and set-off of business losses, unabsorbed depreciation, unabsorbed capital expenditure on scientific research and (ii) the expenditure on patents and copyrights, know how, family planning, preliminary expenses and so on not yet written off in the books of amalgamating/demerged company to be written off by the amalgamated/resulting company in the same number of balance instalments. Virtually all fiscal concessions/incentives/deductions available to the amalgamating/demerged company are also available to the amalgamated/resulting company.

The tax concessions are also available to the amalgamating company. Several tax concessions are also available to the shareholders of the amalgamating as well as the demerged company.

Although the economic considerations of mergers, amalgamations and acquisitions are similar, the legal procedures involved are different. While the mergers and amalgamations are governed by the Companies Act, the takeovers and acquisitions are regulated by the SEBI. The pre-security of combination is done by the CCI.

The pre-entry scrutiny of combinations in India is conducted by the CCI under the Competition Act 2002. It is mandated upon its own knowledge or information to enquire within one year of its happening whether an acquisition/acquiring of control/amalgamation or merger has caused/is likely to cause an appreciable adverse effect on competition in India. It has issued regulation (2011) in respect of procedure regarding transactions of business relating to combinations. The main features of the regulation of combination under the Competition Act are: (i) regulation of combination, (ii) combination, (iii) conditions and (iv) procedure.

- Any combination entered into by any person/enterprise which causes or is likely to cause an appreciable adverse effect on competition within the relevant market in India are void. Whether a combination would have the effect of/is likely to have appreciable adverse effect on competition in the relevant market, the CCI would have due regard to all/any of the factors listed below: (i) Actual/potential level of competition through imports in the market; (ii) Extent of barriers to entry to the market; (iii) Degree of countervailing power in the market; (iv) Likelihood of the combination resulting in the concerned parties being able to significantly and sustainably increase price/profit margin; (v) Extent of effective competition likely to sustain the market; (vi) Extent to which substitutes are/likely to be available in the market; (vii) Market share in the relevant market of the concerned person/enterprise individually/jointly; (viii) Likelihood of the combination resulting in the removal of a vigours/effective competitor(s) in the market; (ix) Nature/extent of vertical integration in the market; (x) Possibility of a failing business; (xi) Nature/extent of innovation; (xii) Relative advantage by way of contribution to economic development by any combination having/likely to have appreciable adverse effect on competition; (xiii) The benefits of combination outweigh the adverse impact of combination.

The parties to combination should give notice to the CCI containing details of the proposed within 30 days of (a) approval of the merger/amalgamation by the Board of Directors, (b) execution of any agreement/other documents for acquisition/acquiring control. The combination would be effective after 210 days from the date of notice.

The conditions for pre-combination scrutiny by the CCI pertain to the value of assets and turnover. The acquirer and the concerned enterprise jointly have in (a) India assets and turnover exceeding ₹1,000 crore and ₹3,000 crore respectively, (b) India/outside India, the respective amounts are more than 500 million US dollars (including at least ₹500 crore in India), and 1,500 million US dollars (including at least ₹1,500 crore in India). The stipulations for the group to which the concerned enterprise belongs are that their joint holdings in India are/would be ₹4,000 crores (assets) and ₹12,000 crores (turnover). Such holdings in India/outside India should aggregate more than two billion US dollars (of which at least ₹500 crore in India) in terms of assets and six billion US dollars (including at least ₹1,500 crore in India) in terms of turnover.

The main provisions of the Companies Act, 2013 relating to combination are contained in Section 230-32. Merger/Amalgamation can be by (i) absorption, (ii) formation of a new company. Merger by absorption involves the transfer of the undertaking, property and liabilities of the merging companies to another existing company. Their transfer to a new company is merger by formation of a new company.

Merger and amalgamation under the Companies Act requires mandatory sanction by the National Company Law Tribunal (NCLT).

The scheme/arrangement/proposal approved by three-fourths in value of creditors/members and sanctioned by the NCLT would be binding on the company and all creditors/members.

The procedural stipulations relate to (i) holding of meeting of creditors/members, (ii) agenda of the meeting, (iii) provision for the specified matter, (iv) filing of the copies of the NCLT order with the ROCs and (v) penalty for contravention of the prescribed procedures.

Takeovers imply acquisition of controlling interest in a company by another company. They can take three forms: (i) negotiated/friendly, (ii) open market/hostile and (iii) bail-out.

In the case of hostile takeover, the target company can use the following strategies to defend itself: (i) Poison Pill, (ii) Poison Put, (iii) Greenmail, (iv) Pac-man defence, (v) White Knight and (vi) White Squire.

The corporate takeovers in India are governed by the Companies Act, listing agreements and SEBI code. The provisions of the Companies Act relate to acquisition of shares, restriction on acquisition and transfer of shares and so on. The takeover of companies listed on stock exchange is regulated by Clause 40–A and 40–B of the listing agreement. While Clause 40–A deals with conditions for continued listing, Clause 40–B contains the requirements to be met when a takeover offer is made.

The SEBI takeover code provides for the following: **(i)** Substantial Acquisition of Shares, Voting Rights/Control, **(ii)** Open Offer Process, **(iii)** Other Obligations, **(iv)** Disclosures of Shareholding and Control, and **(v)** Miscellaneous.

Acquisition means directly/indirectly acquire/agree to acquire shares voting rights in, or control over, a target company. **Control** includes the right to appoint majority of directors or to control the management or policy decisions exercisable by a person(s) acting individually or in concert, directly/indirectly, including by virtue of their shareholding/management rights/shareholders agreement/voting agreements or in any other manner. **Shares** means shares/security carrying voting rights including depository receipts carrying an entitlement to exercise voting rights. **Target company** means a company listed on a stock exchange. **Person acting in concert** means persons who, with a common objective/purpose of acquisition of shares/voting rights in, or exercising control, over a target company, pursuant to a formal/informal agreement/understanding, directly/indirectly co-operate for acquisition of shares/voting rights in, or exercise of control over, the target company. The persons falling within the following categories would be deemed to be persons acting in concert with other persons within the same category, unless the contrary is established: **(i)** a company, its holding company, subsidiary company and any company under the same management/control; **(ii)** a company, its directors, and any person entrusted with the management of the company; **(iii)** directors of companies referred to above and associates of such directors. **Associate** of a person means **(a)** any immediate relative, **(b)** trust of which the person/immediate relative is a trustee, **(c)** firm in which he/immediate relative is a partner, and **(d)** member of a Hindu Undivided Family of which he is a coparcener. **Immediate relative** means his spouse including parents/brothers/ sisters/children or of the spouse; **(iv)** promoters and members of the promoter group; **(v)** immediate relatives; **(vi)** a mutual fund, its sponsor, trustee, trustee company, and asset management company; **(vii)** a collective investment scheme and its collective investment management company, trustees and trustee company; **(viii)** a venture capital fund and its sponsor, trustees, trustee company and asset management company; **(viii-a)** an alternate investment fund and its sponsor/trustee/manager; **(ix)** a foreign institutional investor and its sub-accounts; **(x)** a merchant banker and its client, who is an acquirer; **(xi)** a portfolio manager and its client, who is an acquirer; **(xii)** banks, financial advisors and stock brokers of the acquirer, or of the company which is a holding company or subsidiary of the acquirer, and where the acquirer is an individual, of the immediate relative of such individual. However, a bank whose sole role is that of providing normal commercial banking services or activities in relation to an open offer under these regulations would be excluded; **(xiii)** an investment company or fund and any person who has an interest in such investment company or fund as a shareholder or unitholder having not less than 10 per cent of the paid-up capital of the investment company or unit capital of the fund, and any other investment company or fund in which such person or his associate holds not less than 10 per cent of the paid-up capital of that investment company or unit capital of that fund.

The main elements of the SEBI code relating to substantial acquisition of shares/voting rights/control are: **(i)** substantial acquisition of shares/voting rights, **(ii)** acquisition of control, **(iii)** indirect acquisition of shares/control, **(iv)** voluntary offer, **(v)** offer size, **(vi)** offer price, **(vii)** mode of payment, **(viii)** general exemptions, and **(ix)** exemptions by the SEBI.

The open offer for acquiring shares should be made at a price not lower than the price determined in the manner specified below:

- 1. Direct Acquisition** In the case of direct acquisition and indirect **acquisition deemed to be direct acquisition** of shares, the offer price should be the highest of: **(a)** the highest negotiated price per share of the target company for any acquisition under the agreement attracting the obligation to make a public announcement of an open offer; **(b)** the **volume-weighted average price** (i.e. product of number of equity shares bought and price of each share divided by the number of shares bought) paid/payable for acquisitions, by the acquirer during the 52 two weeks immediately preceding the date of the public announcement; **(c)** the highest price paid/payable for any acquisition by the acquirer during the 26 weeks immediately preceding the date of the public announcement; **(d)** the **volume-weighted average market price** (i.e. product of number of shares traded on a stock exchange and price of each share divided by the total number of shares traded) of such shares for a period of 60 trading days immediately preceding the date of the public announcement as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period, provided such shares are **frequently traded**. Frequently traded shares mean shares in which the traded turnover on any stock exchange during 12-calendar months preceding the calendar month in which the public announcement is made is at least 10 per cent of the total shares of the target company; **(e)** where the shares are not frequently traded, the price determined by the acquirer and the manager to the open offer taking into account valuation parameters including, book value, comparable trading multiples, and such other parameters as are customary for valuation of shares of such companies; and **(f)** the per share value computed in case of indirect acquisition (**discussed later**).
- 2. Indirect Acquisition Deemed Direct Acquisition** In the case of an indirect acquisition of shares, the offer price would be the highest of: **(a)** the highest negotiated price per share of the target company for any acquisition under the agreement attracting the obligation to make a public announcement; **(b)** the volume-weighted average price paid/payable for any acquisition, during the 52 weeks immediately preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain; **(c)** the highest price paid/payable for any acquisition by the acquirer during the 26 weeks immediately preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain; **(d)** the highest price paid/payable for any acquisition between the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain, and the date of the public announcement of the open offer for shares of the target company; **(e)** the volume-weighted average market price of the shares for a period of 60 days earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain, as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period, provided such shares are frequently traded; and **(f)** the per share value in case of indirect acquisition (**discussed later**).

3. In case the offer price is incapable of being determined under any of the parameters above, the offer price should be the fair price of shares of the target company to be determined by the acquirer and the manager to the open offer taking into account valuation parameters including, book value, comparable trading multiples, and such other parameters as are customary for valuation of shares of such companies.
4. **Indirect Acquisition** In the case of an indirect acquisition and open offers, where the proportionate (a) net asset value of the target company as a percentage of the consolidated net asset value; (b) sales turnover of the target company as a percentage of the consolidated sales turnover; or (c) market capitalisation of the target company as a percentage of the enterprise value for the entity or business being acquired is in excess of 15 per cent, the acquirer would be required to compute and disclose, in the letter of offer, the per share value of the target company taken into account for the acquisition, along with a detailed description of the methodology adopted for such computation. The **market capitalisation** of the target company would be taken into account on the basis of the volume-weighted average market price of the shares on the stock exchange for a period of 60 trading days preceding the earlier of, the date on which the primary acquisition is contracted, and the date on which the intention or the decision to make the primary acquisition is announced in the public domain, as traded on the stock exchange where the maximum volume of trading in the shares of the target company are recorded during such period.
5. In respect of direct and indirect deemed direct acquisition, where the acquirer has any outstanding convertible instruments convertible into shares of the target company at a specific price, the price at which such instruments are to be converted into shares, would also be considered as a parameter. The price paid for shares of target company would include any price paid/agreed to be paid for the shares in the target company, in any form whatsoever, whether stated in the agreement for acquisition of shares or in any incidental, contemporaneous or collateral agreement, whether termed as control premium or as non-compete fees or otherwise.
6. Where the acquirer has acquired/agreed to acquire any shares in the target company during the **offer period** (i.e. period between the date of entering into formal/informal agreement to acquire shares/voting rights/control of a target company requiring public announcement and the date of public announcement and the date on which the payment of consideration to shareholders who have accepted the open offer is made or the date on which open offer is withdrawn) by subscription/purchase, at a price higher than the offer price, the offer price would stand revised to the highest price for any acquisition. However, no acquisition would be made after the third working day prior to the commencement and until the expiry of the tendering period.
7. The price parameters outlined above may be adjusted by the acquirer in consultation with the manager to the offer, for corporate actions such as issuances pursuant to rights issue, bonus issue, stock consolidations, stock splits, payment of dividend, de-mergers and reduction of capital, where the record date for effecting such corporate actions falls prior to three working days before the commencement of the tendering period. However, adjustment should be made for dividend declared if the per share dividend is more than 50 per cent higher than the average paid during the three financial years preceding the date of the public announcement.
8. Where the acquirer acquires shares of the target company during the period of 26 weeks after the tendering period at a price higher than the offer price, he would pay the difference between the highest acquisition price and the offer price, to all the shareholders whose shares were accepted in the open offer, within 60 days from the date of such acquisition.

9. Where the open offer is subject to a minimum level of acceptances, the acquirer may indicate a lower price, but not be less than the price determined under this regulation, for acquiring all the acceptances despite the acceptance falling short of the indicated minimum level of acceptance, in the event the open offer does not receive the minimum acceptance.
10. In the case of any indirect acquisition, the offer price would stand enhanced by an amount equal to a sum determined at the rate of 10 per cent per annum for the period between the earlier of the date on which the primary acquisition is contracted or the date on which the intention or the decision to make the primary acquisition is announced in the public domain, and the date of the detailed public statement, provided such period is more than five working days.
11. The offer price for partly-paid-up shares should be computed as the difference between the offer price and the amount due towards calls-in-arrears including calls remaining unpaid with interest.
12. The offer price for equity shares carrying differential voting rights should be determined by the acquirer and the manager to the open offer with full disclosure of justification for the price so determined, being set out in the detailed public statement and the letter of offer. However, the price should not be lower than the amount determined by applying the percentage rate of premium that the offer price for the equity shares carrying full voting rights represents to the price parameter computed above to the volume-weighted average market price of the shares carrying differential voting rights in the aforesaid provisions, subject to shares carrying full voting rights and the shares carrying differential voting rights, both being frequently traded shares.
13. In the event of any of the price parameters not being available or denominated in Indian rupees, the conversion of such amount into Indian rupees would be effected at the exchange rate as prevailing on the date preceding the date of public announcement and the acquirer should set out the source of such exchange rate in the public announcement, the detailed public statement and the letter of offer.
14. The SEBI may, at the expense of the acquirer, require valuation of the shares by an independent merchant banker other than the manager to the open offer or an independent practicing chartered accountant having a minimum experience of 10 years.

The main elements of the open offer process are: **(i)** manager to the offer, **(ii)** timing, **(iii)** publication, **(iv)** contents, **(v)** filing of letter with SEBI, **(vi)** provision of escrow, **(vii)** other procedures, **(viii)** conditional offer, **(ix)** competing offer, **(x)** payment of consideration, **(xi)** completion of acquisition, and **(xii)** withdrawal of open offer.

The other obligations relate to: **(i)** directors of the target company, **(ii)** acquirer, **(iii)** target company, and **(iv)** manager to the offer.

These relate to **(i)** disclosure related provisions, **(ii)** continual disclosures and **(iii)** disclosure of encumbered shares.

The SEBI may, in interest of investors in securities/securities market, issue such directions for violation of these regulations as it deems fit.

Activities related to expansion or contraction of a firm's operations or changes in its assets or financial or ownership structure are referred to as corporate restructuring. Its major forms other than mergers/amalgamation and takeovers/acquisitions are: **(i)** financial restructuring, **(ii)** divestitures/demergers and buyouts.

Financial restructuring is carried out internally in the firm with the consent of its various stakeholders. It is suitable mode of restructuring for corporate firms that have accumulated sizable losses over a number of years but hold prospects for better financial performance in future. An appropriate financial restructuring scheme is formulated which enables the corporate to write-off past accumulated losses and fictitious assets and restart with a fresh balance sheet which shows its share capital as well as its assets at their real/true worth.

Divestitures/demergers involves selling of some segments of a business only in the form of a plant, division, product line, subsidiary and so on as they are either incurring losses or yielding very low returns. This enables the firm to have a more lean and focused operation. Besides, by selling the unproductive assets and utilising cash proceeds in expanding/rejuvenating other leftover assets/operating units, the firm is likely to augment the profits of the demerged firm/wealth for its shareholders. The concept of demerger is also known as reverse synergy in that the value of the parts is greater than that of the whole.

Divesture can take the following forms: (i) outright sale of an operating unit, (ii) spin-off, that is, creation of a new separate firm and (iii) split-up which involves the breaking-up of the entire firm in a number of new created separate legal entities.

The management buyouts (MBO) involves the sale of a existing firm to the management (from the same firm/from outside/hybrid form). The leveraged buyouts (LBO) takes place when debt forms a substantial part of total financing from outsiders. The LBO should be used by corporates which have a low degree of operating /business risk.

SOLVED PROBLEMS

P.32.1 The XYZ Ltd wants to acquire ABC Ltd by exchanging its 1.6 shares for every share of ABC Ltd. It anticipates to maintain the existing P/E ratio subsequent to the merger also. The relevant financial data are furnished below:

	XYZ Ltd	ABC Ltd
Earnings after taxes (EAT) (₹)	15,00,000	4,50,000
Number of equity shares outstanding (N)	3,00,000	75,000
Market price per share (MPS) (₹)	35	40

- What is the exchange ratio based on market prices?
- What is pre-merger EPS and the P/E ratio for each company?
- What was the P/E ratio used in acquiring ABC Ltd.?
- What is EPS of XYZ Company after the acquisition?
- What is the expected market price per share of the merged company?

Solution

(a) Exchange ratio based on market prices: $= \frac{1.6 \times ₹35}{₹40} = 1.4$

- (b) EPS and P/E ratio

Particulars	XYZ Ltd	ABC Ltd
(a) EAT (₹)	15,00,000	4,50,000
(b) N	3,00,000	75,000
(c) EPS (a)/(b) (₹)	5	6
(d) P/E ratio (MPS/EPS) (times)	7 (₹35/5)	6.67 (₹40/6)

- (c) Implied P/E ratio in the acquisition of ABC Ltd:

$$\frac{\text{Market price of shares offered to XYZ}}{\text{Current EPS of ABC Ltd}} = \frac{₹56}{6} = 9.33 \text{ times } (*1.6 \times ₹35 \text{ or } 1.4 \times ₹40)$$

(d) EPS of XYZ Company after merger: $\frac{₹15,00,000 + ₹4,50,000}{3,00,000 + 1,20,000} = ₹4.64$

- (e) Expected market price after merger: $₹4.64 \times 7 \text{ times} = ₹32.48$.

P.32.2 A Ltd wants to acquire T Ltd by exchanging 0.5 of its shares for each share of T Ltd. The relevant financial data are as follows:

LO 32.2 **LOD E**

Particulars	A Ltd	T Ltd
EAT (₹)	18,00,000	3,60,000
Equity share outstanding	6,00,000	1,80,000
EPS (₹)	3	2
P/E ratio (times)	10	7
Market price per share (₹)	30	14

Required:

- What is the number of equity shares required to be issued by A Ltd for acquisition of T Ltd?
- What is the EPS of A Ltd after the acquisition?
- Determine the equivalent earnings per share of T Ltd.
- What is the expected market price per share of A Ltd after the acquisition, assuming its P/E multiple remains unchanged?
- Determine the market value of the merged firm.

Solution

(a) Number of shares = $1,80,000 \times 0.5 = 90,000$.

$$(b) \text{ EPS} = \frac{\text{₹}18,00,000 + \text{₹}3,60,000}{6,00,000 + 90,000} = \text{₹}3.13$$

(c) Equivalent EPS = $\text{₹}3.13 \times 0.5 = \text{₹}1.565$.

(d) Expected Market price = $\text{₹}3.13 \times 10 \text{ times} = \text{₹}31.30$.

(e) Market value = $\text{₹}31.30 \times 6,90,000 \text{ shares} = \text{₹}2,15,97,000$

P.32.3 The following data concern companies A and T:

LO 32.2 LOD M

Particulars	Company A	Company B
Earnings after taxes (₹)	1,40,000	37,500
Equity shares outstanding	20,000	7,500
EPS (₹)	7	5
P/E ratio (times)	10	8
Market price (₹)	70	40

Company A is the acquiring company, exchanging its one share for every 1.5 shares of B Ltd. Assume that company A expects to have the same earnings and P/E ratio after the merger as before (no synergy effect), show the extent of gain accruing to the shareholders of the two companies as a result of the merger. Are they better or worse off than they were before the merger?

Solution **EPS after the merger** = $\frac{\text{₹}1,40,000 + \text{₹}37,500}{20,000 + 5,000} = \text{₹}7.1$.

Market price after the merger = $\text{₹}7.1 \times 10 \text{ times} = \text{₹}71$

Total market value = $\text{₹}71 \times 25,000 = \text{₹}17,75,000$

Gains from the merger

Post-merger market value of the firm		₹17,75,000
Less: Pre-merger market value:		
Company A (20,000 × ₹70)	₹14,00,000	
Company T (7,500 × ₹40)	3,00,000	17,00,000
		75,000

Apportionment of gains among shareholders

Particulars	Post-merger value	Pre-merger value	Difference
Firm A	₹14,20,000*	₹14,00,000	₹20,000
Firm B	3,55,000**	3,00,000	55,000

* $(20,000 \times \text{₹}71)$

** $(5,000 \times \text{₹}71)$

Thus, the shareholders are better off after the merger.

P.32.4 (a) Assume every thing to be the same as provided in P.32.3. Determine the range of the minimum and maximum share exchange ratio between the two firms. Also provide confirmation of your answer. (b) Determine the exchange ratio when the gains from merger are to be shared equally.

LO 32.2 LOD M

Solution**(a) (i) Determination of tolerable exchange ratio for shareholders of Firm A based on total gains accruing to shareholders of Firm B**

(a) Total market value of the merged firm	₹17,75,000
(b) Less: Pre-merger value/minimum post-merger value acceptable to shareholders of firm A	14,00,000
(c) Maximum acceptable post-merger market value of Firm B	3,75,000
(d) To maintain post-merger value of ₹14,00,000 of Firm A, pre-merger MPS of Firm A has to be	70
(e) Number of equity issued required to be issued in firm A to have MPS of ₹70 and to have post-merger value of firm B at ₹3,75,000 (₹3,75,000/₹70)	5,357 app.
(f) Existing number of equity shares outstanding of Firm B	7,500
(g) Share exchange ratio (5,357/7,500)	0.714:1

For every 1 share of Firm B, 0.714 share will be issued in Firm A

Confirmation

Combined earnings of the merged firm	₹1,77,500
Divided by the total number of shares after the merger (20,000 + 5,357)	25,357
Combined EPS after the merger (1,77,500/25,357)	7.00
MPS after the merger (₹7 × 10 P/E ratio)	70
Total value of the post-merger firm (₹70 × ₹25,357)	17,74,990*
Market value of shares for shareholders of Firm A (20,000 × ₹70) after the merger	14,00,000
Market value of shares for shareholders of Firm A before the merger	14,00,000
Gain to the shareholders of Firm A (₹14 lakh – ₹14 lakh)	Nil
Market value of shares for shareholders of Firm B (5,357 × ₹70) after the merger	3,74,990
Market value of shares for shareholders of Firm B before the merger	3,00,000
Gain to the shareholders of Firm B (₹3,74,990 – ₹3,00,000)	74,990*
Total gain from merger	75,000*

*Difference of ₹10 in two sets of figures (₹75,000 – ₹74,990) and (₹17,75,000 – ₹17,74,990) is due to approximation in the number of shares determined (5,357).

(a) (ii) Determination of tolerable exchange ratio for shareholders of Firm B based on total gains accruing to shareholders of Firm A

(a) Total market value of the merged firm	₹17,75,000
(b) Less: Pre-merger value/minimum post-merger value acceptable to shareholders of firm B	3,00,000
(c) Maximum acceptable post-merger market value of Firm A	14,75,000
(d) Divided by the number of existing equity shares of Firm A	20,000
(e) Desired post-merger MPS (₹14,75,000/20,000 shares)	73.75
(f) Number of equity issues required to be issued in Firm A to have MPS of ₹73.75 (given P/E ratio of 10 times) and to have postmerger value of ₹3,00,000 of Firm B (₹3,00,000/₹73.75)	4,068 shares app.
(g) Existing number of equity shares outstanding of Firm B	5,000
(h) Share exchange ratio (4,068/7,500)	0.5424:1

For every 1 share in firm B, 0.5424 share will be issued in firm A

Confirmation

Combined earnings of the merged firm	₹1,77,500
Divided by the total number of shares after the merger (20,000 + 4,068)	24,068
Combined EPS after the merger (₹1,77,500/24,068)	7.375
MPS after the merger (₹7.375 × 10)	73.75
Total value of the post-merger firm (24,068 shares × ₹73.75)	17,75,015*
Market value of shares for shareholders of Firm A (20,000 shares × ₹73.75)	14,75,000
Market value of shares for shareholders of Firm A before the merger	14,00,000
Gain to the shareholders of Firm A (₹14,75,000 – ₹14,00,000)	75,000
Market value of shares for shareholders of Firm B (4,068 shares × ₹73.75)	₹3,00,015*
Market value of shares for shareholders of Firm B before the merger	3,00,000
Gain to the shareholders of Firm B	Nil/₹15*

*Difference of ₹15 in two sets of figures (₹17,75,015 and ₹17,75,000) and (₹3,00,015 and ₹3,00,000) is due to approximation in the number of shares determined 4,068.

Acceptable exchange ratios: Thus, the minimum and maximum shares exchange ratio are 0.5424:1 and 0.714 between the shares of Firm A and Firm B.

(b) Exchange ratio when gains are to be shared equally

Particulars	Firm A	Firm B
Market valuation (desired)	₹14,37,500	₹3,37,500
MPS (desired) (14,37,500/20,000)	71.88	71.88
Number of shares to be issued	-	4,695.33 (4,696)
Share exchange ratio (4,696/7,500)	-	0.63 : 1

For every one share in Firm B, 0.63 share will be issued in Firm A.

P.32.5 Sound Industries Limited (SI) is planning to purchase Not so Sound Industries Ltd. (NSS). SI has 5 lakh shares outstanding of ₹100 each, having the current market price per share (MPS) of ₹250. NSS has 2 lakh shares of ₹100 each, currently selling in the market at ₹170 per share. EPS are ₹32 and ₹24 for SI and NSS, respectively.

LO 32.2 LOD M

Required

- Illustrate the impact of a merger on the EPS, assuming that the share exchange ratio is to be in the relative proportion of EPS of the two firms. Also determine the equivalent EPS after the merger with Firm NSS.
- The management of NSS has quoted a share exchange ratio of 1:1 for the merger to take place. Should SI accept this ratio, even through the price-earning ratio of SI Ltd. will remain unchanged after merger and no synergy accrues due to the merger. If not, what is the maximum ratio it should accept.

Solution

(a) Impact of merger on EPS (based on exchange ratio of ₹24/₹32 = 0.75)

Company	Number of shares	EPS	Total EAT
SI	5,00,000	₹32	₹1,60,00,000
NSS	2,00,000	24	48,00,000
Total post-merger earnings			2,08,00,000
Divided by the number of shares after the merger (5,00,000 + 1,50,000 i.e., 2,00,000 × 0.75)			6,50,000
Combined earnings per share			₹32
Shareholders of SI:			
EPS before the merger			32
EPS after the merger			32
Shareholders of NSS:			
EPS before the merger			24
Equivalent EPS after the merger (EPS after the merger × share exchange ratio) i.e., (₹32 × 0.75)			24

Thus, there is no change in effective EPS for shareholders of either of the firms.

(b) Effect of share exchange ratio of 1:1 on valuation of the firms

(in lakh)

Pre-merger situation:

	Firm SI	Firm NSS
EAT (₹)	160	48
Number of shares outstanding (N)	5	2
EPS (₹)	32	24
Market price per share (₹)	250	170
P/E ratio implicit (MPS/EPS) (times)	7.8125	7.0833
Total market value (N × MPS) (₹)	1,250	340

Post-merger situation:

Combined EAT (₹)		208
Number of shares outstanding after additional shares of 2 lakh issued as shares exchange ratio is 1:1 (N)		7
EPSc (combined EAT/N) (₹)		208/7
P/E ratio (times)		7.8125
MPS (₹)		232.143
Total market value, MPS × Number of shares of merged firm		1,625
Gain from merger (₹1,625 lakh – ₹1,250 lakh – ₹340 lakh)		35
Gain to shareholders of firms		
Firm SI		
Pre-merger market value		1,250
Less: Post-merger market value (5 lakh shares × ₹232.143)		1,160.715
Loss to the shareholders		89.285
Firm NSS		
Post-merger market value (2 lakh shares × ₹232.143)		464.286
Less: Pre-merger market value		340.000
Gain to the shareholders		124.286

Evidently, the management of SI will not accept a share exchange ratio of 1: 1 as it reduces the wealth of its shareholders by ₹89.285 lakh. The maximum ratio likely to be acceptable to its management is (0.75 : 1) as calculated below.

Determination of acceptable share exchange ratio to Firm SI
(based on total gains of ₹35 lakh accruing to Firm NSS)

(₹ lakh)

Total market value of the merged firm	1,625
Less: Minimum post-merger value acceptable to SI	1,250
Post-merger market value of Firm NSS	375

Since post-merger value of Firm SI remains unchanged, it implies MPS of ₹250 is to remain intact. Therefore, the number of equity shares required to be issued in Firm SI to have a MPS of ₹250 and to have a post-merger value of ₹375 lakh for Firm NSS will be (₹375 lakh/₹250)

Existing number of equity shares outstanding in Firm NSS	2,00,000
Share exchange ratio (1,50,000/2,00,000)	0.75:1

For every 1 share in Firm NSS, 0.75 share will be issued in Firm SI. This is the maximum exchange ratio that may be acceptable to management of SI

P.32.6 Company X wishes to takeover Company Y. The financial details of the two companies are as under:

LO 32.2 **LOP M**

Particulars	Company X	Company Y
Equity shares (₹10 per share)	₹1,00,000	₹50,000
Share premium account	—	2,000
Profit & loss account	38,000	4,000
Preference shares	20,000	—
10% debentures	15,000	5,000
	1,73,000	61,000
Fixed assets	1,22,000	35,000
Net current assets	51,000	26,000
Maintainable annual profit (after tax) for equity shareholders	24,000	15,000
Market price per equity share	₹4	₹27
Price earning ratio	10	9

What offer do you think Company X could make to Company Y in terms of exchange ratio, based on (a) net asset value; (b) earning per share; and (c) market price per share? Which method would you prefer from Company X's point of view?

Solution

(a) Exchange ratio based on net asset value

Particulars	Company X	Company Y
Fixed assets	₹1,22,000	₹35,000
Net current assets	51,000	26,000
Total assets	1,73,000	61,000
Less: Preference shares	20,000	—
Less: 10% Debentures	15,000	5,000
Net assets	1,38,000	56,000
Divided by number of shares	10,000	5,000
Net assets per share	13.80	11.20

Exchange ratio = ₹11.20/₹13.80 = 0.8116

The shareholders of Company Y should get 0.8116 share of X for every share held by them.

(b) Exchange ratio based on earnings per share (EPS)

Particulars	Company X	Company Y
Earnings after taxes for equity-holders	₹24,000	₹15,000
Divided by number of shares	10,000	5,000
EPS	2.4	3

Exchange ratio = ₹3/₹2.4 = 1.25

The shareholders of Company Y should get 1.25 shares of Company X for every share held by them.

(c) Exchange ratio based on market price per share = ₹27/₹24 = 1.125

The shareholders of Company Y should get 1.125 shares of Company X for every share held by them.

The exchange ratio based on the net asset value is the best from Company X's point of view as on this basis it will be required to issue the minimum number of equity shares.

P.32.7 Firm A is planning to acquire Firm B. The relevant financial details of the two firms prior to the merger announcement are as follows:

LO 32.2 LOD D

Particulars	Firm A	Firm B
Market price per share	₹75	₹30
Number of shares	10,00,000	5,00,000
Market value of the firm	7,50,00,000	1,50,00,000

The merger is expected to bring gains which have present value of ₹1.5 crore. Firm A offers 2,50,000 shares in exchange for 5 lakh shares to the shareholders of Firm B.

You are required to determine:

- total value of Firm AB (PVAB) after merger;
- gains to the shareholders of Firm A; and
- true cost of acquiring Firm B and net present value of the merger to Firm B.

Solution

(a) $PV_{AB} = PV_A + PV_B + \text{Present value gain from merger}$
 $= ₹7.5 \text{ crore} + ₹1.5 \text{ crore} + ₹1.5 \text{ crore}$
 $= ₹10.5 \text{ crore}$

(b) Number of shares after the merger = 10 lakh (A) + 2.5 Lakh (issued for shareholders of Firm B) = 12.5 lakh. The sum of ₹10.5 crore will be apportioned in the proportion of 4:1 between the shareholders of Firm A and B, that is, ₹8.4 crore and ₹2.1 crore respectively. The gain to firm A = ₹8.4 crore – ₹7.5 crore = ₹0.9 crore.

(c) Cost of acquiring Firm B is equal to the gain shared by the shareholders of Firm B, that is, (₹10.5 crore \times 1/5 = ₹2.1 crore – ₹1.5 crore) = ₹0.6 crore.

P.32.8 A Ltd is considering takeover of B Ltd and C Ltd. The financial data for the three companies are as follows:

LO 32.2 LOD M

Particulars	A Ltd	B Ltd	C Ltd
Equity share capital of ₹10 each (₹/million)	450	180	90
Earnings (₹/million)	90	18	18
Market price of each share (₹)	60	37	46

Calculate (a) Price-earnings (P/E) exchange ratios, and (b) Earnings per share of A Ltd after the acquisition of B Ltd and C Ltd separately. Will you recommend the merger of either/both of the companies? Justify your answer.

Solution

(a) Determination of P/E exchange ratio

Particulars	A Ltd	B Ltd	C Ltd
Total earnings (₹ million)	90	18	18
Number of equity shares (million)	45	18	9
EPS (₹)	2	1	2
MPS (₹)	60	37	46
P/E ratio (times)	30	37	23
P/E Exchange ratio	—	37/30	23/30

1. The first part of the document is a list of names and addresses, which are arranged in a columnar format. The names are written in a cursive hand, and the addresses are written in a more formal, printed style. The list includes names such as John Doe, Jane Smith, and Robert Brown, along with their respective street addresses and city names.

2. The second part of the document is a table with several columns and rows. The columns are labeled with names and addresses, and the rows contain numerical data. The table appears to be a record of some kind, possibly a list of transactions or a summary of data. The data is presented in a clear, organized manner, with each entry corresponding to a specific name and address.

3. The third part of the document is a section of text that appears to be a continuation of the list or table. It contains several lines of text, which are written in a cursive hand. The text is somewhat difficult to read due to the handwriting, but it seems to be providing additional information or details related to the names and addresses listed in the previous sections.

4. The fourth part of the document is a section of text that appears to be a summary or conclusion. It contains several lines of text, which are written in a cursive hand. The text is somewhat difficult to read due to the handwriting, but it seems to be providing a final statement or a summary of the information presented in the previous sections.

5. The fifth part of the document is a section of text that appears to be a list of names and addresses, similar to the first part. It contains several lines of text, which are written in a cursive hand. The text is somewhat difficult to read due to the handwriting, but it seems to be providing additional information or details related to the names and addresses listed in the previous sections.

6. The sixth part of the document is a section of text that appears to be a summary or conclusion. It contains several lines of text, which are written in a cursive hand. The text is somewhat difficult to read due to the handwriting, but it seems to be providing a final statement or a summary of the information presented in the previous sections.

1. The first part of the document is a list of names and addresses, which are arranged in a columnar format. (b) EPS of A Ltd after the acquisition of B Ltd and C Ltd

	After the acquisition of	
	B Ltd	C Ltd
Total earnings after merger (₹ million)	108	108
Number of shares (million)	67.2	51.9
	45 + (18 × 37/30)	45 + (9 × 23/30)
Combined earnings (₹)	1.61	2.081

While there is an accretion in EPS on combining Firm C, there is a dilution in EPS on acquisition of Firm B. Therefore, merger with only company C is recommended.

P.32.9 Prospective Limited is contemplating taking over the business of Target Limited. The summarised balance sheet of Target Limited as on 31st March was as follows:

LO 32.2 LOD M

(₹ lakh)			
Liabilities	Amount	Assets	Amount
Equity share capital (50 lakh @ ₹10)	500	Fixed assets:	
General reserve	250	Land and buildings	300
Profit and loss account	120	Plant and machinery	580
13% Debentures	100	Current assets:	
Current liabilities	30	Inventories	70
		Debtors	35
		Bank	15
	1,000		1,000

Additional information:

- Prospective Limited agrees to takeover all the current assets at their book value but the fixed assets were to be revalued as under:
Land and buildings: ₹500 lakh
Plant and machinery: ₹500 lakh
These sums apart, Prospective Limited is required to pay ₹50 lakh for goodwill.
- Purchase consideration is to be paid as ₹130 lakh, in cash, to pay for 13% debentures and other liabilities, and the balance is to be paid in terms of shares of Prospective Limited.
- Expected benefits (FCFF) accruing to Prospective limited, are as follows:

(₹ lakh)

Year 1	Year 2	Year 3	Year 4	Year 5
₹200	₹300	₹260	₹200	₹100

Further, it is estimated that the FCFF are expected to grow at 5 per cent per annum after 5 years.

- Cost of capital for the purpose of analysis is to be 15 per cent.
Suggest whether Prospective Limited is likely to benefit taking over Target Limited.

Solution**Financial evaluation of merger decision**

(₹ lakh)

(i) Cost of acquisition			
Fixed assets:			
Land and buildings	500		
Plant and machinery	500		
Goodwill	50		₹1,050

(Contd.)

(Contd.)

Current assets:			
Inventories		70	
Debtors		35	
Bank		15	120
			<u>1,170</u>

(ii) ₹1,170 lakh is payable as follows:

Cash payment to pay 13% Debentures and current liabilities	130
Shares of Prospective Limited (₹1,170 lakh – ₹130 lakh)	1,040

(iii) Present value of FCFF (Years 1 = 5) (₹ lakh)

Year-end	FCFF	PV factor (0.15)	Total PV
1	₹200	0.870	₹174.00
2	300	0.756	226.80
3	260	0.658	171.08
4	200	0.572	114.40
5	100	0.497	49.70
			<u>735.98</u>

(iv) PV of FCFF after the forecast period

$$TV5 = FCFF5 (1 + g)/(K_e - g)$$

$$= ₹100 (1.05)/(0.15 - 0.05) = ₹1,050 \text{ lakh}$$

$$\text{Present value} = ₹1,050 \text{ lakh} \times 0.497 = ₹521.85 \text{ lakh}$$

(v) Determination of net present value (₹ lakh)

Present value of FCFF (years 1 – 5)	₹735.98
Present value of FCFF subsequent to year 5	521.85
Total present value of benefits/FCFF	<u>1,257.83</u>
Less: Cost of acquisition	<u>1,170.00</u>
Net present value	87.83

Recommendation As the NPV is positive, acquisition of Target Limited is financially viable.**P.32.10** Balance sheet of XYZ Limited as on March 31 (current year) is as follows:

LO 32.2 LOD M

Liabilities	Amount	Assets	Amount
Equity share capital 10 lakh shares @ ₹20 each)	₹200	Plant and machinery	₹250
13% Debentures	100	Furniture and fittings	5
Retained earnings	50	Inventories	90
Creditors and other current liabilities	30	Debtors	25
	380	Bank balance	10
			<u>380</u>

(i) The company is to be absorbed by ABC Limited on the above date. The consideration for absorption is the discharge of debentures at a premium of 10 per cent, taking over the liability in respect of sundry creditors and other current liabilities and payment of ₹14 in cash and one share of ₹10 in ABC Limited, at the market value of ₹16 per share, in exchange for one share in XYZ Limited. The cost of dissolution of ₹10 lakh is to be met by the purchasing company.

GENERAL AND SPECIAL INSTRUCTIONS

1. The first section of the report should contain a brief summary of the work done during the period covered by the report.

2. The second section should contain a detailed description of the work done, including the methods used, the results obtained, and the conclusions drawn.

3. The third section should contain a list of the references used in the report.

4. The fourth section should contain a list of the symbols and abbreviations used in the report.

5. The fifth section should contain a list of the figures and tables included in the report.

6. The sixth section should contain a list of the names of the persons who assisted in the work.

7. The seventh section should contain a list of the names of the persons who reviewed the report.

8. The eighth section should contain a list of the names of the persons who approved the report.

9. The ninth section should contain a list of the names of the persons who distributed the report.

10. The tenth section should contain a list of the names of the persons who received the report.

11. The eleventh section should contain a list of the names of the persons who were consulted during the preparation of the report.

12. The twelfth section should contain a list of the names of the persons who were consulted during the review of the report.

13. The thirteenth section should contain a list of the names of the persons who were consulted during the approval of the report.

14. The fourteenth section should contain a list of the names of the persons who were consulted during the distribution of the report.

15. The fifteenth section should contain a list of the names of the persons who were consulted during the receipt of the report.

16. The sixteenth section should contain a list of the names of the persons who were consulted during the preparation of the report.

17. The seventeenth section should contain a list of the names of the persons who were consulted during the review of the report.

18. The eighteenth section should contain a list of the names of the persons who were consulted during the approval of the report.

19. The nineteenth section should contain a list of the names of the persons who were consulted during the distribution of the report.

20. The twentieth section should contain a list of the names of the persons who were consulted during the receipt of the report.

GENERAL AND SPECIAL INSTRUCTIONS

1. The first section of the report should contain a brief summary of the work done during the period covered by the report.

2. The second section should contain a detailed description of the work done, including the methods used, the results obtained, and the conclusions drawn.

3. The third section should contain a list of the references used in the report.

4. The fourth section should contain a list of the symbols and abbreviations used in the report.

5. The fifth section should contain a list of the figures and tables included in the report.

13. The thirteenth section should contain a list of the names of the persons who were consulted during the approval of the report.

14. The fourteenth section should contain a list of the names of the persons who were consulted during the distribution of the report.

15. The fifteenth section should contain a list of the names of the persons who were consulted during the receipt of the report.

16. The sixteenth section should contain a list of the names of the persons who were consulted during the preparation of the report.

17. The seventeenth section should contain a list of the names of the persons who were consulted during the review of the report.

18. The eighteenth section should contain a list of the names of the persons who were consulted during the approval of the report.

19. The nineteenth section should contain a list of the names of the persons who were consulted during the distribution of the report.

20. The twentieth section should contain a list of the names of the persons who were consulted during the receipt of the report.

(ii) Expected incremental yearly free cash flows (FCFF) from acquisition for 5 years are as follows:

	(₹ lakh)
Year-end 1	₹100
2	135
3	175
4	200
5	80

(iii) The FCFF of XYZ Limited are expected to be constant after 5 years.

(iv) Cost of capital relevant for XYZ Limited cash flows is to be 14 per cent.

Based on the above information, comment on the financial soundness of ABC's decision regarding merger.

Solution

Financial analysis of merger decision

(i) Cost of acquisition ($t = 0$)	(₹ lakh)
Equity share capital (10 lakh shares \times ₹16)	₹160
Cash payment to shareholders (10 lakh shares \times ₹14)	140
Redemption of 13% Debentures at 10% Premium	110
Payment required for creditors and other liabilities	30
Cost of dissolution	10
	450

(ii) PV of FCFF (years 1 – 5)	(₹ lakh)		
Year-end	FCFF	PV factor (0.14)	Total PV
1	₹100	0.877	₹87.70
2	135	0.769	103.81
3	175	0.675	118.12
4	200	0.592	118.40
5	80	0.519	41.52
			469.55

(iii) Present value of terminal sum related to FCFF after the forecast period

$$\begin{aligned} TV_5 &= FCFF_5/k_0 \\ &= ₹80 \text{ lakh}/0.14 = ₹571.429 \text{ lakh} \\ PV \text{ of TV} &= ₹571.429 \text{ lakh} \times 0.519 = ₹296.57 \text{ lakh} \end{aligned}$$

(iv) Determination of net present value	(₹ lakh)
PV of FCFF (years 1 – 5)	₹469.55
PV of FCFF (after year 5)	296.57
Total PV of FCFF	766.12
Less: Cost of acquisition	450.00
Net present value	316.12

Recommendation As the NPV is positive, acquisition of the target firm XYZ Limited is financially viable.

P.32.11 Excellent Limited, acquiring company, is interested in the acquisition of Pathetic Limited, target company. The management of Excellent Limited wants you to compute the maximum price it should be willing to pay to acquire Pathetic Limited as per adjusted present value approach. For the purpose, you have been provided with the following data:

- (i) As a result of acquisition, it is expected that the FCFF of Excellent Limited are likely to increase as follows for 6 years

	(₹ lakh)
Year – end 1	₹120
2	150
3	200
4	220
5	140
6	100

- (ii) The FCFF of Pathetic Limited are expected to be constant after 6 years.
 (iii) Unlevered cost of equity is 15 per cent.
 (iv) 10% Debt (to the extent of ₹120 lakh) will finance part of acquisition cost. Debt will be reduced to ₹70 lakh at the end of year 6 by repaying ₹10 lakh at the end of the each year, commencing from year 1. Debt level is expected to remain at that level thereafter.
 (v) Corporate tax rate is 35 per cent.
 (vi) Advantage from debt is to be valued at cost of debt.
 (vii) Bankruptcy costs are assumed to be zero.

Solution

- (i) **PV of FCFF, discounted at unlevered cost of equity (k_u)** (₹ lakh)

Year-end	FCFF	PV factor (0.15)	Total PV
1	₹120	0.870	₹104.40
2	150	0.756	113.40
3	200	0.658	131.60
4	220	0.572	125.84
5	140	0.497	69.58
6	100	0.432	43.20
			588.02

- (ii) **PV of FCFF after the explicit forecast period/terminal value**

$$TV_6 = FCFF_6/k_u = ₹100 \text{ lakh}/0.15 = ₹666.67 \text{ lakh}$$

$$\text{PV of terminal value} = ₹666.67 \text{ lakh} \times 0.432 = ₹288.00 \text{ lakh}$$

- (iii) **(a) PV of tax shield, year 1 – 6** (₹ lakh)

Year-end	Debt outstanding at year-end	Interest @ 10%	Tax shield (Interest \times 0.35)	PV factor (0.10)	Total PV
1	₹120	₹12	₹4.20	0.909	₹3.82
2	110	11	3.85	0.826	3.18
3	100	10	3.50	0.751	2.63
4	90	9	3.15	0.683	2.15
5	80	8	2.80	0.621	1.74
6	70	7	2.45	0.564	1.38

(b)	PV of tax shield due to interest (on perpetual debt of ₹70 lakh)	(₹ lakh)
Amount of 10% Debt		₹70
Interest on debt (₹70 lakh × 10%)		7
Tax savings on interest (₹7 lakh × 0.35)		2.45
Present value of tax shield (₹2.45 lakh/0.10 = ₹24.50 lakh × 0.564)		13.82

(iv)	Value of Pathetic Limited as per APV	(₹ lakh)
Present value of FCFF (years 1 – 6)		₹588.02
Present value of FCFF after year 6		288
Present value of tax shield due to interest (₹14.90 lakh + ₹13.82 lakh)		28.72
Total adjusted present value		904.74

Recommendation Excellent Limited should be willing to pay ₹904.74 lakh as the maximum cost of acquiring Pathetic Limited.

P.32.12 The summarised balance sheet of Target Limited as at March 31 (current year is given below:

LO 32.2

Liabilities	Amount	Assets	Amount
Equity share capital (20 lakh shares @ ₹100 each)	₹2,000	Fixed assets	₹1,900
11.5% Preference share capital	100	Investments	100
Retained earnings	400	Current assets:	
10.5% Debentures	300	Inventories	₹500
Current liabilities	200	Debtors	400
	3,000	Bank	100
			1,000
			3,000

Negotiations for takeover of T Limited result in its acquisition by A Limited. The purchase consideration consists of: (i) ₹300 lakh 11% debentures of A Limited for redeeming the 10.5% debentures of T Limited, (ii) ₹100 lakh 12% preference shares in A Ltd for the payment of the 11.5% preference shares capital of T Ltd, (iii) 20 lakh equity shares in A Limited to be issued at its current market price 150 and (iv) A Limited would meet dissolution expenses (estimated to cost ₹30 lakh).

(v) The following are projected incremental free cash flows (FCFF) expected from acquisition for 6 years

	(₹ lakh)
Year-end 1	₹450
2	600
3	780
4	900
5	650
6	350

(vi) The free cash flow of the target firm are expected to decline at 10 per cent per annum after 6 years.

(vii) After acquisition, investments are to be disposed off; they are expected to realise ₹120 lakh.

(viii) Current liabilities are expected to be settled at ₹190 lakh.

(ix) Given the risk complexion of target firm, cost of capital has been decided at 14 per cent.

Advise the company regarding financial feasibility of the acquisition.

Solution**(i) Cost of acquisition (t = 0)**

(₹ lakh)

Share capital (20 lakh shares × ₹150 per share)	₹3,000
12% Preference share capital	100
11% Debentures	300
Settlement of current liabilities	190
Dissolution expenses of target firm	30
Less: Cash proceeds from sale of investments	(120)
	<u>3,500</u>

(ii) Present value of FCFF (years 1 = 6)

(₹ lakh)

Year-end	FCFF	PV factor (0.14)	Total PV
1	₹450	0.877	₹394.65
2	600	0.769	461.40
3	780	0.675	526.50
4	900	0.592	532.80
5	650	0.519	337.35
6	350	0.456	159.60
			<u>2,412.30</u>

(iii) PV of Terminal Value, that is, FCFF after the forecast period

$$TV_6 = FCFF_6 (1 - g) / (k_0 + g)$$

$$= ₹350 \text{ lakh } (1 - 0.10) / (0.14 + 0.10) = ₹315 \text{ lakh} / 0.24 = ₹1,312.5 \text{ lakh}$$

$$PV \text{ of } TV = ₹1312.5 \text{ lakh} \times 0.456 = ₹598.5 \text{ lakh}$$

(iv) Determination of net present value

(₹ lakh)

Present value of FCFF (years 1 – 6)	₹2,412.30
Present value of FCFF subsequent to year 6	598.50
Total PV of FCFF	<u>3010.80</u>
Less: Cost of acquisition	<u>3500.00</u>
Net present value	<u>(489.20)</u>

Recommendation As the NPV is negative, acquisition of Target Limited is not financially viable.

P.32.13 Suppose, shareholders of Target Limited (of P. 33.12) agree to receive shares equivalent to their present net worth in A Limited. Does it make the decision of acquisition favourable?

LO 32.2	LO D
----------------	-------------

Solution**(i) Cost of acquisition (t = 0)**

(₹ lakh)

Share capital (₹2,000 lakh) + Retained earnings (₹400 lakh) = ₹2,400 lakh net worth (16 lakh shares in A Ltd × ₹150 per share)	₹2,400
12% Preference share capital	100
11% Debentures	300
Settlement of current liabilities	190
Dissolution expenses of Target firm	30
Less: Cash proceeds from sale of investments	(120)
	<u>2,900</u>

Handwritten notes on the left page, including a header section and several paragraphs of text.

Handwritten notes on the right page, including a header section and several paragraphs of text.

(ii) Determination of net present value

(₹ lakh)

Total PV of FCFF (computed in P.15.16)	₹3,010.80
Less: Cost of acquisition	<u>2,900.00</u>
Net present value	110.80

Recommendation As the NPV is positive, acquisition of Target Limited is now financially viable. Evidently, the decision of acquisition becomes favourable.

P33.14 A Ltd is contemplating to acquire T Ltd. The following data has been assembled in this connection:

LO 32.2	LO D
----------------	-------------

Particulars	A Ltd	T Ltd
Earnings per share (EPS)	₹2	₹1
Expected growth in EPS	0.05	0.10
Number of equity shares outstanding (lakh)	10	3
Price per share	20	15

- (i) If A Ltd acquires T Ltd on the basis of exchange of shares in proportion to their market values, what will the new EPS be?
- (ii) Assuming no synergic gains, construct a schedule of EPS for the next 10 years with and without the acquisition. How long would it take to eliminate the dilution in EPS? Do you think the acquisition offer is attractive?

Solution

(i) **Exchange ratio** = Market price of shares of T Ltd / Market price of shares of A Ltd = ₹15/20 = 0.75.

Number of shares to be issued in A Ltd = 3,00,000 × 0.75 = 2,25,000.

EPS (new) = (₹2 × 10,00,000) + (₹1 × 3,00,000) / (10,00,000 + 2,25,000) = ₹1.88

(ii) **Schedule of EPS with and without merger of A Ltd**

Year	A Ltd		T Ltd		AT Ltd (combined firm)	
	Total EAT	EPS ^a	Total EAT	EPS ^b	EATC	EPS ^c
0	₹20,00,000	₹2.00	₹3,00,000	₹1.00	₹23,00,000	₹1.88
1	21,00,000	2.10	3,30,000	1.10	24,30,000	1.98
2	22,05,000	2.20	3,63,000	1.21	25,68,000	2.10
3	23,15,250	2.32	3,99,300	1.33	27,14,550	2.22
4	24,31,012	2.43	4,39,230	1.46	29,14,165	2.38
5	25,52,563	2.55	4,83,153	1.61	30,35,716	2.48
6	26,80,191	2.68	5,31,468	1.77	32,11,359	2.62
7	28,14,201	2.81	5,84,615	1.95	32,64,806	2.67
8	29,54,911	2.96	6,43,077	2.14	35,97,988	2.94
9	31,02,656	3.10	7,07,384	2.36	38,10,040	3.11
10	32,57,789	3.26	7,78,123	2.59	40,35,912	3.30

^a EPS without acquisition

^b EPS without acquisition

^c EPS without acquisition

The dilution in EPS will be eliminated after 8 years. The acquisition does not seem to be an attractive proposition for A Ltd.

P33.15 The following are the financial statements for A Ltd and T Ltd for the current financial year. Both firms operate in the same industry.

LO 32.2	LOD D
----------------	--------------

Balance sheets

Particulars	A Ltd	T Ltd
Total current assets	₹14,00,000	₹10,00,000
Total fixed assets (net)	10,00,000	5,00,000
Total assets	<u>24,00,000</u>	<u>15,00,000</u>
Equity capital (of ₹10 each)	10,00,000	8,00,000
Retained earnings	2,00,000	—
14% Long-term debt	5,00,000	3,00,000
Total current liabilities	<u>7,00,000</u>	<u>4,00,000</u>
	<u>24,00,000</u>	<u>15,00,000</u>

Income statements

Net sales	₹34,50,000	₹17,00,000
Cost of goods sold	<u>27,60,000</u>	<u>13,60,000</u>
Gross profit	6,90,000	3,40,000
Operating expenses	2,96,923	1,45,692
Interest	70,000	42,000
Earnings before taxes (EBT)	<u>3,23,077</u>	<u>1,52,308</u>
Taxes (0.35)	1,13,077	53,308
Earnings after taxes (EAT)	<u>2,10,000</u>	<u>99,000</u>

Additional information:

Number of equity shares	1,00,000	80,000
Dividend payment (D/P) ratio	0.40	0.60
Market price per share (MPS)	₹40	₹15

Assume that the two firms are in the process of negotiating a merger through an exchange of equity shares. You have been asked to assist in establishing equitable exchange terms, and are required to:

- (i) Decompose the share prices of both the companies into EPS and P/E components, and also segregate their EPS figures into return on equity (ROE) and book value or intrinsic value per share (BVPS) components.
- (ii) Estimate future EPS growth rates for each firm.
- (iii) Based on expected operating synergies, A Ltd estimates that the intrinsic value of T's equity share would be ₹20 per share on its acquisition. You are required to develop a range of justifiable equity share exchange ratios that can be offered by A Ltd to T Ltd's shareholders. Based on your analysis in parts (i) and (ii), would you expect the negotiated terms to be closer to the upper, or the lower exchange ratio limits? Why?
- (iv) Calculate the post-merger EPS based on an exchange ratio of 0.4 : 1 being offered by A Ltd. Indicate the immediate EPS accretion or dilution, if any, that will occur for each group of shareholders.
- (v) Based on a 0.4:1 exchange ratio, and assuming that A's pre-merger P/E ratio will continue after the merger, estimate the post-merger market price. Show the resulting accretion or dilution in pre-merger market prices.

Solution**(i) Determination of EPS, P/E ratio, ROE and BVPS of A Ltd and T Ltd.**

Particulars	A Ltd	T Ltd
EAT (₹)	2,10,000	99,000
N	1,00,000	80,000
EPS (EAT ÷ N) (₹)	2.10	1.24
Market price per share (MPS) (₹)	40	15
P/E ratio (MPS/EPS)	19.05	12.12
Equity funds (EF) (₹)	12,00,000	8,00,000
BVPS (EF ÷ N) (₹)	12	10
ROE (EAT ÷ EF)	0.175	0.1237

(ii) Growth rates in EPS

Retention ratio (1 - D/P ratio)	0.6	0.4
Growth rate (ROE × Retention ratio)	0.105	0.0495

(iii) Justifiable equity share exchange ratio

(a) Market price based = $MPS_T / MPS_A = ₹15 / ₹40 = 0.375 : 1$ (lower limit)

(b) Intrinsic value based = $₹20 / 40 = 0.5 : 1$ (upper limit)

Since A Ltd has a higher EPS, ROE, P/E ratio, and higher EPS growth expectations, the negotiated terms would be expected to be closer to the lower limit, based on the existing share prices.

(iv) Post-merger EPS and other effects

Particulars	A Ltd	T Ltd	Combined
EAT (₹)	2,10,000	99,000	3,09,000
Shares outstanding	1,00,000	80,000	1,32,000*
EPS (₹)	2.10	1.24	2.34
EPS accretion or (dilution) (₹)	0.24	(0.30**)	—

(v) Post-merger market price and other effects

Particulars	A Ltd	T Ltd	Combined
EPS	₹2.10	₹1.24	₹2.34
P/E ratio	(x) 19.05	(x) 12.12	(x) 19.05
MPS accretion	40	15	44.60
	4.60	2.84***	

* $1,00,000 \text{ shares} + (0.40 \times 80,000) = 1,32,000 \text{ shares}$

** EPS claim per old share = $₹2.34 \times 0.4 = ₹0.936$

EPS dilution ($₹1.24 - ₹0.936$) = $₹0.304$

***MPS claim per old share = $₹44.60 \times 0.4 = ₹17.84$

Less MPS per old share 15.00

2.84

P32.16 The following information is provided relating to the acquiring company Efficient Ltd., and the target company Healthy Ltd.

LO 32.2 LO D

Particulars	Efficient Ltd	Healthy Ltd
Number of shares (face value. ₹10 each)	10.00 lakh	7.5 lakh
Market capitalisation	500.00 lakh	750.00 lakh
P/E ratio (times)	10.00	5.00
Reserves and surplus	300.00 lakh	165.00 lakh
Promoter's holding (number of shares)	4.75 lakh	5.00 lakh

The Board of Directors of both the companies have decided to give a fair deal to the shareholders and accordingly for swap ratio the weights are decided as 40 per cent, 25 per cent and 35 per cent respectively for earning, book value and market price of share of each company.

(i) Calculate the swap ratio and also calculate promoter's holding percentage after acquisition; (ii) What is the EPS of Efficient Ltd. after acquisition of Healthy Ltd.? (iii) What is expected market price per share and market capitalisation of Efficient Ltd. after acquisition, assuming P/E ratio of Firm Efficient Ltd. remains unchanged and (iii) Calculate free float market capitalisation of the merged firm.

Solution

(i) (a) Computation of EPS, book value per share and MPS

Particulars	Efficient Ltd	Healthy Ltd
1. Market capitalisation	₹500 lakh	₹750 lakh
2. Number of shares (face value of ₹10 each)	10 lakh	7.5 lakh
3. Market price per share (1/2)	₹50	₹100
4. Price-earnings ratio (times)	10	5
5. Earnings per share (3/4)	₹5	₹20
6. Total earnings after taxes (2 × 5)	50 lakh	150 lakh
7. Equity share capital (2 × ₹10)	100 lakh	75 lakh
8. Reserves and surplus	300 lakh	165 lakh
9. Equity funds (7 + 8)	400 lakh	240 lakh
10. Book value per share, BPS (9/2)	40	32

Determination of swap ratio

Particulars	Ratio × weight = Total
EPS (₹20:5)	4:1 [®] × 0.40 = 1.6
Book value (₹32:40)	0.8:1 × 0.25 = 0.2
Market price per share (₹100:50)	2:1 × 0.35 = 0.7
	2.5

® Since EPS is 4 times of Healthy Ltd, 4 shares are required to be issued in Efficient Ltd. for every one share of Healthy Ltd; hence, the ratio is 4:1. Similarly, the other ratios are computed.

With a swap ratio is 2.5:1, for every 1 share of Healthy Ltd, 2.5 shares are to be issued in Efficient Ltd. Thus, the total number of shares to be issued to Healthy Ltd. is 7.5 lakh × 2.5 = 18.75 lakh shares.

Total number of shares in Efficient Ltd. (after acquisition) = (10 lakh existing shares + 18.75 lakh shares issued) = 28.75 lakh shares. The promoter's holding (%) after acquisition = number of shares held by promoters, 4.75 lakh + (2.5 × 5.00 lakh = 12.5 lakh) = 17.25 lakh/Total number of shares, 28.75 lakh = 60 per cent.

(ii) EPS after acquisition = Total earnings after acquisition/ Total number of shares after acquisition = ₹50 lakh + ₹150 lakh = ₹200 lakh/28.75 lakh = ₹6.956

(iii) Expected MPS = ₹6.956 × 10 times = ₹69.56

(iv) Free float market capitalisation (merged firm):

Total number of shares	28.75 lakh
Less shares held by promoters	17.25 lakh
Shares in the market	11.50 lakh
Multiplied by MPS	₹69.56
Free float market capitalisation	₹799.94 lakh

P.32.17 Mr. Ravi is a first generational entrepreneur. He had taken over the unorganised coal business- run in the family and organised into a well-respected firm in the region- doing better than the most companies operating in the same industry. The hard working man and his team of dedicated employees worked relentlessly for the growth of the firm.

LO 32.5 LOD M

The company extracted coal from the coalmines, processed it into coke and charcoal and exported it to the energy hungry 'Western World'. The company had done very well during the period of 2002–2007 when the global economy was witnessing the steady growth. But due to the global recession of 2008 and the subsequent time, which followed, his firm witnessed a severe setback and has started to incur losses; its accumulated losses being ₹480 lakh as at March 31, 2014.

Although Mr. Ravi had a good business acumen (as his other two business companies were performing exceptionally well), he did not have the strong financial management background. Mr. Ravi, however, feels that the worst is over and the company would start earning profits. Given its present unsatisfactory state of financial affairs (as shown by its latest balance sheet), he apprehends that the firm would not be able to regain its past glory. While he was upset (at this juncture), he remembers his friend, Ankit, an MBA, who specialised in financial management. He, at present, is a leading consultant in Finance. He apprised him of the situation and sought his advice for future course of action.

Mr. Ankit asked for the current year's balance sheet of the coal processing company.

Balance Sheet of Coal Processing Company as at March 31, 2014

		(In ₹ Lakh)	
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Equity shares (10,00,000 in number)	1,000	Land and building	360
12.5% Preference shares (₹100 each)	60	Plant and machinery	140
10% Debentures	600	Stock	590
Debenture interest payable	60	Debtors	170
10% Bank loan	160	Cash at bank	95
Trade creditors	100	Preliminary expenses	105
		Cost of issue of debentures	40
		Profit and loss account	480
	1,980		1,980

On further conversation with Mr. Ravi, Ankit was convinced that the future of the company looks bright. The company had decided to enter the domestic market- where the energy consumption was fast increasing because of the fast growth and also the Government had eased out the sector—making it possible for the company to expect nearly the same price for the upgraded quality of coke and charcoal.

Mr. Ankit, after looking at the balance sheet and analysing the future strategies of the company, was convinced that the firm is expected to make profits in future. He suggests that the fortune of the company can be turned around if the firm adopts the following measures for financial restructuring:

1. Equity shares are to be reduced by 65%, i.e. ₹35 per share, fully paid up. The company will also issue 7 lakh equity shares at ₹35 each to pay the bank loan and augment the working capital.
2. Preference shareholders are willing to accept new preference shares, carrying lower dividend of 11%.
3. Debentureholders have agreed to forgo the outstanding interest. They have also agreed to accept new debentures but at 9% interest payment.
4. Trade creditors have agreed to forgo 20% of their existing claims.

5. Fixed assets are to be revalued at:

(a) Land and building: ₹400 lakh

(b) Plant and machinery: ₹90 lakh

6. Stock is to be valued at ₹510 lakh.

7. Financial restructuring expenses are estimated at ₹15 lakh.

Show the impact of financial restructuring, drawing the new balance sheet after the scheme is executed. Do you agree with the suggestion provided by Ankit?

Solution

Impact of Financial Restructuring

(₹ in Lakh)

1. Benefits to company		
(a) Reduction of liabilities payable		
(i) Reduction in equity share capital (10 lakh shares × ₹65 per share)		₹650
(ii) Waiver of debentures interest		60
(iii) 20% waiver from trade creditors (20% of ₹100 lakh)		20
		730
(b) Revaluation of land and building (₹400 lakh – ₹360 lakh)		40
(c) Total sum available to write off fictitious and over-valued assets		770
2. Amount utilised to write off losses, fictitious assets, etc.		
(a) Writing off profit and loss account		₹480
(b) Preliminary expenses		105
(c) Cost of issue of debentures		40
(d) Decrease in stock (₹680 lakh – ₹600 lakh)		80
(e) Revaluation of plant and machinery (₹140 lakh – ₹90 lakh)		50
(f) Expenses incurred for restructuring		15
		770

Balance Sheet of Coal Processing Ltd. (After Reconstruction)

(₹ in Lakh)

Liabilities	Amount	Assets	Amount
Equity shares (17 lakh @ ₹35 each)	595	Land and building	400
11% Preference shares (₹100 each)	60	Plant and machinery	90
9% Debentures	600	Stock	510
Trade creditors	80	Debtors	170
		Cash at bank	165
	1335		1335

Financial restructuring is likely to help the company to improve its reputation in the market. Also, the company should be able to raise additional funds in future for business expansion plans. The company is advised to opt for financial restructuring (as suggested by Mr. Ankit).

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the specific procedures and protocols that must be followed to ensure that all records are properly maintained and updated. This includes details on how data should be collected, stored, and reviewed.

3. The third part of the document discusses the role of the management team in overseeing the implementation of these procedures and ensuring that they are followed consistently across all departments.

4. The fourth part of the document provides a detailed overview of the various systems and tools that will be used to support the record-keeping process. This includes information on the software platforms, databases, and other resources that will be utilized.

5. The fifth part of the document discusses the training and support that will be provided to all staff members who will be responsible for maintaining the records. This includes details on the initial training sessions and ongoing support resources.

6. The sixth part of the document discusses the monitoring and evaluation process that will be used to assess the effectiveness of the record-keeping system. This includes details on the key performance indicators (KPIs) that will be tracked and the methods used for data analysis.

7. The seventh part of the document discusses the future plans for the record-keeping system, including potential updates and improvements that will be implemented over time.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice.

2. The second part outlines the procedures for handling discrepancies between the books and the actual cash on hand. It suggests a systematic approach to identifying and resolving such issues.

3. The third part provides a detailed breakdown of the monthly financial statements, including the balance sheet and the profit and loss account.

4. The fourth part discusses the impact of inflation on the value of money over time. It explains how purchasing power decreases as prices rise, and how this affects the real value of assets and liabilities.

5. The fifth part provides a summary of the key findings and recommendations from the analysis. It suggests ways to improve financial management and reduce the risk of future discrepancies.

6. The sixth part includes a list of references and sources used in the research.

7. The final part of the document is a conclusion that reiterates the main points and offers final thoughts on the importance of sound financial practices.

P.32.18 A company has 4 divisions. Its one of the divisions is yielding low returns and has a trend of decline in sales. Therefore, its management is considering to sell it. For the purpose, the finance manager has been asked to determine the value at which it can be sold. He collates the following data to determine the sale value of the division.

LO 32.5 LOD M

(i) The expected operating CFAT the division was to generate for next 5 years (economic useful life) are as follows:

Year	Amount (in ₹ million)
1	₹16
2	12
3	11
4	10
5	8

(ii) The expected salvage value of long-term assets at year-end 5 is ₹15 million

(iii) Release the working capital at year-end is ₹7 million.

(iv) Division's external liabilities at present ($t = 0$) is ₹5 million.

(v) Required rate of return is 12 per cent.

Assume that the buyer of the division would pay for external liabilities.

Solution

Financial evaluation to determine the value of division at which it can be sold.

(i) Expected PV of CFAT to be lost

(Amount in ₹ millions)

Year	CFAT	PV factor (12%)	Total PV
1	₹16	0.893	₹14.29
2	12	0.797	9.56
3	11	0.712	7.83
4	10	0.636	6.36
5(a)	8	0.567	4.54
5(b)	Sale value of long-term assets 15	0.567	8.51
5(c)	Release of working capital 7	0.567	3.97
Total			55.06
PV lost due to sale of division			55.06
(ii) Less: External liabilities of the division			(5.00)
(iii) Sale value of division (i)-(ii)			<u>50.06</u>

Recommendation The management should not sell the division for a price of less than ₹50.06 million.

MINI CASES

32.C.1 Following are the financial statements for A Ltd and T Ltd for the current financial year. Both firms operate in the same industry.

Balance sheets

	A Ltd	T Ltd
Total current assets	₹14,00,000	₹10,00,000
Total fixed assets (net)	10,00,000	5,00,000
Total assets	24,00,000	15,00,000
Equity capital (of ₹10 each)	10,00,000	8,00,000
Retained earnings	2,00,000	—
14% Long-term debt	5,00,000	3,00,000
Total current liabilities	7,00,000	4,00,000
	24,00,000	15,00,000

Income statements

Net sales	₹34,50,000	₹17,00,000
Cost of goods sold	27,60,000	13,60,000
Gross profit	6,90,000	3,40,000
Operating expenses	2,96,923	1,45,692
Interest	70,000	42,000
Earnings before taxes (EBT)	3,23,077	1,52,308
Taxes (0.35)	1,13,077	53,308
Earnings after taxes (EAT)	2,10,000	99,000

Additional information:

Number of equity shares	1,00,000	80,000
Dividend payment (D/P) ratio	0.40	0.60
Market price per share (MPS)	₹40	₹15

Assume that the two firms are in the process of negotiating a merger through an exchange of equity shares. You have been asked to assist in establishing equitable exchange terms, and are required to:

- (i) Decompose the share prices of both the companies into EPS and P/E components, and also segregate their EPS figures into return on equity (ROE) and book value or intrinsic value per share (BVPS) components.
- (ii) Estimate future EPS growth rates for each firm.
- (iii) Based on expected operating synergies, A Ltd estimates that the intrinsic value of T's equity share would be ₹20 per share on its acquisition. You are required to develop a range of justifiable equity share exchange ratios that can be offered by A Ltd to T Ltd's shareholders. - (iv) Calculate the post-merger EPS based on an exchange ratio of 0.4 : 1 being offered by A Ltd. Indicate the immediate EPS accretion or dilution, if any, that will occur for each group of shareholders.
- (v) Based on a 0.4:1 exchange ratio, and assuming that A's pre-merger P/E ratio will continue after the merger, estimate the post-merger market price. Show the resulting accretion or dilution in pre-merger market prices.

Solution**(i) Determination of EPS, P/E ratio, ROE and BVPS of A Ltd and T Ltd**

Particulars	A Ltd	T Ltd
EAT (₹)	2,10,000	99,000
N	1,00,000	80,000
EPS (EAT ÷ N) (₹)	2.10	1.24
Market price per share (MPS) (₹)	40	15
P/E ratio (MPS/EPS)	19.05	12.12
Equity funds (EF) (₹)	12,00,000	8,00,000
BVPS (EF ÷ N) (₹)	12	10
ROE (EAT ÷ EF)	0.175	0.1237

(ii) Growth rates in EPS

	A Ltd	T Ltd
Retention ratio (1 – D/P ratio)	0.6	0.4
Growth rate (ROE × Retention ratio)	0.105	0.0495

(iii) Justifiable equity share exchange ratio

(a) Market price based = $MPS_T / MPS_A = ₹15 / ₹40 = 0.375 : 1$ (lower limit)

(b) Intrinsic value based = $₹20 / 40 = 0.5 : 1$ (upper limit)

Since A Ltd has a higher EPS, ROE, P/E ratio, and higher EPS growth expectations, the negotiated terms would be expected to be closer to the lower limit, based on the existing share prices.

(iv) Post-merger EPS and other effects

	A Ltd	T Ltd	Combined
EAT (₹)	2,10,000	99,000	3,09,000
Shares outstanding	1,00,000	80,000	1,32,000*
EPS (₹)	2.10	1.24	2.34
EPS accretion or (dilution) (₹)	0.24	(0.30**)	—

(v) Post-merger market price and other effects

	A Ltd	T Ltd	Combined
EPS	₹2.10	₹1.24	₹2.34
P/E ratio	(x) 19.05	(x) 12.12	(x) 19.05
MPS accretion	40	15	44.60
	4.60	2.84***	

* $1,00,000 \text{ shares} + (0.40 \times 80,000) = 1,32,000 \text{ shares}$

** $\text{EPS claim per old share} = ₹2.34 \times 0.4 = ₹0.936$

EPS dilution $(₹1.24 - ₹0.936) = ₹0.304$

*** $\text{MPS claim per old share} = ₹44.60 \times 0.4 = ₹17.84$

Less: MPS per old share 15.00

2.84

32.C.2 Expansion Ltd is a well-known brand in the country looking forward to diversify its product portfolio by acquiring another firm in the same industry. Stagnant Ltd is another firm in the country having popular brands in its product portfolio. Expansion Ltd is contemplating to acquire Stagnant Ltd. This acquisition is

likely to add considerable value to Expansion Ltd with expanded client base. The management of Expansion Ltd. is keen to know if this acquisition is financially viable. Its CEO, Mr. Doordarshi Gupta, hires the best consultants in the Industry and asks his CFO, Prateek Dash, to evaluate the deal with the consultants in order to take a final call on the proposal of Expansion Ltd.

The following information is provided by the consultants about Stagnant Ltd:

The forecasted sales revenue of Stagnant Ltd for the next 7 years is given in the table below:

Year	1	2	3	4	5	6	7
Sales revenue (₹ million)	100	120	140	160	160	150	140

Balance sheet of Stagnant Ltd. as at March 31, 2014 is as follows

(₹ in million)			
Liabilities	Amount	Assets	Amount
Share capital (10 lakh shares for ₹100 each)	100	Fixed assets:	
Reserves and surplus	30	Land and building	80
10% Debentures	20	Plant and machinery	90
Profit & loss	15	Patents	20
Trade creditors	80	Current assets:	
Provisions for taxes	5	Marketable securities (8 %)	5
		Inventory	45
		Debtors	5
		Cash and bank	5
	250		250

Additional Information:

- (i) Variable expenses amount to 40 per cent of the sales revenue.
- (ii) Fixed operating costs are estimated to be ₹20 million for the first 5 years and ₹24 million for next two years.
- (iii) It would also be promoting its products by regular advertisement campaigns as per the product life cycle requirements. Estimated expenditure is given below:

Year	1	2	3	4	5	6	7
Expenditure (₹ million)	15	15	10	5	5	10	10

- (iv) Plant and machinery are subject to 15 % rate of depreciation on written down value method.
- (v) The company owns patents having useful life of 10 years and are subject to amortisation on the straight line basis.
- (vi) The company has planned the following capital expenditure (incurred at the beginning of each year) for the next 7 years.

Year	1	2	3	4	5	6	7
Capital expenditure (₹ million)	15	20	25	20	30	25	20

- (vii) Working capital in terms of Investment in current assets is estimated at 20 per cent of sales revenue.
- (viii) Expected non-operating cash flow (including investment in marketable securities) in the initial year is ₹2.5 million.

(ix) Effective tax rate is 30 per cent and estimated cost of capital is 12 per cent.

(x) Free cash flows of the firm are expected to grow at 6 per cent after 7 years.

Balance sheet as at 31st March 2014 of the two firms operating in the same industry is as follows:

(Amounts in ₹ million)

Particulars	Expansion Ltd.	Stagnant Ltd.
Fixed assets	₹250	190
Current assets	100	60
Total assets	350	250
Equity capital	140	100
Reserves and surplus	50	30
10 % Debentures	25	20
Profit and loss Account	45	15
Total current liabilities	90	85
Total liabilities	350	250
Additional Information:		
EAT	20	10
P/E ratio	11	10

Purchase considerations (besides taking over current liabilities) consists of the following:

- (i) Expansion Ltd would need to issue 6,00,000 (Exchange ratio: 0.6) at its current market price of ₹160,
- (ii) Payment of ₹60 in cash per share issued,
- (iii) Redemption of 10 per cent debentures at a premium of 10 per cent,
- (iv) Dissolution expenses are estimated at ₹15 million that would need to be taken into consideration
- (v) Stagnant Ltd has a lawsuit pending against it which would require ₹50 million for its settlement in the coming years,
- (vi) Market value of assets which would not be used after acquisition are worth ₹20 million.

The CFO, Prateek, decides to evaluate the deal as a capital budgeting decision. Prateek decides that in case the deal is viable, the most appropriate exchange ratio for the deal to materialise (at the current date), should also be provided for.

Solution

(i) Cost of acquisition ($t = 0$)

	(₹ in million)
Payment to equity shareholders (6 lakh shares × 160)	96
Plus: Cash payment to equity shareholders (6 lakh shares × 60)	36
Plus: Payment to debentureholders	22
Plus: Payment for current liabilities	85
Plus: Dissolution expenses	15
Plus: Contingent liabilities	50
Less: Cash proceeds from sale of assets of Sunlife Pharma	(20)
Total	284

(ii) Present value of free cash flow for the period (year 1-7)

(Amount in ₹ million)

Particulars	Year						
	1	2	3	4	5	6	7
Sales revenue	100	120	140	160	160	150	140
Less: Variable cost	40	48	56	64	64	60	56
Fixed operating costs	20	20	20	20	20	24	24
Advertisement	15	15	10	5	5	10	10
Depreciation*	15.75	16.39	17.68	18.03	19.82	20.6	20.51
Amortization	2	2	2	2	2	2	2
EBIT	7.25	18.61	34.32	50.97	49.18	33.4	27.49
Less: Taxes (0.30)	2.17	5.58	10.30	15.29	14.75	10.02	8.24
NOPAT	5.08	13.03	24.02	35.68	34.43	23.38	19.25
Non-operating Income	2.5						
Add Depreciation	15.75	16.39	17.68	18.03	19.82	20.6	20.51
Add Amortisation	2	2	2	2	2	2	2
Gross cash flow	25.33	31.42	43.70	55.71	56.25	45.98	41.76
Less:	0	0	28	24	30	23	18
Investment in (capital expenditure and current assets)**							
Free cash flows (FCFF)	25.33	31.42	15.70	31.71	26.25	22.98	23.76
PV factor @ 12%	0.893	0.797	0.712	0.636	0.567	0.507	0.452
PV	22.63	25.04	11.18	20.17	14.89	11.65	10.74
Total present value							116.27

* Depreciation schedule is given in Working note I.

** Calculation for additional Investment is provided in the Working note II.

(iii) PV of free cash flows after the explicit forecast period of 7 years

$$TV_7 = FCFF_7 (1 + g)/(K_0 - g)$$

$$= ₹23.753 \text{ million} (1 + 0.06)/(0.12 - 0.06) = ₹419.64 \text{ million}$$

$$PV \text{ of } TV = ₹419.64 \text{ million} \times 0.452 = ₹189.68 \text{ million}$$

(iv) Determination of NPV

PV of free cash flows (years 1-7)	₹116.27 million
PV of free cash flows subsequent to year 7	189.68
Total PV of benefits/FCFF	305.95
Less: Cost of acquisition	284
Net present value	21.95

Recommendation As the NPV is positive, acquisition of Stagnant Ltd by Expansion Ltd is financially viable.

(v) Effect of merger on the market value of the combined firm.

Particulars	Before Merger		After Merger
	AB Pharma	Sunlife Pharma	AB Pharma (Combined)
EAT	₹2,00,00,000	₹1,00,00,000	₹3,00,00,000
Number of shares	14,00,000	10,00,000	20,00,000
P/E	11	10	11
EPS	14.54	10	15

(Contd.)

Statement of Financial Position		
As at 31st December 1999		
	Assets	Liabilities and Equity
Fixed Assets	100	
Current Assets	200	
	300	
		Capital
		100
		Reserves
		200
		300
	300	300

The above statement shows the financial position of the business at the end of the year. It is a summary of the balance sheet and provides a snapshot of the company's assets and liabilities. The total assets are equal to the total liabilities and equity, which is 300. This indicates that the business is financially sound and has a positive net worth.

The statement also shows the breakdown of assets and liabilities. Fixed assets are valued at 100, and current assets are valued at 200. The total assets are 300. On the liability side, the capital is 100, and reserves are 200, totaling 300. This shows that the business has a strong financial position and is able to meet its obligations.

Statement of Financial Position		
As at 31st December 1999		
	Assets	Liabilities and Equity
Fixed Assets	100	
Current Assets	200	
	300	
		Capital
		100
		Reserves
		200
		300
	300	300

The above statement shows the financial position of the business at the end of the year. It is a summary of the balance sheet and provides a snapshot of the company's assets and liabilities. The total assets are equal to the total liabilities and equity, which is 300. This indicates that the business is financially sound and has a positive net worth.

The statement also shows the breakdown of assets and liabilities. Fixed assets are valued at 100, and current assets are valued at 200. The total assets are 300. On the liability side, the capital is 100, and reserves are 200, totaling 300. This shows that the business has a strong financial position and is able to meet its obligations.

(Contd.)

MPS	160	100	165
Market value	₹22,40,00,000	₹10,00,00,000	₹33,00,00,000
Total MV		32,40,00,000	

Gain in market value after merger is ₹6 million. The minimum and maximum exchange ratio works out to be 0.625 and 0.6625***. So the EPS of the equity holders of both firms do not get diluted after the merger as is happening in the predetermined exchange ratio of 0.6.

(vi) Gain to the share-holders post-merger

Particulars	Post-Merger	
	Expansion Ltd.	Stagnant Ltd.
MPS	₹165	₹165
Market value	23,10,00,000	9,90,00,000
Gain to equityholders	70,00,000	(₹10,00,000)
Total gain	60,00,000	

***Calculation to determine the most the range of exchange ratio is shown in Working note III

Working Notes

I. Depreciation Schedule, Years 1-7

(Amount in ₹ million)

Year	Depreciation base at the beginning of the year	Additions during the year	Total at the end of the year	Depreciation @ 15 %
1	90	15	105	15.75
2	89.25	20	109.25	16.39
3	92.86	25	117.86	17.68
4	100.18	20	120.18	18.03
5	102.15	30	132.15	19.82
6	112.33	25	137.33	20.60
7	116.73	20	136.73	20.51

II. Determination of Investment [Capital Expenditure + Current Assets] Required, Years 1-7

(Amount in ₹ million)

Year	Investment required			Existing investment in CA	Additional investments required
	Capital expenditure	Working capital	Total		
1	15	20	35	60	Nil
2	20	24	44	45@	Nil
3	25	28	53	25@@	28
4	20	32	52	28	24
5	30	32	62	32	30
6	25	30	55	32	23
7	20	28	48	30	18

@ (₹60 million – ₹15 million capital expenditure); @@ (₹45 million – ₹20 capital expenditure)

III. Determination of exchange ratio range acceptable to both the companies

(a) The entire gain (₹6 million) from the merger goes to Expansion Ltd.

Post-merger value:

Expansion Ltd: ₹231 million

Stagnant Ltd: ₹100 million

The number of shares to be issued at market price of ₹160 so that the total market value of Stagnant Ltd remains at ₹100 million: 6,25,000

The number of shares already with Stagnant Ltd: 10,00,000

Therefore, the exchange ratio: 0.625

- (b) If the entire gain (₹6 million) from the merger goes to Stagnant Ltd

Post-merger value:

Expansion Ltd: ₹224 million

Stagnant Ltd: ₹106 million

The number of shares to be issued at market price of ₹160 so that the total market value of Stagnant Ltd. is ₹106,000,000: 6,62,500

The number of shares already with Stagnant Ltd: 10, 00,000

Therefore, the exchange ratio: 0.6625

Acceptable range of exchange ratio is between 0.625 and 0.6625, for both the companies.

REVIEW QUESTIONS

LOD: Easy

RQ.32.1 Provide the appropriate answers in the following:

[LO 32.1.2]

- (i) Merges can provide tax benefits in the case of set off and carry forward of losses. (True/False)
- (ii) The cost of capital of a merged firm is different from both cost of capital of the acquiring firm and the target firm as synergy effects should be taken and risk complexion of both the firms changes on merger. (True/False)
- (iii) In an amalgamation, the amalgamated company is entitled to carry forward accumulated losses as well as unabsorbed depreciation of the amalgamating company. (True/False)
- (iv) Vertical merger is the merger of two firms which are involved
 - (a) in similar line of business (b) in different stages of distribution and production in same business activity (c) in different/unrelated business activities and (d) None of these
- (v) Major advantages of merger are
 - (a) Tax benefits (b) Synergy (c) Economies of scale (d) All of these
- (vi) The type of financing in which an initial payment (to the shareholders of acquired firm) is followed by additional payment in future years based on the target firm's increase in earnings is known as
 - (a) preference share financing (b) tender offer (c) deferred payment plan and (d) ordinary share financing.
- (vii) The type of financing in which the purchaser approaches the shareholders directly instead of the management to acquire interest in acquired firm is known as
 - (a) preference share financing (b) tender offer (c) deferred payment plan and (d) ordinary share financing.
- (viii) What is the terminal value of the firm if FCFF at the end of last year of explicit forecast period is ₹100 lakh. Cost of capital is 15% and growth rate of firm is constant at 5 per cent.
 - (a) ₹1000 lakh (b) ₹1050 lakh (c) ₹950 lakh and (d) None of these
- (ix) Two firms A and B have earnings after taxes of ₹60,000 and ₹40,000 respectively, with identical EPS of ₹10. What will the EPS of the firm be after merger for share exchange ratio as 0.5:1,

The first part of the report deals with the general situation of the country. It is noted that the economy is showing signs of recovery, but that there are still many problems to be solved. The government is taking steps to improve the situation, but more work is needed.

The second part of the report deals with the specific situation of the different regions. It is noted that the situation is not uniform, and that there are still many problems to be solved in some areas. The government is taking steps to improve the situation, but more work is needed.

The third part of the report deals with the specific situation of the different sectors. It is noted that the situation is not uniform, and that there are still many problems to be solved in some sectors. The government is taking steps to improve the situation, but more work is needed.

The fourth part of the report deals with the specific situation of the different groups. It is noted that the situation is not uniform, and that there are still many problems to be solved in some groups. The government is taking steps to improve the situation, but more work is needed.

CONCLUSION

In conclusion, it is noted that the situation is not uniform, and that there are still many problems to be solved. The government is taking steps to improve the situation, but more work is needed.

It is noted that the situation is not uniform, and that there are still many problems to be solved. The government is taking steps to improve the situation, but more work is needed.

It is noted that the situation is not uniform, and that there are still many problems to be solved. The government is taking steps to improve the situation, but more work is needed.

It is noted that the situation is not uniform, and that there are still many problems to be solved. The government is taking steps to improve the situation, but more work is needed.

where A acquires B?

(a) ₹10 (b) ₹15 (c) ₹12.5 and (d) ₹20

- (x) Firm A acquires firm B, MPS of B is ₹20 and EPS is ₹5. For an exchange ratio of 1.5: 1, what was the P/E ratio used in acquiring B?

(a) 4 (b) 5 (c) 6 and (d) 2.67

[Answers: (i) True, (ii) True, (iii) True, (iv) b, (v) d, (vi) c, (vii) b, (viii) b, (ix) c, and (x) c.]

RQ.32.2 (a) What is a merger? Enumerate different types of mergers. What are the potential economic advantages from mergers? [LO 32.1]

(b) What synergies do exist in (a) horizontal mergers, (b) vertical mergers and (c) conglomerate mergers?

RQ.32.3 'Conglomerate firm shares tend to have a higher market value due to lower cost of capital'. Elucidate the statement. [LO 32.1]

RQ.32.4 AB Ltd wishes to acquire CD Ltd on the basis of an exchange ratio of 0.8. Other relevant financial data is as follows: [LO 32.2]

Particulars	AB Ltd	CD Ltd
Earnings after taxes (EAT)	₹1,00,000	₹20,000
Equity shares outstanding	50,000	20,000
Earnings per share (EPS)	2	1
Market price per share	20	8

- (i) Determine the number of shares required to be issued by AB Ltd for acquisition of CD Ltd
 (ii) What would be the exchange ratio if it is based on the market prices of shares of AB Ltd and CD Ltd?
 (iii) What is the current price-earnings ratio of the two companies?
 (iv) Assuming the earnings of each firm remains the same, what is the EPS after the acquisition?
 (v) What is the equivalent EPS per share of CD Ltd?
 (vi) Ascertain the gain to shareholders of both the companies (a) at 0.8 exchange ratio, and (b) an exchange ratio based on market price.

LOD: Medium

RQ.32.5 How are mergers financed? Analyse the impact of the various modes of finance on a company's EPS. [LO 32.2]

RQ.32.6 How are the expected gains from the merger shared between the acquiring and the acquired firms? Illustrate your answer with appropriate examples. [LO 32.2]

RQ.32.7 'The capital budgeting technique of evaluating a merger proposition is the most appropriate.' Elucidate the statement. [LO 32.2]

RQ.32.8 How are lower limit and upper limit of share exchange ratio between the acquiring company and the target company determined? Explain your answer with an appropriate numerical example. [LO 32.2]

RQ.32.9 What is corporate restructuring? State the major forms in which it can be carried out. [LO 32.5]

RQ.32.10 Distinguish between 'friendly takeover' and 'hostile takeover'. What strategies are adopted by the acquiring firm in the case of a hostile takeover? [LO 32.4]

RQ.32.11 What is a leveraged buyout (LBO)? What key points should be borne in mind in such an acquisition? [LO 32.5]

RQ.32.12 Describe the tax aspects related to amalgamations and demergers. [LO 32.3]

RQ.32.13 Discuss the legal process relating to approval of merger. [LO 32.4]

RQ.32.14 Examine the provisions of the Indian Companies Act governing corporate takeovers. [LO 32.4]

RQ.32.15 State the defences available to the target firm to prevent hostile takeover. [LO 32.4]

RQ.32.16 A Ltd has acquired T Ltd in the current year. T Ltd has its base year earnings of ₹15 lakh. At the time of merger, its equity shareholders received initial payment of 1 lakh shares of A Ltd. The market value of A Ltd's share is ₹100 per share and the P/E ratio is 10. As a part of the agreement, it has been also decided to pay to the shareholders of T Ltd on deferred payment basis for next 3 years; the payment is contingent to the realisation of the potential projected earnings after merger.

The projected post-merger earnings of T Ltd for next 3 years are ₹18 lakh, ₹20 lakh and ₹25 lakh respectively.

Assuming no change in the P/E ratio and share prices of T Ltd, determine the number of shares required to be issued to the shareholders of T Ltd during these years. [LO 32.2]

RQ.32.17 The Sick Company Ltd (SCL) has total accumulated losses of ₹25 lakh caused by operating losses of past several years. The Strong Ltd has acquired the SCL to use these losses and to diversify its operations. The Strong Ltd's expected earnings before taxes are ₹20 lakh per year for the next 3 years.

Assuming these earnings are realised and setting off the losses is allowed under tax laws, determine the likely benefit to Strong Ltd, given corporate tax rate of 35 per cent and its cost of capital as 15 per cent. [LO 32.2]

RQ.32.18 Royal Industries Ltd (RIL) is considering a takeover of Supreme Industries Ltd (SIL). The earnings, number of outstanding equity shares and P/E ratios of the two companies are as follows: [LO 32.2]

Particulars	Royal Industries Ltd	Supreme Industries Ltd
Earnings after taxes (EAT)	₹20,00,000	₹10,00,000
Equity shares outstanding	10,00,000	10,00,000
Earnings per share (EPS)	2	1
P/E ratio (times)	10	5

- (i) What is the market value of each company before merger?
- (ii) Assume that the management of RIL estimates that the shareholders of SIL will accept an offer of one share of RIL for four shares of SIL. If there are no synergic effects, what is the market value of the post-merger RIL? What is the new price per share? Are the shareholders of RIL better or worse-off than they were before the merger?
- (iii) Assume because of synergic effects, the management of RIL estimates that the earnings will increase by 10 per cent, what is the new post-merger EPS and price per share? Are the shareholders better or worse off than before the merger?

LOD: Difficult

RQ.32.19 What is the adjusted present value (APV) approach? How does it differ from the conventional net present value approach of evaluating a target firm? [LO 32.2]

RQ.32.20 What is financial restructuring? What are the key components of the financial restructuring scheme? Draw an appropriate financial restructuring scheme for a financially troubled firm. [LO 32.5]

RQ.32.21 What is demerger? What are the common methods used by firms to divest/demerger themselves off operating units? [LO 32.5]

RQ.32.22 Critically examine the SEBI takeover code. [LO 32.4]

RQ.32.23 Consider the following financial data of A Ltd and T Ltd just before the merger announcement of the latter by the former: [LO 32.2]

Particulars	A Ltd	T Ltd
Market price per share	₹150	₹30
Number of shares (in lakh)	10	6
Market value (MV) of the firm (in ₹lakh)	1,500	180

Determine the cost of merger:

- (i) if A Ltd intends to pay ₹240 lakh in cash to T Ltd;
 (ii) if A Ltd intends to offer its 1,60,000 shares in exchange of shares of T Ltd. Assume further, the merger is expected to generate cost savings with present value of ₹94.80 lakh. It is expected that these cost savings would push up the market price.
 (Note: consider each case independently)

ANSWERS

- 32.4 (i) 16,000 shares,
 (ii) 0.4:1,
 (iii) P/E ratio 10 for AB Ltd. And 8 for CD Ltd.
 (iv) ₹1.82 (when exchange ratio is 0.8) and ₹2.07 (when exchange ratio is 0.4),
 (v) ₹1.45,
 (vi) Loss ₹90,909 for shareholders of AB Ltd. and gain of ₹1,30,909 for shareholders of CD Ltd. (when exchange ratio is 0.8); Gain of ₹34.483 and of ₹5,517 for shareholders of AB Ltd. and Cd Ltd. (when exchange ratio is 0.4).
- 32.16 Year 1 (30,000 shares); Year 2 (50,000 shares); Year 3 (1,00,000 shares).
- 32.17 ₹7.4 lakh.
- 32.18 (i) ₹200 lakh (RIL), ₹50 lakh (SIL).
 (ii) ₹300 lakh (Post-merger market value of RIL); ₹24 (MPS); Gain to the shareholders of RIL is ₹40 lakh due to merger.
 (iii) EPS ₹2.64; the shareholders are better in post-merger situation.
- 32.23 (i) ₹60 lakh (ii) ₹64.80 lakh.

Chapter 35
**INTERNATIONAL FINANCIAL
MANAGEMENT**

International finance has assumed considerable significance in the context of the emerging financial scenario in India, in the wake of the globalisation of the Indian economy. Its important dimensions are comprehensively examined in Part 10 of the book. Chapter 33 discusses foreign exchange markets and dealings. Foreign exchange exposure and risk management are illustrated in Chapter 34, while international financial management, including important sources of international finance, is covered in Chapter 35.

Part 10

International Finance

INTERNATIONAL FINANCE

International finance is defined as the flow of funds across national boundaries. It involves the study of the international financial system, including the balance of payments, foreign exchange, and international trade. The primary focus is on the flow of capital and goods between countries.

Foreign Exchange Markets and Dealings

LEARNING OBJECTIVES

LO 33.1	Present a broad view of the foreign exchange markets
LO 33.2	Explain the various types of foreign exchange rates (spot, forward and cross), direct and indirect quotations and spread and arbitrage processes in foreign exchange dealings
LO 33.3	Discuss the factors—inflation, interest, balance of payment, volume of international reserves and level of activity and employment—and theories that account for variation in exchange rates

INTRODUCTION

There is a growing tendency among business firms to operate in other countries. They set up their factories/subsidiaries abroad to seek new markets and develop products to cater to the needs and requirements of foreign markets; they raise capital from many countries. Being so, it is imperative for finance managers, in particular, and other managers, in general, to understand the processes and methods of dealings in foreign exchange markets.

This Chapter deals with the *modus operandi* of foreign exchange transactions in foreign exchange markets. First, it presents a broad overview of the foreign exchange markets. The foreign exchange dealings are covered in the subsequent discussion. The major determinants/select theories of exchange rates are also explained. The main points are summarised by way of recapitulation.

LO 33.1 FOREIGN EXCHANGE MARKETS

Different countries have different currencies and the settlement of all business transactions within a country is done/preferred in the local currency. The foreign exchange market provides a forum where the currency of one country is traded for the currency of another country. Suppose Air India has signed an agreement to buy/import aircrafts from a US based firm. Air India has to pay the US firm in American dollars. To do so, Air India has to purchase US dollars (\$) in the foreign exchange market and pay the US firm. In case Air India buys aircrafts from a French firm, it would be required to purchase euros (€) from the foreign exchange market to make the payment. Thus,

CHAPTER 33

The foreign exchange market is a market for the purchase and sale of foreign currencies. It is a market where the exchange rate of one currency against another is determined. The market is made up of many different participants, including banks, governments, and individuals. The market is also influenced by many factors, including interest rates, inflation, and political events. The market is a key part of the global financial system and plays a crucial role in international trade and investment.

CHAPTER 33

The foreign exchange market is a market for the purchase and sale of foreign currencies. It is a market where the exchange rate of one currency against another is determined. The market is made up of many different participants, including banks, governments, and individuals. The market is also influenced by many factors, including interest rates, inflation, and political events. The market is a key part of the global financial system and plays a crucial role in international trade and investment.

the requirement of foreign currency of the importer (Air India) hinges upon which country the imports are made from and/or the currency preferred by the exporter. While domestic currency is preferred by the exporters, in general, they may be willing to deal in the 'major' currencies (also referred to as 'hard' currencies) of the world. Included in this category are the US dollar (US \$), the British pound sterling (£), Euro (€), the Japanese yen, and the Swiss franc (CHF). Apart from the payment of imports, foreign currency requirements may be traced to foreign direct investment and lendings also.

Foreign exchange (FE) markets deal with a large volume of funds as well as a large number of currencies (belonging to various countries). For this reason, they are not only worldwide markets but also the world's largest financial markets. Though there are foreign exchange markets in virtually all countries, London, New York and Tokyo are the nerve centres of foreign exchange activity. The large commercial/investment banks and central banks of the countries are the principal participants in the FE markets. In general, business firms do not operate on their own, they normally buy and sell currencies through a commercial bank. Likewise, as a strategy, commercial banks may sometimes engage/prefer the services of individual brokers to hide their identity as they apprehend that the disclosure of their names may unfavourably influence short-term quotes. For the same reason, importers, needing a large volume of funds may like to deal through brokers/commercial banks.

While the primary objective of commercial banks, investment bankers and brokers in dealing FE markets is *commercial* in nature, whether they deal on their own account or for their clients, the central bank's operations (say, in the case of India, the Reserve Bank of India) in the market are *regulatory* in nature. To put it differently, the principal central bank of the country intervenes in the FE market primarily to regulate the volatility of foreign exchange rates. Obviously, the objective of their operations in the FE markets is not to make profits. They intend to maintain the exchange rate of the domestic country in tune with the requirements of the national economy and Government policy. They intend to avoid a sudden appreciation or depreciation of the domestic currency as it may be against the interest of the domestic economy. This is achieved through the buying and selling of the foreign currency by the central bank of the country. For instance, the Reserve Bank of India, on many occasions in recent years, has sold US \$ to augment their supply with a view to prevent a continuous decline in the value of Indian rupee *vis-à-vis* US \$; likewise, it has purchased US \$ many a time to weaken the Indian rupee, with a view to promote exports.

Most of the trading in the FE markets take place in the 'major' currencies stated earlier. All these currencies are fully convertible. There is an active market for these currencies in terms of the presence of a large number of buyers and sellers willing to execute foreign exchange dealings in these currencies; foreign exchange dealings primarily take place through telephone and fax messages. Therefore, the geographical existence of the foreign exchange markets does not have much relevance.

LO 33.2 FOREIGN EXCHANGE DEALINGS

We explain below the procedure of foreign exchange dealings—in terms of various types of exchange rates (spot, forward and cross), direct and indirect quotations and spread and arbitrage processes—to realise profits in the case of misalignment of exchange rates.

Exchange Rates

Different countries have different currencies and the different currencies have different values. Evidently, there is a need for rules for currency conversions for global business and investments.

The rate of conversion is the exchange rate. In other words, an **exchange rate** is the price of one country's currency expressed in terms of the currency of another country. For instance, a rate of ₹60 per US \$ implies that one US dollar costs ₹60. To put it differently, US \$0.01667 costs one rupee as $1/60 = \$0.01667$. Thus, there are two quotes: **(i)** Indian ₹60 = US \$1 (Direct quote) and **(ii)** US \$0.01667 = Indian ₹1 (Indirect quote). Both quotations reflect the same exchange/conversion rate and are reciprocal to each other.

- **Exchange rate**
- is the price of one
- currency expressed
- in terms of the
- currency of another
- country.

Direct and Indirect Quotations A foreign exchange (FE) quotation can either be direct or indirect. A FE quotation is said to be **direct** when it is quoted/expressed in a manner that reflects the exchange of a specified number of domestic currency *vis-à-vis* 1 unit of foreign currency. In our preceding example, ₹60 = US \$1 is a direct quotation for US \$ in India. Likewise, ₹92.06 = British pound sterling £1, ₹70.94 = Euro €1, are direct FE quotes in India in that they indicate ₹92.06 and ₹70.94 are required to exchange one unit of £ and €1 respectively.

- **Direct**
- **quotation/**
- **European**
- **quotation**
- is expressed
- in a manner
- that reflects the
- exchange of a
- specified number
- of domestic
- currencies vis-
- à-vis one unit of
- foreign currency.

The FE quotation is **indirect** when it is quoted in a manner that reflects the exchange of a specified number of foreign currency *vis-à-vis* 1 unit of local currency. In the above example, US \$0.01667 = ₹1 is an indirect quotation in India. Likewise, £0.01076 = ₹ 1, €0.01409 = ₹ 1, are examples of indirect quotations in India.

Direct quotations are known as **European quotations** and indirect quotations as **American quotations**. Direct quotations are more easy to comprehend and are, hence, followed by a large number of countries, including India.

- **Indirect**
- **quotation/**
- **American**
- **quotation**
- is expressed in a
- manner that reflects
- the exchange of a
- specified number of
- foreign currencies
- vis-à-vis one unit of
- local currency.

Two-way Quotations/Rates The FE rates explained above are single quote/rate. In practice, dealers quote two-way rates, one for buying the foreign currency (known as *bid price/rate*) and another for selling the foreign currency (referred to as *ask price/rate*). Since dealers expect profit in foreign exchange operations, the two prices obviously cannot be the same. Evidently, the dealer will buy the foreign currency at a lower rate and sell the foreign currency at a higher rate. For this reason, the 'bid' quote is at a lower rate and the 'ask' quote is a higher rate. The *quotations are always with respect to the dealer*.

The foreign exchange quotations contain two rates. By convention the first rate is the buying rate and selling rate is the second rate. For example, when a dealer in Mumbai quotes pound sterling £1 = ₹92.00 – ₹92.18, it implies that the dealer is prepared to buy British pound sterling at ₹92 and sell it at ₹92.18. Though we have taken the quote up to 2 decimal points, quotations in practice are normally made up to four decimal points for most of the currencies.

Spread Spread is the difference between the ask price and the bid price. The spread is affected by a number of factors. The currency involved, the volume of business and the market sentiments/rumours about the currency are the major variables reckoned by dealers/operators in the foreign exchange market. In case the currency involved is subject to higher volatility (say, the US \$ in February-March 2003, on account of the US threat of war on Iraq), the dealer will obviously like to have a higher spread in his quote to compensate for the higher risk he assumes in such circumstances.

- **Spread**
- is the difference
- between the ask
- price (sale price)
- and the bid price
- (purchase price).

THE HISTORY OF THE UNITED STATES

Spread to the dealer is akin to the gross profit for a business firm, out of which he is to meet its establishment expenses. In percentage terms, spread can be expressed in terms of Equations 33.1 and 33.2.

$$\text{Spread (per cent)} = [(\text{Ask price} - \text{Bid price})/\text{Ask price}] \times 100 \quad (33.1)$$

$$\text{Spread (per cent)} = [(\text{Ask price} - \text{Bid price})/\text{Bid price}] \times 100 \quad (33.2)$$

In the above example of the £, the spread per cent is 0.19527, that is $[(\text{₹}92.18 - \text{₹}92.00)/\text{₹}92.18] \times 100$, when it is determined with reference to the ask price.

Prima facie, the spread (percentage) appears to be very low. Since the volume of business involved is substantial, the total gross return to the dealer (in absolute terms) may turn out to be attractive. Continuing with 0.19527 spread, if the dealer has a turnover of ₹100 million in a day, his gross spread will be ₹1,95,270, that is, $(0.19527 \times \text{₹}100 \text{ million})/100$.

Spot Rates and Forward Rates In discussing exchange rates, it is important to distinguish between spot exchange rates and forward exchange rates. *Spot exchange rates* are applicable to the purchase and sale of foreign exchange on an immediate delivery basis. Though the term 'immediate' gives

Spot rate is the rate of exchange of the day on which the transaction has taken place and of the days the transaction is executed.

an impression of instantaneous delivery, in practice, delivery actually takes place two days later. Suppose Air India has bought aircrafts. It is to convert Indian rupees into US \$ or £ (depending on which country aircrafts have been bought from). In case the terms of payment are immediate, Air India is to arrange the spontaneous purchase of the required sum of US \$/£ at the spot rate from the spot market. The **spot rate** is the rate of day on which the transaction has taken place, though the execution of transaction occurs within a maximum of two working days.

In contrast, **forward exchange rates** are applicable for the delivery of foreign exchange at a future date. If Air India is to make payment after 90 days, as per the credit terms from the US firm, it has two options available. First, do nothing to arrange

foreign exchange payment; on the due date of payment (after 3 months), make purchases of the due sum of US \$ from the spot market, at the spot rate prevailing at that point of time, and then remit the payment to the US firm. Second, Air India may wish to avoid the uncertainty of the exchange rate three months from now. In that case, Air India is to purchase the required US \$ in the forward market at a forward exchange rate that is decided at the time of the agreement. The agreed forward rate is valid for settlement irrespective of the actual spot rate on the date of the maturity of the forward contract (that is, 90 days from today in the case of Air India). The

delivery of US \$ and the payment of Indian rupees takes place 90 days later, on the date of settlement. Thus, Air India has eliminated exchange risk by entering into a forward contract.

The concept of **forward rates** is equally significant and relevant to the exporter/seller. The seller/exporter may/will like/prefer to be sure of the export/sale proceeds. Suppose, the Indian firm sells goods of the value of US \$10 million on 6 months credit. To eliminate the uncertainty of the US \$-rupee exchange rate, the Indian firm may enter into a contract of selling US \$10 million six months from now. Consider Example 33.1.

Example 33.1

On February 1, an Indian firm exports goods of the value of US \$100 million on 6 months credit. On February 1, the six-month forward rate is ₹62 per US \$. The firm agrees to sell US \$100 million at ₹62 on August 1. By entering into such a contract, the Indian firm has assured itself of the receipt of (US \$100 million × ₹62) ₹6,200 million, irrespective of the spot rate prevailing on that day. Suppose, the actual spot rate is ₹61 per US \$ on August 1. The Indian firm has gained ₹100 million (₹6,200 million actual receipts minus ₹6,100

million that it otherwise would have obtained in absence of the forward rate contract). However, it should also be noted that the firm also runs the risk of potential loss in the event of the actual spot rate on August 1 turns out to be higher than ₹62. Let us assume that the actual spot rate is ₹62.2 on 1st August. The firm, in absence of the forward rate contract, would have received ₹6,220 million (US \$100 million × ₹62.2); as a result, it would suffer a loss of ₹20 million (₹6,220 million – ₹6,200 million).

It is apparent from Example 33.1 that the forward rate contracts (which take place in the forward markets) eliminate exchange rate risk. The example also highlights that risk elimination is achieved at a cost in terms of the potential loss of less receipts (in the case of forward sale transaction) and more payments (in the case of forward purchase transactions). This happens when the actual spot rate on the date of settlement turns out to be unfavourable to the business firm hedging the risk.

In general, spot rates as well as forward rates have two way quotes, that is, the quotation contains both the buying rate and selling rate. Theoretically, forward rates can be for any number of months or even a fraction of a month. In practice, forward rates are normally quoted for one month, two months, three months, six months, nine months and twelve months.

Finally, forward rates can be at a premium or discount. There is a very simple rule to ascertain whether the forward exchange rates are at a premium or discount. *The rule requires the comparison of the spot rate and forward rate.* In case the forward rates are higher than the spot rates, it implies that forward rates are at premium as more amount of domestic currency is required to be paid in future (to purchase y amount of foreign currency). On the contrary, if the forward rates are lower than the spot rates, it signals that the forward rates are at discount in that less amount of domestic currency is required in future (to purchase y amount of foreign currency). Forward rate premium or discount (in annualised percentage) *vis-à-vis* spot rate can be computed as per Equations 33.3 and 33.4.

- Forward rate premium
- foreign currency is at premium when its forward rate is higher than spot rate.

- Forward rate discount
- foreign currency is at discount when its spot rate is higher than the forward rate.

$$\text{Premium} = \frac{\text{Forward rate} - \text{Spot rate}}{\text{Spot rate}} \times \frac{12 \text{ months}}{N} \tag{33.3}$$

$$\text{Discount} = \frac{\text{Spot rate} - \text{Forward rate}}{\text{Spot rate}} \times \frac{12 \text{ months}}{N} \tag{33.4}$$

where *N* refers to the number of months for which the forward contract has been made. Consider Example 33.2.

Example 33.2

From the data given below calculate forward premium or discount, as the case may be, of the £ in relation to the rupee.

	Spot	1 month forward	3 months forward	6 months forward
₹/£	₹92.1255/92.3279	₹92.4291/6523	₹91.7134/8906	₹93.1900/3200

Solution

Since 1 month forward rate and 6 months forward rate are higher than the spot rate, the British £ is at premium in these two periods. The premium amount is determined separately both for bid price and ask price. The first quote is the bid price and the second quote (after the slash) is the ask/offer/sell price. It is the normal way of quotation in foreign exchange markets.

Premium with Respect to Bid Price

$$1 \text{ month} = \left(\frac{₹92.4291 - ₹92.1255}{₹92.1255} \right) \times \frac{12}{1} \times 100 = 3.29 \text{ per cent per annum}$$

$$6 \text{ months} = \left(\frac{₹93.1900 - ₹92.1255}{₹92.1255} \right) \times \frac{12}{6} \times 100 = 2.31 \text{ per cent per annum}$$

... the ... of the ...

... the ... of the ...
... the ... of the ...
... the ... of the ...

... the ... of the ...
... the ... of the ...
... the ... of the ...

Premium with Respect to Ask Price

$$1 \text{ month} = \left(\frac{₹92.6523 - ₹92.3279}{₹92.3279} \right) \times \frac{12}{1} \times 100 = 3.51 \text{ pre cent per annum}$$

$$6 \text{ months} = \left(\frac{₹93.3200 - ₹92.3279}{₹92.3279} \right) \times \frac{12}{6} \times 100 = 2.15 \text{ pre cent per annum}$$

In the case of 3 months forward, spot rates are higher than the forward rates, signalling that forward rates are at a discount.

Discount with Respect to Bid Price

$$3 \text{ months} = \left(\frac{₹92.1255 - ₹91.7134}{₹92.1255} \right) \times \frac{12}{3} \times 100 = 1.79 \text{ pre cent per annum}$$

Discount with Respect to Ask Price

$$\left(\frac{₹92.3279 - ₹91.8906}{₹92.3279} \right) \times \frac{12}{3} \times 100 = 1.89 \text{ pre cent per annum}$$

In Example 33.2, the British £ is at premium for one month and six months forward exchange deals. In other words, it implies that the Indian rupee is at a discount. Thus, when one currency (in the pair) is at a forward premium, it is imperative that the other currency is at a discount.

Example 33.2 shows the hybrid picture of the £ (both in terms of premium and discount). In general, forward premiums for longer time spans tend to be higher in view of enhanced risk with longer maturities.

Cross Rates When a direct quote of the home currency or any other currency (desired by dealer/corporate firm/bank) is not available in the forex market, it is computed with the help of exchange

quotes of other pairs of currencies, known as **cross rates**. Thus, cross rates facilitate in deriving/determining exchange rates (both spot and forward) with respect to currencies that normally lack availability of direct quotes.

The US \$ is the most actively traded currency in the world foreign exchange markets. On account of a dominant position of the US \$, it is convention to quote exchange rates of most of the currencies in relation to the US dollar. Therefore, the US \$ often acts as a benchmark currency to calculate exchange rates of other currencies. Though

in the vast majority of cases, the US \$ is normally the benchmark/intermediate/third currency, conceptually, the cross rate between two currencies can be determined/inferred using any other currency also (say £, €, ¥ and so on). Example 33.3 explains the concept of cross rates.

Example 33.3

Suppose an Indian importer is to pay to a New Zealand export firm in New Zealand dollars. Assume further that the direct quote of Indian rupee and New Zealand dollars is not available. Therefore, the exporter is to use the other two relevant quotes, namely, the New Zealand \$/US \$ and ₹/US \$. These rates are as follows:

New Zealand \$/US \$: 1.2806 – 1.2816

Rupee/US \$: 60.148 – 60.163

Determine the exchange rate between Indian rupee and New Zealand dollar.

Solution

Determination of ₹/New Zealand dollar exchange rate involves the following steps:

- (i) The Indian importer is to buy US \$ at the rate of ₹60.163 (when US \$ are bought by the importer, the dealer say, the bank is selling US dollars and hence ₹60.163 is the relevant selling rate and not ₹60.148).

Cross rate is the rate of exchange of two currencies on the basis of exchange quotes of other pairs of currencies.

- (ii) The Indian importer then sells the US \$ to buy New Zealand \$. When he sells the US \$, the dealer/bank buys US \$1 in exchange for New Zealand \$1.2806. In other words, the Indian importer gets New Zealand \$1.2806 by selling 1 US \$.
- (iii) In sum, the Indian importer gets New Zealand \$1.2806 in exchange for Indian ₹60.163. Therefore, the rupee/New Zealand \$ exchange rate is $(₹60.163/1.2806) = ₹46.9803/\text{New Zealand } \$$.

Thus, ₹46.9803/New Zealand \$ is a cross rate, derived from the two sets of rates, namely, New Zealand \$/US \$ and rupee/US \$. Cross rates defined as a rate between a third pair of currencies, by using the rates of two pairs, in which one currency is common are derived rates.

₹46.9803/New Zealand \$ is the selling rate from the point of view of the dealer/bank. This provides one quote of the cross rate. To complete the quote, bid/buying rate is required. The buying rate would be derived as per the following steps:

- (i) The dealer purchases one US \$ for ₹60.148.
- (ii) The dealer sells one US \$ in exchange for 1.2816 New Zealand \$.
- (iii) 1.2816 New Zealand \$ are equivalent to ₹60.148.

Accordingly, the rupee/New Zealand \$ buying rate is: $₹60.148/1.2816 = ₹46.9319$

The complete quote is: Rupee/New Zealand \$ = ₹46.9319 – ₹46.9803.

The quote implies that the bank purchases New Zealand \$ at ₹46.9319 and sells it for ₹46.9803. The term 'cross' is used *literally* to determine bid rate and ask rate. For instance, bid rate is based on ₹60.163 and New Zealand \$1.2806 (it is one cross). Likewise, ask rate is based on ₹60.148 and New Zealand \$1.2816 (it is another cross). This is shown in Figure 33.1.

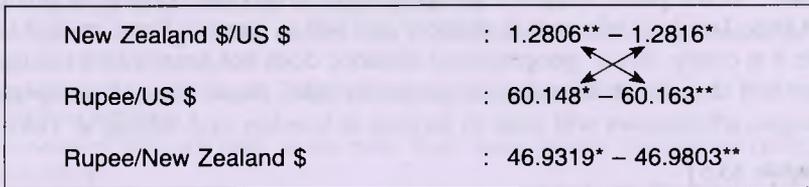

FIGURE 33.1 Determination of Cross Rates

It is clear from Example 33.3 (summed up in Figure 33.1) that exchange rates for a third pair of currency can easily be derived, given two pairs of exchange rates. Conceptually, Equations 33.5 and 33.6 can be used to find the cross rates between two currencies, say B and C, if the rates between currencies A and B as well as A and C are given.

$$(B/C)_{bid} = (B/A)_{bid} \times (A/C)_{bid}, \text{ Where } (A/C)_{bid} = 1/(C/A)_{ask} \tag{33.5}$$

$$(B/C)_{ask} = (B/A)_{ask} \times (A/C)_{ask}, \text{ Where } (A/C)_{ask} = 1/(C/A)_{bid} \tag{33.6}$$

The concept is illustrated in Example 33.4.

Example 33.4

From the following rates, determine ₹/Canadian \$ exchange rate:

₹/US \$: ₹61.5642/61.8358

Canadian \$/US \$: 1.0949/1.0959

Solution

$$\begin{aligned} (\text{₹/Canadian } \$)_{bid} &= (\text{₹/US } \$)_{bid} \times (\text{US } \$/\text{Canadian } \$)_{bid} \\ &= ₹61.5642 \times 1/(1.0959) = ₹56.1768 \end{aligned}$$

(* Since the question provides the rate in terms of Canadian \$/US \$, the equation warrants US \$/Canadian \$, the values get reversed to have denomination effect)

$$\begin{aligned} (\text{₹/Canadian } \$)_{ask} &= (\text{₹/US } \$)_{ask} \times (\text{US } \$/\text{Canadian } \$)_{ask} \\ &= ₹61.8358 \times 1/(1.0949) = ₹56.4762 \end{aligned}$$

₹/Canadian exchange rate is = ₹56.1768 – ₹56.4762.

Example 1: Find the area of the rectangle below.

$AB = 12$ and $BC = 8$.

Solution: The area of a rectangle is given by the formula $A = l \cdot w$. In this case, the length is 12 and the width is 8. So, the area is $12 \cdot 8 = 96$.

Example 2: Find the area of the square below.

$AB = 10$.

Solution: The area of a square is given by the formula $A = s^2$. In this case, the side length is 10. So, the area is $10^2 = 100$.

Example 3: Find the area of the triangle below.

$AB = 12$ and $BC = 8$.

Solution: The area of a triangle is given by the formula $A = \frac{1}{2}bh$. In this case, the base is 12 and the height is 8. So, the area is $\frac{1}{2} \cdot 12 \cdot 8 = 48$.

Example 4: Find the area of the circle below.

$AB = 10$.

Solution: The area of a circle is given by the formula $A = \pi r^2$. In this case, the radius is 10. So, the area is $\pi \cdot 10^2 = 100\pi$.

Example 5: Find the area of the trapezoid below.

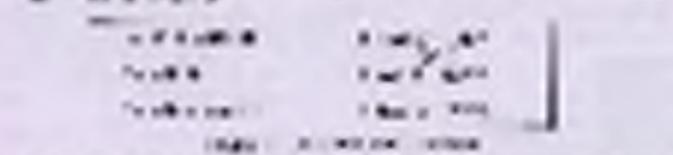

$AB = 12$, $CD = 8$, and $BC = 6$.

Solution: The area of a trapezoid is given by the formula $A = \frac{1}{2}(b_1 + b_2)h$. In this case, the top base is 8, the bottom base is 12, and the height is 6. So, the area is $\frac{1}{2}(8 + 12) \cdot 6 = 60$.

Example 6: Find the area of the parallelogram below.

$AB = 12$ and $BC = 8$.

Solution: The area of a parallelogram is given by the formula $A = b \cdot h$. In this case, the base is 12 and the height is 8. So, the area is $12 \cdot 8 = 96$.

Example 7: Find the area of the circle below.

$AB = 10$.

Solution: The area of a circle is given by the formula $A = \pi r^2$. In this case, the radius is 10. So, the area is $\pi \cdot 10^2 = 100\pi$.

Example 8: Find the area of the trapezoid below.

$AB = 12$, $CD = 8$, and $BC = 6$.

Solution: The area of a trapezoid is given by the formula $A = \frac{1}{2}(b_1 + b_2)h$. In this case, the top base is 8, the bottom base is 12, and the height is 6. So, the area is $\frac{1}{2}(8 + 12) \cdot 6 = 60$.

Example 9: Find the area of the circle below.

$AB = 10$.

Solution: The area of a circle is given by the formula $A = \pi r^2$. In this case, the radius is 10. So, the area is $\pi \cdot 10^2 = 100\pi$.

In case the actual exchange rates are not in tune with cross rates, firms as well as dealers/bankers would like to switch over to markets offering them more favourable rates. Trading firms will benefit in terms of receiving more or paying less. On the other hand, non-equivalence of the two rates would provide a riskless arbitrage opportunity to dealers, bankers and arbitrageurs in forex markets. Eventually, the arbitrage process is likely to align actual and cross rates.

Arbitrage Process as a Means of Attaining Equilibrium on Spot Markets

Arbitrage

is an act of buying currency in one market at a lower price and selling it in another at higher price resulting in equilibrium in exchange rates of different currencies.

The term **arbitrage** in the context of forex markets refers to an act of buying currency in one market (at lower price) and selling it in another (at higher price). Thus, the difference in exchange rates (in a specified pair of currencies) in two markets provides an opportunity to the operators/arbitrageurs in the market to earn profit without risk. As a result, equilibrium is restored in the exchange rates of currencies in different forex markets. The essence of the arbitrage process is to buy currencies from markets where prices are lower and sell in markets where prices are higher. In operational terms, the arbitrage process is essentially a balancing operation that does not allow the same currency to have varying rates in different forex markets on a sustainable basis.

In the context of spot markets, two types of arbitrages are plausible: (i) Geographical arbitrage and (ii) Triangular arbitrage. These are now briefly described.

Geographical Arbitrage As the name suggests, **geographical arbitrage** consists of buying currency from a forex market (say, London) where it is cheaper and sell in another forex market (say, Tokyo)

where it is costly. Since geographical distance does not have much relevance in view of the fact that forex transactions primarily take place through telephone and fax messages, arbitrageurs will gain in buying at London and selling at Tokyo.

Geographical arbitrage

is the buying of foreign currency from a foreign exchange market where it is cheaper and selling in another foreign exchange market where it is costly.

Example 33.5

At two forex centres, the following rates with respect to US \$ are quoted:

London : ₹61.5730 – 61.6100

Tokyo : ₹61.6350 – 61.6675

Find out arbitrage possibilities for an arbitrageur who has ₹100 million.

Solution

The following *modus operandi*, will be deployed by the arbitrageur:

- (i) He will buy US \$ from the London forex market at the rate of ₹61.6100, as it is cheaper there compared to the Tokyo market (₹61.6675). He will obtain (₹100 million/₹61.6100) US \$1,623,113.130 on conversion.
- (ii) He will sell US \$1,623,113.130 at the rate of ₹61.6350 per US \$ and will obtain ₹100,040,577.76.
- (iii) As a result of arbitrage, he will earn a profit of ₹40,577.76 (₹100,040,577.76 – ₹100 million) without any risk.

Example 33.6

Assume the rate at London remains unchanged as stated in Example 33.5, but there is a change in the Tokyo rate.

London : ₹61.5730 – 61.6100

Tokyo : ₹61.6000 – 61.6450

Are there still any arbitrage gain possibilities for the arbitrageur of Example 33.5?

Solution

While, it is true that it is cheaper to buy US \$ in London compared to Tokyo, there are no arbitrage gain possibilities as explained in the following steps:

- (i) The Arbitrageur buys US \$ at the London forex market at the rate of ₹61.6100.
 (ii) He can sell US \$ in the Tokyo market only at the lower rate of ₹61.6000. Thus, he loses. Clearly, there are no arbitrage gain possibilities. To have profits, the selling rate for an arbitrageur in one forex market should be higher than his buying rate. In other words, the differential in currency rates, *prima facie*, need not necessarily generate arbitrage gain.

Triangular Arbitrage As the name suggests, **triangular arbitrage** takes place when there are three currencies involving three markets. For this reason, triangular arbitrage is also known as a *three-point arbitrage*. Example 33.7 illustrates the concept of such an arbitrage.

- **Triangular arbitrage**
- involves three
- foreign currencies
- involving three
- different foreign
- exchange markets.

Example 33.7

The following are three quotes in three forex markets:

\$1 = ₹62.2133 in Mumbai
 £1 = ₹92.1125 in London
 £1 = \$1.5050 in New York

Are any arbitrage gains possible? Assume there are no transaction costs and the arbitrageur has US \$1,000,000.

Solution

Arbitrage gains are possible since the cross rate between US \$/British £ by using the rates at London and at Mumbai is different ($\text{₹}92.1125/\text{₹}62.2133 = \text{US } \$1.4805/\text{£}1$) from that of New York (\$1.5050). The arbitrageur can adopt the following steps to realise arbitrage gain.

- (i) The arbitrageur will buy Indian rupees with US \$1 million. The total proceeds he obtains is ($\text{₹}62.2133 \times \$1 \text{ million US } \$$) ₹62,213,300.
 (ii) He converts Indian rupees in British £ at the London forex market. He receives ($\text{₹}62,213,300/\text{₹}92.1125$) £675,405.6181.
 (iii) He then converts £675,405.6181 at the New York forex market. He obtains ($\text{£}675,405.6181 \times \1.5050) US \$1,016,485.45
 (iv) Thus, he has net gain of ($\text{US } \$1,016,485.45 - \$1,000,000$) US \$16,485.45

To sum up the discussion, it can be said that the arbitrage process will set in whenever there are significant differences between cross rates and quoted rates and this process continues till there is a realignment between these rates.

Arbitrage in Forward Market

The concept of the arbitrage process is equally applicable in forward markets. In the case of spot markets, a mismatch between cross rates and quoted rates provides an opportunity for arbitrage gains. Similar arbitrage gain possibilities exist in forward markets also, in case the difference between the forward rate and the spot rate (in terms of premium or discount) is not matched by the interest rate differentials of the two currencies. Conceptually, interest rate differentials of the two currencies should be equal to the forward premium or discount on their exchange rates. Since the comparison is to be made with interest rate differentials, this kind of arbitrage is also appropriately referred to as **covered interest arbitrage**.

Example 33.8 explains the arbitrage in a forward market.

Example 33.8

Determine arbitrage gain from the following data:

Spot rate	₹91.2/£
3 month forward rate	₹91.7/£
3 month interest rates:	
Rupees: 9%	
British £: 5%	

Assume ₹10 million borrowings or £200,000 (as the case may be) to explain your answer.

... ..

...

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

Solution

3 month forward rate of £ is higher (at ₹91.7) than the spot rate (₹91.2).

This implies that the £ is at premium.

$$\text{Premium (percentage)} = \left(\frac{₹91.7 - ₹91.2}{₹91.2} \right) \times \frac{12}{3} \times 100 = 2.19\%$$

$$\text{Interest rate differential} = 9\% - 5\% = 4\%$$

Since interest rate differential (4%) and premium percentage (2.19%) do not match, there are arbitrage gain possibilities. An arbitrageur can take the following steps in this regard.

- (i) The arbitrageur borrows £ 2,00,000 at 5 per cent for 3 months (he borrows in British currency, as it carries lower interest rate).
- (ii) He then converts £ 2,00,000 at the spot rate of ₹91.2 in the spot market. He gets an amount of ₹1,82,40,000 (£ 2,00,000 × ₹91.2).
- (iii) He invests ₹1,82,40,000 in the money market at 9 per cent interest per annum for 3 months. As a result of this investment, he obtains interest of ₹4,10,400 (₹1,82,40,000 × 3/12 × 9/100).
- (iv) Total sum available with the arbitrageur, three months from now is ₹1,86,50,400 i.e. (₹1,82,40,000 amount invested + ₹4,10,400 interest).
- (v) Since he would get ₹1,86,50,400 after 3 months, he will sell ₹1,86,50,400 forward at the rate of ₹91.7.
- (vi) As a result of the forward deal, at the end of 3 months from now, he would get £ 2,03,384.9509, that is, (₹1,86,50,400/₹91.7).
- (vii) He refunds £ 2,00,000 sum borrowed along with interest due on it. The refunded sum is £ 2,00,000 + £ 2,500 interest i.e., (£ 2,00,000 × 3/12 × 5/100) = £ 2,02,500.
- (viii) Net gain is £ 2,03,384.9509 - £ 2,02,500 = £ 884.9509.

These arbitrage gain possibilities will cease to exist if the difference in forward rate and spot rate (in percentage terms) coincides with the interest rate differential (in percentage) of the two currencies. This principle is useful in determining/predicting forward rates (consider Example 33.9).

Example 33.9

For facts in Example 33.8 as unchanged, determine the forward rate at which there will be no arbitrage gain possibilities.

Solution

Since the interest rate differential is 4 per cent, the forward premium differential should also be 4 per cent to have no arbitrage gain possibilities. Accordingly, the forward rate should fetch 4 per cent premium (on annual basis). The desired forward rate (on approximate basis) is determined as follows:

Spot rate	₹91.2
Add: 4% premium for 3 month period (₹91.2 × 4/100 × 3/12)	0.912
Forward rate	92.112*

*According to interest rate parity theory (as per equation 33.9), the forward rate will be ₹91.2 × 1.0225**/1.0125** = ₹92.1007; (** interest of 3 months)

At the forward rate of ₹92.1007/£ as per interest rate parity theory arbitrage gain possibility would come to an end. The verification table is as follows:

- (i) to (iv) The steps (i) to (iv) are the same (as in Example 33.8).
- (v) Since he would get ₹1,86,50,400 after three months, he will sell forward ₹1,86,50,400 at the rate of ₹92.1007.
- (vi) At the end of 3 months he gets ₹1,86,50,400/₹92.1007 = £ 2,02,500.0895.
- (vii) He refunds £ 2,00,000, the borrowed sum. On this, interest due is £ 2,500 (£ 2,00,000 × 3/12 × 5/100). Total sum refunded is £ 2,02,500.
- (viii) Net gain is zero. (£ 0.0895 difference is due to approximation).

In contrast, if the interest rate differential is smaller than the forward discount, the arbitrageur would be benefitted by borrowing the currency that carries a higher interest rate and investing that currency in the money market that provides a lower interest rate. The concept is illustrated in Example 33.10.

Example 33.10

Assume for Example 33.8 that the interest rate on the British £ is 6 per cent and on Indian rupee is 5 per cent and the 3 month forward rate is ₹90.60. Show the arbitrage process.

Solution

The British £ is at a forward discount of 2.631 per cent = $\left(\frac{₹91.20 - ₹90.60}{₹91.2} \times 100 \right) \times \frac{12}{3}$

Interest rate differential is (6% - 5%) = 1 per cent

In view of the above disparity, there are arbitrage gain possibilities.

The arbitrageur is to adopt the following steps:

- (i) The arbitrageur borrows £ 2,00,000 at 6 per cent for 3 months.
- (ii) He converts £ 2,00,000 into rupees at the spot rate of ₹91.2, in the spot market. He gets an amount of ₹1,82,40,000 (£ 2,00,000 × ₹91.2).
- (iii) He invests ₹1,82,40,000 in the money market at 5 per cent interest per annum for 3 months. After 3 months, he gets interest of ₹2,28,000, i.e., (₹1,82,40,000 × 5/100 × 3/12).
- (iv) Total sum available at the end of 3 months is ₹1,84,68,000 (₹1,82,40,000 + 2,28,000).
- (v) He sells forward ₹1,84,68,000 at the rate of ₹90.60.
- (vi) At the end of 3 months he converts Indian Rupee and gets £ 2,03,841.0596 (₹1,84,68,000/₹90.6).
- (vii) He refunds £ 2,00,000, the borrowed sum. On this, the interest due is £ 3,000 (£ 2,00,000 × 3/12 × 6/100). The total sum refunded is £ 2,03,000.
- (viii) The net gain [£ 2,03,841.0596 - £ 2,03,000] = £ 841.0596.

Again at the forward equilibrium rate of ₹90.9753/£ as per interest rate parity theory (₹91.2 × 1.0125/1.015), there would be no arbitrage gain possible as shown below.

(i to iv) The steps (i) to (iv) remain the same.

- (v) The arbitrageur sells forward ₹1,84,68,000 at the rate of ₹90.9753.
- (vi) At the end of 3 months he converts Indian rupees and gets £ 2,03,000.1549 (₹1,84,68,000/₹90.9753).
- (vii) He refunds £ 2,00,000, the borrowed sum plus £ 3,000 interest (£ 2,00,000 × 3/12 × 6/100). The total refunded sum is £ 203,000.
- (viii) Net gain is zero (£ 0.1549 difference is due to approximation).

In sum, the arbitrage process helps in restoring/re-establishing the equilibrium both in the spot markets and forward markets.

LO 33.3 DETERMINANTS AND SELECT THEORIES OF EXCHANGE RATES

The preceding discussion has provided the *modus operandi* of dealing with foreign transactions primarily in terms of exchange rates. It has been observed that these rates vary between different currencies. The exchange rate values of some currencies (say of the British £, European €, US \$) are significantly higher than those of others (say Japanese ¥ and Indian rupee). Why is it so? There are several political and economic factors that have a marked bearing on the determination of exchange rates of various currencies. We briefly explain the major factors/theories that account for variation in exchange rates of currencies of different countries. These factors are: (i) inflation rates, (ii) interest rates, (iii) balance of payment position, (iv) volume of international reserves and (v) level of activity and employment.

Inflation Rates

Differences in inflation rates between two countries are considered as the most important factor to explain the variation in exchange rates of two countries. In case the domestic inflation rate is greater than foreign inflation rate (prices of domestic goods are rising faster than the prices of

... ..

foreign goods), it leads to more demand for foreign goods/imports (as they are relatively cheaper). This, in turn, leads to more demand for foreign exchange, making it costlier. In other words, there will be a relative decline in the value of domestic currency. This explanation has its genesis in the economic law of demand and supply.

In contrast, a lower domestic inflation rate will make domestic goods relatively cheaper. As a result, demand for exports will increase. This, in turn, will augment the supply of foreign exchange, resulting in lower price in relation to the domestic currency. In other words, domestic currency appreciates. In technical terms, the floating exchange rates are likely to vary in accordance with differing inflation rates in two countries.

The **purchasing power parity (PPP) theory** provides the rationale for differences in exchange rates. The basic principle underlying this theory is that *goods of equal value in different countries are plausible to be equated through an exchange rate*. For instance, if a basket of goods in US costs \$10 and ₹600 in India, it is fair and equitable that the exchange rate between these currencies should be ₹60/\$1. In more comprehensive form, the PPP theory can be expressed as per Equation 33.7.

$$PPP_r = \text{Spot rate} \times (1 + r_b/1 + r_f) \quad (33.7)$$

$$PPP_r = \text{Spot rate} \times (P_b/P_f) \quad (33.8)$$

Where PPP_r = purchasing power rate; r_b and r_f are rates of inflation in the home country and foreign country, respectively; P_b and P_f represent the respective price indices of the home country and the foreign country. Consider Example 33.11.

Example 33.11

Assume the spot rate between the Indian rupee and US \$ is ₹60 in year 1. In the first quarter of year 2, the price index of India is 108 and that of US is 102 (with year 1 as the base year, 100). Based on this data, determine the likely new exchange rate of the Indian rupee and US \$.

Solution

Exchange rate (₹/US \$) = ₹60 × (108/102) = ₹63.5294: US \$1

Since the inflation rate is relatively higher in India, the value of rupee *vis-à-vis* the US \$ declines. Thus, the PPP theory is very useful in explaining both existing exchange rates and future exchange rates. Essentially, it indicates that in countries that witness high inflation rates currency values decline more compared to the currencies of countries with lower inflation rates.

Interest Rates

Relative interest rates constitute the second major factor in determining exchange rates. For instance, if interest rates are relatively higher in US than in Japan, Japanese funds are likely to be attracted to the US as Japanese bankers/investors will earn higher yields by parking their funds in US than in investing in their own country. As a result, there will be a flight of capital funds from Japan to US; there will be more demand for US \$ in Japan, causing appreciation in the exchange rate of the US \$. In other words, more units of Japanese yen will be required to buy the same US \$; there would be a relative decline in the exchange value of Japanese ¥ *vis-à-vis* US \$.

Thus, the interest rate differentials in the two countries are likely to have a decisive influence on their exchange rates. This point was highlighted in the previous section when adjustment in the spot rate had been made pertaining to interest rate differentials of the two countries to predict the future forward rates (Example 33.9).

The economic premise of determining/predicting future forward rates of different currencies (based on differences in the interest rates) is derived from **the interest rate parity theory**. Basically, the

Purchasing power parity theory is a theory according to which goods of equal value in different countries are equated through an exchange rate.

Interest rate parity theory is a theory according to which the discount/premium of one currency in relation to another reflects the interest differentials between them.

theory states that the *premium or discount of one currency in relation to the other should reflect the interest rate differentials between the two currencies*. Forward rate, according to the theory, can be estimated as per Equation 33.9.

$$\text{Forward rate} = \text{Spot rate} \times \frac{(1 + I_h)}{(1 + I_f)} \quad (33.9)$$

Where I_f and I_h represent interest rates on foreign currency and home currency respectively.

It is very apparent from Equation 33.9 that foreign currency is to be at premium if it has a relatively lower interest rate *vis-à-vis* the home currency. On the other hand, foreign currency will be at a discount, in case interest rates are lower on home currency.

Balance of Payment Position

The structure of the balance of payments of a country also has a major impact on its exchange rate. In the event of the country running a big deficit or persistent deficit in its balance of payments, its currency is likely to be under pressure as deficits require payments in foreign currency. In the case of fixed exchange rates, therefore, persistent deficit mounts both internal and external pressures on the monetary authority to devalue the currency. Devaluation is expected to help in reducing imports (as foreign goods become more costly in view of the enhanced value of foreign currency) and in increasing exports (as the home currency becomes cheaper, which in turn makes the country's goods cheaper overseas). In a system of floating rates, persistent and big deficits are a forewarning signals of depreciation of the concerned country's currency.

In contrast, if the balance of payments of the country is having a favourable position in term of surpluses, the value of the currency of such a country appreciates/is likely to appreciate.

Volume of International Reserves/Foreign Exchange

The level of foreign exchange reserves (including gold) the Central Bank of the country/monetary authority possesses also has an impact on its currency exchange rate. In case the monetary authority feels that its currency is depreciating in the forex markets and has economic reasons to support/stabilise it, it may step in by releasing/selling foreign exchange out of its international reserves. Thus, sizeable reserves can contain the depreciation of home currency. In the case of inadequate reserves/foreign exchange, the monetary authority may find itself helpless/constrained to provide support to its currency. However, the monetary authority can "prop up" its currency only as long as it has foreign exchange reserves available.

Level of Activity and Employment

There is likely to be a positive impact by way of a higher level of economic activity and full employment on exchange rates. The low level of activity and low level of employment in the economy increases the probability of depreciation of its currency. In contrast, growing economies having a higher level of economic activity and employment have good potential and prospects of appreciation in the value of their currencies.

To sum up, all the above factors, taken together, have their impact on exchange rates. Low inflation rate, higher interest rates, surplus balance of payment position, possession of sizeable foreign exchange reserves and a higher level of economic activity have a positive impact in pushing up a country's exchange rates. In contrast, higher inflation rate, low interest rates, big/persistent deficit in the balance of payments, inadequate reserves with the monetary authority and a low level of economic activity tend to depreciate exchange rates.

The first thing I noticed when I stepped out of the car was the cold, crisp air. It felt like a fresh blanket after a long, hot summer. The sun was just starting to rise, painting the sky in soft, golden hues. I took a deep breath, savoring the scent of pine trees and the distant sound of a train whistle.

As I walked down the street, I noticed how quiet it was. The houses were old and well-kept, with flower boxes under the doors. A few people were walking, some carrying umbrellas, suggesting a recent rain. The overall atmosphere was peaceful and nostalgic.

I turned onto a side street, and the scene changed. There were more shops and a few people standing outside. A sign for a local cafe caught my eye. I decided to stop for a moment, looking at the menu and the people who were sitting at the tables. It felt like I had stepped back in time.

The cafe was small and cozy, with a warm glow from the lights. I ordered a coffee and sat at a table by the window. Outside, the street was still quiet, but I could see the movement of cars and people in the distance. The contrast between the quiet interior and the busy street outside was interesting.

I sat there for a while, watching the world go by. The coffee was delicious, and the atmosphere was just what I needed. It felt like a perfect start to a new day. The sun was higher now, and the light was brighter. I felt a sense of calm and contentment.

As I finished my coffee, I looked out the window one last time. The street was still quiet, but I could see the promise of a new day. I took a deep breath and walked back to the car. The journey was over, but the memories would last a lifetime.

The end of the journey was just as peaceful as the beginning. I felt a sense of accomplishment and a deep connection to the place. The memories of this day would stay with me forever.

Notes:

The weather was perfect, not too hot and not too cold. The people were friendly and the food was delicious. I had a great time and would love to go back soon. The scenery was beautiful and the overall experience was unforgettable.

I had a great time and would love to go back soon. The scenery was beautiful and the overall experience was unforgettable. The weather was perfect, not too hot and not too cold. The people were friendly and the food was delicious.

SUMMARY

LO 33.1

Different countries have different currencies and the settlement of all business transactions within a country is required/preferred in the local currency. The foreign exchange (FE) market provides a forum where the currency of one country is traded for the currency of another country.

The FE markets deal with a large volume of funds as well as a large number of currencies of various countries. The major FE markets are London, New York and Tokyo and the major currencies traded are the US dollar, British pound sterling, Euro and Japanese yen.

Commercial banks and central banks of the countries are the major participants in the FE markets. Business firms normally buy and sell securities through authorised dealers, say, commercial banks or brokers.

While the commercial banks and other participants in the FE markets operate on commercial principles, the operations of the central banks are primarily regulatory in nature.

LO 33.2

Different currencies have different values; they are traded at an exchange rate. An exchange rate is the price of one country's currency expressed in terms of the currency of another country.

Foreign exchange rate/quotation can either be direct or indirect. It is said to be direct when it is expressed in a manner that reflects the exchange of a specified number of domestic currency (say, ₹60) for one unit of foreign currency (say, US \$). The FE quotation is indirect when it is quoted in a manner that reflects the exchange of a specified number of foreign currency (say, US \$0.01667) for one unit of local currency (say 1 rupee). Direct quotations are known as European quotations and indirect quotations as American.

There are two-way rates for the FE quotations, one for buying the foreign currency (bid price) and another for its selling (ask price). Since dealers expect profit in foreign exchange operations, the bid price is lower than the ask price.

The FE quotations are always with respect to the dealer. By convention, the first rate is the buying rate and the second rate is the selling rate (say ₹60.50 – ₹61.00 for US \$1). Quotations, in practice, are up to four decimal points.

Spread is the difference between the bid price and the ask price. It is gross profit of a dealer, out of which it meets its business/establishment expenses.

While spot exchange rates are applicable to the purchase and sale of foreign exchange on an immediate delivery basis (in practice delivery takes place two days later), the forward exchange rates are applicable for the delivery of foreign exchange at a future date (say, after 1 month/3 months/6 months and so on).

Forward rates can be at a premium or discount. In case the forward rates are higher than the spot rates, the forward rates are at premium. The forward rates are at a discount when they are lower than the spot rates.

When a direct quote of the home currency or any other desired currency is not available in the FE market, it is computed with the help of exchange quotes of other pairs of currencies, and is known as cross rates. Thus, cross rates facilitate computation of exchange rates of those currencies for which direct quotes are not available.

Arbitrage refers to an act of buying foreign currency in one FE market at lower price and selling it in another at higher price. This difference in the exchange rates provides an opportunity to the arbitrageurs to earn profit without risk. As a result, equilibrium is restored in the exchange rates of currencies in different FE markets.

Geographical arbitrage and triangular arbitrage are possible in spot markets. Geographical arbitrage consists of buying currency from a FE market where it is cheaper and selling it in another forex market where it is costly. Triangular/three-point arbitrage takes place when three currencies traded at three markets are involved.

LO 33.2

Covered interest arbitrage is feasible in forward markets. This is profitable when the difference between the forward rate and spot rate (in terms of premium or discount) is not matched by the interest rate differentials of the two currencies. In other words, when the difference in the forward and spot rates of the currencies involved coincides with their interest-rate differentials, arbitrage gain possibilities cease to exist.

LO 33.3

There are several factors that influence the determination of exchange rates of various currencies. The major factors are: (i) inflation rates, (ii) interest rates, (iii) balance of payment position, (iv) volume of international reserves and (v) level of activity and employment. Lower domestic inflation rate, higher interest rates, favourable balance of payment position, comfortable volume of international reserves (including gold) and the higher level of economic activity and full employment tend to appreciate exchange rates. In contrast, higher inflation rate, lower interest rates, big/persistent deficit in the balance of payment, inadequate/low foreign exchange reserves and a low level of economic activity tend to depreciate exchange rates.

SOLVED PROBLEMS

P.33.1 The following rates appear in the foreign exchange market:

LO 33.2 LO 33.2 LO 33.2

	Spot rate	2 Month forward
₹/1 US \$	₹60.75/61.06	₹61.5/62.00

- (a) How many dollars should a firm sell to get ₹61.50 million after 2 months?
- (b) How many rupees does the firm require to pay to obtain US \$2,00,000 in the spot market?
- (c) Assume the firm has US \$50,000. How many rupees does the firm obtain in exchange for the US \$?
- (d) Are forward rates at premium or discount? Determine the percentages also.

Solution

- (a) After 2 months, to get ₹61.50 million, the firm is to sell the US \$. In other words, the dealer is buying dollars. As rates are always quoted from the point of view of the dealer, the dealer's buying of \$ at ₹61.50 is relevant. Accordingly, the firm is required to pay US \$1 million, i.e., (₹61.50 million/₹61.5).
- (b) The firm is buying US \$. To put it differently, the dealer is selling dollars. As per the spot rate quotation, the dollar selling rate is ₹61.06. Accordingly, the firm is to pay ₹1,22,12,000, i.e., (US \$2,00,000 × ₹61.06) to buy US \$2,00,000.
- (c) The firm is selling US \$. The relevant spot exchange rate will be the buying rate from the point of view of the dealer; this rate is ₹60.75. Accordingly, the firm will receive ₹3,037,500 (US \$50,000 × ₹60.75).
- (d) Forward rates are at a premium as these rates are higher than the spot rate. The premium amount is determined separately both for the bid price and the ask price.

$$\left(\frac{\text{Forward rate} - \text{Spot rate}}{\text{Spot rate}} \right) \times \frac{12}{N} \times 100$$

Premium with respect to bid price:

$$\left(\frac{\text{₹}61.50 - \text{₹}60.75}{\text{₹}60.75} \times \frac{12}{2} \times 100 \right) = 7.40 \text{ per cent per annum}$$

Premium with respect to offer price:

$$\left(\frac{\text{₹}62 - \text{₹}61.06}{\text{₹}61.06} \times \frac{12}{2} \times 100 \right) = 9.23 \text{ per cent per annum}$$

P.33.2 Rates of the rupee and euro in the International market are US \$0.0162 and US \$1.2900, respectively. What direct quote of US dollar and euro will be provided by a forex dealer in India?

LO 33.2 LOD M

Solution As US \$/₹ = 0.0162, it implies US \$0.0162 is equal to ₹1 [or 1 ₹ = US \$0.0162]
Or, ₹/US \$ = 1/0.0162 = ₹61.7283

So, direct quote of US \$ in India will be ₹/US \$: ₹61.7283

$$\text{₹/US \$} = 61.7283$$

$$\text{US \$}/\text{€} = 1.2900$$

$$\text{₹}/\text{€} = \text{₹}61.7283 \times 1.2900 = \text{₹}79.6295$$

So, a direct quote of € in India will be ₹/€ ₹79.6295.

P.33.3 Spot rate of Euro in New York is US \$1.2800 and of the rupee is US \$0.0163

LO 33.2 M

(a) What will the price of Euro be in India?

(b) If the euro is quoted in India as ₹78.65/€, what would you do to profit from the situation?

Solution In New York, spot rates are US \$/€ = 1.2800 and US \$/₹ = 0.0163

(a) So, ₹/€ = (₹/US \$) × (US \$/€) = 1/0.0163 × 1.2800 = ₹78.527

So, a direct quote of the euro in India is ₹/€ ₹78.527

(b) As the direct quote of the euro in India is ₹78.65 (higher), it will be profitable to buy Euros using cross rates and sell to the dealer providing the direct quote. The following steps will be carried out to realise the arbitrage gain:

(i) Buy US \$ for ₹1 million in New York. Total US \$ obtained is (\$0.0163 × ₹1 million) = US \$16,300.

(ii) Convert these US \$ into euros at New York, thus receiving (1/1.2800 × \$16,300) = €12,734.375

(iii) Sell these euros in India to receive rupees. The proceeds will be (€12,734.375 × ₹78.65) = ₹10,01,558.593

Thus, there is a net gain of (₹10,01,558.593 – ₹10,00,000) = ₹1,558.593. In reality, the gain will be lower due to the transaction cost involved.

P.33.4 In the foreign exchange market the following information appears:

LO 33.2 LOD M

	Spot	1 month forward	2 month forward	3 month forward
1 British pound (£)	₹90.20/90.72	₹.80/.98	₹.60/.50	₹.30/.70

Determine forward rates for 1 month, 2 months and 3 months.

Solution Determination of forward rates

In case the forward margins are in the increasing order, they imply the forward rates are at a premium. Therefore, margins are added to the spot rate to compute the forward exchange rate. From the perusal of the data, the £ is at premium for 1 and 3 month forward deals. The computed forward rates are as follows:

	1 month		3 month	
Spot Rate	₹90.20/	₹90.72	₹90.20/	₹90.72
Margin	+ 0.80/	0.98	0.30/	0.70
	91.00/	91.70	90.5/	91.42

In contrast, decreasing margins indicate that the forward rates are at a discount. Therefore, these margins are deducted from the spot rate to compute forward rates. The British £ is at a discount for a 2 month deal. Its forward rate is computed below:

$$(\text{Spot rate } ₹90.20/₹90.72 - \text{Margin } ₹0.60/0.50) = ₹89.60/₹90.22$$

P.33.5 John is to pay £20,000 two months from today. Spot rate (ask) ₹1 = £0.0108. The rupee is likely to appreciate by 2% over two months. What is the likely forward rate? How much cash (in ₹) is likely to be paid by John to buy £20,000 after two months? **LO 33.2 LOD M**

Solution Since the rupee is likely to appreciate, the rupee will be at a premium of 2 per cent. Therefore, the premium sum of 2 per cent is to be added to the existing spot rate to compute the likely forward rate (ask/sell).

$$(i) \quad ₹1 = ₹0.0108 \text{ Spot rate} + (£0.0108) 0.02 \text{ premium} \\ = ₹0.0108 + ₹0.000216 = ₹0.01106$$

(ii) John is to pay ₹1,808,318.264, i.e., (£20,000/0.01106) to purchase £20,000.

P.33.6 An importer is to make payment of 1 million Thai baht to its trading partner in Bangkok. The currency quotes available are: **LO 33.2 LOD E**

For dollar in India : ₹60.0843/60.0996

For dollar in Thailand : Thai baht 31.9400/31.9600

What is the amount of bill payable in terms of Indian rupees?

Solution As a direct quote of ₹/Thai baht is not available, the cross rate will be used by the importer to buy Thai baht.

$$₹/\text{US } \$: ₹60.0843 - 60.0996$$

$$\text{Thai baht}/\text{US } \$: 31.9400 - 31.9600$$

$$\text{For cross rates, } (₹/\text{Thai baht})_{\text{bid}} = (₹/\text{US } \$)_{\text{bid}} \times (\text{US } \$/\text{Thai Baht})_{\text{bid}} \\ = 60.0843 \times 1/31.9600 = 1.8799$$

$$\text{And, } (₹/\text{Thai Baht})_{\text{ask}} = (₹/\text{US } \$)_{\text{ask}} \times (\text{US } \$/\text{Thai baht})_{\text{ask}} \\ = 60.0996 \times 1/31.9400 = 1.8816$$

So the cross rate of ₹/Thai baht : 1.8799 - 1.8816.

As the importer is to buy 1 million Thai baht; his payment in rupees will be = 10,00,000 × 1.8816 = ₹18,81,600.

P.33.7 Shoe Company sells to a wholesaler in Singapore. The purchase price of a shipment is 50,000 Singapore dollar with a term of 90 days. Upon payment, the Shoe Company will convert the SGD to US dollars. The present spot rate for SGD per dollar is 1.31, whereas the 90 day forward rate is 1.30. **LO 33.2 LOD D**

You are required to calculate and explain:

- If the Shoe Company were to hedge its foreign exchange risk, what would it do? What transactions are necessary?
- Is the Singapore dollar at a forward premium or at a forward discount?
- What is the implied differential in interest rate between the two countries? (Use interest rate parity assumption)

Solution

- In case the Shoe Company wishes to hedge its foreign exchange risk, it can opt for a forward contract. The spot rate for SGD/US \$ is 1.31, that is, if the Shoe Company receives the payment of 50,000 SGD

today then its equivalent dollar receipts are US \$38,167.938, that is, (50,000 SGD/1.31). By entering in the forward sale contract of selling SGD 50,000 at the rate of 1.30 SGD per \$, the company's dollar receipts are to be US \$38,461.538, i.e., (50,000 SGD/1.30). As a result, the company gains US \$293.600.

(ii) Spot rate is 1 US \$ = 1.31 SGD

$$1 \text{ SGD} = 0.76335 \text{ US \$}$$

90 day forward rate is 1 US \$ = 1.30 SGD

$$1 \text{ SGD} = 0.769230 \text{ US \$}$$

Since the US \$ forward rate is lower, it is at discount. In other words SGD is at premium.

$$\text{Premium of SGD (\%)} = \frac{\text{US \$ } 0.76923 - \text{US \$ } 0.76335}{\text{US \$ } 0.76335} \times \frac{365}{90} \times 100 = 3.124 \text{ per cent per annum.}$$

(iii) The implied interest rate differential between the two countries is 3.124 per cent. According to the interest rate parity theory, forward rate is equivalent to spot rate + interest rate differential. Interest rates in Singapore are likely to be higher by 3.124 per cent compared to US.

P.33.8 Alert Limited is planning to import a multipurpose machine from Japan at a cost of 1680 lakh yen. The company can avail loans at 18 per cent interest per annum with quarterly rests with which it can import the machine. However, there is an offer from the Tokyo branch of an India based bank extending credit of 180 days at 2 per cent per annum against the opening of an irrevocable letter of credit. Other information is as follows:

LOD 33.2 **LOD M**

(i) Present exchange rate ₹100 = 168 yen.

(ii) 180 days forward rate ₹100 = 170 yen.

(iii) Commission charges for letters of credit are at 2 per cent for 12 months.

Advise whether the offer from the foreign branch should be accepted?

Solution Alert Limited will accept the offer from the foreign branch only when it involves less cash outflows as compared to the domestic loan alternative. Given this as a financial framework for decision criterion, cash payments under both the alternatives are computed.

(a) Determination of cash payment under bank loan alternative

(i) Cost of multipurpose machine/borrowings (lakh)	₹1,680
(ii) Spot exchange rate	₹100 = ₹168
(iii) Bank loan required (₹1680 lakh/₹168) (assumed for 180 days as this period is equivalent to the credit period of the Tokyo branch) (in ₹lakh)	1,000
(iv) Interest for quarter 1 (₹1,000 lakh × 0.18 × 3/12) (in ₹lakh)	45
(v) Interest for quarter 2 (₹1,045 lakh × 0.18 × 3/12) (in ₹lakh)	47.025
(vi) Total cash payments (iii + iv + v) (after 180 days) (in ₹lakh)	1,092.025

(b) Determination of cash payment under letter of credit alternative

(i) Amount of borrowings (lakh)	₹1,680
(ii) Interest (₹1,680 lakh × 0.02 × 6/12) (in ₹lakh)	16.8
(iii) Commission charges (₹1,680 lakh × 0.02 × 6/12) (in ₹lakh)	16.8 ¹
(iv) Total payment required (after 180 days) (in ₹lakh)	1,713.60
(v) Forward rate for 6 months ₹100 = ₹170	₹1 = ₹170
(vi) Indian rupees required to pay ₹1,713.6 lakh/1.70 (in ₹lakh)	1,008

(1) Assumption: Interest is not taken into account on commission that is due to be paid after 6 months as it is not normally subject to interest. However, if commission is subject to interest, there will be an additional interest of ₹16,800, i.e., (₹16.8 lakh × 0.02 × 6/12). As a result, total cash payments will be ₹1008.168 lakh (₹1008 lakh) + ₹16,800).

Recommendation Alert Limited is advised to avail an overseas offer as it causes less cash payments.

P.33.9 Calculate cross currency rate between €/\$ (bid as well as ask), given the following spot exchange rates of 3 pair of currencies

LO 33.2 **LOD D**

₹/US \$: ₹61.25 – 61.94
₹/€	: 78.43 – 79.03
\$/£	: \$ 1.50 – 1.52

Solution Determination of €/£ exchange rate (bid quote)

$$(\text{€}/\text{£})_{\text{bid}} = (\text{€}/\text{₹})_{\text{bid}} \times (\text{₹}/\text{\$})_{\text{bid}} \times (\text{\$/£})_{\text{bid}}$$

As per equation, $(\text{₹}/\text{\$})_{\text{bid}}$ and $(\text{\$/£})_{\text{bid}}$ are available in the desired form; $(\text{€}/\text{₹})$ is not in desired form (its exchange rate is given as $\text{€}/\text{₹}$). To convert in the desired form $\text{€}/\text{₹}$ the values become ₹79.03 – ₹78.43. The rate to be determined is the unit of which can be purchased for 1 ₹ euro was sold at ₹79.03 as per the quote provided. Therefore, 1 ₹ can purchase $\text{€}1/79.03 = 0.01265$. Substituting the values in equation, we have $(\text{€}/\text{£})_{\text{bid}} = 0.01265 \times 61.25 \times 1.50 = 1.1622$

Determination of €/£ exchange rate (ask quote)

$$\begin{aligned} (\text{€}/\text{£})_{\text{ask}} &= (\text{€}/\text{₹})_{\text{ask}} \times (\text{₹}/\text{\$})_{\text{ask}} \times (\text{\$/£})_{\text{bid}} \\ &= 1/78.43 = 0.01275 \times 61.94 \times 1.52 = 1.2003 \end{aligned}$$

P.33.10 If a direct quote of the euro in Delhi is ₹79 and if the transaction cost in buying or selling any currency is 1 per cent of the transaction amount, what is the range of possible direct quotes of the rupee in various EU countries?

LO 33.2 **LOD E**

Solution Direct quote of the euro in Delhi = ₹79/€. Let us say the direct quote of the rupee in a EU country is €q/₹, in an equilibrium condition, there should not be any possibility of arbitrage gain. If we convert ₹10,00,000 into euros in Delhi. We will receive $\text{₹}10,00,000 \times 1/79 \times 0.99$ euro. Thus, the euro is converted back into the rupee using the quote in the EU country, this will give $[10,00,000 \times 1/79 \times 0.99] \times 1/q \times 0.99$ rupees.

$$\text{For no arbitrage profit } [10,00,000 \times 1/79 \times 0.99] \times 1/q \times (0.99)^2 < \text{₹}10,00,000$$

$$q > 0.0122$$

(i)

Similarly, if we convert ₹10,00,000 in euros first in a EU country currency, we receive $(10,00,000 \times q \times 0.99)$ euros. These euros exchanged for rupees in Delhi will fetch $(10,00,000 \times q \times 0.99) \times 79 \times 0.99$ rupees.

$$\text{To avoid arbitrage profit } 10,00,000 \times q \times 79 \times (0.99)^2 < \text{₹}10,00,000$$

$$\text{or } q < 0.0129$$

(ii)

So as it is evident from equations **(i)** and **(ii)** range is $0.0122 < q < 0.0129$

$$\text{or } \text{€}/\text{₹} > 0.0122$$

$$\text{and } \text{€}/\text{₹} < 0.0129$$

P.33.11 In the international monetary market, an international forward bid for December, 15 on a pound sterling future for delivery on the same day is US \$1.4906. The contract size of the pound sterling is £62,500. How could the dealer use arbitrage in profit in this situation and how much profit is earned?

LO 33.2 **LOD M**

Solution The dealer can make arbitrage profit through the following steps:

- (i)** The dealer can purchase dollars from £62,500 in the international monetary market. He will obtain US \$93,437.5, i.e., $(\text{£}62,500 \times 1.4906)$.
- (ii)** The dealer can sell US \$93,437.5 in the future market at the rate of 1£ = US \$1.4906. In other words, 1 US \$ = $1/1.4906 = \text{£}0.67087$.
- (iii)** On the date of settlement, the dealer will have = £62,684.415, i.e., $(\text{US } \$93,437.5 \times \text{£}0.67087)$.
- (iv)** There is a gain of $\text{£}62,684.415 - \text{£}62,500 = \text{£}184.415$ to the dealer.

P.33.12 Are there any arbitrage gains possible from the spot exchange rates quoted at 3 different forex markets. There are no transaction costs and arbitrageur has 10 million US \$.

\$1	= ₹61.50 in India
£1	= ₹90.62 in London
£1	= \$1.4901 in New York

Solution Arbitrage gains are possible since the cross rates between the US \$/British pound by using the rates at London and at Mumbai are different ($\text{₹}90.62/61.50 = \text{US } \$1.4734/\text{£}1$) from that of New York ($\text{US } \$1.4901$).

The arbitrageur can adopt the following steps to realise arbitrage gain.

- (i) The arbitrageur will buy Indian rupees for 10 million US \$. The total proceeds he obtains is ($\text{₹}61.50 \times 10 \text{ million US } \$$) = ₹61,50,00,000.
- (ii) He converts Indian rupees into British pounds at the London forex market. He receives ($\text{₹}61,50,00,000/\text{₹}90.62$) = £6,786,581.328.
- (iii) He then converts £6,786,581.328 at the New York forex market. He obtains ($\text{£}6,786,581.328 \times \text{US } \1.4901) = US \$10,112,684.83.
- (iv) Thus, he has a net gain of ($\text{US } \$10,112,684.83 - \text{US } \$10,000,000$) = US \$112,684.83.

P.33.13 The following quotations are available to you:

LO 33.2 **LOD D**

by a bank in New York	: \$1.6012/£
by a bank in Hong Kong	: HKD7.75/\$
by a bank in London	: £0.0870/HKD

Is any triangular arbitrage possible?

Solution From a direct quote of New York and Hong Kong, the cross rate for £/HKD is $\text{£}/\text{HKD} = \text{£}/\$ \times \$/\text{HKD} = 1/1.6012 \times 1/7.7500$ or $\text{£}/\text{HKD} = 0.0805$. Since in the direct quote the HKD in London is £0.0870/HKD (different from 0.0805), triangular arbitrage is possible.

P.33.14 Are arbitrage gains possible from the following set of information to the arbitrageur?

LO 33.2 **LOD M**

Spot rate	: 61.88/\$
3 month forward rate	: ₹62.28/\$
3 month interest rates:	
₹	: 7% p a
\$: 11% p a

Solution 3 month forward rate of the dollar is higher (at ₹62.28) than the spot rate (₹61.88). It implies that the dollar is at premium.

$$\text{Premium (percentage)} = \left(\frac{\text{₹}62.28 - \text{₹}61.88}{\text{₹}61.88} \right) \times \frac{12}{3} \times 100 = 2.58\% \text{ per annum}$$

Interest rate differential = 11% - 7% = 4% per annum

Since interest rate differential (4%) and premium percentage (2.58%) do not match, there are arbitrage gain possibilities. An arbitrageur can take the following steps in this regard.

- (i) Arbitrageur borrows, say, ₹100 million at 7 per cent for 3 months (he borrows in Indian currency as it carries lower interest rate).
- (ii) He then converts ₹100 million in US \$ at the spot rate of ₹61.88 in the spot market. He gets an amount US \$1,616,031.02 ($\text{₹}100 \text{ million}/\text{₹}61.88$).
- (iii) He invests US \$1,616,031.02 in the money market at 11 per cent interest per annum for 3 months. As a result of this investment, he obtains the interest of US \$44,440.85 ($\text{US } \$1,616,031.02 \times 3/12 \times 11/100$).
- (iv) Total sum available with arbitrageur, 3 months from now is (US \$1,616,031.02 amount invested + US \$44,440.85 interest) = US \$1,660,471.87.
- (v) Since he would get US \$1,660,471.87 after 3 months, he sells forward US \$1,660,471.87 at the rate of ₹62.28.
- (vi) As a result of a forward deal, at the end of 3 months from now, he would get ₹10,34,14,188.266, i.e., ($\text{US } \$1,660,471.87 \times 62.28$).

(vii) He refunds the ₹100 million borrowed, along with interest due on it. The refunded sum is ₹100 million + ₹1,750,000 i.e. $(₹100 \text{ million} \times 3/12 \times 7/100) = ₹10,17,50,000$.

(viii) Net gain is ₹10,34,14,188.266 – ₹10,17,50,000 = ₹16,64,188.266.

P.33.15 An Indian software company receives an order from an European union country. The buyer will pay in four quarterly instalments each of €0.5 million, starting from the end of the first quarter.

LO 33.2 LOD M

The rates for euros in India is as follow:

Spot	3 month forward	6 month forward	9 month forward	1 year forward
₹78.40	₹78.20	₹77.95	₹77.80	₹77.75

If an Indian company hedges its foreign exchange rate risk in the forward market, how much revenue does it earn?

Solution

Indian software company will have the following income streams:

Instalment	Euro income	Rate	Revenue
1 st quarter-end	€ 5,00,000	₹78.2/ €	₹3,91,00,000
2 nd quarter-end	5,00,000	77.95/ €	3,89,75,000
3 rd quarter-end	5,00,000	77.80/ €	3,89,00,000
4 th quarter-end	5,00,000	77.75/ €	3,88,75,000
Total revenue income is			15,58,50,000

P.33.16 The following data (related to interest rates) is available from the forex market:

LO 33.3 LOD M

US 1 month treasury bill	: 2.50 – 2.55% p a
India 1 month treasury bill	: 6.75 – 6.80% p a

If the dollar spot rate in India is ₹61.5040/61.5054 per US \$, find the no-arbitrage range of future prices for a 1 month dollar future.

Solution Let us assume the forward rate to be F. There are two possibilities for arbitrage.

(a) Borrow dollar, buy rupees, invest rupees, sell rupees in future.

(i) Borrows 1 dollar (@ 2.55%) and sell it in spot market to receive ₹61.5040.

(ii) Lends these rupees in money market to earn @ 6.75%. Thus, the future value after 1 month = 61.5040 $(1 + 0.0675 \times 1/12) = ₹61.8500$.

(iii) Sells ₹61.8500 in future market (@ F) to receive dollars $(61.8500 \times 1/F)$.

(iv) As dollar 1 has been borrowed, after 1 month, the dollar to be returned is $(1 \times 0.0255 \times 1/12)$.

For a no arbitrage condition, dollars in (iii) must be less than dollar in (iv) or $61.8500 \times 1/F < 1 \times 0.0255 \times 1/12$ or $F > 61.7185$.

(b) Borrow rupees, buy dollar, invest in dollar, buy rupees in future.

(i) Borrows 1 ₹ (@ 6.80%) and sells it in spot market to receive US $\$1/61.5054 = \text{US } \0.0162 .

(ii) Lends these US \$0.0162 in money market @ 2.50%. After 1 month, it will fetch US $\$0.0162 (1 + 0.025 \times 1/12)$.

(iii) Selling the dollar calculated in (ii) in the future market will provide ₹F $\times 0.0162 (1 + 0.025 \times 1/12)$.

(iv) As 1 ₹ will be borrowed, so after 1 month the rupee to be returned is ₹ $(1 + 0.068 \times 1/12)$.

For no arbitrage condition the rupee calculated in (iii) must be less than that in (iv) or $F \times 0.0162 (1 + 0.025 \times 1/12) < (1 + 0.068 \times 1/12)$ or $F < 61.9491$.

So the range in which forward prices will lie is $₹61.7185 < F < ₹61.9491$.

P.33.17 The US inflation rate is expected to be 2 per cent annually and that of India is expected to be 6.5 per cent annually. The current spot rate of US \$ in India is ₹59.4050/US \$.

LO 33.3 LOD M

Find the expected rate of US \$ in India after one year and after three years from now using purchase power theory of exchange rate.

Solution According to Purchase Power Parity, Forward rate = Spot rate $\left(\frac{1 + R_H}{1 + R_F}\right)^t$. Where R_H is the rate of inflation in the home country and R_F is rate of inflation in a foreign country during the year

$$\text{Forward rate} = ₹59.4050 \left(\frac{1 + 0.065}{1 + 0.02}\right)^1 = ₹62.0258$$

or, Spot rate after one year = ₹62.0258/US \$

$$\text{Spot rate after three years} = 59.4050 \left(\frac{1 + 0.065}{1 + 0.02}\right)^3 = ₹67.4228/\text{US } \$$$

P.33.18 On April 1, 3 months interest rate in the US \$ and UK are 6.5 per cent and 4.5 per cent per annum, respectively. The US \$/UK £ spot rate is 0.6560. What would be the forward rate for £, for **LO 33.3 LOD D** delivery on 30th June?

Solution Spot rate is US \$0.6560/£

Using the interest rate parity relationship $S_1 = S_0 \left[\frac{1 + i_{nA}}{1 + i_{nB}}\right]$

S_0 = Spot rate

S_1 = Future exchange rate

i_{nA} = Nominal interest rate in country A (USA)

i_{nB} = Nominal interest rate in country B (UK)

$$S_1 = 0.6560 \left[\frac{1 + (0.065 \times 3/12)}{1 + (0.045 \times 3/12)}\right]$$

$$S_1 = 0.6560 \times (1.01625/1.01125) = \text{USD } 0.6592 \text{ } \$/\text{£}$$

P33.19 An American importer has purchased goods worth euro 15,00,000. Payments are to be made after 6 months. The spot rate of Euro is US \$ 1.2800/€. The American importer expects depreciation of the dollar against the euro in the coming months. A New York bank gives the 6 month forward rate as US\$ 1.3381/€. **LO 33.3 LOD D**

If the American importer makes use of the forward rate to hedge its currency risk, what is its loss or profit under following circumstances.

(a) Spot price of euro after 6 months is US\$ 1.2800/€

(b) Spot price of euro after 6 months is US\$ 1.3962/€

(c) Spot price of euro after 6 month is US\$ 1.2000/€

Solution The importer will hedge his currency rate fluctuation exposure by hedging (buying euro) in the future market; the rate to be paid by him is US\$ 1.3381/€, irrespective of what the rate will be in spot market after 6 months.

(a) If the rate in spot market after 6 months is US\$ 1.2800/€, the importer suffers a loss due to forward contract = $(\$ 1.3381 - 1.2800) \times 15,00,000 = \text{€}87,150$.

(b) If the rate in the spot market after 6 months is US\$ 1.3962/€, the importer gains due to the forward contract $(\$ 1.3962 - 1.3381) \times 15,00,000 = \text{€}87,150$.

(c) If the rate in the spot market after 6 months is US\$ 1.2000/€, the importer suffers a loss $(\text{US\$ } 1.3381 - 1.2000) \times 15,00,000 = \text{€ } 2,07,150$

P33.20 In March, 2018, the Multinational Industries makes the following assessment of dollar rates per British pound to prevail as on 1.9.2018: **LO 33.2 LOD M**

\$/Pound	Probability
1.50	0.15
1.60	0.20
1.70	0.25
1.80	0.20
1.90	0.20

- (i) What is the expected spot rate for 1.9.2018?
 (ii) If, as of March, 2018 the 6-month forward rate is \$ 1.70, should the firm sell forward its pound receivables due in September, 2018?

Solution**(i) Computation of expected spot rate (\$/pound) as on September 1, 2018**

\$/Pound (X)	Probability	Expected \$/Pound
1.50	0.15	0.225
1.60	0.20	0.32
1.70	0.25	0.425
1.80	0.20	0.36
1.90	0.20	0.38
Expected spot rate (\$ for British pound)		1.71

(ii) Since the 6-month forward rate is lower (\$1.70) than the expected spot rate (\$1.71), it will be profitable for the firm not to sell forward its pounds receivables. By retaining pounds receivables, the firm is likely to get \$1.71 for each pound receivable *vis-à-vis* \$1.70 if it sells forward.

P33.21 A company operating in Japan has today effected sales to an Indian company, the payment being due 3 months from the date of invoice. The invoice amount is 108 lakh yen. At today's spot rate, it is equivalent to ₹60 lakh. It is anticipated that the exchange rate will decline by 10 per cent over the 3 months period and in order to protect the yen payments, the importer proposes to take appropriate action in the foreign exchange market. The 3 months forward rate is presently quoted as 1.75 yen per rupee. You are required to calculate the expected loss and to show how it can be hedged by a forward contract.

LO 33.2 LOD M

Solution**Computation of expected loss due to decline in exchange rate**

Current spot rate of exchange is ₹1 = 1.8 yen, (108 lakh yen/₹60 lakh)	
Anticipated decline in exchange rate of Indian rupee is 10 per cent	
Expected spot rate of exchange after three months is 1.8 yen – (10% × 1.8 yen) = 1.62 yen per rupee	
Expected payment in Indian rupees after three months (108 lakh yen/1.62)	₹66,66,667
Less present cost of 108 lakh yen	60,00,000
Difference represents expected exchange loss	6,66,667

Computation of loss with forward contract

Payment in Indian rupees after three months under forward contract (108 lakh yen/1.75)	₹61,71,428.5
Less present cost of 108 lakh yen	60,00,000.0
Loss	1,71,428.5

Recommendation The company is advised to cover risk with forward contract in view of reduced exchange loss.

P33.22 You sold Hong Kong Dollar 1,00,00,000 value spot to your customer at ₹8.00 and covered yourself in London market on the same day, when the exchange rates were

LO 33.2 LOD M

$$\text{US\$ 1} = \text{H.K. \$ } 7.7580 - 7.8920$$

Local inter bank market rates for US\$ were

$$\text{Spot US\$ 1} = ₹61.70 - 61.85$$

Calculate cover rate and ascertain the profit or loss in the transaction. Ignore brokerage.

Solution Cover rate: For buying 1 US\$ in the spot market, ₹61.85 are required. 1 US\$ can be sold at London in exchange for HK \$ 7.7580. The cover rate therefore will be:

$$₹61.85/7.7580 = ₹7.9724$$

Or $1 \text{ HK } \$ = ₹7.9724$

Calculation of profit or loss in the transaction

Sale rate: 1 HK \$	₹8.00
Cover rate: 1 HK \$	7.9724
Profit per HK \$	0.0276
Profit on the transaction (1,00,00,000 × 0.0276)	₹2,76,000

P33.23 Z Ltd (importing goods worth USD 2 million) requires 90 days to make the payment. The overseas supplier has offered a 60 days interest free credit period and for additional credit for 30 days interest is to be charged at 8% per annum. LO 33.2,3 LO D

The banker of Z Ltd offers a 30 days loan at 10% per annum and their quote for foreign exchange is as follows:

Spot 1 USD	₹62.50
60 days forward for 1 USD	63.10
90 days forward for 1 USD	63.50

You are required to evaluate the following options:

(i) Pay the supplier in 60 days, or (ii) Avail the supplier's offer of 90 days credit. Advise Z Ltd.

Solution

(i) Payment to supplier in 60 days

If the payment is made to supplier in 60 days, the applicable forward rate for 1 USD	₹63.10
Payment due	USD 2,000,000
Outflow in rupees (USD 2,000,000 × ₹63.10)	₹126,200,000
Add: Interest on loan for 30 days @ 10% p.a.	₹10,51,667
Total outflow	₹127,251,670

(ii) Payment to supplier in 90 days

Amount payable	USD 2,000,000
Add: Interest on credit period for 30 days @ 8% p.a.	USD 13,333
Total outflow in USD	USD 2,013,333
Applicable forward rate for 1 USD	₹63.50
Total outflow in ₹(USD 2,013,333 × ₹63.50)	₹127,846,646

Recommendation Alternative 1 is better as it entails lower cash outflow.

P33.24 A bank sold Hong Kong Dollars 40, 00,000 to its customer at spot price of ₹8.05 and covered itself in London Market on the same day, when the exchange rates were: US\$ = HK\$ 7.7500 – 7.7538 LO 33.2 LO M
Local interbank market rates for US\$ were: Spot US\$ 1 = ₹62.50–63.00

You are required to calculate rate and ascertain the gain or loss in the transaction. Ignore brokerage. You are to show the calculations for exchange rate up to four decimal points.

Solution

The bank (Dealer) covered itself by buying from the London market at market selling rate.

Rupee – US Dollar selling rate	₹63.00
US Dollar – Hong Kong Dollar	HK \$ 7.7500
Rupee – Hong Kong cross rate (₹63.00/7.7500)	₹8.1290

Gain/Loss to the Bank

Amount received from customer (HK\$ 40,00,000) × ₹8.05	₹3,22,00,000
Amount paid on cover deal (HK\$ 40,00,000 × ₹8.1290)	₹3,25,16,000
Loss to bank	(₹3,16,000)

Alternative calculation: Loss to bank = 40,00,000 (₹8.05 – ₹8.1290) = ₹3,16,000

REVIEW QUESTIONS**LOD: Easy**

RQ.33.1(a) Indicate whether the following statements are true or false:

[LO 33.1.2.3]

- (i) Foreign exchange is required by a country only to make payments for imports.
- (ii) Business firms operate on their own in the foreign exchange market.
- (iii) The role of a central bank in the foreign exchange market is commercial in nature.
- (iv) Exchange rate is the price of one country's currency expressed in terms of the currency of another country.
- (v) A foreign exchange quotation can be direct or indirect.
- (vi) Spread is the difference between the ask price and the bid price.
- (vii) Forward exchange rate is the rate of that day on which the transaction has taken place.
- (viii) Cross rate is the rate of exchange of two currencies on the basis of exchange quotes of other pairs of currencies.
- (ix) Foreign exchange quotations are always with respect to the customer.
- (x) If the forward rates are higher than the spot rates, the forward rates are at discount.

[Answers: (i) False (ii) False (iii) False (iv) True (v) True
(vi) True (vii) False (viii) True (ix) False (x) False]

(b) Fill in the blanks with the correct answer (out of the choices provided).

- (i) A rate of ₹62 per U.S. dollar is an example of _____ (direct/indirect) quotation.
- (ii) Indirect quotations are known as _____ (European/American) quotations.
- (iii) Geographical arbitrage involves _____ (two/three) currencies.
- (iv) In countries that witness high inflation rates, currency values decline _____ (more/less) compared to the currencies of countries with lower inflation rates.
- (v) The spot and two month forward buying rates of US\$ are ₹60.80 and ₹61.50 respectively. It implies that Rupee is quoting at a _____ (premium/discount) in the forward market.
- (vi) Given the spot rate of ₹89.00/£ and interest rate differential of 3 per cent between the two currencies, the 3 month forward rate should be _____ (₹89.5675/£ or ₹89.6675/£) to eliminate any arbitrage gains.
- (vii) If a foreign currency is to be at a premium in the forward market, it should have a relatively _____ (higher/lower) interest rate vis-à-vis the home currency.
- (viii) When a direct quote of the home currency or any other desired currency is not available in the foreign exchange market, it is computed with the help of _____ (spot/forward/cross) rates.

- (ix) The settlement of spot transactions in the foreign exchange markets occurs within a maximum period of _____ (two/three) days.
- (x) The rate at which a foreign exchange dealer is ready to sell a currency is called _____ (bid/ask) rate.

[Answers: (i) direct (ii) American (iii) two (iv) more (v) discount
(vi) ₹89.6675/£ (vii) lower (viii) cross (ix) two (x) ask]

- RQ.33.12** The following are the various quotes for the US \$ available in a bank in Mumbai. [LO 33.2]

Spot	1 month forward	3 month forward
₹60.9350/60.9550	325/375	520/580

Find the bid and ask rates and spread for all the quotes.

- RQ.33.13** An Indian importer receives the following quotes of dollar from its banker. [LO 33.2]

Spot	: ₹61.3250
1 month forward	: ₹61.5230
6 month forward	: ₹62.1050

What is the discount/premium of the dollar forward prices?

- RQ.33.14(a)** The following is a direct quote of the dollar provided by a leading Indian bank. [LO 33.2]

Spot	1 month forward	3 month forward	6 month forward
₹60.6500/60.6620	35/30	60/45	30/38

What is the bid-ask rates for these quotes?

- (b) If you are a small forex dealer and are required to provide forward rates for 2 month to a client, what forward bid-ask rate will you quote on the basis of rates provided in RQ 33.17(a)? [LO 33.2]

RQ.33.15 From the following data, at what forward rate will no arbitrage gain be possible:

[LO 33.3]

₹61.00/\$ (Spot)
 6 month interest rate:
 India : 7.5% per annum
 US : 2.0% per annum

LOD: Difficult

RQ.33.16 Indicate whether forward exchange rates are normally at premium or discount compared to spot rates. How do you determine, such a discount or premium? Illustrate with an appropriate example.

[LO 33.2]

RQ.33.17 What are cross rates? How are they determined?

[LO 33.2]

RQ.33.18 State the situations in which riskless arbitrage opportunities are possible to the arbitrageur. Explain your answer with appropriate examples.

[LO 33.2]

ANSWERS

RQ.33.3 (a) ₹4,79,550

(b) ₹4,79,450

RQ.33.4 The direct quote of rupee in New York (US \$ / ₹) : 0.16236 – 0.16251

RQ.33.11 Arbitrage process will involve the following steps:

(i) Sell 1 million Singaporean \$ and get rupees in Mumbai. The proceeds will be ₹10,00,000 × 47.00 = ₹4,70,00,000

(ii) Sell ₹4,70,00,000 in Mumbai and get US \$. The proceeds will be US \$ 4,70,00,000 × 1/60.3610 = US \$ 7,78,648

(iii) Sell US \$ 7,78,648 in Singapore to receive Singapore \$ (7,78,648 × 1.2900) = Singapore \$ 10,04,456
 Thus, there is a gain of (Singapore \$ 10,04,456 - \$ 10,00,000) = Singapore \$ 4,456.

RQ.33.12

Foreign Exchange Exposure and Risk Management

LEARNING OBJECTIVES

LO 34.1	Explain the three types of exposures in international business—transaction exposure, translation exposure and economic exposure
LO 34.2	Describe the four external techniques—forward contracts, currency options, swaps and money market operations—of foreign exchange risk management
LO 34.3	Discuss the important internal hedging techniques to reduce foreign exchange risk exposure, namely, leading and lagging, invoice/billing in the desired currency, indexation clauses, sharing risk, shifting the manufacturing base, netting and reinvoicing centre
LO 34.4	Enumerate risk management practices in India

INTRODUCTION

Foreign exchange risk management (FERM) constitutes an integral part of all major corporate decisions to manage foreign exchange exposure, given the global business scenario in which business firms (in particular international companies and multinational companies) operate. Therefore, it is imperative that corporate firms are in the know of the various types of the foreign exchange risks they are exposed to as well as are fully conversant with the various important FERM techniques to deal with such risks. This Chapter discusses both these aspects. The major exposures faced by business firms in their international operations are discussed first. The techniques to hedge/cover foreign exchange risk, namely, currency market hedges and internal techniques are dealt in subsequent discussions. The chapter also enumerates risk management practices in India. The major points are summarised by way of recapitulation.

LO 34.1 TYPES OF EXPOSURE

Business firms, having international business operations, primarily encounter three types of exposure: (i) **transaction exposure**, (ii) **translation exposure** and (iii) **economic exposure**. They have been briefly explained below.

Foreign Exchange Exposure and Risk Management

LEARNING OBJECTIVES

- LO 1** Explain the concept of foreign exchange exposure and risk management.
- LO 2** Explain the concept of foreign exchange risk and the different types of foreign exchange risk.
- LO 3** Explain the concept of foreign exchange risk management and the different types of foreign exchange risk management.
- LO 4** Explain the concept of foreign exchange risk management and the different types of foreign exchange risk management.

RISK DEFINITION

The risk of a change in the value of a foreign exchange exposure is the risk of a change in the value of the exposure. This risk is known as foreign exchange risk. Foreign exchange risk is the risk of a change in the value of a foreign exchange exposure. This risk is known as foreign exchange risk. Foreign exchange risk is the risk of a change in the value of a foreign exchange exposure. This risk is known as foreign exchange risk.

IF EXPOSURE DEFINITION

A foreign exchange exposure is a foreign exchange exposure. This is a foreign exchange exposure. This is a foreign exchange exposure. This is a foreign exchange exposure.

Transaction Exposure

Transaction exposure is inherent in all foreign currency denominated contractual obligations/ transactions. This involves gain or loss arising out of the various types of transactions that require settlement in a foreign currency. The transactions may relate to cross-border trade in terms of import or export of goods, the borrowing or lending in foreign currencies, domestic purchases and sales of goods and services of the foreign subsidiaries and the purchase of assets or take over of the liability involving foreign currency. The actual profit the firm earns or loss it suffers, of course, is known only at the time of settlement of these transactions.

Transaction exposure involves gain/loss arising out of the various types of transactions that require settlement in a foreign currency.

A firm's balance sheet already contains several items reflecting transaction exposure; the notable items being debtors receivable in foreign currency, creditors payable in foreign currency, foreign loans and foreign investments. While it is true that transaction exposure is applicable to all these foreign transactions, it is usually employed in connection with foreign trade, that is, specific imports or exports on open account credit¹. Example 34.1 illustrates transaction exposure.

Example 34.1

Suppose an Indian firm imports goods from the US, invoiced at US \$1 million. At the time of invoicing, the US dollar exchange rate was ₹61.4513. The payment is due after 4 months. During the intervening period, the Indian rupee weakens/and the exchange rate of the dollar appreciates to ₹61.9824. As a result, the Indian importer has a transaction loss to the extent of excess rupee payment required to purchase US \$1 million. Now, the firm is to pay US \$1 million \times ₹61.4513 = ₹61.4513 million. After 4 months from now when it is to make payment on maturity, it will have to make higher payment at ₹61.9824 million, (US \$1 million \times ₹61.9824). Thus, the Indian firm suffers a transaction loss of ₹5,31,100, (₹61.9824 million – ₹61.4513 million).

In case the Indian rupee appreciates (or the US dollar weakens) to ₹61.1124, the Indian importer gains (in terms of the lower payment of Indian rupees); its equivalent rupee payment (of US \$1 million) will be ₹61.1124 million. As a result, the firm has profit of ₹3,38,900, (₹61.4513 million – ₹61.1124 million).

Example 34.1 clearly demonstrates that the firm may not necessarily have losses from the transaction exposure; it may earn profits also. In fact, the international firms have a number of items in balance sheet at a point of time, on some of the items (say payments), it may suffer losses due to weakening of its home currency; it is then likely to gain on foreign currency receipts. However, in practice, the transaction exposure is associated with losses presumably due to the principle of conservatism.

Translation Exposure

Translation exposure relates to the change in accounting income and balance sheet statements caused by the changes in exchange rates. These changes may take place by/at the time of finalisation of accounts compared to the time when the asset was purchased or liability was assumed. In other words, translation exposure results from the need to translate foreign currency assets or liabilities into the local currency at the time of finalising accounts. Example 34.2 illustrates the impact of translation exposure.

Example 34.2

Suppose, an Indian corporate has taken a loan from a bank in the US to import plant and machinery worth US \$10 million. When the import materialised, the exchange rate was ₹60.0. The imported plant and machinery in the books of the corporate would be shown at ₹60 \times US \$10 million = ₹60 crore and loan at ₹60 crore.

Assuming no change in the exchange rate, the corporate at the time of preparation of final accounts, will provide depreciation (say at 25 per cent) of ₹15 crore on the book value of ₹60 crore.

Translation exposure results from the need to translate foreign currency assets/liabilities into local currency at the time of finalising accounts.

Let us assume further that the dollar exchange rate appreciates to ₹61. As a result, the book value of plant and machinery will change to ₹61 crore (₹61 × US \$10 million); depreciation will increase to ₹15.25 crore (₹61 crore × 0.25), and the loan amount will also be revised upwards to ₹61 crore. Thus, there is a translation loss of ₹1 crore due to the increased value of loan. Besides, the higher book value of the plant and machinery causes higher depreciation, reducing the net profit.

Alternatively, translation losses (or gains) may not be reflected in the income statement. They may be shown separately under the head of 'translation adjustment' in the balance sheet, without affecting accounting income. This translation loss adjustment is to be carried out in the owners' equity account. The adjustment made to the owners' equity account is a better approach as the accounting income would not be diluted on account of translation losses or gains.

On account of varying ways of dealing with translation losses or gains, accounting practices vary in different countries and among business firms within a country. Whichever method is adopted to deal with translation losses/gains, it makes an impact on both the income statement and the balance sheet.

Economic Exposure

Of all the three exposures, **economic exposure** is considered the most important as it has an impact on the valuation of a firm. It is defined as the **change in the value of a company that accompanies an unanticipated change in exchange rates**². It is important to note that anticipated changes in exchange rates are already reflected in the market value of the company. For instance, when an Indian firm transacts business with an American firm, it has the expectation that the Indian rupee is likely to weaken *vis-à-vis* the US dollar. This weakening of the Indian rupee will not affect the market value (as it was anticipated, and hence already considered in valuation). However, in case the extent/margin of weakening is different from expected, it will have a bearing on the market value. The market value may enhance if the Indian rupee depreciates less than expected. In case, the Indian rupee weakens more than expected, it may entail erosion in the firm's market value. In brief, the unanticipated changes in exchange rates (favourable or unfavourable) are not accounted for in valuation and, hence, cause economic exposure.

- **Economic exposure**
- implies change in the value of a company, that accompanies an unanticipated change in exchange rates.

Since economic exposure emanates from unanticipated changes, its measurement is not as precise and accurate as those of transaction and translation exposures; it involves subjectivity. Shapiro's definition of economic exposure provides the basis of its measurement. According to him, it is based on the extent to which the value of the firm—as measured by the present value of the expected future cash flows—will change when exchange rates change³.

Symbolically, the firm has exposure risk when,

$$(\Delta PV/\Delta e) \neq \text{zero} \quad (34.1)$$

Where, ΔPV is the change in the firm's present value associated with an exchange rate change (Δe). Thus, Equation 34.1 measures variability in the value of the firm due to uncertain exchange rate changes. Since the major parameter in determination of the PV is future cash flows, exposure risk clearly reflects the variability of the firm's future cash flows.

The transaction exposure also affects cash flow exposure (the importing firm is to make more payments in case the home currency depreciates). Should transaction exposure, then, not be a part of economic exposure? Shapiro recognises this and considers transaction exposure as a part of economic exposure. He classifies economic exposure into two components, namely, **transaction exposure** and **operating exposure**. Since transaction exposure is already explained, operating exposure will now be discussed.

Operating Exposure Operating exposure has an impact on the firm's future operating revenues, future operating costs and future operating cash flows. Clearly, operating exposure has a longer-

Operating exposure has impact on firm's future operating revenue, costs and cash flows.

term perspective. Given the fact that the firm is valued as a going concern entity, its future revenues and costs are likely to be affected by the exchange rate changes. In particular, it is true for all those business firms that deal in selling goods and services that are subject to foreign competition and/or uses inputs from abroad.

In case, the firm succeeds in passing on the impact of higher input costs (caused due to appreciation of foreign currency) fully by increasing the selling price, it does not have any operating risk exposure as its operating future cash flows are likely to remain unaffected. The less price elastic is the demand of the goods/services the firm deals in, the greater is the price flexibility it has to respond to exchange rate changes. Price elasticity in turn depends, *inter alia*, on the degree of competition and location of the key competitors. The more differentiated a firm's products are, the less competition it encounters and the greater is its ability to maintain its domestic currency prices, both at home and abroad⁴. Evidently, such firms have relatively less operating risk exposure. In contrast, firms that sell goods/services in a highly competitive market (in technical terms, have higher price elasticity of demand) run a higher operating risk exposure as they are constrained to pass on the impact of higher input costs (due to change in exchange rates) to the consumers.

Apart from supply and demand elasticities, the firm's ability to shift production and sourcing of inputs is another major factor affecting operating risk exposure. In operational terms, a firm having higher elasticity of substitution between home-country and foreign-country inputs or production is less susceptible to foreign exchange risk and hence encounters low operating risk exposure.

In brief, the firm's ability to adjust its cost structure and raise the prices of its products and services is the major determinant of its operating risk exposure.

Measurement of Economic Exposure Its measurement is a daunting task. A workable approach is suggested by Shapiro. The approach is based on an operational definition of the exchange risk encountered by a parent or one of its foreign subsidiaries. A company faces exchange risk to the extent that variations in the dollar value of the units' cash flows are correlated with variations in the nominal exchange rate⁵. This correlation is the same thing that a regression analysis seeks to provide. The relevant regression equation in this regard is:

$$\Delta CF_t = a + \beta \Delta EXCH_t + U_t \quad (34.2)$$

Where,

$$\Delta CF_t = CF_t - CF_{t-1},$$

and CF_t equals the dollar value of total affiliate (parent) cash flows in period t .

$$\Delta EXCH_t = EXCH_t - EXCH_{t-1},$$

and $EXCH_t$ equals the average nominal exchange rate (dollar value of one unit of the foreign currency) during period t .

U = a random error term with mean 0.

Equation 34.2 provides three key parameters: **(i)** The foreign exchange beta coefficient (β) measures the sensitivity of dollar cash flows to exchange rate changes; **(ii)** the ' t ' statistic measures the statistical significance of the beta coefficient and **(iii)** the R^2 measures the fraction of cash flow variability explained by variations in exchange rates. The higher the value of β , the greater the impact of the change in exchange rates on the dollar value of cash flows. The firm is more exposed to exchange rate changes and has a higher degree of economic exposure. In contrast, a lower β value is indicative of the fact that the firm is less exposed to exchange rate changes and, hence, has less economic exposure. A larger ' t ' value implies a higher level of confidence in the value of

the beta coefficient. In practice, while interpreting the result of the regression equation, it should be borne in mind that the past is representative of the future (as the past data is used to determine the values).

To sum up the discussion, it can be said that the firm can assess the economic exposure by predicting the future exchange rates and what impact such rates have on operating revenues, operating costs, operating profits and eventually operating cash flows. The greater is the susceptibility of operating cash flows to exchange rates changes, the greater is the economic exposure of the business firm, and *vice-versa*.

LO 34.2 FOREIGN EXCHANGE RISK MANAGEMENT—EXTERNAL TECHNIQUES

From an operational perspective, **foreign exchange risk** is defined as the possibility of loss to the business unit on account of unfavourable movement in foreign exchange rates. Foreign exchange risk management (FERM) is the process through which finance managers try to eliminate/reduce the adverse impact of unfavourable changes in the foreign exchange rates to a tolerable level. We describe below the four major external techniques of the FERM (also known as derivatives)* and money market operations. Derivatives are: **(i)** forward contracts, **(ii)** currency futures, **(iii)** currency options and **(iv)** swaps.

- **Foreign exchange risk**
- is the possibility of loss on account of unfavourable movement in foreign exchange rates.

Forward Contracts

Forward exchange contracts (discussed in the previous chapter) are widely used by business firms to hedge against volatile/adverse exchange rates. Business firms enter into a forward contract (with authorised dealers of the forward exchange market, normally banks) to buy or sell foreign currency in exchange for home currency, normally at a specific future date, at a predetermined exchange conversion rate (known as forward rate). An Indian importer, who wishes to avoid foreign exchange risk, has to purchase the required foreign currency (say US \$/British £) forward (for a period, say 90 days, when the payments are to be made). Likewise, an Indian exporter to US can enter into a forward exchange contract to sell US dollar to avoid the risk of depreciation of the dollar when he receives payment on maturity (say, 90 days hence). Forward exchange contracts enable firms to cover the foreign exchange risk. They are ideally suited for hedging transaction exposure.

A typical forward contract specifies the **(i)** contract amount, **(ii)** forward exchange rate, **(iii)** parties to the contract, **(iv)** the specified date of delivery, **(v)** name of foreign currencies involved in exchange and, **(vi)** terms and conditions for cancellation.

- **Futures contract**
- is a standardised agreement to buy/sell a specified amount of foreign currency in future at some future date.

Currency Futures

Currency futures are closely related to forward contracts. These are more popularly known as *futures contracts* and are traded at the futures markets. A **futures contract** is a standardised agreement to buy or sell a pre-specified amount of foreign currency in the futures market at some specified future date between the parties to the contract.

*As per the L C Gupta Committee, "derivative means forward, futures or option contract of pre determined fixed duration, linked for the purpose of contract fulfillment to the value of specified real or financial asset or to index security".

...the ... of the ...

SECRET

...the ... of the ...

SECRET

SECRET

Currency futures contracts/markets are for the major/hard currencies of the world, namely, the US \$, the British £, the Euro €, the Singapore dollar, the Japanese Yen and the Canadian dollar.

Futures, being standardised contracts in nature, are traded on an organised exchange; the clearing house of the exchange operates as a link between the two parties of the contract, namely, the buyer and the seller. In other words, transactions are through the clearing house and the two parties do not deal directly between themselves.

While it is true that futures contracts are similar to the forward contracts in their objective of hedging foreign exchange risk of business firms, they differ in many significant ways.

Differences Between Forward Contracts and Future Contracts The major differences between the forward contracts and futures contracts are as follows:

(i) Nature and size of Contracts Futures contracts are standardised contracts in that dealings in such contracts are permissible in standard-size sums, say multiples of 1,25,000 Euros or 12.5 million yen. Apart from standard-size contracts, maturities are also standardised. In contrast, forward contracts are customised/tailor-made; such contracts can virtually be of any size or maturity.

(ii) Mode of Trading In the case of forward contracts, there is a direct link between the firm and the authorised dealer (normally a bank) both at the time of entering the contract and at the time of execution. On the other hand, the clearing house interposes between the two parties involved in futures contracts.

(iii) Liquidity The two positive features of futures contracts, namely, their standard-size and trading at clearing house of an organised exchange, provide them relatively more liquidity *vis-à-vis* forward contracts, which are neither standardised nor traded through organised futures markets. For this reason, the future markets are more liquid than the forward markets.

(iv) Deposits/Margins While futures contracts require guarantee deposits from the parties, no such deposits are needed for forward contracts. Besides, the futures contract necessitate valuation on a daily basis, meaning that gains and losses are noted (the practice is known as *marked-to-market*⁶). Valuation results in one of the parties becoming a gainer and the other a loser; while the loser has to deposit money to cover losses, the winner is entitled to the withdrawal of excess margin. Such an exercise is conspicuous by its absence in forward contracts as settlement between the parties concerned is made on the pre-specified date of maturity.

(v) Default Risk As a sequel to the deposit and margin requirements in the case of futures contracts, default risk is reduced to a marked extent in such contracts compared to forward contracts.

(vi) Actual Delivery Forward contracts are normally closed, involving actual delivery of foreign currency in exchange for home currency/or some other country currency (cross currency forward contracts). In contrast, very few futures contracts involve actual delivery; buyers and sellers normally reverse their positions to close the deal. Alternatively, the two parties simply settle the difference between the contracted price and the actual price with cash on the expiration date⁷. This implies that the seller cancels a contract by buying another contract and the buyer by selling the contract on the date of settlement.

Interest Rate Futures Apart from currency futures, interest rate futures represent another major technique available to business firms. *Interest rate futures* can be used to hedge/reduce risk of a rise in interest rates in the future. Example 34.3 illustrates the usefulness of interest rate futures.

Example 34.3

Suppose IBM has taken a decision to build a new plant, estimated to cost US \$100 million. It has been decided to finance it by 10-year bonds; the current coupon rate of interest on such bonds is 7 per cent. IBM does not need money for about 6 months. Of course, IBM can issue 7 per cent bonds now and can arrange funds. Since the money is not immediately needed, it would be invested in short-term securities, yielding an interest of less than 7 per cent, entailing loss.

Another alternative is that the IBM waits for 6 months to sell the bond issue. So far so good, if the interest rates remain unchanged at 7 per cent. In case, they move up higher than 7 per cent, the company will be required to pay higher interest on US \$100 million for the 10 year period. Not surprisingly, IBM may find the building-up of the new plant with higher interest costs an unprofitable proposition.

Interest rate futures provide a solution to the IBM dilemma/or its worry pertaining to an increase in interest rates. IBM can have a futures contract to sell Treasury-bond futures 6 months hence to hedge its position [it is assumed that Treasury bonds (T-bonds) carry a rate of interest of 5 per cent]. Should interest rates rise, the value of T-bonds will decline (there is a negative correlation between interest rates and the value of bonds). As a result, it makes profit on the futures position. Of course, it has to pay higher interest on its bond issue, but it is partly compensated in terms of the profit it has earned by selling T-bonds. In the event of a decline of interest rates, it will suffer losses on its future position, but it would gain as it would pay a lower interest rate for all ten years. Thus, interest rate futures are useful derivatives to hedge/reduce the risk of a rise in the interest rates in future.

In view of the above, it is not surprising to find that forward contracts and futures contracts are widely used techniques of hedging risk. It has been estimated that more than 95 per cent of all transactions are designed as hedges, with banks and futures dealers serving as middlemen between hedging counterparties⁸.

Currency Options

Forward contracts as well as futures contracts provide a hedge to firms against adverse movements in exchange rates. This is the major advantage of such financial instruments. However, at the same time, these contracts deprive firms of a chance to avail the benefits that may accrue due to favourable movements in foreign exchange rates. The reason for this is that the firm is under obligation to buy or sell currencies at pre-determined rates. This limitation of these contracts is the main reason for the genesis/emergence of currency options in forex markets.

Currency option is a financial instrument that provides its holder a right but no obligation to buy or sell a pre-specified amount of a foreign currency at a pre-determined rate in the future (on a fixed maturity date/up to a certain period). While the buyer of an option wants to avoid the risk of adverse changes in exchange rates, the seller of the option is prepared to assume the risk. Options are of two types, namely, call option and put option.

- **Currency option**
- provides its holder
- the right but not
- the obligation to
- buy/sell a specified
- amount of foreign
- currency at a
- specified rate upto
- a specified period.

Call Option In a call option the holder has the right to buy/call a specific currency at a specific price on a specific maturity date or within a specified period of time.

However, the holder of the option is under no obligation to buy the currency. Such an option is to be exercised only when the actual price in the forex market, at the time of the exercising option, is more than the price specified in call option contract. To put it differently, the holder of the option obviously will not use the call option in case the actual currency price in the spot market, at the time of using the option, turns out to be lower than that specified in the call option contract.

Put Option A put option confers the right but no obligation to sell a specified amount of currency at a pre-fixed price on or up to a specified date. Obviously, put options will be exercised when

the actual exchange rate on the date of maturity is lower than the rate specified in the put-option contract.

The option contracts place their holders in a very favourable/privileged position for the following two reasons: (i) they hedge foreign exchange risk of adverse movements in exchange rates and (ii) they retain the advantage of the favourable movement of exchange rates. Given the advantages of option contracts, the cost of currency option (which is limited to the amount of premium; it may be absolute sum but normally expressed as a percentage of the spot rate prevailing at the time of entering into a contract) seems to be worth incurring. In contrast, the seller of the option contract runs the risk of unlimited/substantial loss and the amount of premium he receives is income to him. Evidently, between the buyer and seller of call option contracts, the risk of a currency option seller is/seems to be relatively much higher than that of a buyer of such an option.

In view of high potential risk to the sellers of these currency options, option contracts are primarily dealt in the major currencies of the world that are actively traded in the over-the-counter (OTC) market. All the operations on the OTC option markets are carried out virtually round the clock. The buyer of the option pays the **option price** (referred to as *premium*) upfront at the time of entering an option contract with the seller of the option (known as the *writer of the option*). The predetermined price at which the buyer of the option (also called as the *holder of the option*) can exercise his option to buy/sell currency is called the **strike/exercise price**. When the option can be exercised only on the maturity date, it is called a **European option**; in contrast, when the option can be exercised on any date upto maturity, it is referred to as an **American option**. An option is said to be **in-money**, if its immediate exercise yields a positive value to its holder; in case the strike price is equal to the spot price, the option is said to be **at-money**; when option has no positive value, it is said **out-of-money**. Example 34.4 illustrates currency option.

Example 34.4

An Indian importer is required to pay British £2 million to a UK company in 4 months time. To guard against the possible appreciation of the pound sterling, he buys an option by paying 2 per cent premium on the current prices. The spot rate is ₹90.50/£. The strike price is fixed at ₹91.32/£.

The Indian importer will need £2 million in 4 months. In case, the pound sterling appreciates against the rupee, the importer will have to spend a greater amount on buying £2 million (in rupees). Therefore, he buys a call option for the amount of £2 million. For this, he pays the premium up-front, which is: £2 million \times ₹90.50 \times 0.02 = ₹3.62 million.

Then the importer waits for 4 months. On the maturity date, his action will depend on the exchange rate of the £ *vis-à-vis* the rupee. There are three possibilities in this regard, namely £ appreciates, does not change and depreciates.

(i) Pound Sterling Appreciates If the pound sterling appreciates, say to ₹92.25/£, on the settlement date, the importer will exercise his call option and buy the required amount of pounds at the contract rate of ₹91.32/£. The total sum paid by importer is: (£2 million \times ₹91.32) + Premium already paid = ₹182.64 million + ₹3.62 million = ₹186.26 million.

(ii) Pound Sterling Exchange rate does not Change This implies that the spot rate on the date of maturity is ₹91.32/£. Evidently, he is indifferent/neutral as he has to spend the same amount of Indian rupees whether he buys from the spot market or he executes call option contract; the premium amount has already been paid by him. Therefore, the total effective cash outflows in both the situations remain exactly identical at ₹186.26 million, that is, [(£2 million \times ₹91.32) + Premium of ₹3.62 million already paid].

(iii) Pound Sterling Depreciates If the pound sterling depreciates and the actual spot rate is ₹90/£ on the settlement date, the importer will prefer to abandon the call option as it is economically cheaper to buy the required amount of pounds directly from the exchange market. His total cash outflow will be lower at ₹183.62 million, that is, (£2 million × ₹90) + Premium of ₹3.62 million, already paid.

Thus, it is clear that the importer is not to pay more than ₹186.26 million irrespective of the exchange rate of £ prevailing on the date of maturity. But he benefits from the favourable movement of the pound. Evidently, currency options are more ideally suited to hedge currency risks. Therefore, options markets represent a significant volume of transactions and they are developing at a fast pace.

An additional feature of currency options is that they can be repurchased or sold before the date of maturity (in the case of American type of options). The intrinsic value of an American call option is given by the positive difference between the spot rate and the exercise price; in the case of a European call option, the positive difference between the forward rate and exercise price yields the intrinsic value.

$$\text{Intrinsic value (American option)} = \text{Spot rate} - \text{Exercise price} \quad (34.3)$$

$$\text{Intrinsic value (European option)} = \text{Forward rate} - \text{Exercise price} \quad (34.4)$$

Of course, the option expires when it is either exercised or has attained maturity. Normally, it happens when the spot rate/forward rate is lower than the exercise price; otherwise holders of options will normally like to exercise their options if they carry positive intrinsic value.

Swaps

Swaps, as the name implies, are exchange/swap of debt obligations (interest and/or principal payments) between two parties. In general, currency swaps are arranged between two firms/parties through a bank. While it is true that swaps are not financing instruments (as the firms involved in swap contracts already have debt) they comfort the parties involved not only in terms of the desired currency involved in debt financing but also provide logistic convenience in making specified payments of interest and/or principal. Swaps are of two types, namely, interest swaps and currency swaps.

Interest Swaps Interest swaps involve exchange of interest obligations between two parties. Example 34.5 explains the *modus operandi* of interest swaps.

- Interest swaps
- involve exchange of
- interest obligations
- between two
- parties.

Example 34.5

Suppose, a US based party (Company X) has 10-year outstanding US \$200 million bonds, with floating rate of interest. A French party (Company Y) also has 10 year outstanding US \$200 million bonds. However, these bonds carry a fixed rate of interest. While both companies are to make a series of interest payments (annual/semi-annual basis) over the next 10 years, the interest payment stream is known/fixed in the case of Company Y and it varies in the case of Company X, as per the movements of interest rate changes.

Suppose further, Company X now has stable cash flows and, hence, it desires to have interest, which is non-varying/fixed. Unlike Company X, let us assume Company Y does not have stable cash flows; they are fluctuating in nature and move with the economy. Interest rates also move up or down with the economy. Therefore, its management feels it will be more appropriate to have a floating rate debt.

Interest rate swaps will obviously be ideal in these circumstances for both the companies. As a result of the swap, Company X is to make fixed interest payments (matching with its stable cash flow) and Company Y is to make fluctuating interest payments (consistent with its fluctuating earnings/cash flows).

Though both the companies, *prima facie*, find the interest rate swap catering to their preferences, yet in practice, one firm may be required to make payments to the other. For instance, payment may be necessitated

if one of the two companies has a higher credit risk than the another; the weaker company is to make payments to the stronger company in a swap. Likewise, payments may be involved in the event of differences in the rate of interest of the two parties/firms involved in interest swaps.

Currency swaps involve two parties who agree to pay each other's debt obligations denominated in different currencies. Example 34.6 illustrates currency swaps.

Example 34.6

Suppose Company B, a British firm, had issued £50 million pound-denominated bonds in the UK to fund an investment in France. Almost at the same time, Company F, a French firm, had issued £50 million of Euro-denominated bonds in France to make the investment in UK. Company B earns in Euros (€) but is required to make payments in the British pound. Likewise, Company F earns in pound but is to make payments in Euros. As a result, both the companies are exposed to foreign exchange risk. Foreign exchange risk exposure is eliminated for both the companies if they swap payment obligations. Company B pays in pound and Company F pays in Euros. Like interest rate swaps, extra payment may be involved from one company to another, depending on the creditworthiness of the company. The eventual risk of non-payment of bonds lies with the company that had initially issued the bonds. This apart, there may also be differences in the interest rates attached to these bonds, requiring compensation from one company to another.

Interest rate swaps are distinguished from currency swaps for the sake of comprehension only. In practice, currency swaps may also include interest rate swaps. Currency swaps involve three aspects: **(i)** parties involve exchange debt obligations in different currencies, **(ii)** each party agrees to pay the interest obligation of the other party and **(iii)** on maturity, principal amounts are exchanged at an exchange rate agreed in advance.

Money Market Operations

Apart from derivatives, foreign exchange risk can also be hedged through money market operations. The steps involved are as follows: **(i)** Determine the amount required in foreign currency, to be paid on specified date (say 3 months/4 months) from now. **(ii)** From an authorised dealer (say bank) ascertain the spot exchange rate at which it is selling the required foreign currency in exchange for home currency. **(iii)** Borrow home currency from the money market, at the prevailing interest rate. The quantum of borrowing should be in such a manner that can make the required foreign currency sums available on the date of payment (say, after 3 or 4 months). **(iv)** The borrowed funds are to be used to buy the required foreign currency from the forex spot market; once purchased, it is to be invested in forex money markets to yield interest in the desired foreign currency **(v)** As per steps **(iii)** and **(iv)**, the required amount of foreign currency to be purchased can be determined. These steps enable the firm to know the precise amount it will require to make payments of foreign currency on the date of maturity. Money-market operations serve an important hedging function in that uncertainty is resolved regarding the amount to be paid. Consider Example 34.7.

Example 34.7

Suppose, an Indian importer is to make payment of US \$1.1 million after 3 months. 3 months interest rates are: 4 per cent on the US dollar and 6 per cent on the Indian rupee. The current spot exchange rate of ₹/\$ is ₹61.

The following steps will enable the Indian importer to know the precise amount he needs in Indian rupees to make a payment of US \$1.1 million after 3 months.

- (i)** First of all, the Indian importer is to ascertain the amount of borrowings so that the borrowings along with interest earned on such funds can accumulate to US \$1.1 million after 3 months. Let us say this amount is A. Equation 34.5 provides the required value.

$$A(1 + \text{rate} \times \text{time}) = \text{US } \$1.1 \text{ million}$$

$$A(1 + 0.04 \times 3/12) = \text{US } \$1.1 \text{ million}$$

$$A = \text{US } \$1.1 \text{ million}/1.01 = \text{US } \$1,089,108.91$$

(34.5)

- (ii) The Indian importer has to then borrow a sum of ₹66,435,643.51 to purchase US\$ 1,089,108.91 @ ₹61 from the spot market.
- (iii) He will invest US \$1,089,108.91 in the money market at 4 per cent rate of interest for a period of 3 months, yielding him US \$1.1 million after 3 months, (US \$1,089,108.91 × 0.04 × 3/12).
- (iv) The accumulated sum of US \$1.1 million will be paid by the Indian importer on the due date to the American export firm.
- (v) The Indian importer would refund ₹66,435,643.51 along with 6 per cent interest after 3 months, to the Indian lender. The sum is ₹66,435,643.51 (1 + 0.06 × 3/12) = ₹67,432,178.16.
- (vi) The Indian importer is to pay ₹67.43217816 million at the end of 3 months. To put it differently, he knows that his home currency cash outflow is ₹67.43217816 million, irrespective of the ₹/US dollar exchange rate, 3 months from now.

LO 34.3 FIRM—INTERNAL HEDGING TECHNIQUES

We explain below the major internal techniques that can be adopted by international and multinational companies (MNCs) to hedge/reduce their foreign exchange risk exposure. It is appropriate to designate these techniques as 'internal' in that corporate firms with international operations/MNCs and their subsidiaries can make use of these techniques independently, without the assistance of external agencies. The important internal hedging techniques are: (i) Leading and lagging, (ii) Invoicing/Billing in the desired currency, (iii) Indexation clauses, (iv) Sharing risk, (v) Shifting the manufacturing base, (vi) Netting and (vii) Re invoicing centre.

Leading and Lagging

Sound international financial management practices warrant that the firms engaged in international operations should endeavour to have their assets in a strong currency and liabilities in a weak currency. This may be achieved with the help of the technique known as 'leading and lagging' (also called *leads* and *lags*) by adjusting the timing of receipts and payments (related to current account transactions). **Leading**, as its name implies, is taking the lead to collect from foreign currency designated debtors expeditiously before they are due (when the home currency is expected to strengthen) and to initiate lead to pay foreign currency designated creditors before their due date of payment (when depreciation/devaluation of the home currency is apprehended). Payment to creditors on maturity in such a situation will, obviously involve more cash outflow of home currency as the foreign currency is likely to become costlier. Likewise, when an upward movement of the home currency is expected, early receipts from foreign currency designated debtors will lead to higher home currency receipts.

In contrast, **lagging**, as the name implies, is delaying receipts from the foreign currency designated receivables whose currencies are likely to appreciate/strengthen and delaying foreign currency designated payables whose currencies are likely to depreciate/devalue/weaken. This makes financial sense on account of more receipts from debtors and less payment to creditors

Therefore, to receive maximum receipts or make minimum payment, in appreciation-prone countries, accounts receivables are collected as soon as possible and payment of accounts

- **Leading**
- implies collection
- from designated
- debtors
- expeditiously
- foreign currency
- before due date.

- **Lagging**
- implies delaying
- receipts from
- foreign currency
- designated
- receivables.

... ..

... ..

... ..

... ..

payable is delayed as long as possible. The converse will hold true in depreciation-prone countries; debtors are collected as late as possible and creditors are paid as early as possible⁹. Example 34.8 illustrates the advantage of following such an approach.

Example 34.8

Suppose, an Indian Company X imports and exports both to US and France. Assume further that Company X is to pay US \$1 million for its imports after 2 months and is to receive € 0.5 million for exports due after 2 months. The current spot rates are ₹60/\$ and ₹80/€. It is expected that the dollar exchange rate is likely to appreciate to ₹61 in about 2 months from now. Obviously, by preponing payment, Company X gains. Immediate payment will save ₹1 per US \$ × US \$1 million = ₹1 million (total savings). Payment after 1 month may be at the rate of ₹60.5 per US \$; the determination exchange rate is based on interpolation, that is, the average price of ₹60 today and ₹61 after two months); the amount saved will be ₹0.5 × US \$1 million = ₹5,00,000. There is a gain to Firm X due to lead in making early payment.

Assume that the € is likely to depreciate to ₹79.5, 2 months from now; Company X will initiate measures to collect € 0.5 million as early as possible; assuming its efforts enable him to collect after a month (based on interpolation technique, the € exchange rate is likely to be the average of ₹80 and ₹79.5 that is, ₹79.75. In rupee terms, its value is ₹79.75 × € 0.5 million = ₹39.875 million; the potential loss saved is ₹0.25 per € [(i.e., ₹79.75 – ₹79.50 likely € rate after two months)] multiplied by € 0.5 million = ₹1,25,000.

Example 34.8 clearly demonstrates the advantage of the 'leads and lags' approach to international firms. International firms/MNCs have substantial transaction/current account risk exposure in foreign currency designated accounts payable and accounts receivable; these accounts may relate to inter-company purchases and sales, dividends, interest receivable/payable, fees, royalties and so on.

Invoicing/Billing in Desired Currency

Invoicing sales as well as purchases in the home currency is an ideal method of hedging foreign exchange risk. Billing in home currency enables the firm to know the precise amount it is likely to receive from sales (exports) and likewise the exact amount it is to pay for purchases (imports). As a result, its foreign exchange risk is completely eliminated.

Although the method provides a natural hedge, it may not be operationally feasible to be used always and by all firms. Only firms having high demand for their products, across the world, and those having products with low price-elasticity, say petroleum products/with low competition/with less substitutes available, may be in a strong position with their counterparty to make them agree to receive/pay in their own home currency. This implies that the company should be in a very strong position to impose billing, either in its own domestic currency or currency of its choice, on the other party. In the current business world of globalisation, the number of such firms is decreasing. In fact, the vast majority of companies have to encounter competition on many fronts and, hence, it is likely to be a very daunting task for them to force the counter party to have billing in the currency of their choice. In sum, relatively few firms may enjoy 'hedge luxury' of this sort.

Indexation Clauses

Yet another technique of hedging risk is to provide clause (s) related to the export and import of goods and services between the two parties in contracts/agreements. Obviously, the terms and conditions included in the contract depend on the bargaining strengths of the parties involved. For instance, the exporter may be in a better bargaining position (on account of selling new technology or essential products like petroleum) to include a clause in a contract whereby prices are to be adjusted in such a manner that the adverse movement of foreign exchange rates is to be absorbed by the importer alone. In other words, prices are adjusted to take care of foreign exchange loss

so that the exporter receives virtually the same amount in local currency; in such situations, the incidence of exchange rate loss is to be borne completely by the importer.

In contrast, if the buyer/importer happens to be in a strong bargaining position (as he is buying a competitive product having high price elasticity), he may succeed in pursuing the exporter to have a clause whereby prices are to be adjusted downwards to absorb losses due to unfavourable movement of exchange rates (i.e., the home currency depreciates or the currency of the exporting country appreciates). In such a situation, the foreign exchange risk is borne completely by the exporter. Such clauses are 'extreme' in nature; the indexation clause may be mild in nature stating changes in exchange rates, beyond which prices are to be adjusted (say above 5 per cent).

Sharing Risk

The indexation clauses illustrate the extreme positions/situations in which the entire incidence/loss of the unfavourable foreign exchange risk is shared by one of the parties only. In practice, the two parties may stipulate that loss incurred during the intervening period (the dates of contract and maturity) is to be shared between them in predetermined proportions. Risk-sharing techniques may be appropriate when the currency (currencies) involved in business deals are subject to abnormal rate of changes. Who bears a higher loss will depend on the bargaining positions of the two parties.

Shifting the Manufacturing Base

The use of such a technique is feasible for large MNCs having large financial resources and a large chain of subsidiaries operating around the world. In case an MNC has a production centre in one country and large sales in some another country, it may find it useful to have a new subsidiary set up or shift the existing one to a country where there are substantial sales of its products. As a result, there is built-in hedging of foreign exchange risk as the costs and revenues are then in the same currency.

Netting

It may not be uncommon among international companies to have mutual trading among themselves like multinational companies. Foreign exchange risk exposure of such companies can be substantially reduced if foreign designated receivables and payments among them are settled *on the net balance basis* (known as *netting*) instead of making two-way flows of money—one of receiving and another of paying. To have such a netting, it is important that the dates of settlement should match and the foreign currency involved should be the same for receipts and payments that are due.

Since the risk exposure is hedged for both parties, they try to match the maturity dates and currencies of sums receivable and payable between themselves.

Types of Netting Netting is of two types, namely, bilateral and multilateral. While netting involving two parties is referred to as *bilateral*, netting with more than two parties is called *multilateral*. Multilateral netting is practised among multinational corporations having subsidiaries whereas, bilateral netting is feasible between any two transacting companies.

Bilateral Netting Suppose Company X exports goods to Company Y for US \$2 million and imports goods worth US \$1.5 million from Company Y. Their dates of maturity are the same. Figure 34.1 shows the movement of funds between these two companies. The movement of funds with netting is exhibited in Figure 34.2.

In absence of netting, the total exposure of the two companies is US \$3.5 million (Figure 34.1); this exposure is reduced substantially to the net sum of US \$0.5 million, payable by Y to X.

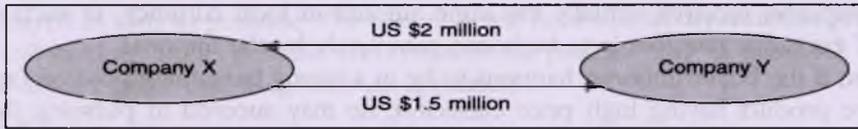

FIGURE 34.1 Normal Movement of Funds

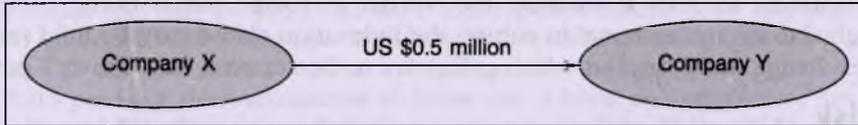

FIGURE 34.2 Movement of Funds with Netting

Multilateral Netting As stated above, multilateral netting involves netting of risk exposure among more than two companies. Normally such nettings are practised among a parent company and its subsidiaries. Figure 34.3 depicts the normal movement of funds between a parent company (P) and its four subsidiaries without netting.

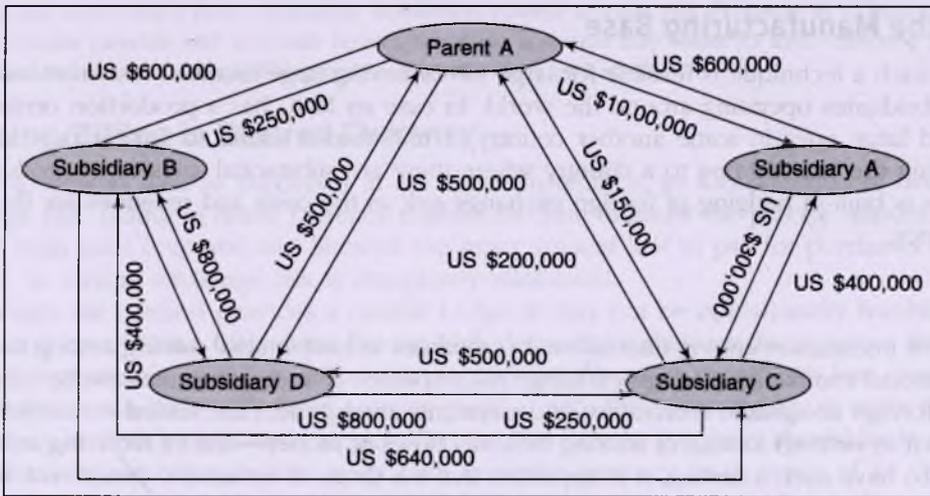

FIGURE 34.3 Normal Movement of Funds between Parent and Subsidiaries

The total risk exposure without netting is US \$7,890,000. As a result of bilateral netting, as portrayed in Figure 34.4, the total risk exposure gets reduced to US \$1,710,000.

Multilateral netting simplifies funds flow in that it requires only net amounts to be transferred. A further simplification is possible in such a manner that a company is either paying or receiving a net sum. As a result, the total risk exposure gets further reduced to US \$1,410,000 (Figure 34.5). Let us explain the procedure of arriving at the various amounts shown in Figure 34.5.

Procedure:

- (i) Parent Company (P) is to pay Subsidiary A (Figure 34.4) US \$4,00,000
- Subsidiary C is to pay Parent (Figure 34.4) \$50,000
- Subsidiary C is to pay Subsidiary A (Figure 34.4) \$1,00,000
- C's direct payables to A \$1,50,000

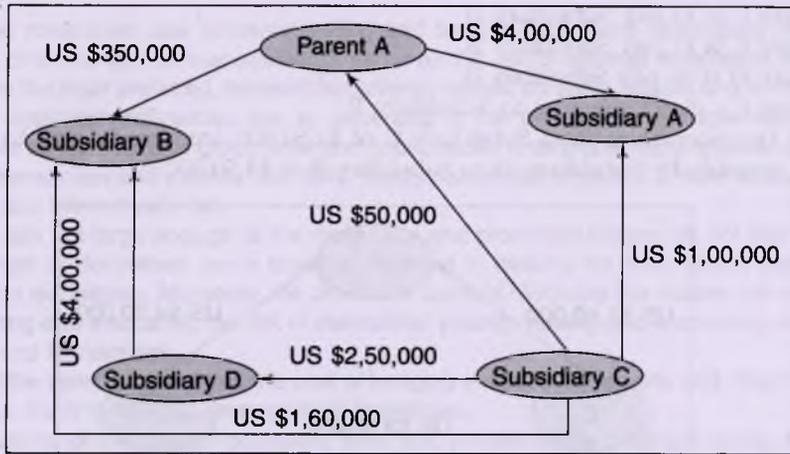

FIGURE 34.4 Movement of Funds with Bilateral Netting

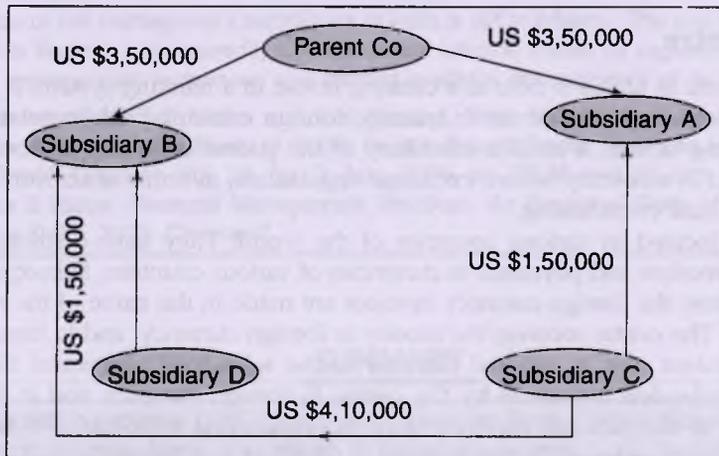

FIGURE 34.5 Movement of Funds subsequent to Multilateral Netting

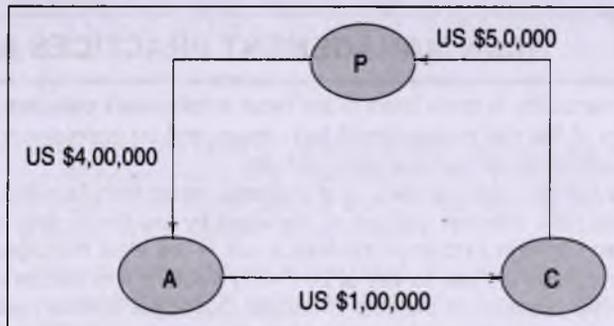

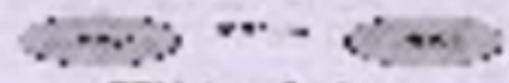

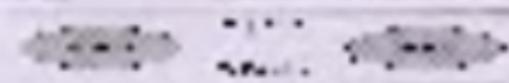

FIGURE 34.6 Net position of P and Subsidiaries A and C

Since P's receivables from C of US \$50,000 are already paid to Subsidiary A, the net amount payable by P to A is US \$350,000.

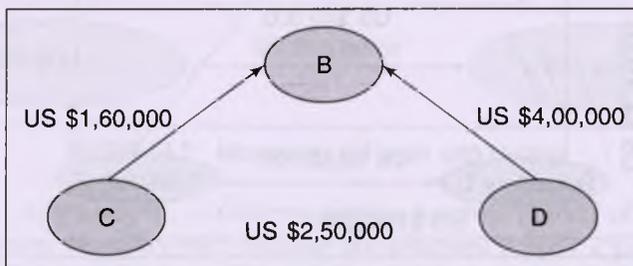

FIGURE 34.7 Net position of Subsidiaries B, C and D.

Reinvoicing Centre

The reinvoicing centre in MNCs is akin to a clearing house in a banking system. It may be beneficial for an MNC to create a separate centre to manage foreign exchange risk exposure. Such a centre, known as reinvoicing centre, is itself a subsidiary of the parent company; its location, for obvious reasons, is preferred in a country where exchange regulations, in terms of convertibility, repatriation and so on are the least constraining.

Subsidiaries are located in various countries of the world. They have dealings with clients and suppliers involving receipts and payments in currencies of various countries. Subsequent to the creation of a reinvoicing centre, the foreign currency invoices are made in the name of the reinvoicing centre by the subsidiaries. The centre receives the money in foreign currency, and in turn, makes payment/remittance of equivalent sum in national currency to the subsidiary concerned. Similarly, payments to various suppliers/lenders are made by the centre in foreign currency and it is reimbursed with an equivalent sum in the national currency from the concerned subsidiaries¹⁰. Being a centralised collection and payment centre of foreign currencies for all of its subsidiaries and affiliate companies, it not only helps in reducing the volume of foreign currency transfers but also hedging costs.

LO 34.4

RISK MANAGEMENT PRACTICES IN INDIA

- Minimising the variability in cash flows is the most emphasised objective of risk management.
- Firms are aware of the risk management techniques and an appreciably large proportion of them is using such techniques to manage various risks.
- All the risks are not managed equally. For instance, more than four-fifth of the firms manage the foreign exchange risk. Interest rate risk is managed by two-thirds, only two-fifths manage foreign exchange risk and foreign exchange translation risk is the least managed risk.
- The sample companies (as per survey of 2011–12) would like to reduce political or country risk by incorporating a risk premium in the cost of capital. Out of the various measures available, creating a joint venture with an enterprise of the host country is the most preferred one.
- In the case of anticipated depreciation of local currency, the sample companies sell local currency forward, invoice exports in foreign currency and import in local currency. In the case of anticipated appreciation, buying local currency forward and reducing local currency borrowings are the exchange risk management techniques adopted by the respondent firms.

- The sample companies use primarily netting and back-to-back swap techniques (from internal techniques of exchange risk management); as far as the use of external techniques is concerned, forwards are the most preferred, followed by currency swaps, currency options and currency futures.
- There are significant differences due to ownership in the use of risk management techniques. While private sector business group firms and public sector enterprises make greater use of foreign exchange transaction and interest rate risks, foreign controlled firms find it more useful to manage all risks except interest rate risk.
- 'Exposures are not large enough' is the most cited and prominent reason for not managing risks.
- Risks inherent in derivatives are a significant reason in making the firms desist from using risk management techniques. Moreover, the prominent barriers hindering the routine use of derivatives are monitoring and evaluating the risk of derivatives' pricing, valuing and accounting in conjunction with credit and liquidity risk.
- One-fifth of the firms perceive that the cost of hedging exceeds its benefits and, therefore, it is not beneficial for them to use risk management techniques.
- While a majority of the foreign controlled firms and private sector business group firms can be characterised as 'partial' hedgers, the majority of the public sector firms belong to the category of 'negligible' hedgers.
- The adoption of risk management techniques in India is still in infancy. The use of risk management techniques is likely to grow speedily with the active interest shown by regulatory bodies in propagating risk management techniques and making available various types of derivatives.

SUMMARY

LO 34.1

The multinational corporates (MNCs) and other business firms, having global business operations primarily encounter three types of exposure: (i) transaction exposure, (ii) translation exposure and (iii) economic exposure.

Transaction exposure is inherent in all foreign currency denominated contractual obligations/transactions which require settlement in foreign currency. The notable items susceptible to translation exposure are debtors receivable in foreign currency, creditors payable in foreign currency, foreign loans and foreign investments. The profit (or loss) accruing to the business firm on these transactions is known at the time of their settlement.

Translation exposure results from the need to translate foreign currency assets or liabilities into the local currency at the time of finalising accounts. Translation profits (or losses) may either be reflected in the income statement or be shown in the balance sheet (under the head of 'translation adjustment' as a separate item or adjusted in the owners' equity account).

Economic exposure is defined as the change in the value of a firm due to unanticipated change in exchange rates. While favourable change in exchange rates enhances the value of a firm, unfavourable change may entail its erosion.

Shapiro classifies economic exposure into two components, namely, transaction exposure and operating exposure. Operating exposure has an impact on the firm's future operating revenues, future operating costs and future operating cash flows.

LO 34.1

The greater is the susceptibility of operating cash flows to exchange rate changes, the greater is the economic exposure of the business firm, or *vice versa*. The firm's ability to adjust its cost structure and raise the prices of its products and services (depending on supply and demand elasticities) is the major determinant of its operating risk exposure.

Foreign exchange risk is defined as the possibility of loss to the business firm on account of unfavourable movement in foreign exchange rates.

Foreign exchange risk management (FERM) is concerned with techniques (both external and internal) through which finance managers/firms try to eliminate/reduce the adverse impact of unfavourable changes in the foreign exchange rates.

The major external techniques of the FERM are: (i) forward contracts, (ii) currency futures, (iii) currency options, (iv) swaps and (v) money market operations.

Forward contracts are contracts between business firms and authorised dealers of the FE markets in which the firms undertake to buy or sell foreign currency in exchange for home currency, at a specific future date at a pre-agreed exchange rate. A typical forward contract contains the (i) contract amount, (ii) forward exchange rate, (iii) parties of the contract, (iv) specific date of delivery, (v) name of foreign currencies involved and (vi) terms and conditions for cancellation.

A currency future/futures contract is a standardised agreement to buy or sell a pre-specified amount of foreign currency at some specified future date between the parties of the contract. Currency future contracts are normally in the hard currencies (say British £, US \$, Japanese yen) of the world and are traded on an organised exchange.

Although future contracts are similar to the forward contracts in their objective of hedging foreign exchange risk, they differ in many significant ways. These are: (i) nature and size of contracts, (ii) mode of trading, (iii) liquidity, (iv) deposits/margins, (v) default risk and (vi) actual delivery.

Currency option is a financial instrument that provides its holder a right but no obligation to buy or sell a pre-specified amount of a foreign currency at a pre-determined rate in the future (on a fixed maturity date/upto a certain period). Options are of two types: (i) call option and (ii) put option.

In a call option the holder has the right to buy (but is under no obligation to buy) a specific currency at a specific price on a specific maturity date or within a specified period of time. In contrast, a put option confers the right but no obligation to sell a specified amount of a specific currency at a pre-fixed price on or upto a specified date.

Swaps are exchange of debt obligations (interest and/or principal payments) between two parties. These are of two types, namely, interest swaps and currency swaps. While interest swaps involve exchange of interest obligations between two parties, currency swaps involve two parties who agree to pay each other's debt obligations denominated in different currencies.

Money market operations involve borrowing home currency by the business firm which will enable it to buy required foreign currency from the spot market. Once purchased, it is to be invested in the forex money markets in the desired foreign currency. The amount of home currency borrowed should be of the magnitude which will enable the firm to accumulate (after investment) such an amount of foreign currency which will enable it to make full payment on the date of maturity.

LO 34.3

The important internal hedging techniques of FERM are: (i) leading and lagging, (ii) invoicing/billing in the desired currency, (iii) indexation clauses, (iv) sharing risk, (v) shifting the manufacturing base, (vi) netting and (vii) re-invoicing center.

'Leading' is taking the lead to collect debtors receivable in foreign currency before they are due (when the home currency is expected to strengthen) and to initiate lead to pay 'foreign' creditors before they are due for payment (when depreciation/devaluation of the home currency is apprehended). The strategy leads to higher home currency receipts and lower home currency payments. In contrast, lagging is delaying receipts from foreign currency designated receivables whose currencies are likely to appreciate and delaying payments of 'foreign' creditors whose currencies are likely to weaken.

Instead of making two-way flows of money—one of receiving and another of paying, netting implies settlement on net basis. Netting is of two types: (i) bilateral and (ii) multilateral. While netting between two parties is referred to as bilateral, netting with more than two parties is called multilateral.

Reinvoicing center (normally a subsidiary of the parent company) is a centralised collection and payment center of foreign currencies for all of its subsidiaries and affiliate companies. It is located in such a country where the foreign exchange regulations primarily in terms of convertibility and repatriation are the least constraining. The Centre not only helps in reducing the volume of foreign currency transfers but also hedging costs.

SOLVED PROBLEMS

P.34.1 An Indian exporter has sold handicrafts items to an American business house. The exporter will be receiving US \$1,00,000 in 90 days. Premium for a dollar put option with a strike price of ₹62 and a 90 day settlement is ₹1. The exporter anticipates the spot rate after 90 days to be ₹60. Should the exporter hedge its account receivable in the option market? If the exporter is anticipating the spot rate to be ₹61.5 'or' ₹62.5 after 90 days, how would it effect the exporter's decision?

LO 34.2

Solution The Indian exporter will be buying a put option on the US \$ to hedge against depreciation in the US \$.

For settlement price of ₹60/US \$	
Option	Put
Strike	₹62/US \$
Premium	1/US \$
Settlement (expiration) rate	60

$$\begin{aligned} \text{Benefit from put option} &= \text{Max} [(\text{Strike rate} - \text{Expiration rate}), 0] - \text{Premium} \\ &= \text{Max} [(\text{₹62/US \$} - \text{₹60/US \$}), 0] - \text{₹1/US \$} = \text{₹1/US \$} \end{aligned}$$

As there is benefit in owning the put, so the exporter should hedge using the put option.

Here, if exporter remains unhedged, it will receive ₹60,00,000 [₹60/US \$ × US \$100,000]. But with hedging using put option, the exporter receives at the end 90 days. ₹61,00,000 [₹62/US \$ × US \$1,00,000 – ₹1/US \$ × US \$1,00,000].

For settlement price of ₹61.50/US \$.

$$\text{Benefit from put option} = \text{Max} [(\text{₹62/US \$} - \text{₹61.5/US \$}), 0] - \text{₹1/US \$} = -\text{₹0.5/US \$}$$

THE BOARD OF DIRECTORS OF THE COMPANY, upon the recommendation of the Management, has declared a dividend of \$0.10 per share of common stock for the quarter ended 3/31/2018.

The dividend will be payable on 4/15/2018 to shareholders of record as of 4/1/2018.

Shareholders may contact the Company at (800) 555-1234 for more information.

Very truly yours,

For settlement price of ₹62.50/US \$

$$\text{Benefit from put option} = \text{Max} [(\text{₹}62/\text{US } \$ - \text{₹}62.50/\text{US } \$), 0] - \text{₹}1/\text{US } \$ = -\text{₹}1/\text{US } \$.$$

So, for anticipated price of ₹61.5/US \$ or ₹62.5/US \$, the exporter will not be hedging through a put option as that does not have positive benefit.

P.34.2 Mars Enterprises buys dollar futures contract to cover possible exchange losses on its import order denominated in US dollars. The firm has to put up an initial margin of ₹3,00,000. The maintenance margin imposed by the exchange is 70 per cent of initial margin. When would Mars Enterprises receive a margin call from its broker and what does Mars Enterprises have in such circumstances?

LO 34.2
LO D M

Solution If the spot rate for the US \$ declines, the value of Mars Enterprises' future contract declines. As long as the decline is less than ₹90,000 (maintenance margin of 70 per cent is equal to ₹2,10,000), it does not need to put up any additional margin. When the cumulative decline in value comes to ₹90,001 and the margin account balance becomes ₹2,09,999. Mars Enterprises will receive a margin call from its brokerage firm. Under these circumstances, the company must restore the account to the initial level of ₹3,00,000. Otherwise, the exchange will sell out the future position of Mars Enterprises and return any remaining balance in the margin account.

P.34.3 A currency trader working at ONS capital management, expects higher volatility in the foreign exchange market owing to uncertain geopolitical situation. He expects the rupee to either appreciate by 2 per cent or depreciate by 2 per cent in comparison to the US \$ in 30 days time. He assumes equal probability for the two scenarios. The currency quote machine installed at ONS capital management is flashing the following quotes:

LO 34.2
LO D

Spot rate	₹61/US \$
Future rate (for one month)	61.7650/US \$
Call option (strike price ₹61, one month)	0.8900/US \$
Put option (strike price ₹61, one month)	0.2000/US \$

(a) What strategy should the currency trader adopt?

(b) If at the end of one month the spot rate is ₹62.35/US \$, what is the return on investment?

Solution Spot rate = ₹61/US \$: the spot rate after 30 days is

For 2 per cent appreciation in the rupee,

$$\text{₹}61/(1 + 0.02) = \text{₹}59.8039/\text{US } \$$$

For 2 per cent depreciation in the rupee

$$\text{₹}61/(1 - 0.02) = \text{₹}62.2450/\text{US } \$$$

So after 30 days the trader expects the spot rate (settlement rate for option or future) to be either ₹59.8039/US \$ or ₹62.2450/US \$.

To benefit from this expectation, the trader cannot use the futures market. Because if the trader takes a long position by buying futures at ₹61.7650/US \$, it can earn only if the settlement rate is ₹62.2450/US \$, whereas for a settlement rate of ₹59.8039 the trader will suffer loss. Similarly, if the trader takes a short position by selling futures, he can earn only if settlement rate is ₹59.8039, whereas he will lose if settlement rate is ₹62.2450/US \$.

Also, buying only call or only put will not give profit in both expected settlement rate. Appropriate strategy for the trader at ONS capital management will be to buy call and simultaneously also buy put. As call will be providing profit for depreciation in rupees (settlement rate ₹62.2450/US \$) and put will be providing profit for appreciation in rupees (settlement rate ₹59.8039/US \$).

For a settlement rate of ₹62.2450/US \$

$$\begin{aligned} \text{Profit} &= \text{Profit from call option} + \text{Profit from put option} \\ &= [\text{Max} [(\text{Settlement rate} - \text{Strike rate}), 0] - \text{Call premium}] + \end{aligned}$$

$$\begin{aligned} & \{\text{Max} [(\text{Strike rate} - \text{Settlement rate}), 0] - \text{Put premium}\} \\ &= \{\text{Max} [(\text{₹}62.3500/\text{US \$} - \text{₹}61.000/\text{US \$}), 0] - \text{₹}0.8900/\text{US \$}\} + \\ & \{\text{Max} [(\text{₹}61.000/\text{US \$} - \text{₹}62.3500/\text{US \$}), 0] - \text{₹}0.2000/\text{US \$}\} \\ & \{\text{₹}1.35/\text{US \$} - \text{₹}0.89/\text{US \$}\} + \{0 - \text{₹}0.2000/\text{US \$}\} = \text{₹}0.26/\text{US \$}. \end{aligned}$$

Return on investment

Investment in buying a call and a put = ₹0.8900/US \$ + ₹0.2000/US \$ = ₹1.09/US \$.

So the return on investment = $(0.26/1.09) \times 100 = 23.85$ per cent per month.

P.34.4 The corporate treasurer of a US multinational receives a fax on 21st February from its European subsidiary. The subsidiary will transfer € 10 million to the parent company on 16th August. The corporate treasurer decides to hedge the position using currency futures. The available spot and future rate of the Euro on the 21st February are:

LO 34.2 LOD M

Spot	September future	December future
US \$1.2800/€	US \$1.3283/€	US \$1.400/€

- (a) What expiry month will be chosen for the future by the corporate treasurer?
- (b) Will the corporate treasurer go long or short on the euro future?
- (c) If the corporate treasurer plans to hedge through futures in the European currency market, will he buy or sell dollar futures?
- (d) What is the unhedged and hedged outcome on 16th August, if the spot and futures rate on the 16th August are as follows:

Spot	September future	December future
US \$1.2200/€	US \$1.2320/€	US \$1.3529/€

Solution

- (a) The treasurer will choose the September future for hedging as it is the nearest expiry month from the date of euro receipt.
- (b) The treasurer will go short on the euro future.
- (c) He will buy a dollar future.
- (d) If it remains unhedged.

In this case on 16th August, when the multinational will receive € 10 million, it will convert them in to dollars on an applicable spot rate of US \$1.2200/€.

So the US dollar proceeds = US \$12,200,000 $(1.2200 \times 1,00,00,000)$

If hedged through future

As the settlement date is still far, the multinational has to convert its euro receipt using the spot market on 16th August and he will cover its short euro future position and receive the benefit.

The US dollar proceeds from the spot market = US \$12,200,000. US dollar profit from the futures market $(\text{US } \$1.3283/\text{€} - \text{US } \$1.2320/\text{€}) \times 10,000,000 = \text{US } \$9,63,000$. So the total US dollar proceeds = US \$1,31,63,000.

P.34.5 Company ABC and XYZ have been offered the following rates per annum on a ₹50.0 lakh five year loan.

LO 34.2 LOD M

	Fixed rate	Floating rate
Company ABC	9.0 %	Mibor + 0.3%
Company XYZ	10.8%	Mibor + 0.8%

Company ABC requires a floating rate loan. Company XYZ requires a fixed rate loan.

- (a) How can the two companies enter into a swap arrangement in which each benefits equally?
- (b) What risk could this arrangement generate?

Solution There is 1.8 per cent per annum differential between the fixed rate offered to the two companies and a 0.5 per cent per annum differential between the floating rates offered to the two companies. This provides

1. The first part of the document discusses the general principles of the law.

2. The second part of the document discusses the specific provisions of the law.

3. The third part of the document discusses the application of the law to the facts of the case.

4. The fourth part of the document discusses the conclusion of the court.

5. The fifth part of the document discusses the dissenting opinion.

6. The sixth part of the document discusses the majority opinion.

7. The seventh part of the document discusses the concurring opinion.

8. The eighth part of the document discusses the dissenting opinion.

9. The ninth part of the document discusses the majority opinion.

10. The tenth part of the document discusses the dissenting opinion.

11. The eleventh part of the document discusses the majority opinion.

12. The twelfth part of the document discusses the dissenting opinion.

13. The thirteenth part of the document discusses the majority opinion.

14. The fourteenth part of the document discusses the dissenting opinion.

15. The fifteenth part of the document discusses the majority opinion.

16. The sixteenth part of the document discusses the dissenting opinion.

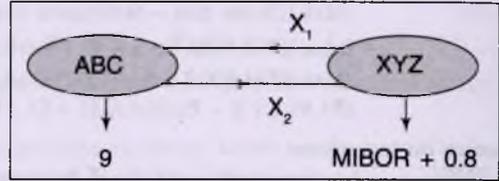

17. The seventeenth part of the document discusses the majority opinion.

18. The eighteenth part of the document discusses the dissenting opinion.

19. The nineteenth part of the document discusses the majority opinion.

20. The twentieth part of the document discusses the dissenting opinion.

the basis for swap. The total gain to the party from the swap is 1.8% in fixed rate to company ABC – 0.5% loss in higher payment of interest in floating rate by XYZ = 1.3 per cent per annum. Thus if the swap benefit has to be equally distributed (0.65%) between the two companies; swap will lead to an effective rate of MIBOR – 0.35 i.e., Mibor + 0.3 – 0.65% for Company ABC and 10.15% rate of interest for Company XYZ i.e. 10.80% – 0.65%.

- (a) Under swap arrangement, Company ABC will be borrowing from the fixed rate market and lending it to Company XYZ (say at X_1 is the rate of interest), similarly XYZ will be borrowing from the floating rate market and will lend that to Company ABC.
- (b) The risk would include default risk on the part of the 2 swap parties. There may also be liquidity risk in the event that one or both of the swaps may need to be reversed. There may also be a country risk if one party is based overseas.

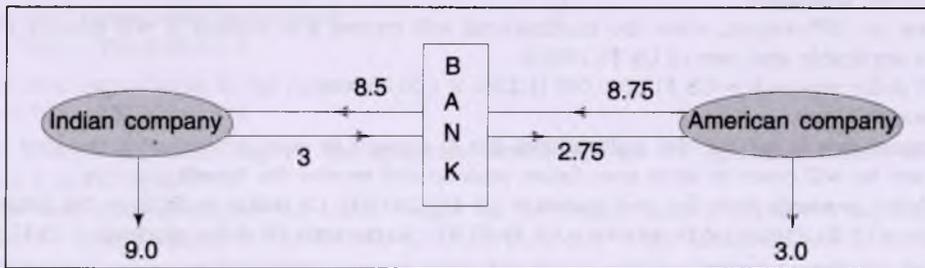

P.34.6 An Indian business house has decided to borrow US \$ for its New York subsidiary. And an American multinational has made up its mind to borrow Indian rupees for its Indian subsidiary. The amount required by the two companies are the same at the current exchange rate. The companies have been quoted the following interest rates:

LO 34.2 **LO M**

	On rupee loan in India	On US \$ loan in America
Indian Company	9.0%	4.0%
American Company	9.5%	3.0%

Both the Indian business house and the American multinational carries out their banking operation through the same multinational bank. The multinational bank comes to know of the situation faced by the two companies and plans to design a swap. As the bank will be assuming all foreign exchange risk, it plans to receive total 50 basis points per annum and also plans to make the swap equally attractive to the two companies. What will the design of the swap be?

Solution On a rupee loan, the Indian company has absolute advantage of 0.5 per cent and the American company has absolute advantage of 1.0 per cent, so under the swap arrangement there will be benefit of 1.5 per cent. Since the bank requires 0.5 per cent, this leaves 1.0 per cent benefit to be shared. So, there will be 0.5 per cent gain for each, the Indian company and the US company.

Thus swap should lead to the Indian company borrowing the dollar at $4.0 - 0.5 = 3.5$ per cent and to the American company borrowing the rupee at $9.5 - 0.5 = 9.0$ per cent.

The interest flow can be as follows:

Here the Indian company borrows in India at 9 per cent and lends the same to the bank at 8.5 per cent. Whereas the American company borrows in America at 3.0 per cent and lends to the bank at 2.75 per cent. Simultaneously the bank charges 8.75 per cent from the American company (gain is of 0.75 per cent – loss of 0.25 per cent, i.e., $3\% - 2.75\%$) and 3 per cent from the Indian company (i.e. gain of 1% – loss of 0.5 per cent as it borrows at 9% and lends of 8.5%). Thus, there is a gain of 0.5% to both the companies.

P.34.7 Company ABC and XYZ face the following interest rate:

LO 34.2 LOD D

	ABC	XYZ
US dollar (floating rate)	LIBOR + 0.5%	LIBOR + 2.5%
Japanese yen (fixed rate)	2%	2.25%

Assume that XYZ wants to borrow dollars at a floating rate of interest and ABC wants to borrow Japanese yen at a fixed rate of interest. A financial institution is planning to arrange a swap and requires a 75 basis point spread. If the swap is equally attractive to ABC and XYZ, what rate of interest will they end up paying?

Solution ABC has a higher comparative advantage in the floating rate US dollar market but wants to borrow in the fixed rate yen market. This provides the basis for a swap.

There is a 2 per cent per annum differential between the dollar rate offered to the two companies and a 0.25 per cent difference in yen rate offered to the two companies. Also, ABC has the advantage in absolute terms in both markets. So, the total gain to all parties from the swap is $2 - 0.25 = 1.75$ per cent per annum as ABC company will raise in \$ yielding gain of 2% and XYZ company will borrow in Japanese yen causing loss of 0.25%. Since the bank gets 0.75 per cent per annum, the swap should make ABC and XYZ 0.5 per cent per annum benefit. This means the swap should lead to ABC borrowing the yen at 1.5 per cent per annum and to XYZ borrowing the dollar at LIBOR + 2 per cent per annum.

P.34.8 Drishti Electro Limited enjoys a very high rating in the Indian money market due to its strong financials and track record. Om Software Limited is a new but growing company. Drishti Electro and Om Software can obtain loans at the rate given below:

LO 34.2 LOD D

	CD (Company Deposit) with fixed rate	Mumbai inter-bank money market with variable rate
Drishti Electronics Limited	T + 0.50	MIBOR + 0.10
Om Softwares Limited	T + 2.10	MIBOR + 0.60

Here T is the yield on 15-year government treasury bonds. Drishti Electronics Limited wants to take a loan at variable rate, while Om Software wants loan at fixed rate. The two companies approach a bank to design suitable swaps.

- (a) If the bank wants to have a profit of 0.20 per cent to be contributed from the Om Software's (out of total profit of swap) share of swap benefit, what would be the two agreements that the bank will enter with these two companies?
- (b) What are likely costs of debt to the two companies?

Solution Drishti Electronics has a comparative advantage in the fixed rate market of 1.6 per cent per annum but wants to take a loan at a variable rate. In the variable rate (floating rate) market the comparative advantage is 0.50 per cent. So, under swap arrangement there will be a total benefit of $1.6 - 0.5 = 1.1$ per cent.

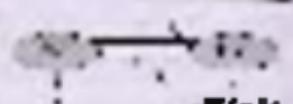

- (a) Drishti Electronics will raise money from the fixed rate market and Om Software will raise money from the floating rate market. The bank will make an agreement with Drishti Electronics, under which the bank will borrow fixed rate money and will lend floating rate money. Similarly, the bank will make an agreement with Om Software for borrowing at floating rate and lending at fixed rate.
- (b) As the total swap benefit is 1.1 per cent, 0.55 per cent benefit belongs to each party. The bank's share is 0.20 per cent of Om Software's share of benefit. As a result, Om Software's share of profit will decrease to 0.35 per cent per annum; Drishti Electronics's gain is 0.55 per cent per annum.

So, the likely cost of debt for Drishti Electronics will be MIBOR-0.45 per cent per annum and the cost of debt for Om Software will be $(T + 1.75)$ per cent per annum.

P.34.9 Credit Bank Limited needs fixed rate funding. It plans to raise finance at the cost of a six month LIBOR + 1/4 per cent for £ 500 million, for 5 years. The bank is considering to enter into a swap of fixed rate at 6 per cent and receiving interest equivalent to a six month LIBOR.

Set out the cash flows involved. What will the all-in-cost of funds to Credit Bank Limited be? Consider 6 months as exactly half a year.

Solution (a) Credit bank pays LIBOR + 0.25 per cent per annum for 5 years. Swap involves payment of 6 per cent per annum and receipts of LIBOR are 0.50.

Interest rates inflow	LIBOR
Interest rates outflow	(LIBOR + 0.25%) + 6%
So net interest payment	(LIBOR + 0.25%) + (6%) – LIBOR = 6.25 per cent per annum

Cash flows per six month period £ The 500 million \times 6/12 \times 6.25/100 = £ 15.625 million

P.34.10 The Airlines Company entered into an agreement with Airbus for buying the latest planes for a total value of Euro 100 million, payable after 6 months. The current spot exchange rate is INR 78/€. The Airlines Company cannot predict the exchange rate in the future. Can the Airlines Company hedge its foreign exchange risk using derivatives? Explain by examples. LO 34.2 ^{LOO}
E

Solution Yes. The Airlines Company can hedge its foreign exchange risk through the following methods:

- (i) **Forward Contract:** The Airlines Company can enter into a forward contract (for a period of 6 months) for the full payment of € 100 million to hedge/reduce its foreign exchange risk. The given spot rate is ₹78/€, its liability is ₹7,800 million. The Airlines Company can enter into a forward contract with the bank to buy € forward, say, at the rate of ₹78.2/€. So the liability of the company is ₹7,820 million after 6 months. Suppose the actual exchange rate after 6 months turns out to be ₹78.5/€, in absence of such a forward contract, the liability would have been of ₹7,850 million. As a result, the Airline Company has reduced the risk and benefited by ₹30 million.
- (ii) **Foreign Currency Option:** Risk can be hedged by having a call option. The call option holder will exercise the right only if it is beneficial for him. Airlines Company can purchase a 6 months call option at an agreed rate of, say, ₹78.5/€ plus a premium of 3 per cent. So, in this case the actual cost is ₹7,850 million \times 1.03 = ₹8085.5 million.

Suppose at the end of 6 months the spot exchange rate turns out to be ₹79/€. Airlines Company will exercise its option and pay ₹78.5 per € and the total cost will be ₹8,085.5 million. In the open market one € will be available at ₹79 (Total outflow will be ₹7,900 million + premium already paid ₹235.5 million = ₹8135.5 million). So it is beneficial for him to exercise the option (the gain is ₹8135.5 million – ₹8085.5 million = ₹50 million).

Whether the company will opt for a forward contract (futures forward is also a possibility in case the amount of € 100 million is the standardised sum) or a call option will depend on the management's attitude towards risk. In case it is interested in hedging risk only, it would like to enter into a forward contract/futures contract (cash outflows are known with certainty irrespective of the Ff exchange rate on maturity). However, if the company wants to avail the advantage that may accrue due to the lowering of the Euro exchange rate, it will prefer to go for the call option.

P.34.11 A company operating in a country having the dollar as its unit of currency has invoiced sales to an Indian company today, the payment is due three months from the date of invoice. The invoice amount is US \$16,500 and at today's spot rate of US \$0.0165 per ₹1, it is equivalent to ₹10,00,000. It is anticipated that the exchange rate will decline by 5 per cent over the three month period and in order to protect the dollar proceeds, the importer proposes to take appropriate action through the foreign exchange market. LO 34.2,3 ^{LOO}
M

The three month forward rate is quoted as US \$0.0160 per ₹1. You are required to calculate the expected loss and show how it can be hedged by a forward contract.

Solution Spot rate: ₹1 = US \$0.0165

Three month forward rate: ₹1 = US \$0.0160

Three month forward rate without forward contract is US \$0.0165 \times ₹0.95 = US \$0.015675.

Calculation of expected loss without forward contract

Invoice amount is US \$16,500, which is equal to ₹10,00,000, i.e. US \$16,500/0.0165.

Payment due after three months is US \$16,500/0.015675 = ₹10,52,631.58

Expected loss is ₹10,52,631.58 – ₹10,00,000 = ₹52,631.58

Hedging of loss under forward contract

Payment at the time of import is US \$16,500, which is equal to ₹10,00,000

Payment due in three months is \$16,500/0.0160 = ₹10,31,250

Loss is ₹10,31,250 – ₹10,00,000 = ₹31,250

So, under the forward contract loss is hedged by 52,631.58 – 31,250 = ₹21,381.58.

P.34.12 X Limited, an Indian company, has an export exposure of 10 million yen value at September-end. The yen is not directly quoted against the rupee. The current spot rates are USD/INR = 61.79 and USD/JPY = 102.00. It is estimated that the yen will depreciate to 115 level and the rupee will depreciate against the dollar to ₹63.

LO 34.2 LOD M

Forward rate for September USD/Yen = 108 and USD/INR = 62.89.

You are required: (i) to calculate the expected loss if hedging is not done. How the position will change with the company taking forward cover? (ii) If the spot rate on 30th September was eventually US \$/₹ = 109 and USD/INR = 62.78, is the decision to take forward cover justified?

Solution Since a direct quote for yen and rupee is not given, it is to be calculated by cross currency exchange rates.

$$\text{INR/USD} \times \text{USD/JPY} = \text{INR/JPY}$$

$$61.79/1 \times 1/102.00 = 61.79/102.00 = 0.6057$$

Spot rate on the date of export = 1 yen = ₹0.6057

Estimated rate on September 1 yen = ₹0.5478 (63/115)

Actual rate on September [1 yen = ₹0.5760] i.e., (62.78/109)

Forward rate on September [1 yen = ₹0.5823] i.e., [62.89/108.0]

(i) Calculation of expected loss without hedging:

Value of exports at the time of export is ₹0.6057 × ₹10 million = ₹60,57,000.

Estimated payment to be received in September is ₹0.5478 × ₹10 million = ₹54,78,000.

$$\text{Loss is } ₹60,57,000 - ₹54,78,000 = ₹5,79,000$$

Hedging of loss under forward cover

Rupee value of exports (on the date of export) = ₹0.6057 × ₹10 million = ₹60,57,000.

Payment received under forward cover is ₹0.5823 × ₹10 million = ₹58,23,000.

$$\text{Loss is } ₹60,57,000 - ₹58,23,000 = ₹2,34,000.$$

By taking forward cover, loss of ₹3,45,000 (₹5,79,000 – 2,34,000) is reduced.

(ii) Since payment received under forward cover is higher at ₹58,23,000 *vis-a-vis* without any forward cover (₹57,60,000), the decision to take forward cover is justified.

P.34.13 A customer with whom the bank had entered into 3 months forward purchase contract for Swiss francs 10,000 at the rate of ₹62.25 comes to the bank after 2 months and requests cancellation of the contract. On this date, the rates prevailing are:

LO 34.2 LOD E

Spot	CHF 1 = ₹62.30	62.35
One month forward	62.45	62.52

Determine the amount of loss suffered by the customer due to cancellation of the contract.

Solution Since the customer finds the forward rate higher than the contract rate, at which he is to sell the Swiss francs (CHF) to the bank, he is suffering loss from the transaction. The loss amount will be equivalent to the difference of the one month forward price at which the customer would have purchased the CHF from the market (the relevant price is the selling price from the dealer's point of view, i.e., ₹62.52) and the contracted price of the bank is ₹62.25 multiplied by CHF 10,000. Total loss, therefore, is equivalent to ₹2,700 (₹62.52 – ₹62.25) × CHF 10,000.

P.34.14 Assume that in P34.13 the customer is a buyer of Swiss francs 10,000 at ₹62.25. Assume all rates remain unchanged, do you think the buyer would have cancelled the contract?

LO 34.2

LOD
M

Solution The buyer will not cancel the contract as it will be profitable from him to buy at ₹62.25 and sell at ₹62.45 (equivalent to the dealer's buying price). His gain will be ₹2,000, i.e., $(₹62.45 - ₹62.25) \times \text{CHF } 10,000$.

P.34.15 A fixed rate currency swap has a remaining life of 12 months. It involves exchanging interest at 8 per cent on £10 million for interest at 6 per cent on US \$20 million. If the swap rate were negotiated today, interest exchanged would be 4 per cent on the US \$ and 6.5 per cent on pound sterling. The current exchange rate is US \$1.6100/£. What is the value of the swap to the party paying pound sterling?

LO 34.2

LOD
M

Solution The swap involves exchanging the sterling interest of £10 million $\times 0.08 =$ £0.8 million for the dollar interest of \$20 million $\times 0.06 =$ US \$1.2 million. The principal amounts are also exchanged at the end of the swap's life.

So the value of the sterling bond underlying the swap is the present value of the sterling payment = $(£10 \text{ million} + £0.8 \text{ million})/1.065 =$ £10.14 million.

The value of dollar bond underlying the swap is = $(\text{US } \$20 \text{ million} + \text{US } \$1.2 \text{ million})/1.04 =$ US \$20.38 million.

(a) Thus, the value of the swap to the party paying sterling is $\$20.38 - (£10.14 \times 1.610) =$ \$16.3254, i.e., US \$4.0546 million.

P.34.16 An Indian importer purchases goods worth US \$1,00,000. Payment is due in three months. The importer wants to hedge foreign exchange risk by using the money market. Money market data are as follows:

LO 34.2

LOD
M

Interest rate in the US money market for 3 months: 4% p a

Interest rate in the Indian money market for 3 months: 10% p a and spot rate of US \$ is ₹62/\$.

State all transactions the importer will undertake to hedge his risk.

Solution As the importer is to pay US \$1,00,000 after 3 months, he would like to enter into a set of transactions that makes the rupee cost of this payment immune to exchange rate fluctuations. For this he will carry out the following transaction in the money market.

(a) He will invest the dollar amount (say x) in the US market in such quantity that he receives US \$1,00,000 at the end of 3 months. Or

$$x(1 + 0.04 \times 3/12) = \text{US } \$1,00,000$$

$$1.01x = \text{US } \$1,00,000$$

$$x = \text{US } \$1,00,000/1.01 = \text{US } \$99,010.$$

(b) To invest US \$99,010 in the US market, the importer will buy these US \$ in the spot market. Rupees required to make this purchase = $\text{US } \$99,010 \times ₹62 =$ ₹61,38,620.

(c) The importer is required to arrange through borrowings in Indian market (@ 10% p a). So, the importer will need to pay ₹61,38,620 $(1 + 0.1 \times 3/12) =$ ₹62,92,086 after 3 months.

Thus, whatever be the change in the spot rate over next 3 months the Indian importer is to pay ₹62,92,086 to pay its import bill of US \$1,00,000.

P.34.17 ABC Textiles Limited places an order to buy textile machinery with an American company. As per the agreement, ABC Textiles Limited will be paying US \$200,000 after 180 days. As the fluctuation in the spot rate of the US dollar over next 180 days will impact the rupee cost of import, the Board of ABC Textiles Limited asks its finance manager to collect data from the currency forward market, money market, currency option market etc. The board also asks a consultant to assess various possible dollar spot rates after six months.

LO 34.2

LOD
D

The various findings are as follows:

- (a) Possible spot rate of dollar after six months, as estimated by the consultant, is ₹61.25, ₹61.75, ₹62, ₹62.50, ₹62.90.
- (b) Spot rate of dollar as of today is ₹62/US \$.
- (c) 180 day forward rate of dollar as of today is ₹62.48/US \$.
- (d) Interest rates are as follows:

	India	USA
For 180 day deposit rate (per annum)	7.5%	1.5%
For 180 day borrowing rate (per annum)	8.0%	2.0%

- (e) A call option on the dollar, which expires in 180 days, has an exercise price of ₹62/US \$ and premium ₹0.52/US \$.
- (f) A put option on dollar, which expires in 180 days, has an exercise of ₹62/US \$ and premium of ₹0.04/US \$.

Carry out a comparative analysis of the various outcomes (rupee cost of import) under the alternatives of (i) not hedging (ii) forward hedging (iii) money market hedging and (iv) option hedging.

Solution Comparison of hedging alternative for ABC Textiles Limited.

ABC Textiles will need to purchase US \$2,00,000 to fulfill its import obligation. It will do so by making a purchase in the spot market after 180 days. ABC textiles rupee outgo in this circumstances will be:

Expected spot rate after 180 days	Rupee outgo to purchase US \$2,00,000
₹61.25/US \$	₹1,22,50,000
61.75/US \$	1,23,50,000
62.00/US \$	1,24,00,000
62.50/US \$	1,25,00,000
62.90/US \$	1,25,80,000

Forward hedge:

Rupees needed to buy US \$2,00,000 with forward contract = US \$2,00,000 × ₹62.48/US \$ = ₹1,24,96,000.

Money market hedge

Borrow rupee, convert to US dollar, invest US dollar to receive US \$2,00,000 in 180 days. Amount in US dollar to be invested = US \$2,00,000/(1 + 0.015 × 180/360) = US \$1,98,511.

Amount in rupees that need to converted into US dollar for investing = US \$1,98,511 × ₹62/US \$ = ₹1,23,07,682.

Interest and principal owed in rupee loan to be returned after 180 days = ₹1,23,07,682 (1 + 0.08 × 180/360) = ₹1,27,99,990.

So the rupee outgo for ABC Textiles will be ₹1,27,99,990.

Option hedge

Purchase call (assuming that the option is to be exercised on the day the US dollar are needed) exercised price is ₹62/US \$; premium is ₹0.52/US \$.

Possible spot rate after 180 days	Premium per unit paid for option	Exercise option	Total price paid per unit	Total price paid for US \$2,00,000
₹61.25	₹0.52	No	₹61.77	₹1,23,54,000
61.75	0.52	No	62.27	1,24,54,000
62.00	0.52	No	62.52	1,25,04,000
62.50	0.52	Yes	62.52	1,25,04,000
62.90	0.52	Yes	62.52	1,25,04,000

P.34.18 Romesh Sharma is a currency trader for a large currency trading firm of USA, based in New Jersey. He expects the US dollar to depreciate against the euro. The current spot rate of the euro is US \$ 1.300/€ and the premium on call and put options are as follows:

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

Strike: US\$ 1.3280/€	30 days	60 days
Call option on the euro	0.085	0.100
Put option on the euro	0.110	0.135

- (a) What should Romesh Sharma do to profit from his anticipation?
 (b) What will the profit or loss be, if the rate on settlement date, after 30 days, is US \$ 1.4728/€, and (i) Romesh Sharma has bought a 30 day call, (ii) Romesh Sharma has sold a 30 day put.

Solution

- (a) As Romesh Sharma anticipates the US dollar to depreciate against the euro (appreciation of euro against the US dollar), he can be benefited either by buying a call option on euros or selling a put option on euros.

- (b) (i) Profit from purchase of call

Profit from purchase of call for a strike price of US \$ 1.3280/€, premium US \$ 0.085/€ and settlement rate (expiration rate) of US \$ 1.4728/€

$$= \text{US } \$ (1.4728 - 1.3280)/\text{€} - \text{US } \$ 0.085/\text{€} = \text{US } \$ 0.0598/\text{€}$$

As the settlement rate is higher than the strike rate, Romesh Sharma will exercise the option.

- (ii) Profit from sell of put

As the settlement rate (US \$ 1.4728/€) is higher than the strike rate, this put option will not be exercised. So, for Romesh Sharma the premium that he received on selling (writing) the put option is his profit (US \$ 0.110/€).

Selling an option entails high risk, but is used as a strategy by the currency trader when he is confident of his anticipation.

P.34.19 On January 28, 2018 an importer customer requested a bank to remit Singapore Dollar (SGD) 25,00,000 under an irrevocable LD. However, due to bank strikes, the bank could effect the remittance only on February 4, 2018. The interbank market rates were as follows:

LO 34.2 **LOD M**

	January 28	February 4
Mumbai US \$ 1	₹60.85/60.90	60.91/60.97
London Pound 1	US\$ 1.4940/1.4950	1.4865/1.4875
Pound 1	SGD 1.9175/1.9190	1.8990/1.9000

The bank wishes to retain an exchange margin of 0.125 per cent. How much does the customer stand to gain or lose due to the delay? (Calculate rate in multiples of .0001)

Solution

Since importer needs SGD, and the exchange rate of ₹/SGD is not given, we are to compute first the cross rate - (As the bank is selling so only ask prices are required)

$$[\text{₹}/\text{SGD}]_{\text{ask}} = [\text{₹}/\$]_{\text{ask}} \times [\$/\text{SGD}]_{\text{ask}}$$

Since, $[\text{\$/SGD}]_{\text{ask}}$ is not given, we will calculate it

$$[\text{₹}/\text{SGD}]_{\text{ask}} = [\$/\text{₹}]_{\text{ask}} \times [£/\text{SGD}]_{\text{ask}}$$

For January 28, 2018:

$$\begin{aligned} [\text{₹}/\text{SGD}]_{\text{ask}} &= 1.4950 \times \frac{1}{3.9175} \\ &\Rightarrow \$0.7797/\text{SGD} \end{aligned}$$

On February 4, 2018:

$$[\text{₹}/\text{SGD}]_{\text{ask}} = 1.4875 \times \frac{1}{1.8990}$$

$$\Rightarrow \$0.78330/\text{SGD}$$

On January 28, Inter-bank rate:

$$\begin{aligned} [₹/\text{SGD}]_{\text{ask}} &= ₹60.90 \times 0.7797 \\ &= ₹47.483/\text{SGD} \end{aligned}$$

Rate to be charged from importer

SGD ₁	₹47.4830
Plus exchange margin (0.125%)	0.0593
	₹47.5423

On February 4, Inter-bank rate:

$$\begin{aligned} [₹/\text{SGD}]_{\text{ask}} &= ₹60.97 \times 0.7833 \\ &\Rightarrow ₹47.7578/\text{SGD} \end{aligned}$$

Rate to be charged from importer

SGD ₁	₹47.7578
Plus exchange margin (0.125)	0.0597
	₹47.8175

Since on February 4, the SGD has appreciated, importer suffers loss.

$$\begin{aligned} \text{Loss} &= (₹47.8175 - ₹47.5423) \times 25,00,000 \text{ (SGD)} \\ &= ₹6,88,000 \end{aligned}$$

P.34.20 XYZ Limited borrows ₹15 million of six months LIBOR + 10.00% for a period of 24 months. The company anticipates a rise in LIBOR, hence, it proposes to buy a cap option from its bankers at the strike rate of 8.00%. The lump sum premium is 1.00% for the entire reset periods and the fixed rate of interest is 7.00% per annum. The actual position of LIBOR during the forthcoming reset period is as under:

LO 34.2,3

Reset Period	1	2	3
LIBOR (%)	9.00	9.50	10.00

You are required to show how far interest rate risk is hedged through cap option. For calculation, work out figures at each stage up to four decimal points and amount nearest to ₹. It should form part of working notes.

Solution

Premium payable to bank:

$$\begin{aligned} P &= \frac{R_p \times A}{\{(1/i) - [1/(i \times (1 + i)^t)]\}} = \frac{0.01}{\{(1/0.035) - [1/(0.035 \times 1.035^4)]\}} \times ₹15,000,000 \\ &= ₹40,861 \end{aligned}$$

where

- P = Premium
- A = Principal amount
- R_p = Rate of premium
- i = Fixed rate of interest
- t = Time period

Computation of net payment received from bank

Reset period	Additional interest due to rise in interest rate	Amount received from bank	Premium paid to bank	Net amount received from bank
1	₹75,000	₹75,000	₹40,861	₹34,139
2	₹112,500	₹112,500	₹40,861	₹71,639
3	₹150,000	₹150,000	₹40,861	₹109,139
Total	₹337,500	₹337,500	₹122,583	₹214,917

Thus, interest rate risk of ₹337,500 gets reduced by ₹214,917 by using cap option.

Net Sales	100.00	100.00
Cost of Goods Sold	60.00	60.00

MINI CASES

34.C.1 The investment manager of a large Indian software company receives the following quotes from its foreign exchange broker.

US dollar spot rate : ₹60.75/US \$

US dollar option quotation

Strike price	Call			Put		
	June	September	December	June	September	December
58.0000	3.0	—	—	—	—	—
58.5000	2.6	2.9	—	—	—	—
59.0000	2.0	2.3	2.45	0.2	—	—
59.5000	1.85	1.95	2.15	0.25	—	—
60.0000	1.25	1.85	2.00	0.70	0.90	—
60.5000	0.85	1.15	1.45	1.00	1.25	1.75
61.0000	0.50	0.74	0.89	1.59	1.92	2.50
61.5000	0.30	0.52	0.68	1.70	2.20	—
62.0000	0.15	—	—	1.90	—	—
62.5000	0.10	—	—	2.00	—	—
63.0000	0.08	—	—	2.30	—	—

What calculation will the investment manager make for following questions?

- What is the intrinsic value for the September 60.5 call option?
- What is the intrinsic value for the June 59 put option?
- What is the break-even exchange rate for the December 59.5 call and the December 61 put?
- If the December spot rate is expected to be ₹61.50/US \$, which call option should be bought?
- The software company will receive its export income in December and the expected spot rate (in December) will be ₹59.5/US \$, which put option should be bought?

Solution Intrinsic value of an option is the amount by which the option is in-the-money

For a call option, intrinsic value = Maximum [(Spot rate – Strike rate), 0]

For a put option, intrinsic value = Maximum [(Strike rate – Spot rate), 0]

(a) Intrinsic value for the September 60.5 call option

$$= \text{Max} [(\text{₹}60.75/\text{US } \$ - \text{₹}60.5/\text{US } \$), 0] = \text{Max} [0.25/\text{US } \$, 0] = 0.25/\text{US } \$$$

(b) Intrinsic value for the June 59 put option

$$= \text{Max} [(\text{₹}59/\text{US } \$ - \text{₹}60.75/\text{US } \$), 0] = \text{Max} [-1.75/\text{US } \$, 0] = 0$$

(c) The break-even exchange rate for the December 59.5 call on settlement date is ₹X/US \$

So, the premium paid = ₹2.15/US \$

profit from the call option = ₹(X – 59.5)/US \$

at break-even, ₹(X – 59.5)/US \$ = ₹2.15/US \$

$$X = \text{₹}61.65/\text{US } \$$$

The break-even exchange rate for December 61 put is:

Premium paid = ₹2.50/US \$

Profit from the put option = ₹(61 – X)/US \$

At break-even, ₹(61 – X)/US \$ = ₹2.50/US \$

$$X = \text{₹}58.5/\text{US } \$$$

(d) For an expected spot rate of ₹61.5/US \$, we need to find out profit from buying the December call option at various strike prices.

Gain from call option

$$= \text{Max} [(\text{Settlement rate} - \text{Strike rate}), 0] - \text{Premium}$$

$$= \text{Value of option at expiration} - \text{Premium}$$

Option	Strike price	Premium (A)	Option value at expiration (B)	Gain/Loss [B - A]
December call	₹59.00/US \$	₹2.45/US \$	₹2.50/US \$	₹0.05/US \$
December call	59.50/US \$	2.15/US \$	2.00/US \$	- 0.15/US \$
December call	60.00/US \$	2.00/US \$	1.50/US \$	- 0.50/US \$
December call	60.50/US \$	1.45/US \$	1.00/US \$	- 0.45/US \$
December call	61.00/US \$	0.89/US \$	0.50/US \$	- 0.39/US \$
December call	61.50/US \$	0.68/US \$	0.00/US \$	- 0.68/US \$

So, for the expected December spot price of ₹61.50/US \$, the December call option of strike price ₹59.00/US \$ should be bought.

- (e) Gain from purchasing the December put option of various strikes, for which quotes are available, for an expiration price of ₹59.50/US \$.

Option	Strike price	Premium (A)	Option value at expiration (B)	Gain/Loss [B - A]
December put	₹60.50/US \$	₹1.75/US \$	₹1/US \$	- ₹0.75/US \$
December put	61.00/US \$	2.50/US \$	1.50/US \$	- 1.00/US \$

As no gains accrue by purchasing the different December put available for the expected December expiration rate of ₹61.50/US \$, the software company should not hedge through the put options.

REVIEW QUESTIONS

LOD: Easy

RQ.34.1 (a) Indicate whether the following statements are true or false:

[LO 34.1,2,3]

- (i) Exposure relating to the change in accounting income and balance sheet statements caused by changes in exchange rates is called Transaction exposure.
- (ii) Change in the value of a company that accompanies an unanticipated change in exchange rates is called economic exposure.
- (iii) Forward exchange contracts are traded on at an organised exchange.
- (iv) Future contracts are carried out through direct dealings between parties.
- (v) The benefits that accrue due to favourable movements in foreign exchange rates can be availed of by using currency options.
- (vi) Firms engaged in international operations should endeavour to have their assets in a strong currency.
- (vii) Leading and lagging is an internal technique of foreign exchange risk management.
- (viii) Translation profits or losses must be reflected in the income statement.
- (ix) In a call option, the holder has the right to sell (but is under no obligation to sell) a specific currency at a specific price on a specific maturity date or within a specified period of time.
- (x) Currency swaps involve exchange of interest obligations between two parties.

[Answers: (i) False (ii) True (iii) False (iv) False (v) True
(vi) True (vii) True (viii) False (ix) False (x) False]

(b) Fill in the blanks with the correct answer (out of the choices provided).

- (i) Operating exposure to exchange rate changes has an impact on the firm's _____ (current/future) operating revenues, costs and cash flows.
- (ii) The more differentiated a firm's products are, the _____ (more/less) is its operating exposure to exchange rate changes.
- (iii) Forward contracts in currencies are closed by _____ (actual delivery of foreign currency/settlement of difference between the contracted and actual price.)
- (iv) When the option can be exercised only on the maturity date, it is called an _____ (American/European) option.

- (v) Operating exposure to exchange risk is _____ (more/less) if the price elasticity of demand of the goods/services, the firm deals in is low.
- (vi) If the immediate exercise of the option yields a positive value to the holder, the option is said to be _____ (in/at) the money.
- (vii) The practice of delaying receipts from the foreign currency designated receivables whose currencies are likely to appreciate and delaying foreign currency designated payables whose currencies are likely to depreciate is known as _____ (leading/lagging).
- (viii) Multilateral netting involves _____ (two/more than two) parties.
- (ix) A firm having a higher elasticity of substitution between home-country and foreign-country inputs or production is _____ (more/less) susceptible to foreign exchange risk.
- (x) Where an MNC firm having many foreign subsidiaries creates a re-invoicing centre, the invoices are made in the name of _____ (subsidiaries/reinvoicing centre).

[Answers: (i) future (ii) less (iii) actual delivery of foreign currency (iv) European (v) less (vi) in (vii) lagging (viii) more than two (ix) less (x) re-invoicing centre]

- RQ.34.2** What types of exchange exposures do international companies and multinational companies (MNCs) face? [LO 34.1]
- RQ.34.3** What is 'strike price'? What is its relevance? [LO 34.2]
- RQ.34.4** An Indian exporter sold goods to a US company. The receivables of 10 million dollars are due in 3 months. How can the exporter hedge this exposure by using a put option given the following information: [LO 34.2]

Strike price	₹61.10/\$
Maturity	3 months
Premium	2 per cent
Current spot rate	₹61.50/\$

Also state various possibilities regarding the use of the put option by him.

- RQ.34.5** ABC Company is to pay 1 million Euro on 1st October in the current year. It wants to make sure that it does not pay too high in case Euro appreciates. It buys a call option by paying 3 per cent premium on the current price. The current rate is ₹78.10/€. The strike price is decided at ₹78.60/€. Determine the net price paid per Euro. Suppose on 1st October, the spot rate is ₹78.92. Will the company exercise its call option? [LO 34.2]

LOD: Medium

- RQ.34.6** "Economic exposure implies the change in the value of a firm due to unanticipated change in exchange rates". Elaborate. [LO 34.1]
- RQ.34.7** What are the major external techniques used in managing foreign exchange risk? Do you subscribe to the view that currency options are superior to other derivative financial instruments? Explain. [LO 34.3]
- RQ.34.8** What are currency futures? In what major respects do they differ from forward contracts? [LO 34.2]
- RQ.34.9** Distinguish between call and put options. Enumerate situations when the holder of such options would like to exercise his option. Use appropriate examples to explain your answer. [LO 34.2]
- RQ.34.10** What are interest swaps and currency swaps? [LO 34.2]
- RQ.34.11** Explain with examples how foreign exchange risk can be covered in the money market. [LO 34.2]
- RQ.34.12** In case there are identical costs in a forward contract and a futures contract, which would you prefer and why? [LO 34.2]
- RQ.34.13** What are the important internal techniques that can be used by MNCs to hedge their foreign exchange risk? [LO 34.3]

- RQ.34.14** Explain the technique of 'Leads and Lags'. Enumerate situations, with examples, when it is the ideal technique of managing foreign exchange risk. [LO 34.3]
- RQ.34.15** X Company Limited, an Indian company, is required to make a payment of 3 million US dollars after 6 months, against import of plant and machinery. What are the different alternatives to hedge against this foreign currency exposure. Give explanations. [LO 34.3]
- RQ.34.16** Spot rate of the US dollar was ₹60.7650/US \$ on February 28. And the call rate premium of the March (call option on the US dollar, with a strike ₹61/US \$ and expiring on 28th March) was ₹0.2500/US \$. [LO 34.2]
- (a) Is the call option in-the-money, at-the-money, or out-of-the-money?
- (b) Compute the intrinsic value of the call.
- (c) If the exchange rate settlement rate on 28th March is ₹61.3520, what is the percentage return on investment, if the investor has purchased a call on February 28.

Hint: As the settlement rate is higher than the strike rate, the call option will be exercised giving a value of (settlement rate – strike rate). And the premium is the cost incurred in buying the option.

$$\text{Return on investment} = (0.102/0.2500) \times 100 = 40.8 \text{ per cent per month.}$$

LOD: Difficult

- RQ.34.17** Explain, with appropriate examples and figures, the technique of netting as a measure of covering foreign exchange risk. What are the prerequisites for using such a technique? Is it feasible to be used by MNCs only? [LO 34.3]
- RQ.34.18** The "derivatives market in India is in its infancy". Elaborate. [LO 34.2]
- RQ.34.19** Eureka Software is in the business of BPO (Business Process Outsourcing). The firm is run by three software engineers. For last three years, Eureka Software had been providing its services to a multinational firm based in UK for fixed every quarter-end revenue of £ 50,000. As the Indian rupee was consistently depreciating in respect to the pound, this fixed quarter-end revenue in pounds had an effect of increasing the revenue in rupee terms. So, the management never thought of foreign exchange risk exposure hedging. But during the last quarter the rupee revenue for Eureka Software was less than the previous quarter as the rupee appreciated during this time. This motivated the owners of Eureka Software to understand this risk and to neutralise it. Eureka Software's banker suggested that they hedge through currency forward or currency option. Understanding these hedging techniques, Eureka Software decides on option hedging (as forward hedging will not allow them profit in case of further depreciation in the rupee—because of which they have been benefited for so long—so they do not opt for the forward market route to hedge). [LO 34.2.3]

As Eureka Software's banker you are required to prepare a report on the rupee revenue possibility for various possible spot rates of the pound, for the next quarter.

- (i) Current spot rate of the pound is ₹92/£.

(ii) Possible spot rate of the pound after 3 months	Probability
₹93.0/£	5%
92.5/£	10%
92.0/£	20%
91.5/£	20%
91.0/£	20%
90.5/£	15%
90.0/£	10%

- (ii) A call option on the pound, which expires in 90 days, has an exercise price of ₹91.75/£ and premium of ₹0.80/£.
- (iii) A put option on pound, which expires in 90 days, has an exercise price of ₹91.75/£ and premium of ₹0.55/£.

Also calculate the rupee revenue, if Eureka decides to remain unhedged.

ANSWERS

- 34.4** Exporter hedges risk by buying put option. He is to pay premium of ₹12.3 million. There are three possibilities: (i) US \$ depreciates, (ii) US \$ appreciates and (iii) its value is equal to strike price.
- 34.5** The company will not exercise call option. The net price paid per Euro is ₹81.2876.
- 34.15** The various methods available to X Company Limited are forward contract, foreign currency options and money market operations.
- 34.16** (a) Call option is out-of-money,
(b) zero,
(c) 40.8 per cent per month.

34.19 Spot rate (in ₹)	93	92.5	92	91.5	91.0	90.5	90.0

International Financial Management

LEARNING OBJECTIVES

LO 35.1	Explain multinational capital budgeting decisions—nature, difficulties and importance, data requirement, accounting for intangible benefits, cash flows at parent and subsidiary levels and expropriation and other political risks
LO 35.2	Discuss the computation of cost of capital for foreign investment projects
LO 35.3	Outline the adjusted present value approach to evaluation of foreign investment proposals
LO 35.4	Analyse the main components of multinational working capital management
LO 35.5	Examine the features of external commercial borrowings (ECBs) as a source of international finance in India
LO 35.6	Discuss another important source of international finance—Euro-issues
LO 35.7	Describe foreign currency exchangeable bonds

INTRODUCTION

The objective of this Chapter is to explain international financial management in terms of foreign/multinational capital budgeting decisions, cost of capital, working capital and important sources of international finance. The focus is primarily on the distinguishing/special aspects related to the financial decisions of the multinational corporations (MNCs)/international firms since principles of financial management applicable to the domestic/local firms, by and large, do also apply to international firms. In fact, the fundamental goal of international firms as well as MNCs matches with that of domestic firms, that is, maximisation of the wealth of shareholders. The Chapter first deals with foreign/multinational capital budgeting decisions. The aspects related to cost of capital, adjusted present value approach and working capital are discussed subsequently. The major international sources of finance in India, namely, external commercial borrowings and euro issues are also described. The foreign currency exchangeable bonds are covered in the subsequent discussion. The main points are summarised by way of recapitulation.

LO 35.1 MULTINATIONAL CAPITAL BUDGETING DECISIONS

Nature, Difficulties and Importance

Foreign capital budgeting decisions are beset with a variety of problems that are rarely encountered by domestic/local firms. The reason is that international firms have to deal with issues related to, among others, exchange rate risks, expropriation risk, blocked funds, foreign tax regulations, political risk and differences between basic business risks of foreign and domestic projects.¹ However, in spite of the complex problems of investing abroad, there is an increasing trend to set-up subsidiaries by MNCs and to have direct foreign investment by international firms in other countries. The major motivating factors for undertaking these investments are as follows: **(i)** Comparative cost advantage is a major factor in favour of foreign investments; **(ii)** Taxation is another vital economic/financial incentive to make such investments; **(iii)** Financial diversification, in terms of spreading the firm's risk over a wider range than just one nation, constitutes yet another economic motivation for multinational firms.²

Foreign capital budgeting projects/decisions are more difficult to evaluate than domestic capital budgeting projects. For operational purposes, there is a need to develop a *conceptual framework* that enables the set of factors mentioned above to be measured/reduced to a common denominator so that the various foreign investment projects under consideration can be evaluated on a uniform basis.

Data Requirement—Incremental/Relevant Cash Flows

The relevant data indicating *incremental cash outflows* to undertake foreign investment decisions are to be measured and so also the *incremental cash inflows* the foreign investment project is expected to yield during its projected economic useful life. These cash flows are to be discounted at an appropriate cost of capital to determine the net present value of the foreign capital budgeting project.

Incremental Cash Outflows These are incremental investment/capital outlays that can be conveniently, wholly and exclusively identified with the proposed foreign investment project. In the case of independent subsidiaries, maintaining independent books of accounts, preparing financial statements in the local currency of the country where the subsidiary is located, the determination of cash outflows (as well as cash inflows, discussed later) are akin to domestic capital budgeting decisions. Cash outflows are summarised in Format 35.1.

FORMAT 35.1 Cash Outflows

Cost of the proposed plant and equipment

Add: Shipping charges, custom duties, local transport etc

Add: Installation cost of plant and equipment

Add: Additional working capital requirement

Add: Cost of technology transfer

Add: Training cost of personnel (those required to work on the proposed plant), if any

Less: Sale proceeds (duly adjusted for taxes) from the existing plant and equipment
(in case of replacement of existing technology/plant and equipment)

Incremental Cash Inflows After Taxes (CFAT) The determination of incremental CFAT is a daunting task for foreign capital budgeting projects in view of their more risky nature. Incremental cash inflows, like cash outflows, should be exclusively/wholly identifiable with the proposed project. For this purpose, it is very important to draw the distinction between the total CFAT, the proposed foreign investment project generates and incremental CFAT the firm eventually has. The major points of differences between the total and incremental cash flows are now explained.

Cannibalisation It implies the lost sales of the firm's existing product(s) on account of launching a new product (or on account of proposed foreign investment). This happens when an MNC builds a plant overseas in a country to which it was hitherto exporting. The proposed/new investment project's sales/profits should be reduced by the lost sales/earnings to the extent that the sales of a new product or plant just replace other corporate sales of a parent company. Thus, in the context of capital budgeting decisions, the effect of cannibalisation is equal to the profit on lost sales that otherwise would not have been lost had the new/proposed project not been undertaken. The sales that would have been lost irrespective of the proposed project, say on account of competition from other MNCs, should obviously, not be reckoned as an adverse effect/impact of cannibalisation.³

- Cannibalisation
- implies lost sale
- of existing prod
- of a multination
- company on
- account of
- proposed foreig
- investment.

Sales Creation Sales creation means an increase in sales and is just the antithesis of cannibalisation. It has a favourable effect on cash flows. It is possible that the proposed investment project overseas may result in the additional sales of the existing products of the parent company. In such an event, incremental profits/cash inflows yielded by such additional sales should be attributed to the proposed investment project. Therefore, credit should be given to the proposed investment project on account of sales creation.

- Sales creation
- implies increase
- sales on account
- of proposed foreig
- investment.

Opportunity Cost Opportunity cost (cost of the next best alternative foregone) constitutes yet another important factor to be reckoned with in this regard. For example, rent foregone on account of the use of the factory/office space in the proposed project should be considered as cost on account of the new project. The current market value of the land and building that are used for undertaking a new project should also be counted as the cost of the project.

Treatment of Fixed Overheads Only additional fixed overheads are to be considered for determining cash flows since existing overheads are to be incurred irrespective of the proposed investment project. In operational terms, the allocation of existing fixed overheads (either of parent or an MNC) should be excluded.

Fees and Royalties The proposed investment project should not be charged for various items such as legal counsel, management costs, training of personnel engaged by the subsidiary, by the parent and the like, (collectively referred to as fees and royalties) unless these costs are incurred additionally.

Accounting for Intangible Benefits

Besides quantifiable benefits, intangible benefits such as better quality, faster time to market, prompt and less error-prone order processing and higher customer satisfaction, and so on as these benefits hold the potential of having a favourable impact on corporate cash flows, even if they cannot be measured precisely should also be accounted for. Besides, many foreign projects can provide valuable learning experiences and sharpen competitive skills as they expose companies to tough foreign competition.⁴ This, in turn, helps corporates to adapt their existing product(s) as well as develop new product(s); this is likely to have a favourable impact in terms of increased demand for its products in its own home country/market.

In brief, only incremental cash inflows after taxes accruing from investment abroad (by either setting up a new foreign subsidiary or expansion/diversification of existing subsidiary) should form a part of the capital budgeting exercise. The capital budgeting analysis based on total CFAT would overstate the profitability of the foreign project and run the risk of resulting in wrong decisions.

Example 35.1

A US multinational is planning to set up a subsidiary in India (where hitherto it was exporting) in view of the growing demand for its product and the competition from other MNCs. The initial project cost (consisting of plant and machinery including installation) is estimated to be US dollar 400 million; working capital requirements are estimated at \$50 million. The US multinational follows the straight-line method of depreciation.

At present, it is exporting 2 million units every year at a unit price of US dollar 80, its variable cost per unit being US dollar 40.

The finance manager of the firm has estimated, with respect to the project cost (measured in US dollars) as follows: (i) variable cost of production and sales, \$20 per unit, (ii) additional fixed costs per annum at \$30 million and the share of allocated fixed costs, \$3 million, (iii) capacity of the plant set up in India is, to produce and sell 4 million units, (iv) the expected economic useful life of the plant is 5 years, with no salvage value, and (v) the firm's existing working capital investment in production and sales of 2 million units was \$10 million.

In his report the finance manager also mentions that exports will decrease to 1.5 million units in case the firm does not open the subsidiary in view of the presence of competing MNCs that are in the process of setting up their subsidiaries in India.

The firm is subject to 35 per cent corporate tax rate and its required rate of return for such projects is 12 per cent. Assuming that there will be no variation in the exchange rate between the two countries and that all profits can be repatriated without withholding taxes, advise the US multinational regarding the financial viability of having a subsidiary in India.

Solution**Analysis of Financial Viability***(figures in million)***(i) Incremental Cash Outflows:**

Cost of plant and machinery		\$400
Add: Additional working capital (\$50 million – Release of existing working capital, \$10 million)		40
		<u>440</u>

(ii) Incremental Cash Inflows After Taxes (CFAT):**(a) Generated by subsidiary ($t = 1 - 5$)**

Sales revenue (4 million units × \$80)		320
Less: Costs:		
Variable costs (4 million units × \$20)	\$80	
Additional fixed costs	30	
Depreciation (\$400 million/5 years)	<u>80</u>	190

Earnings before taxes		130
-----------------------	--	-----

Less: Taxes (0.35)		<u>45.5</u>
--------------------	--	-------------

Earnings after taxes		84.5
----------------------	--	------

Add: Depreciation		80.0
-------------------	--	------

CFAT ($t = 1 - 4$)		<u>164.5</u>
----------------------	--	--------------

CFAT in 5th year		
------------------	--	--

Operating CFAT	\$164.5	
----------------	---------	--

Add: Release of working capital	<u>40.0</u>	<u>204.5</u>
---------------------------------	-------------	--------------

(b) Generated by exports ($t = 1 - 5$)

Sales revenue ^a (1.5 million units × \$80)		\$120
---	--	-------

Less: Variable costs (1.5 million × \$40)		<u>60</u>
---	--	-----------

Contribution before taxes		60
---------------------------	--	----

Less: Taxes (0.35)		<u>21</u>
--------------------	--	-----------

Contribution after taxes/CFAT		<u>39</u>
-------------------------------	--	-----------

(c) Incremental CFAT due to subsidiary

(\$164.5 million – \$39 million)/[(a) – (b)]		125.5
--	--	-------

(iii) Determination of NPV (\$ million)

Years	CFAT	PV factor (0.12)	Total PV
1 - 4	\$125.5	3.037	\$381.14
5	165.5 ^b	0.567	93.84
Gross present value			474.98
Less: Incremental cash outflows			440.00
Net present value			34.98

(a) In future, in the event of not having subsidiary, exports are to produce/sell 1.5 million units only.

(b) \$125.5 million + Recovery of working capital, \$40 million.

Recommendation Since the NPV is positive, the firm is advised to go for its decision to set-up the subsidiary in India.

Cash Flows at Subsidiary and Parent Level

In foreign capital budgeting decisions, there may be a substantial difference between the cash flows of the project at the subsidiary level and the level of the parent firm. The difference arises primarily due to tax regulations (affecting repatriation to the parent), exchange controls, inflation as well as interest rates affecting the exchange rate and so on. The difference between the two sets of cash flows also arises on account of the fact that the parent company usually charges management fees, fees for technology transfer and royalties on production/sales from its subsidiary units. As per the incremental analysis, these expenses are ignored. However, in estimating the true profitability of the subsidiary unit, these expenses merit recognition as these are project expenses at the level of subsidiary. These project expenses constitute cash inflows/incomes at the parent level and, hence, need to be counted. In fact, the principle (as enunciated by Shapiro) can be any cash inflow back to the investor (parent company in the present context), should be taken into account in cash inflows for the purpose of determining NPV of the project. In respect of other incomes, the parent should value only those cash flows that are, or can be, repatriated net of any transfer costs (such as withholding taxes/other taxes) as these are the only accessible funds available to it.⁵

Assessing true profitability of an independent subsidiary company in terms of local currency where it is located, the determination of the CFAT is akin to a domestic project, as shown in Format 35.2. Cash inflows to the parent company are depicted in Format 35.3.

FORMAT 35.2 Cash Inflows After Taxes (CFAT) of Independent Subsidiary Company

Particulars	Years		
	1	2	...N
Sales revenue			
Less: Variable costs			
Less: Additional fixed costs			
Less: Management fees charged by parent			
Less: Royalties for patents, licences, brands, etc charged by parent			
Less: Depreciation/amortisation			
Earnings before tax			
Less: Taxes			
Earnings after taxes			
Add: Depreciation/amortisation/non-cash expenses			

(Contd.)

(Contd.)

CFAT (operating)

Add: Salvage value of the plant, if any (nth year)

Add: Recovery or working capital (*n*th year or in earlier years)**FORMAT 35.3** Cash Inflows to the Parent Company

Particulars	Years		
	1	2	...N
Dividends received			
Interest received			
Management fees			
Royalties received for patents, licences, brands, technology transfer, etc			
Terminal cash flows (net of all types of taxes) such as repatriation of sale proceeds of plant, release of working capital, blocked funds not paid due to exchange control restrictions, etc.			
Repayment of loan			
Increase in cash profits (after tax) due to increased export sales of other products at parent MNC			
Less: Decrease in cash profits (after taxes) due to decrease in export sales			

Apart from quantifiable benefits, there may be other intangible/indirect benefits that may improve/enhance the corporate's competitive position worldwide, contributing through increased sales of its other products. Sales accretion may also take place as the firm has a better knowledge of markets abroad. Though these benefits are non-quantifiable, they need to be reckoned, being strategic in nature, while evaluating foreign investment decisions. These qualitative benefits acquire added significance when the NPV of the project is either negligible/zero or negative by a marginal/small amount. In such situations, projects based on quantitative analysis is/may be rejected. Given the fact that non-quantifiable intangible benefits also contribute to cash flows (though non-measurable), the project that would otherwise have been rejected may be found worth accepting when such benefits are also taken into account.

Most of the items contained in Format 35.3 are self explanatory. However, aspects related to taxes, repatriation of profits/blocked funds and exchange rate risk deserve more explanation.

Impact of Taxes Since cash inflows after taxes are relevant, it is important to know when and what amount of taxes are payable on foreign earnings. These earnings are subject to tax at more than one 'stage' as per the tax laws in vogue in many countries. First of all, the taxes are levied on the subsidiary company by the local government of the country where it is located, as per the tax laws applicable to foreign companies⁶. In general, corporate tax rates of foreign companies are different from those of domestic companies.

Apart from corporate taxes, subsidiary companies may be required to pay withholding taxes on dividends remitted to the parent. These dividends, being the income of the parent company, may be further subject to tax in the country where the parent company is located. This causes *double taxation* [in fact, it tantamounts to *triple taxation* in that the affiliate of the parent company is taxed at two times already—one when it earns and another when it remits such earnings in the form of dividends; payment of taxes by the parent on dividends received is the third stage at which the same income earned (by the subsidiary) is taxed].

'Taxes at many stages' appears to be inequitable. Therefore, it is not uncommon for the governments of many countries to have special tax treaties to avoid/minimise the incidence of such heavy taxation on foreign subsidiaries/foreign earnings.

Granting *tax credit* is an alternative to special tax treaties. Under the tax credit system the tax laws of the country permit the adjustment of taxes already paid by the subsidiary unit (located in other country) either fully or partially against the tax liability of the parent; as a result, the incidence of tax is reduced. Tax credit adjustment is illustrated in Example 35.2.

Example 35.2

Assume that a US multinational has its subsidiary in a country where its income is taxed at 20 per cent. Withholding tax rate is 5 per cent. Assume further that corporate firms in US are subject to tax of 35 per cent; however, corporate firms having their subsidiaries abroad are allowed tax credit.

Determine the amount of tax credit available to a subsidiary having remitted US \$4 million after-tax earnings as dividends.

Solution

- (i) The subsidiary's before-tax earnings (EBT) are equivalent to \$5 million [i.e., \$4 million/(1-tax rate 0.2)].
- (ii) Taxes paid are (\$5 million EBT \times 0.20) = \$1 million (corporate taxes). Withholding taxes paid are \$4 million \times 0.05 = \$0.2 million. Thus, the total taxes paid are \$1 million + \$0.2 = 1.2 million.
- (iii) In USA, the taxes on before-tax income of a subsidiary would have been (\$5 million \times 0.35) = \$1.75 million, out of which, the subsidiary has already paid \$1.2 million.
- (iv) The tax liability of the US firm, after tax credit adjustment of \$1.2 million, will be \$0.55 million only (\$1.75 million - \$1.2 million).

The subsidiary has got tax credit for the entire amount of \$1.2 million paid abroad. In case the tax rate is 40 per cent (applicable to subsidiary abroad), the tax credit allowed in the US would then have been limited to 35 per cent (\$1.75 million only).

Repatriation of Profits It is not uncommon among third world countries to place restrictions on repatriation of profits, particularly in 'hard' currencies, in view of their limited foreign currency reserves. An equally important factor for restriction may be/is to make more funds available for development. As a result of such restrictions on the movement of foreign currency, the profits/funds available to the parent are reduced. This, in turn, may adversely affect the profitability of the foreign investment project, in particular when the currency of the country where the foreign investments are made is likely to depreciate.

To overcome the problem of blocked funds, MNCs and other international firms have innovated many ways/methods. The commonly used practices include transfer price adjustments on inter-corporate sales, loan repayments and fee and royalty adjustments. Instead of repatriating profits, subsidiary companies, adopt/prefer these methods to remit more funds to the parent. In general, the *modus operandi* of repatriation of funds through these ways is less restrictive.

In case the parent company intends to continue expanding the subsidiary's operations abroad (as they are profitable), repatriation restrictions on profits cease to be relevant as expansion of operation would require funds to be ploughed back in to the project instead of being remitted to the parent company.⁷

Exchange Rate Risk Exchange rate risk is yet another major factor affecting the profitability of foreign investment projects, particularly in the case of countries whose currencies are normally subject to depreciation/devaluation. Adverse exchange rates obviously decrease repatriable cash flows available to the parent in its own 'hard' currency and as a result it entails an unfavourable impact on the profitability of its foreign investment project as illustrated in Example 35.3.

SECRET
U.S. GOVERNMENT PRINTING OFFICE
1950 O - 488,000

MEMORANDUM FOR THE RECORD

10

TO : SAC, [illegible]
FROM : [illegible]
SUBJECT: [illegible]

[illegible text]

Example 35.3

Assume for **Example 35.1** that the exchange rate of ₹/US dollar during 0–1 year remains unchanged at ₹62/\$. For the subsequent 4 years, it is forecasted that the rupee will depreciate vis-à-vis the US dollar by 2 per cent after the first year. As a result, the exchange rates for years 2–5 will be as follows:

Year 2	₹63.24 (₹62 × 1.02)
3	64.50 (63.24 × 1.02)
4	65.7948 (64.50 × 1.02)
5	67.1106 (65.7948 × 1.02)

Given the exchange rate of ₹62/\$ in year 1, the equivalent Indian rupees of \$125.5 million dollars will be (\$125.5 million × ₹62) = ₹7781.0 million. This is the incremental operating CFAT in Indian currency, that the project is expected to generate in all the 5 years, as per Example 35.1 (given the assumption of no variation in exchange rate).

Assuming full repatriation every year, with no withholding taxes and full tax credit available in US, advise the US multinational regarding the financial viability of having a subsidiary in India.

Solution

Determination of NPV						(Amount in million)
Year	CFAT	Exchange rate (₹/\$)	\$ equivalent	PV factor (0.12)	Total PV	
1	₹7781	62.00	\$125.50	0.893	\$112.07	
2	7781	63.24	123.04	0.797	98.06	
3	7781	64.50	120.63	0.712	85.89	
4	7781	65.7948	118.26	0.636	75.21	
5	7781	67.1106	115.94	0.567	65.74	
5	2480*	67.1106	36.95	0.567	20.95	
Gross present value					457.92	
Less: Cash outflows					440.00	
Net present value					17.92	

*Release of working capital will be equivalent to the working capital invested in Indian rupees in time zero period, that is, (\$40 million at time zero period × ₹62 exchange rate = ₹2480 million); its conversion in dollars will be at the exchange rate of year 5.

Recommendation Since the NPV is positive at \$17.92 million, the opening of a subsidiary in India continues to be financially viable.

Example 35.3 indicates that the NPV with the unfavourable exchange rate has come down by nearly 50 per cent (from \$34.98 million to \$17.92 million). By interpolation, it implies that the weakening of the Indian rupee at more than 4 per cent in relation to the US dollar would have resulted in negative NPV.

Example 35.3 is further modified to make it more realistic by incorporating withholding taxes on repatriation of profits (which may be partial).

In brief, the relevant cash inflows for evaluating international capital budgeting decisions are those that can be repatriated to the parent company. Format 35.4 contains the procedure of determining such relevant CFAT and NPV of the project.

FORMAT 35.4 Steps for Evaluating Foreign Capital Budgeting Decision from the
Perspective of the Parent Company

1. Estimate cash outflows for undertaking foreign investment in the foreign currency (in which repatriation is to be made to the parent company)

2. Determine the expected incremental cash inflows after taxes (CFAT) in the currency of the country where the foreign investment is to be made/subsidiary is to be set up.
3. Determine the expected repatriation of CFAT/funds/profits as per the regulations of the country where foreign investment is made (say 60 per cent/70 per cent)
4. Deduct withholding tax from expected repatriation (as per step 3). The amount so determined is the sum available for repatriation to the parent company. In the terminal year, adjustments are to be carried out for payment of blocked funds, release of working capital (as shown in Example 35.4) and any other payment to be received by the parent.
5. Convert the expected CFAT (as per step 4), in foreign exchange equivalents (say \$, £ or the currency of the parent), at the projected exchange rate.
6. Determine the NPV of the project of CFAT (as per step 5) by using the appropriate required rate of return/cost of capital, duly adjusted for the risk the proposed international project carries.
7. Accept the project if the NPV is positive; reject the project in case it is negative.

Example 35.4

Let us further assume that repatriation is allowed to the extent of 70 per cent of CFAT⁸ in the first 4 years, accumulated arrears of blocked funds is allowed at the year-end 5 and withholding taxes are 10 per cent. Determine the feasibility of having a subsidiary company in India.

Solution

Particulars	Determination of NPV					(Amount in million)
	Year 1	2	3	4	5	
1. CFAT	₹7781	₹7781	₹7781	₹7781	₹7781	
2. Less: Retentions (0.3 for $t = 1-4$)	2334.3	2334.3	2334.3	2334.3	—	
3. Repatriation made	5446.7	5446.7	5446.7	5446.7	7781	
4. Less: Withholding taxes (0.10)	544.7	544.7	544.7	544.7	778.1	
5. Accessible funds to parent	4902	4902	4902	4902	7002.9	
6. Add: Repatriation of blocked funds**	—	—	—	—	8403.48	
7. Add: Recovery of working capital	—	—	—	—	2480	
8. ₹/\$ Exchange rate	62	63.24	64.5	65.7948	67.1106	
9. \$ Equivalent (5/8)	\$79.06	\$77.51	\$75.99	\$74.50	\$266.52	
10. Multiply by PV factor (0.12)	0.893	0.797	0.712	0.636	0.567	
11. Present value (9×10)	70.60	61.73	54.10	47.38	151.12	
12. Total present value					384.93	
13. Less: Cash outflows					440.00	
14. Net present value					(55.07)	

Recommendation Since the NPV is negative, a subsidiary in India is not financially viable for US multinational.

Working Note

****Repatriation of Blocked Funds, After Withholding Taxes**

(in million)

Total CFAT (in years 1-4)	₹31,124
Less: Repatriation (0.70 × ₹31,124 million)	<u>21,786.8</u>
Funds blocked	9,337.2
Less: Withholding taxes (0.10)	<u>933.72</u>
Funds repatriated (arrears of years 1-4) in year 5	<u>8,403.48</u>

The comprehensive Example 35.4 clearly brings to fore that the finance manager should take into consideration total taxes, extent of repatriation allowed, blocked funds and exchange rate to determine the funds accessible to the parent. The accessible funds should then form the basis of determining NPV to assess true profitability/the financial viability of the foreign investment project.

Expropriation and Other Political Risk

Finally, expropriation risk merits consideration in foreign investment decisions as investment in a foreign country entails political risk. **Political risk** can range from mild interference to complete confiscation of all assets (referred to as outright expropriation). Included in interference are the laws warranting the employment of nationals at various positions, investment in environmental and social projects and restriction on the convertibility of currencies⁹. Political risk can also arise from other reasons. For instance, an incoming foreign government might not honour the previous government's agreement to permit convertibility or the foreign government might impose discriminatory/higher taxes, higher utility charges and so on.¹⁰

Political risk ranges from mild interference to complete confiscation of all assets of the MNC by the government in a foreign country.

In view of the fact that political risk has a serious influence on the overall risk of a foreign investment project, it merits realistic assessment. The MNCs/international firms should try to ascertain, *inter-alia*, the stability of the government in power, prevailing political wind in case of the change of power, the likely attitude of a new government towards foreign investment, economic stability of the country, fairness and equitability of the courts/judiciary. Answers to these questions should provide considerable insight into the political risk involved in the foreign investment. Based on these parameters, some companies categorise countries according to their political risk; they avoid investment in countries classified in the undesirable category, irrespective of the potentials of earning higher rates of return.¹¹

Since political risk has a profound influence on foreign investment projects, MNCs/international firms evidently prefer investment in countries with stable governments, having stable economic policies and the least political risk of expropriation. Being so important, it should be incorporated in determining NPV. Shapiro has suggested three methods for this purpose. These are (i) shortening the minimum payback period, (ii) raising the required rate of return of the investment and (iii) adjusting cash flows (numerator) to reflect the specific impact of a given risk.¹² The third method can be appropriately used for evaluating foreign investment projects.

LO 35.2 COST OF CAPITAL

The cost of capital for foreign investment projects (like domestic capital budgeting projects) should be based on the weighted average cost of long-term sources of finance. While computing the cost of capital, cash flows warrant adjustment not only for corporate taxes but also for foreign exchange

risk, withholding taxes on repatriations made and so on. The determination of the WACC requires calculation of specific costs of different sources of long-term funds. The procedure of computing various sources of finance—(i) debt, (ii) preference shares, (iii) equity and (iv) retained earnings—is now explained.

Cost of Debt

The computation of cost of debt (k_d) is similar to the one used by domestic firms when subsidiary borrows in the host country. Consider Example 35.5.

Example 35.5

The Indian subsidiary of an American MNC has raised ₹50 million to finance its investment requirements by issuing 8-year, 12 per cent debentures in the Indian market. While interest is to be paid annually, the debentures are to be redeemed at year-end 8, at 4 per cent premium. Flotation costs are estimated at 2 per cent. Assume that tax laws in India allow full amortisation of flotation costs in the first year itself, payment of premium in the year in which it is paid and corporate tax of 35 per cent. Determine the effective cost of debt of the Indian subsidiary.

Solution

Cost of debt is determined by solving the following equation:

$$CI_0 = \sum_{t=1}^8 \frac{COI_t}{(1+k_d)^t} + \frac{COP_8}{(1+k_d)^8}$$

Where COI = Cash outflow of interest in years 1–8, duly adjusted for tax advantage, ($₹50 \text{ million} \times 0.12 \times 0.65$) = ₹3.9 million.

COP_8 = Principal repayment in the year of maturity ($t = 8$) [₹50 million + 4 per cent premium, i.e., ₹2 million less tax advantage ($₹2 \text{ million} \times 0.35$) = ₹0.70 million = ₹51.3 million.]

CI_0 = Effective cash inflows/proceeds duly adjusted for flotation cost and tax shield on it as shown below:

	(₹ million)	
Amount of debentures		₹50.00
Less: Flotation costs ($₹50 \times 0.02$)	₹1	
Tax advantage on flotation costs ($₹1 \times 0.35$)	0.35	0.65
Effective cash proceeds received		49.35

$$\text{Therefore, } ₹49.35 = \sum_{t=1}^8 \frac{₹3.9}{(1+k_d)^t} + \frac{₹51.3}{(1+k_d)^8}$$

k_d has two elements: (i) the after-tax cost of interest, that is, 12 per cent ($1 - 0.35$) = 7.8 per cent and (ii) flotation costs in raising funds and payment of premium on redemption of debentures, that is, ₹51.3 million – ₹49.35 million = ₹1.95 million. Evidently, k_d is to be higher than 7.8 per cent to take note of such costs.

While the determination of k_d involves a trial and error process, it is to be 7.8 per cent plus. For calculating how much that would be the rule is simple, ₹1.95 million (₹51.3 million – ₹49.35 million) is the cost of the ₹49.35 million funds that have been raised. It yields 4 per cent effective flotation cost. This 4 per cent is to be spread over in 8 years, which approximately is to 0.5 per cent each year. As a result, the k_d is to be 7.8 per cent + 0.5 per cent = 8.3 per cent. Accordingly, its precise value can be computed by interpolating two rates of discount, namely, 8 per cent and 9 per cent.

Determination of k_d at 8 Per cent and 9 Per cent

₹ million)

Years	Cash outflows	PV factor at (%)		Total PV at %	
		8	9	8	9
1 - 8	₹3.9	5.747	5.535	₹22.41	₹21.59
8	51.3	0.540	0.502	27.70	25.75
				50.11	47.34

$$k_d = 8\% + \left(\frac{₹50.11 - ₹49.35 = 0.76}{₹50.11 - ₹47.34 = 2.77} \right) = 8.27 \text{ per cent}$$

In case the subsidiary raises funds from the international markets and not from the host country where it is located, the k_d computation requires adjustment for variation in foreign exchange rates. The cash outflows exercise should take into account the value of foreign currency (in which borrowings are made) with reference to the currency of the host country (known as the base currency). This is illustrated in Example 35.6.

Example 35.6

From the following facts pertaining to an Indian subsidiary of an American multinational, determine the effective cost of debt to the US parent MNC.

- (i) Amount borrowed ₹3,000 million @ 11 per cent, for 6 years.
- (ii) Flotation costs are estimated to be ₹12.85 million.
- (iii) Interest is to be paid at the end of each year and the principal sum borrowed is to be returned at the end of 6th year.
- (iv) Corporate tax applicable to the Indian subsidiary is 35 per cent.
- (v) The rupee is expected to depreciate in relation to the US dollar at the rate of 2 per cent each year for 6 years; the current exchange rate of US dollar to the Indian rupee is ₹61.50.
- (vi) For tax purposes, total flotation costs can be amortised at a uniform rate during 6 years

Solution

$$₹3,000 \text{ million} - ₹12.85 \text{ million} = \sum_{t=1}^6 \frac{COI_t}{(1+k_d)^t} + \frac{COP_6}{(1+k_d)^6}$$

Where COI_t = Cash outflow on interest payments in time period ($t = 1 - 6$) after adjusting tax savings on interest payments and flotation costs in US dollars (taking the exchange rate into account).

COP_6 = Repayment of principal sum borrowed at year-end 6

Since cash outflows are to be in US dollars, proceeds of debt are also to be converted into US dollars, that is, $(₹3,000 \text{ million} - ₹12.85 \text{ million}) = ₹2987.15 \text{ million}/₹61.50 = \48.5715 million

Determination of Cash Outflows (\$)

(\$ million)

Year	Cash outflows	Rate of exchange ₹/\$	Cash outflows
		Interest (1 - 0.35) - Tax savings on flotation costs	
1	₹213.75 ^a	62.73	\$3.4074
2	213.75	63.984	3.3406
3	213.75	65.264	3.2751
4	213.75	66.5695	3.2109
5	213.75	67.900	3.1480
6	3,213.75 ^b	69.2589	46.4019

^a₹3,000 million \times 0.11 = ₹330 million $(1 - 0.35) = ₹214.50 \text{ million} - (\text{Tax savings on flotation costs } ₹12.85 \text{ million}/6 \text{ years} = ₹2.14 \text{ million} \times 0.35 = 0.75 \text{ million}) = ₹213.75 \text{ million}$

^bIncludes principal payment at year-end 6 of ₹3,000 million

Based on cash outflows and cash inflows determined k_d will be given by the following equation (amount is in million).

$$\$48.5715 = \frac{\$3.4074}{(1 + k_d)^1} + \frac{\$3.3406}{(1 + k_d)^2} + \dots + \frac{\$46.4019}{(1 + k_d)^6}$$

Solution of k_d involves trial and error. The hint of rate (k_d) can be inferred from total effective cost of interest paid each year (₹213.75 million) vis-à-vis the net proceeds of borrowings (₹2987.15 million). Based on these figures, $k_d = ₹213.75 \text{ million}/₹2987.15 \text{ million} = 7.16$ per cent. Since the Indian rupee depreciates at 2 per cent, k_d is to be lower as the US MNC gains in terms of a lower payment by 2 per cent of the US dollar. Therefore, the effective cost of debt (k_d) is likely to hover around 7.16 per cent minus 2 per cent = 5.16 per cent. Accordingly, the determination of k_d is attempted at 5 and 6 per cent rates of discount.

Determination of PV at 5 Per cent and 6 Per cent

(\$ million)

Year	Cash outflows	PV factor at		Total PV at	
		5%	6%	5%	6%
1	\$3.4074	0.952	0.943	3.2438	3.2131
2	3.3406	0.907	0.890	3.0299	2.9731
3	3.2757	0.864	0.840	2.8296	2.7510
4	3.2109	0.823	0.792	2.6425	2.5430
5	3.1480	0.784	0.747	2.4680	2.3515
6	46.4019	0.746	0.705	34.6158	32.7133
Total present value				48.8296	46.5450

$$\begin{aligned} \text{By interpolation, } k_d &= 5\% + \left(\frac{\$48.8296 - 48.5715 = \$0.2581 \text{ million}}{\$48.8296 - 46.5450 = \$2.2846 \text{ million}} \right) \\ &= 5\% + 0.11\% = 5.11 \text{ per cent.} \end{aligned}$$

It may be observed that the computed value of effective cost of debt (5.11 per cent) is very close to the approximate value (5.16 per cent). In fact, the approximate basis of determining the cost of debt (k_d) itself is a measure for its determination, as shown in Equation 36.1.

$$k_d = k_i(1 - t)(1 - d)(1 + f) - d \quad (35.1)$$

Where k_i = Coupon rate of interest; t = Corporate tax rate; f = Flotation costs (duly adjusted for taxes); d = Depreciation/devaluation rate of the currency in which borrowings are made with respect to the base currency (US dollar, in the present case). Based on Equation 36.1:

$$\begin{aligned} k_d &= 11\% (1 - 0.35) (1 - 0.02) (1 + 0.0015)^* - 2\% \\ &= (11\% \times 0.65 \times 0.98 \times 1.0015) - 2\% = 7.02\% - 2\% = 5.02\% \end{aligned}$$

* Flotation costs are 0.428 per cent; effective after tax flotation costs will be 0.428 per cent - Tax savings on 0.428 \times 0.35 = 0.15 per cent.

Between 5.1 per cent and 5.02 per cent, 5.1 per cent value of k_d is precise. Equation 36.1 provides the approximate value. An approximate measure, however, is very useful in determining the precise value of k_d in that it provides a *benchmark rate(s)* at which the trial and error exercise can be worked.

Example 35.6 was based on the depreciation of the currency in which borrowings are made; the impact of such a depreciation in exchange rate has been reflected in a lower cost of debt. Therefore, it is likely to be financially cheaper for foreign companies to borrow in currencies that are likely to depreciate/devalue. In other words, borrowings should be avoided in currencies that

Year	1909	1910	1911
...

...

...

...

...

...

...

Year	1909	1910	1911
...

...

...

...

Year	1909	1910	1911
...

...

...

...

...

...

...

are likely to appreciate or be revalued; appreciation in the exchange rate increases the effective cost of borrowings, as shown by Equation 36.2 and Example 35.7.

$$k_d = k_f(1 - t)(1 + r)(1 + f) + r \quad (35.2)$$

Where r = appreciation/revaluation rate of the currency in which borrowings are made with respect to the base currency.

Example 35.7

Assume for Example 35.6, that the Indian rupee is likely to appreciate by 2 per cent in relation to the US dollar, each year for 6 years. Determine the effective cost of debt to the US parent.

Solution

$$(i) \quad k_d = 11\% (1 - 0.35) (1 + 0.02) (1 + 0.0015) + 2\% \\ = 7.16\% + 2\% = 9.16\%$$

(ii) Determination of k_d based on trial and error

(a) Determination of Cash Outflows (₹ & \$ in million)

Year	Cash outflows*	Rate of exchange ₹/\$	Cash outflows
1	₹213.75	₹60.27	\$3.5465
2	213.75	59.064	3.6189
3	213.75	57.8833	3.6928
4	213.75	56.7256	3.7681
5	213.75	55.5911	3.8450
6	3,213.75	54.4792	58.9904

*Taken from solution of Example 35.6.

k_d is given by the following equation (amount is in million \$)

$$\$48.5715 = \frac{\$3.5465}{(1 + k_d)^1} + \frac{\$3.6189}{(1 + k_d)^2} + \dots + \frac{\$58.9904}{(1 + k_d)^6}$$

(b) Determination of PV at 9 Per Cent and 10 Per Cent (\$ million)

Years	Cash outflows	PV factor at		Total PV at	
		9%	10%	9%	10%
1	\$3.5465	0.917	0.909	\$3.2521	\$3.2238
2	3.6189	0.842	0.826	3.0471	2.9892
3	3.6928	0.772	0.751	2.8022	2.7260
4	3.7681	0.708	0.683	2.6678	2.5736
5	3.8450	0.650	0.621	2.4993	2.3877
6	58.9904	0.596	0.564	35.1583	33.2706
Gross present value				49.4268	47.1709

$$\text{By interpolation, } k_d = 10\% - \left(\frac{\$48.5715 - \$47.1709 = \$1.4006 \text{ million}}{\$49.4268 - \$47.1709 = \$2.2559 \text{ million}} \right)$$

$$k_d = 10\% - 0.62\% = 9.38 \text{ per cent}$$

The comparison of the effective cost of debt in Examples 36.6 and 36.7 is revealing in that the k_d is slightly less than double when exchange rate of the currency in which borrowings are made appreciates ($k_d = 9.38$ per cent); the corresponding value of k_d is 5.1 per cent when exchange rate depreciates.

In brief, the finance manager should take into account all the major factors, namely, exchange rate, rate of interest, corporate taxes, flotation costs, mode and timing of payment of interest as well as principal, tax laws applicable to exchange losses/gains, treatment of flotation costs and so on in determining k_d . For the precise measurement of k_d , the IRR based approach should be preferred.

Cost of Preference Shares

The computation of the cost of preference shares (k_p) is akin to the cost of debt. The stipulated/coupon rate of dividend on preference shares, like the interest on debt, constitutes the basis for the calculation of the cost of preference shares. However, unlike interest payments on debt, dividends payable on preference shares are not tax-deductible. Therefore, no adjustment is required for taxes while computing the cost of preference shares. In view of the non-availability of tax shields on dividends paid, k_p is higher than k_d .

The explicit cost of preference shares is the discount rate that equates the net proceeds of the sale of preference shares with the present value of the future preference dividends and principal repayments. The appropriate formula for determining k_p is given by Equation 35.3.

$$P_o (1 - f) = \sum_{i=1}^n \frac{DP_i}{(1 + k_p)^i} + \frac{P_n}{(1 + k_p)^n} \tag{35.3}$$

Where P_o = Expected sale price of preference shares; f = Flotation cost as percentage of P_o ; DP = Dividends paid on preference shares; P_n = Repayment of preference capital amount in the year of maturity.

Example 35.8

A US MNC has its subsidiary in India. The subsidiary has issued 12 per cent preference shares of the face value of ₹100, to be redeemed at year-end 8. Flotation costs are expected to be 4 per cent; these costs can be amortised for tax purposes during the 8 years at a uniform rate. The corporate tax rate is 35 per cent. Determine the cost of preference shares from the perspective of the subsidiary.

Solution ₹96 = $\sum_{i=1}^8 \frac{₹11.825 *}{(1 + k_p)^i} + \frac{₹100}{(1 + k_p)^8}$

* Determination of Cash Outflows During Years 1-8

Dividend payment	₹12.00
Less: Tax advantage on flotation cost [of ₹4/8 years = ₹ 0.5 @ 35%]	0.175
Effective dividend paid/cash outflows	11.825

Accordingly, $k_p = ₹96 = \sum_{i=1}^8 \frac{₹11.825}{(1 + k_p)^i} + \frac{₹100}{(1 + k_p)^8}$

Given the rate of preference dividend of 12 per cent, the value of k_p is likely to be between 12 and 13 per cent.

Determination of PV at 12 Per Cent and 13 Per Cent

Year	Effective cash outflows	PV factor at		Total PV at	
		12%	13%	12%	13%
1 - 8	₹11.825	4.968	4.799	₹58.75	₹56.75
8	100.00	0.404	0.376	40.04	37.60
Total present value				98.79	94.35

$$k_p = 12\% + \left(\frac{\text{₹} 98.79 - \text{₹} 96 = \text{₹} 2.79}{\text{₹} 98.79 - \text{₹} 94.35 = \text{₹} 4.44} \right) = 12\% + 0.63\% = 12.63 \text{ per cent.}$$

Example 35.8 shows the computation of k_p when the foreign subsidiary raises funds in the currency of the country where it is located and payment of dividends as well as of principal repayments are to be made in Indian rupees.

In the event of a Indian subsidiary either raising preference share capital abroad or k_p is to be measured from the perspective of the US parent company, additional calculations in terms of adjustment for foreign exchange variations are required to determine the cost of preference shares. The treatment is akin to cost of debt. Consider Example 35.9.

Example 35.9

Assume for Example 35.6 that the subsidiary has issued 12 per cent preference shares of ₹3,000 million for a 6 years period, with flotation costs of 3 per cent. Determine the effective cost of preference shares to the US parent.

Solution

(i) Determination of Cash Inflows		(₹ million)
Face value of 12 per cent preference shares		₹3,000
Less: Flotation costs (0.03 × ₹3,000 million)		90
Net proceeds received		2,910
Divided by ₹/\$ exchange rate		61.50
US \$ equivalent received		\$47.3170

(ii) Determination of Cash Outflows (t = 1-8)		(₹ million)
Dividend payable on preference shares (0.12 × ₹3,000 million)		₹360
Less: Tax advantage on flotation costs (₹90 million/6 years = ₹15 million × 0.35)		5.25
Effective cash outflows		354.75

(iii) Determination of Cash Outflows in US \$				(million)
Year	Effective cash outflows	Rate of exchange ₹/\$	Cash outflows (\$)	
1	₹354.75	62.73	\$5.6551	
2	354.75	63.984	5.5443	
3	354.75	65.264	5.4356	
4	354.75	66.5695	5.3290	
5	354.75	67.900	5.2246	
6	3,354.75*	69.2589	48.4378	

* Includes redemption sum of ₹3,000 million at year-end 6.

Based on Equation 35.3, $k_p =$

$$\$47.3170 = \frac{\$5.6551}{(1+k_p)^1} + \frac{\$5.5443}{(1+k_p)^2} + \dots + \frac{\$48.4378}{(1+k_p)^6}$$

Like k_d , the approximate formula to determine k_p is provided by Equation 36.5.

$$\begin{aligned} &= DP(1-d)(1+f) - d && (35.4) \\ &= 12\%(1-0.02)(1+0.0195) - 2\% \\ &= 11.99\% - 2\% = 9.99\% \text{ or } 10 \text{ per cent.} \end{aligned}$$

The value of k_p is likely to be between 10 and 11 per cent.

Determination of PV at 10 Per Cent and 11 Per Cent

(\$ million)

Year	Cash outflows	PV factor at		Total PV at	
		10%	11%	10%	11%
1	\$5.6551	0.909	0.901	\$5.1405	\$5.0952
2	5.5443	0.826	0.812	4.5796	4.5019
3	5.4356	0.751	0.731	4.0821	3.9734
4	5.3290	0.683	0.659	3.6397	3.5118
5	5.2246	0.621	0.593	3.2444	3.0981
6	48.4378	0.564	0.535	27.3189	25.9142
Total present value				48.0052	46.0946

$$k_p = 10\% + \left(\frac{\$48.0052 \text{ million} - \$47.3170 \text{ million} = \$0.6882 \text{ million}}{\$48.0052 \text{ million} - \$46.0946 = \$1.9106 \text{ million}} \right)$$

$$= 10\% + 0.36\% = 10.36 \text{ per cent.}$$

In the event of the currency in which borrowings are made appreciating vis-à-vis the base currency (US dollar in the present context), Equation 36.5 provides the basis of determining the approximate value of k_p .

$$k_p = DP (1 + r) (1 + f) + r \quad (35.5)$$

Example 35.10

Assume for Example 35.9 that the Indian rupee is likely to appreciate by 2 per cent each year in relation to US dollar, for 6 years. Determine the effective cost of preference shares from the point of view of the parent company.

$$k_p = 12\% (1 + 0.02) (1 + 0.0195) + 2\%$$

$$= 12.48\% + 2\% = 14.48 \text{ per cent}$$

Cost of Equity Capital

Two possible approaches can be employed to calculate the cost of equity capital are: (i) the dividend approach and (ii) the capital asset pricing model (CAPM) approach.

Dividend Approach According to this approach, the cost of equity capital is calculated on the basis of a required rate of return, in terms of the future dividends to be paid on the shares. Accordingly, k_e is defined as the discount rate that equates the present value of all expected future dividends per share with the net proceeds of the sale (or the current market price) of a share. In equation terms,

$$P_o (1 - f) = \sum_{t=1}^n \frac{D_t (1 + g)^{t-1}}{(1 + k_e)^t} \quad (35.6)$$

Where P_o = Current market price of the equity share, f = Flotation costs as a percentage of market price, and g = Growth in expected dividends

Simplifying Equation 35.6, we get

$$K_e = (D_1/P_o) + g \quad (35.7)$$

Equation 35.6, *inter-alia*, assumes that g is constant. This equation needs to be modified to take note of differing growth rates.

$$P_o = \sum_{t=1}^n \frac{D_0 (1 + g_n)^{t-1}}{(1 + k_e)^t} + \sum_{t=n+1}^{\infty} \frac{D_n (1 + g_c)^{t-1}}{(1 + k_e)^t} \quad (35.8)$$

Where g_n = Rate of growth in earlier years and g_c = Constant growth in later years

... ..

Example 35.11

The following information is available in respect of an Indian subsidiary of a US parent.

Current dividend per share is ₹2

Current market price per share is ₹75

Compound growth rates of dividends (%)

1 – 5 years	15
6 – 10 years	10
11 years and beyond	5

Determine the cost of equity, assuming a fixed dividend pay out ratio.

Solution

The k_e would be obtained by solving for k_e in the following equation, as it is the case of different growth rates in expected dividends.

$$₹75 = \sum_{t=1}^5 \frac{Rs\ 2\ (1.15)^t}{(1+k_e)^t} + \sum_{t=6}^{10} \frac{D_5\ (1.10)^{t-5}}{(1+k_e)^t} + \sum_{t=11}^{\infty} \frac{D_{10}\ (1.05)^{t-10}}{(1+k_e)^t}$$

The solution of the above equation gives the value of k_e equal to 9.5 per cent.

Capital Asset Pricing Model (CAPM) Approach¹⁵ Another technique that can be used to estimate the cost of equity is the CAPM approach. According to CAPM approach, the k_e is a function of (i) the riskless rate of return (normally represented by the rate of return/yield available on long-term treasury bonds of the government of the country), (ii) market rate of return (average rate of return on market portfolio—represented in India, by say, the National Stock Exchange Index, NIFTY, and so on) and (iii) the beta is the measure of non-diversifiable/systematic risk. Symbolically,

$$K_e = R_f + b (R_m - R_f) \quad (35.9)$$

Where R_f = Rate of return required on a risk-free investment; R_m = Rate of return expected on the market portfolio; b = Beta coefficient. The value of beta is measured as per Equation 36.10.

$$b = \frac{\text{Co-variance } (R_m, R_f)}{\text{Variance } R_m} \quad (35.10)$$

The CAPM based equation of determining the cost of equity is in conformity with the basic finance theory related to risk and return, that is, the higher the risk, the higher the cost of equity, or vice versa. Clearly, this is a logical approach to determine k_e .

Example 35.12

The British MNC's equity shares have a beta of 1.5, the British Treasury bonds yield a rate of return of 5 per cent and the return on the market portfolio is 11 per cent. Compute the cost of equity capital of the British multinational.

Solution

$$K_e = 5\% + 1.5 (11\% - 5\%) = 14 \text{ per cent}$$

*Return on British Treasury bonds is a proxy of risk-free rate of return.

The value of beta of 1.5 means that the equity shares of the British multinational is more risky than the average market portfolio. Hence, the required rate of return expected by an equity investor is higher or the cost of equity is higher. It will obviously decrease with decrease in the value of beta. Assume, b is 0.9; k_e is lower at 10.4 per cent, that is, $5\% + 0.9 (11\% - 5\%) = 10.4$ per cent. The reason is that the equity securities of the British multinational are less risky than those of the market portfolio.

It is significant to note that foreign companies/MNCs, in general, may have a lower k_e than domestic companies due to the fact that they have access to several foreign capital markets to raise funds.

Cost of Retained Earnings

There is implicit cost of retained earnings i.e., the firm is implicitly required to earn on the retained earnings, at least equal to the rate that would have been earned by the shareholders, if they were distributed to them. Thus, retained earnings involve opportunity cost; the opportunity cost of retention of earnings is the rate of return that could be earned by investing the funds retained in investment opportunities that have the same degree of risk as that of the firm itself. In other words, the rate of return, the equityholders have been deprived of by allowing retentions with the corporate firm, is the cost of retained earnings (k_r). Accordingly, the cost of retained earnings (k_r) for all practical purposes is equal to the cost of equity. Gitman has appropriately referred retained earnings as un-issued equity shares. However, since raising funds through equity involves flotation costs, the k_r is marginally lower.

Apart from the adjustment for flotation costs, the cost of retained earnings in the context of foreign firms may require additional adjustment with respect to withholding taxes, as repatriation of dividends in most countries are subject to such taxes. As a result, k_r gets further reduced, as shown in Equation 35.11.

$$K_r = k_e (1 - wt) (1 - f) \quad (35.11)$$

Where wt = Withholding taxes on earnings repatriated to the parent company and f = Flotation cost in percentage.

In case, transfer costs are also involved, k_r will be further lower.

$$k_e (1 - wt) (1 - f) (1 - c) \quad (35.12)$$

Where c = Costs of transfer.

Computation of Overall Cost of Capital

The specific costs are combined together to obtain the overall/composite cost of capital/weighted average cost of capital. While market value weights are theoretically superior to book value weights, book value weights are operationally convenient and more often used in practice. The computation of the overall/weighted average cost of capital (k_o) is illustrated in Example 35.13.

Example 35.13

Given below is the information related to the capital structure of a US based Indian subsidiary.

	Amount (₹ million)	Specific cost (%)
Equity share capital	900	15.0
12% Preference share capital	100	12.5
11% Debentures	400	7.5
Retained earnings	600	13.0

Determine the weighted average cost of capital (based on book value weights).

Solution

Computation of Weighted Average Cost of Capital

Source of capital	Amount (₹ million)	Specific cost	Total cost (₹ million)
Equity	900	0.15	135.0
12% Preference share capital	100	0.125	12.5
11% Debentures	400	0.075	30.0
Retained earnings	600	0.13	78.0
	2,000		255.5

$$K_o = (\text{₹}255.5 \text{ million} / \text{₹}2,000 \text{ million}) \times 100 = 12.8 \text{ per cent.}$$

LO 35.3 ADJUSTED PRESENT VALUE APPROACH

The concept of single discount rate (based on weighted average cost of capital) is appropriate if the risks are similar for all the foreign investment projects. However, projects with different risks are likely to have different debt capacities and, hence, warrant separate capital structures. For instance, projects with higher business risk (reflected in a high degree of operating leverage) should have equity dominated capital structure. In contrast, projects with lower business risk can afford more debt.

Apart from the varying risk profile of foreign projects, some foreign investments may carry project specific loans at concessional rates of interest. There may be other foreign capital budgeting projects that may require higher cost foreign funds due to home country exchange controls, higher political and economic risk and so on. Obviously, applying a single rate of discount (WACC) to evaluate capital budgeting proposals is not appropriate.

Adjusted present value is the total of present value of (1) cash flows after taxes, (2) interest tax shield and (3) any concessions/subsidies on interest costs.

An alternative approach to WACC is to discount cash flows at a rate that reflects only the business risks of the project¹⁶. The rate of discount is the *all equity rate* (explained in Chapter 32), to exclude the impact of debt on financing.

When an all equity rate (k_e^*) is used as a discount rate in evaluating a capital budgeting proposal, the value of the project can be said to consist of the following three components: **(i)** the present value of CFAT, discounted at k_e^* ; **(ii)** the PV of interest tax shield and **(iii)** the PV of any subsidies/concessions on interest costs associated with project-specific financing¹⁷. The **adjusted present value** (APV) of the project is the sum of these three components, as shown in equation 35.13.

$$APV = \left[\sum_{t=1}^n \frac{CFAT_t}{(1+k_e^*)^t} + \sum_{t=1}^n \frac{TS_t}{(1+k_t)^t} + \sum_{t=1}^n \frac{S_t}{(1+k_t)^t} \right] - CO_0 \quad (35.13)$$

Where TS = Tax savings on interest, S = Value of interest subsidy,
 K_t = Before-tax cost of debt, and CO_0 = Initial capital cash outflows

In case the APV is positive, the project is worth accepting, otherwise, it merits rejection. It may be noted that the APV approach is similar to the NPV approach. However, the unique feature of the APV approach is that each project is assessed without reference to the firm's other investments and has its own required rate of return.

LO 35.4 MULTINATIONAL WORKING CAPITAL MANAGEMENT

The goals of working capital management in an MNC are the same as those of a domestic firm, that is, to manage the firm's current assets and liabilities in such a way that a satisfactory level of working capital is maintained. The discussion of the working capital management below is made with reference to: **(i)** cash management, **(ii)** credit management and **(iii)** inventory management.

Cash Management

Cash management is one of the key areas of working capital management. Its basic objective is to meet the payment schedule, that is, to have sufficient cash to meet the cash disbursement needs of the firm. In the normal course of business, firms are to make cash payments on a continuous and regular basis to suppliers of goods, employees, bankers and so on.

The importance of sufficient cash to meet the payment schedule can hardly be overemphasised. The major advantages are: **(i)** It helps in fostering good relations with trade creditors and suppliers of raw materials. **(ii)** Good relations are maintained with banks. **(iii)** It leads to a strong credit rating, which enables the firm to purchase goods on favourable terms and to maintain its line of credit with banks and other sources of credit, and **(iv)** Cash discounts can be availed.

Since large cash balances entail high financial costs, international firms/MNCs/foreign subsidiaries (like domestic firms) should maintain *adequate cash balances and not excessive cash balances*.

Like domestic firms, multinational companies can employ the following key cash management strategies to minimise the operating cash balance requirement: **(i)** speedy collection of accounts receivable (by using lock box system and electronic funds transfer); **(ii)** stretching accounts payable (without damaging its credit standing); **(iii)** shift cash as fast as possible from those parts of the business/foreign subsidiaries where it is not needed to those parts/places where it is needed (by using the netting system and currency centre concept). The first two strategies are self explanatory. The concept of currency centre is illustrated in Example 35.14.

Example 35.14

A US multinational has its subsidiaries in India, UK and China. The multinational optimises its inter-subsidiary cash flow using the netting system and currency centre located at its headquarters. Each subsidiary reports its payables to other subsidiaries, on the first day of each month, to the centre. In their report, these subsidiaries also intimate the funds available with them and expected requirement of funds for operations by it in that month.

The currency centre then issues instructions to the net-paying subsidiary on the fifth of each month, using the market exchange rate on that date. Also, the currency centre requires subsidiary companies to transfer their cash surplus to the currency centre. Deficit subsidiaries are asked to cover their temporary needs by drawing on their overdraft facilities with local banks.

Following is the summary of the report sent by three subsidiary companies on March 1.

Subsidiary	Amounts due to other subsidiary	Funds available	Funds required for operation March 1–31
Indian (₹)	₹3,000,000 to UK subsidiary CNY 4,000,000 to Chinese subsidiary	₹100,000,000	₹20,000,000
UK (£)	₹32,500,000 to Indian subsidiary CNY 10,000,000 to Chinese subsidiary	£50,000	£2,000,000
China (CNY)	₹150,000,000 to Indian subsidiary £2,000,000 to UK subsidiary	CNY 50,000,000	CNY 20,000,000

Spot exchange rate on March 5, are as follows:

\$1 = ₹62.00

£1 = \$1.50

\$1 = CNY 7.00

- Design a netting system for all three subsidiary companies.
- Determine the total funds available to the currency centre for money market investment during March.
- Which subsidiary will be using local overdrafts and of what amount?

Solution

When positions are reported to the currency centre, the centre will convert these positions to US dollars using the spot exchange rate. The following matrix shows the amount due to and from one subsidiary to the other subsidiary in US dollars.

100 100

The first part of the report...

The third part of the report...

The fourth part of the report...

The fifth part of the report...

The sixth part of the report...

The seventh part of the report...

The eighth part of the report...

The ninth part of the report...

The first part of the report...

The second part of the report...

The third part of the report...

The fourth part of the report...

The fifth part of the report...

The sixth part of the report...

The seventh part of the report...

The eighth part of the report...

The ninth part of the report...

	Indian subsidiary	UK subsidiary	French subsidiary	Total payable
Indian subsidiary	—	4,500,000	571,428	5,071,428
UK subsidiary	524,194	—	1,428,571	1,952,765
French subsidiary	2,419,355	3,000,000	—	5,419,355
Total receivable	2,943,549	7,500,000	1,999,999	—

The matrix suggests that the Indian subsidiary as well as the Chinese subsidiary have higher total payables than total receivables; the UK subsidiary has higher receivable than payable. In view of these facts, the currency centre issues instructions to the Indian and Chinese subsidiaries to make the following payments to the UK subsidiary in pound sterling.

Indian subsidiary to UK subsidiary = \$2,127,879 (\$5,071,428-\$2,943,549) or £1,418,586 (\$2,127,879/\$1.5)

French subsidiary to UK subsidiary = \$3,419,356 (\$5,419,355-\$1,999,999) or £2,279,571 (\$3,419,356/\$1.5)

The following resources are available to the three subsidiary companies after the netting process

Subsidiary	Currency	Total resources available	Funds required	Surplus or (deficit)
Indian	₹	₹100,000,000 - 131,928,498 [⊙]	₹20,000,000	(₹51,928,498)
UK	£	£50,000 + 3,698,157	£2,000,000	£1,748,157
Chinese	CNY	CNY 50,000,000 - 23,935,492	CNY 20,000,000	CNY 6,064,508

[⊙](\$2,127,879 × ₹62)

As the Indian subsidiary has a net deficit of ₹51,928,498 for the month of March, it will use the local overdraft facility to tide over. The Chinese subsidiary has a surplus of CNY 6,064,508 (or \$866,358) and the UK subsidiary has a surplus of £1,748,157 (or \$2,622,236). The Chinese and UK subsidiary companies will transfer cash surplus to the centre. As a result, the currency centre will have \$3,488,594 (\$866,358 + \$2,622,236) to carry out money market investment during March.

The temporarily idle cash balances need deployment in appropriate marketable securities to yield extra income. The MNC has also to hedge its undesirable cash and marketable securities against foreign exchange rate risks. This can be achieved by various foreign exchange rate hedging methods (explained in Chapter 35). Forward contracts are by far the most commonly used hedging technique. The other feasible techniques are borrowing or lending in different currencies, future contracts, options, interest rate swaps and currency swaps.

Credit Management

Multinational firms located in different countries compete for the same global export markets. Being so, it is imperative that they offer attractive/liberal credit terms to potential customers. While the favourable credit terms are desirable to enhance sales and hence profits, MNCs should ensure that the risk/cost of default is lower than the incremental profits expected from such liberal credit terms because granting credit is more risky in the international context. In particular, such an exercise is required in the case of sales/exports to developing countries (given the risks associated with such sales and their lack of 'hard' currency). To minimise the risk, MNCs should seek the backing of their respective governments in extending credit.¹⁸

Risk also emanates from exchange rate fluctuations on account of time lag between when the sale is made and time when collections are made from debtors. Hedging can reduce this type of risk, but at a cost. In general, cost incurred in hedging techniques (such as options, forward contracts) may outweigh the benefit. Therefore international firms should adopt the appropriate hedging technique(s) to minimise exchange rate risk, particularly with respect to export sales made to less developed countries, as their currencies are prone to depreciation/devaluation.

Finally, it will be useful to apply the “leads and lags” technique for advancing or delaying settlements, both in respect of debtors and creditors, as per the need (explained in Chapter 35).

Inventory Management

The task of inventory management in the case of multinational firms is more complex than that of domestic firms, particularly when foreign subsidiaries encounter the following situations:

- (i) When a foreign subsidiary is located in a country having a high rate of inflation, it may be profitable, *prima-facie*, to accumulate more stocks than otherwise needed. However, carrying inventory involves costs, in particular, interest costs; such costs tend to be high in countries experiencing inflation. Therefore, MNCs should undertake a cost-benefit analysis before taking the decision of carrying more stocks. This becomes all the more important if foreign subsidiaries are located in politically unstable countries and run the threat/risk of expropriation of assets.
- (ii) When the foreign subsidiary is located far from the market supplying the goods, the consideration will have to be given to potential delays in getting the goods from central storage locations to user locations, all around the world. There is a need to maintain both working stocks and safety stocks at each user location as well as at the strategic storage centres. The problem gets compounded in case the foreign subsidiaries are imposed with property taxes on assets, including inventories. In such cases the tax is on the holdings, on specific days, say, 31st December/31st March. Such rules then warrant that the foreign subsidiary should have a low inventory on these dates. To achieve that, it should hold safety stocks in different countries/locations at different times during the year¹⁹. Clearly, the problem of physical location of inventories is more acute in the case of foreign firms *vis-à-vis* domestic firms.
- (iii) Finally, the MNC and its subsidiaries are to deal with, *inter-alia*, adverse exchange rate fluctuations, tariffs, non-tariff barriers, and other similar problems, generally when they are located in less developed nations.

LO 35.5 EXTERNAL COMMERCIAL BORROWINGS (ECBs)

External Commercial Borrowings (ECBs): ECBs are commercial loans raised by eligible resident entities from recognised non-resident entities and should conform to parameters such as minimum maturity, permitted and non-permitted end-uses, maximum all-in-cost ceiling and so on. The parameters apply in totality and not on a standalone basis. The framework for raising loans through ECBs (ECB Framework) comprises the following three tracks: **Track I:** Medium term foreign currency denominated ECBs with minimum average maturity of 3-5 years. **Track II:** Long term foreign currency denominated ECBs with minimum average maturity of 10 years. **Track III:** Indian Rupee (INR) denominated ECBs with minimum average maturity of 3-5 years.

Forms of ECBs

The ECB Framework enables permitted resident entities to borrow from recognised non-resident entities in the following forms: (i) Loans including bank loans,

- External
- commercial
- borrowings
- refer to commercial
- loans in the form of
- bank loans, buyer's
- credit, securities
- instruments, such
- as floating rate
- notes and fixed
- interest bonds
- availed from non-
- resident lenders
- with minimum
- average maturity of
- 3 years.

Year	1950	1951	1952	1953
...

The first part of the document discusses the general situation of the country in 1950. It mentions the economic growth and the political stability that has been achieved since the end of the war.

In the second part, the author discusses the social and cultural developments. It highlights the progress in education and the improvement in the standard of living for the general population.

Category	1950	1951	1952	1953
...

The third part of the document focuses on the international relations. It discusses the country's role in the global community and its efforts to maintain peace and stability in the region.

In the final part, the author provides a summary of the achievements and challenges. It concludes with a positive outlook for the future, emphasizing the country's potential for continued growth and development.

CONCLUSION

The document concludes by reiterating the country's commitment to progress and the well-being of its citizens. It expresses confidence in the future and the ability of the nation to overcome any challenges that may arise.

The author expresses gratitude to the government and the people for their support and cooperation. It ends with a final statement of hope and optimism for the nation's future.

Year	1950	1951	1952	1953
...

(ii) Securitised instruments (e.g. floating rate notes and fixed rate bonds, non-convertible, optionally convertible or partially convertible preference shares / debentures), (iii) Buyers' credit, (iv) Suppliers' credit, (v) Foreign Currency Convertible Bonds (FCCBs), (vi) Financial lease and (vii) Foreign Currency Exchangeable Bonds (FCEBs). However, ECB framework is not applicable in respect of the investment in non-convertible debentures (NCDs) in India made by registered Foreign Portfolio Investors (FPIs).

Available Routes for Raising ECBs

The ECBs can be raised either under the automatic route or under the approval route. For the automatic route, the cases are examined by the Authorised Dealer Category-I (AD Category-I) banks. Under the approval route, the prospective borrowers are required to send their requests to the RBI through their ADs for examination. While the regulatory provisions are mostly similar, there are some differences in the form of amount of borrowing, eligibility of borrowers, permissible end-uses, and so on under the two routes. While all the above forms of borrowing can be raised both under the automatic and approval routes, FCEBs can be issued only under the approval route.

Parameters for ECBs

The various parameters of raising loan under ECB framework are mentioned below:

Minimum Average Maturity Period: The minimum average maturities for the three tracks are:

Track I (i) 3 years for ECBs upto USD 50 million or its equivalent.

(ii) 5 years for ECBs beyond USD 50 million or its equivalent.

(iii) 5 years for eligible borrowers in infrastructure sector; non-banking financial companies - infrastructure finance companies (NBFC-IFCs); NBFCs-asset finance companies (NBFC-AFCs); holding companies; and core investment companies (CISs) irrespective of the amount of borrowing;

(iv) 5 years for (FCCBs)/ (FCEBs) irrespective of the amount of borrowing. The call and put option for FCCBs would not be exercisable prior to 5 years.

Track II 10 years irrespective of the amount

Track III Same as under Track I.

Eligible Borrowers The list of entities eligible to raise ECBs under the three tracks is set out below:

Track I (i) Companies in manufacturing and software development sectors, **(ii)** Shipping and airlines companies, **(iii)** Small Industries Development Bank of India (SIDBI), **(iv)** Units in Special Economic Zones (SEZs) **(v)** Export Import Bank of India (Exim Bank) (only under the approval route), **(vi)** Companies in infrastructure sector, Non-Banking Financial Companies - Infrastructure Finance Companies (NBFCIFCs), NBFCs-Asset Finance Companies (NBFC-AFCs), Holding Companies and Core Investment Companies (CICs), **(vii)** Housing Finance Companies regulated by the NHB, **(viii)** Port trusts.

Track II (i) All entities listed under Track I, **(ii)** Real Estate Investment Trusts (REITs) and Infrastructure Investment Trusts (INVITs) coming under the SEBI regulatory framework, **(iii)** Housing Finance Companies regulated by the NHB, **(iv)** Port trusts.

Track III (i) All entities listed under Track II, **(ii)** All Non-Banking Financial Companies (NBFCs) under the regulatory purview of the RBI, **(iii)** NBFCs-Micro Finance Institutions (NBFCs-MFIs), Not-for-Profit companies, societies, trusts and cooperatives, Non-Government Organisations (NGOs) which are engaged in micro-finance activities, **(iv)** Companies engaged in miscellaneous services, namely,

research and development (R&D), training (other than educational institutes), companies supporting infrastructure, companies providing logistics services, **(v)** Developers of Special Economic Zones (SEZs)/ National Manufacturing and Investment Zones (NMIZs), **(vi)** HFCs regulated by the NHB, **(vii)** Port trusts.

Notes: Entities engaged in micro-finance activities to be eligible to raise ECB should have a (i) satisfactory borrowing relationship for at least three years with an AD Category I bank in India, and (ii) certificate of due diligence on 'fit and proper' status from the AD Category I bank.

Recognised Lenders/Investors: The list of recognised lenders / investors for the three tracks is as follows:

Track I: (i) International banks, **(ii)** International capital markets, **(iii)** Multilateral financial institutions (such as, IFC, ADB, etc.) / regional financial institutions and Government owned (either wholly or partially) financial institutions, **(iv)** Export credit agencies, **(v)** Suppliers of equipment, **(vi)** Foreign equity holders. **(vii)** Overseas long term investors such as: (a) Prudentially regulated financial entities; (b) Pension funds; (c) Insurance companies; (d) Sovereign Wealth Funds; (e) Financial institutions located in International Financial Services Centres in India and **(viii)** Overseas branches / subsidiaries of Indian banks.

Track II: All entities listed under Track I except overseas branches / subsidiaries of Indian banks.

Track III: All entities listed under Track I except overseas branches / subsidiaries of Indian banks. In case of NBFCs-MFIs, other eligible MFIs, not for profit companies and NGOs, ECBs can also be availed from overseas organisations and individuals*.

Notes:

- Overseas branches/subsidiaries of Indian banks can be lenders only under Track I. Further, their participation is subject to the prudential norms issued by the RBI.
- Overseas Organizations proposing to lend ECBs would have to furnish to the authorised dealer bank of the borrower a certificate of due diligence from an overseas bank, which, in turn, is subject to regulation of host-country regulators and such host country adheres to the Financial Action Task Force (FATF) guidelines on anti-money laundering (AML)/ combating the financing of terrorism (CFT). The certificate of due diligence should comprise the following: that **(i)** the lender maintains an account with the bank at least for a period of two years, **(ii)** the lending entity is organised as per the local laws and held in good esteem by the business/local community, and **(iii)** there is no criminal action pending against it.
- Individual lender has to obtain a certificate of due diligence from an overseas bank indicating that the lender maintains an account with the bank for at least a period of two years. Other evidence /documents such as audited statement of account and income tax return, which the overseas lender may furnish, need to be certified and forwarded by the overseas bank. Individual lenders from countries which do not adhere to FATF guidelines on AML / CFT are not eligible to extend ECBs.

All-in-Cost (AIC): The all-in-cost requirements for the three tracks are as under:

With a view to harmonising the provisions of foreign currency/rupee FCBs and RDBs, a uniform all-in cost ceiling of 450 basis points over the benchmark rate would be applicable. The benchmark rate would be 6 months USD LIBOR or applicable benchmark for respective currency, for Track I and Track II, while it would be the prevailing yield of GOI securities for corresponding maturity for Track III.

End-use Prescriptions The end-use prescriptions for ECBs raised under the three tracks are given in the following manner:

All the three categories of borrowers (Track I, II, and III) and not permitted to invest in (i) real estate/ purchase of land except when used for affordable housing/construction and development of SEZs/ industrial parks, integrated townships, (ii) capital market and (iii) equity shares. In addition, Tracks I and III borrowers cannot invest for (i) working capital/general corporate purposes, (ii) repayment

of rupee loans except when raised from direct/indirect equity holders or from a group company and the loan is for a minimum average maturity of 5 years. Finally, all the three category of companies are prohibited from on-lending to entities for all the activities specified above.

Individual Limits: The individual limits refer to the amount of ECBs which can be raised in a financial year under the automatic route.

- (i) The individual limits of ECBs that can be raised by eligible entities under the automatic route per financial year for all the three tracks are: (a) Up to USD 750 million or equivalent for the companies in infrastructure and manufacturing sectors, NBFC-IFCs, NBFC-AFCs, Holding Companies and Core Investment Companies(CICs); (b) Up to USD 200 million or equivalent for companies in software development sector; (c) Up to USD 100 million or equivalent for entities engaged in micro-finance activities; and (d) Up to USD 500 million or equivalent for remaining entities.
- (ii) The ECB proposals beyond aforesaid limits will come under the approval route. For computation of individual limits under **Track III**, The exchange rate prevailing on the date of agreement should be taken into account.
- (iii) In case the ECBs is raised from direct equity holder, the specified individual ECB limits will also be subject to ECBs liability: equity ratio requirement. For ECBs raised under the automatic route, the ECBs liability of the borrower (including all outstanding ECBs and the proposed one) towards the foreign equity holder should not be more than four times of the equity contributed by the latter. For ECBs raised under the approval route, this ratio should not be more than 7:1. This ratio will not be applicable if total of all ECBs raised by an entity is up to USD 5 million or equivalent.

Notes: For the purpose of ECBs liability: equity ratio, the paid-up capital, free reserves (including the share premium received in foreign currency) as per the latest audited balance sheet can be reckoned for calculating the 'equity' of the foreign equity holder. Where there are more than one foreign equity holders in the borrowing company, the portion of the share premium in foreign currency brought in by the lender(s) concerned should only be considered for calculating the ratio.

Currency of Borrowing: The ECBs can be raised in any freely convertible foreign currency as well as in Indian rupees. In case of Rupee denominated ECBs, the non-resident lender, other than foreign equity holders, should mobilise Indian Rupees through swaps/outright sale undertaken through an AD Category-I bank in India. The change of currency of ECBs from one convertible foreign currency to any other convertible foreign currency as well as to INR is freely permitted. The change of currency from INR to any foreign currency is, however, not permitted. The change of currency of ECBs into INR can be at the exchange rate prevailing on the date of the agreement between the parties concerned for such change or at an exchange rate which is less than the rate prevailing on the date of agreement if consented to by the ECBs lender.

Hedging Requirements

The eligible borrowers should have a Board approved risk management policy and keep their ECBs exposure hedged 100 per cent at all times. Further, the designated AD Category-I bank should verify that 100 per cent hedging requirement is complied with during the currency of ECBs and report the position to RBI through ECBs returns. Also, the entities raising ECBs under the provisions of **Tracks I and II** should follow the guidelines for hedging issued by the concerned sectoral or prudential regulator in respect of foreign currency exposure.

Wherever hedging has been mandated by the RBI, the following should be ensured. The ECBs borrower will cover principal as well as coupon through financial hedges. The financial hedge for all exposures on account of ECBs should start from the time of each such exposure (i.e. the day liability is created in the books of the borrower). A minimum tenor of one year of financial hedge would be required with periodic rollover duly ensuring that the exposure on account of ECBs is not unhedged at any point during the currency of ECBs. The natural hedge, in lieu of financial hedge, will be considered only to the extent of offsetting projected cash flows / revenues in matching currency, net of all other projected outflows. An ECB may be considered naturally hedged if the offsetting exposure has the maturity/cash flow within the same accounting year. Any other arrangements/ structures, where revenues are indexed to foreign currency will not be considered as natural hedge.

Security for raising ECBs The AD Category-I banks are permitted to allow creation of charge on immovable assets, movable assets, financial securities and issue of corporate and/ or personal guarantees in favour of overseas lender / security trustee, to secure the ECBs to be raised / raised by the borrower, subject to satisfying themselves that: **(i)** the underlying ECBs is in compliance with the extant ECBs guidelines, **(ii)** there exists a security clause in the Loan Agreement requiring the ECBs borrower to create charge, in favour of overseas lender / security trustee, on immovable assets / movable assets / financial securities / issuance of corporate and / or personal guarantee, and **(iii)** No objection certificate, as applicable, from the existing lenders in India has been obtained.

Additional Conditions: Once the aforesaid stipulations are met, the AD Category-I bank may permit creation of charge on immovable assets, movable assets, financial securities and issue of corporate and / or personal guarantees, during the currency of the ECBs with security co-terminating with underlying ECBs, subject to the following:

Creation of Charge on Immovable Assets The arrangement should be subject to the following:

- (i)** The security should subject to provisions contained in the Foreign Exchange Management (Acquisition and Transfer of Immovable Property in India) Regulations, 2000,
- (ii)** The permission should not be construed as a permission to acquire immovable asset (property) in India, by the overseas lender/ security trustee,
- (iii)** In the event of enforcement / invocation of the charge, the immovable asset/ property will have to be sold only to a person resident in India and the sale proceeds repatriated to liquidate the outstanding ECBs.

Creation of Charge on Movable Assets In the event of enforcement/ invocation of the charge, the claim of the lender, whether the lender takes over the movable asset or otherwise, will be restricted to the outstanding claim against the ECBs. The encumbered movable assets may also be taken out of the country subject to getting 'No Objection Certificate' from domestic lender/s, if any.

Creation of Charge over Financial Securities The arrangements may be permitted subject to the following:

- (i)** Pledge of shares of the borrowing company held by the promoters as well as in domestic associate companies of the borrower is permitted. Pledge on other financial securities, namely, bonds and debentures, Government Securities, Government savings certificates, deposit receipts of securities and units of the Unit Trust of India or of any mutual funds, standing in the name of ECBs borrower/promoter, is also permitted,
- (ii)** In addition, security interest over all current and future loan assets and all current assets including cash and cash equivalents, including Rupee accounts of the borrower with ADs in India, standing in the name of the borrower/promoter, can be used as security for ECBs. The

Rupee accounts of the borrower/promoter can also be in the form of escrow arrangement or debt service reserve account,

- (iii) In case of invocation of pledge, transfer of financial securities should be in accordance with the extant FDI/FII policy including provisions relating to sectoral cap and pricing as applicable read with the Foreign Exchange Management (Transfer or Issue of Security by a Person Resident outside India) Regulations, 2000.

Issue of Corporate or Personal Guarantee The arrangement should be subject to the following:

- (i) A copy of Board resolution for the issue of corporate guarantee for the company issuing such guarantee, specifying name of the officials authorised to execute such guarantees on behalf of the company or in individual capacity should be obtained,
- (ii) Specific requests from individuals to issue personal guarantee indicating details of the ECBs should be obtained,
- (iii) The security shall be subject to provisions contained in the Foreign Exchange Management (Guarantees) Regulations, 2000, and
- (iv) ECBs can be credit enhanced / guaranteed / insured by overseas party/ parties only if/ they fulfil(s) the criteria of recognised lender under extant ECB guidelines.

Issuance of Guarantee

Issuance of guarantee, standby letter of credit, letter of undertaking or letter of comfort by Indian banks, All India Financial Institutions and NBFCs relating to ECB is not permitted. Further, they should not invest in FCCBs in any manner whatsoever.

Debt Equity Ratio

The ECB liability to equity ratio for ECBs raised from direct foreign equity holder under the automatic route would be 7 : 1 if the total of all ECBs raised by an entity exceeds USD 5 million or equivalent.

Parking of ECBs proceeds

The ECB proceeds are permitted to be parked abroad as well as domestically in the manner given below:

Parking of ECB Proceeds Abroad The ECB proceeds meant only for foreign currency expenditure can be parked abroad pending utilisation. Till utilisation, these funds can be invested in the following liquid assets: (a) deposits or Certificate of Deposit or other products offered by banks rated not less than **AA (-)** by Standard and Poor/ Fitch IBCA or Aa3 by Moody's; (b) Treasury bills and other monetary instruments of one year maturity having minimum rating as indicated above and (c) deposits with overseas branches/ subsidiaries of Indian banks abroad.

Parking of ECB Proceeds Domestically The ECB proceeds meant for Rupee expenditure should be repatriated immediately for credit to their Rupee accounts with AD Category I banks in India. The ECB borrowers are also allowed to park ECB proceeds in term deposits with AD Category I banks in India for a maximum period of 12 months. These term deposits should be kept in unencumbered position.

Conversion of ECBs into Equity

The conversion of ECBs, including those which are matured but unpaid, into equity is permitted subject to the following conditions:

- (i) The activity of the borrowing company is covered under the automatic route for Foreign Direct Investment (FDI) or approval, for foreign equity participation has been obtained as per the extant FDI policy;
- (ii) The conversion, which should be with the lender's consent and without any additional cost, will not result in breach of applicable sector cap on the foreign equity holding;
- (iii) The applicable pricing guidelines for shares are complied with;
- (iv) The applicable reporting requirements are fulfilled; and
- (v) If the borrower concerned has availed of other credit facilities from the Indian banking system, including overseas branches/subsidiaries, the applicable prudential guidelines issued by the RBI, including guidelines on restructuring are complied with; and
- (vi) Consent of other lenders, if any, to the same borrower is available or at least information regarding conversions is exchanged with other lenders of the borrower.

Exchange Rate for Conversion of ECBs Dues into Equity: For conversion of ECBs dues into equity, the exchange rate prevailing on the date of the agreement between the parties concerned for such conversion or any lesser rate can be applied with a mutual agreement with the ECBs lender. The fair value of the equity shares to be issued should be worked out with reference to the date of conversion only.

LO 35.6 EURO ISSUES

As a part of globalising the Indian economy after 1991, Indian corporates are permitted to float their securities in, and raise funds from, the Euro markets. The two long-term primary instruments of Euro issues are Foreign Currency Convertible Bonds (FCCBs) and Global Depository Receipts/Certificates (GDRs)/American Depository Receipts/Certificates (ADRs). **A FCCB** means a bond subscribed by a non-resident in foreign currency and convertible into ordinary shares of the issuing company in India in any manner, wholly or in part, on the basis of any equity related warrants attached to the debt instruments. **A GDR/ADR** means any instrument in the form of a depository receipt/certificate, by whatever name called, created by the Overseas Depository Bank (ODB) outside India and issued to non-resident investors against the issue of ordinary shares or FCCBs of the issuing company. A bank authorised by the issuing company to issue GDRs/ADRs against the issue of FCCBs/ordinary shares of the issuing company is known as an ODB. The scheme for facilitating issue of FCCBs and ordinary shares through the GDR/ADR mechanism by Indian companies is discussed below.

- **Foreign**
- **currency**
- **convertible**
- **bonds**
- are subscribed by
- a non-resident in
- a foreign currency
- and convertible into
- ordinary shares
- of the issuing
- company in India.

- **American/**
- **Global**
- **depository**
- **receipts**
- implies an
- instrument in
- the form of a
- depository receipt/
- certificate issued
- to non-resident
- investors against
- the issue of
- ordinary shares of
- the issuing Indian
- company.

Eligibility for Issue of Convertible Bonds or Ordinary Shares of Issuing Company

An issuing company desirous of raising funds by issuing FCCBs or ordinary shares for equity issues through GDR/ADR is required to obtain the prior permission of the Department of Economic Affairs, Ministry of Finance, Government of India. It may sponsor an issue of ADRs/GDRs with an overseas depository against shares held by its shareholders, at a price determined by the lead manager with respect to disinvestment of their holdings by shareholders of Indian companies that are (i) listed in India, (ii) not listed in India, but listed overseas. Such a facility would be available *pari passu* to all categories of shareholders of the company whose shares are being sold in the ADR/GDR market overseas. An approved intermediary under the scheme would be

The first part of the history of the world is the history of the human race. It is a story of progress and struggle, of triumph and defeat. It is a story of the human mind and the human heart, of the human spirit and the human soul. It is a story of the human race, of the human race, of the human race.

The second part of the history of the world is the history of the human mind. It is a story of discovery and invention, of knowledge and wisdom. It is a story of the human mind, of the human mind, of the human mind.

The third part of the history of the world is the history of the human heart. It is a story of love and compassion, of kindness and generosity. It is a story of the human heart, of the human heart, of the human heart.

The fourth part of the history of the world is the history of the human spirit. It is a story of courage and bravery, of strength and endurance. It is a story of the human spirit, of the human spirit, of the human spirit.

The fifth part of the history of the world is the history of the human soul. It is a story of faith and hope, of belief and conviction. It is a story of the human soul, of the human soul, of the human soul.

The sixth part of the history of the world is the history of the human race. It is a story of progress and struggle, of triumph and defeat. It is a story of the human mind and the human heart, of the human spirit and the human soul. It is a story of the human race, of the human race, of the human race.

The seventh part of the history of the world is the history of the human mind. It is a story of discovery and invention, of knowledge and wisdom. It is a story of the human mind, of the human mind, of the human mind.

The eighth part of the history of the world is the history of the human heart. It is a story of love and compassion, of kindness and generosity. It is a story of the human heart, of the human heart, of the human heart.

The ninth part of the history of the world is the history of the human spirit. It is a story of courage and bravery, of strength and endurance. It is a story of the human spirit, of the human spirit, of the human spirit.

The tenth part of the history of the world is the history of the human soul. It is a story of faith and hope, of belief and conviction. It is a story of the human soul, of the human soul, of the human soul.

an investment banker registered with the Securities and Exchange Commission in the USA, or under the Financial Services Authority in UK, or the appropriate regulatory authority in Germany, France, Singapore or in Japan. Such issues would need to conform to the foreign direct investment policy and other mandatory statutory requirements and detailed guidelines issued in this regard.

An Indian company which is not eligible to raise funds from the Indian capital including a company restrained by the SEBI from accessing the securities market would not be eligible to issue FCCBs and ordinary shares through GDRs. Unlisted Indian companies issuing GDRs/FCCBs should be simultaneously listed in the Indian stock exchange(s). However, if they have taken verifiable *effective steps* would be exempt from the requirement of simultaneous listing. **Effective steps** mean that (1) it has completed due diligence and filed offering circular in the overseas exchange(s), or (2) the approval of the overseas stock exchange(s) has been obtained, or, (3) the listing fee is paid, or (4) approval of the RBI for meeting issue-related expenses has been obtained. Private placement of issues, where no offering circular was placed before the overseas stock exchange(s), would not qualify for effective steps.

The issuing company should have a consistent track record of good performance (financial or Otherwise) for a minimum period of three years, on the basis of which an approval for finalising the issue structure would be issued to the company. On finalising the issue structure (discussed subsequently in this Section) in consultation with the lead manager to the issue, the issuing company should obtain the final approval from the Government for proceeding ahead with the issue.

FCCBs should be denominated in any convertible foreign currency and ordinary shares of an issuing company should be denominated in Indian rupees. The issued ordinary shares or bonds should be delivered to a DCB who would instruct the ODB to issue GDR/ADR certificates to non-resident investors against the shares or bonds held by it. A DCB means a banking company that acts as a custodian for ordinary shares/FCCBs of an Indian company, which are issued by it against GDRs/ADRs certificates. A GDR may be issued in negotiable form and may be listed on any international stock exchange for trading outside India. The provision of any law relating to the issue of capital by an Indian company would apply in relation to the issue of FCCBs or ordinary shares of an issuing company and it should obtain the necessary permission or exemption from the appropriate authority, under the relevant law, in this regard.

An Indian company which is not eligible to raise funds from the Indian capital market cannot issue FCCBs and ordinary shares through GDRs. Unlisted Indian companies issuing GDRs/FCCBs should be simultaneously listed in the Indian stock exchange(s). The OCBs (overseas corporate bodies) who are not eligible to invest in India through portfolio routes and entities prohibited by SEBI to buy/sell/deal in securities are not eligible to subscribe to FCCBs/ordinary shares through GDRs/ADRs.

Limits of Foreign Investment in the Issuing Company The ordinary shares and FCCBs issued against GDRs/ADRs should be treated as direct foreign investment in the issuing company. The aggregate of the foreign investment, made either directly or indirectly through GDR/ADR mechanism, should not exceed 51 per cent of the issue and the subscribed capital of the issuing company.

Issue Structure of the GDRs/ADRs A GDR/ADR may be issued for one or more underlying shares or bonds held with the domestic custodian bank (DCB). GDRs/FCCBs may be denominated in any freely convertible foreign currency. The ordinary shares underlying the GDRs and the shares issued upon conversion of the FCCBs should be denominated only in Indian currency. The following issues would be decided by the issuing company with the lead manager to the issue, namely: (a) public or private placement; (b) number of GDRs/ADRs to be issued; (c) the issue price. For listed companies: the pricing should not be less than the higher of the average of weekly high and

low of the closing prices of the related shares quoted on the stock exchange during **(i)** the 6 months, **(ii)** the two weeks preceding the relevant date (i.e. the date 30 days prior to the date on which the meeting of the shareholders is held to consider the proposed issue). Companies issuing GDRs that have taken verifiable "effective steps" would be exempt from these requirements. For unlisted companies: the pricing should be in accordance with the RBI regulations. Listed companies going in for an offering in the domestic market and a simultaneous or immediately following on offering (i.e. within 30 days of domestic issue) through ADRs/GDRs issues wherein GDRs/ADRs are priced at/above the domestic price would be exempt from the above requirement. Such companies would have to take SEBI's approval for such issue which would specify the percentage to be offered in the domestic and ADR/GDR markets; **(d)** the rate of interest payable on FCCBs; and **(e)** the conversion price, coupon rate, and the pricing of the conversion options of the FCCBs. The conversion price of the FCCBs of listed companies should be similar to the issue price. They would be exempt from this requirement if they have taken the verifiable effective steps. The conversion price of FCCBs of unlisted companies should be in accordance with the RBI regulations. There would be no lock-in period for GDRs/ADRs. The pricing for listed companies as well as the conversion price of the FCCBs should not be less than the higher of the average of the weekly high and low of the closing prices of the related shares quoted in the stock exchange during **(i)** 2 weeks or **(ii)** 6 months preceding the relevant date (i.e. the date 30 days prior to the date on which the proposed issue is considered in the general meeting of the shareholders). The pricing for unlisted companies as well as the conversion price of the FCCBs should be according to the RBI regulations under FEMA.

Listing

The GDRs/ADRs may be listed on any of the overseas stock exchanges, or over the counter exchanges or through the book entry transfer system prevalent abroad. They may be purchased, possessed and freely transferable by a person who is a non-resident.

Transfer and Redemption

A non-resident holder of GDRs/ADRs may transfer them, or may ask the ODB to redeem them. In the case of redemption, the ODB should require the DCB to get the corresponding underlying shares released in favour of the non-resident investor, for being sold directly on his behalf, or transferring them in the name of the non-resident in the books of account of the issuing company. The redeemed GDRs and underlying shares sold may be re-issued to the extent of such redemption and sale made in the domestic market. Such re-issuance should be in terms of the Foreign Exchange Management (Transfer or Issue of Security by a Person Resident Outside India) Regulations, 2000, as amended from time to time, and the guidelines issued in this regard. In case of redemption of the GDRs/ADRs into underlying shares, a request for the same should be transmitted by the ODB to the DCB in India, with a copy of the same being sent to the issuing company for information and record. On redemption, the cost of acquisition of the shares underlying the GDRs/ADRs would be reckoned as the cost on the date on which the ODB advises the DCB regarding redemption. The price of the ordinary shares of the issuing company prevailing in the Bombay Stock Exchange or the National Stock Exchange on the date of the advice of redemption should be taken as the cost of acquisition of the underlying ordinary shares. For the purpose of conversion of FCCBs, the cost of acquisition in the hands of non-resident investors would be the conversion price which is determined on the basis of the price of the shares at the Bombay Stock Exchange or the National Stock Exchange on the date of conversion into shares.

Taxation of Foreign Currency Convertible Bonds

Interest payments on bonds, until the conversion option is exercised, would be subject to deduction of tax at source at the rate of ten per cent. Tax on dividend on the converted portion of the FCCB would be subject to deduction of tax at source at the rate of ten per cent. Conversion of FCCBs into shares would not give rise to any capital gains liable to income tax in India. Transfer of FCCBs made outside India by a non-resident investor to another non-resident investor would not give rise to any capital gains liable to tax in India.

Taxation on Shares Issued Under GDR Mechanism

Under the provisions of the Income tax Act, income by way of dividend on shares issued under the GDR/ADR mechanism would be taxed at the rate of 10 per cent. The issuing company should transfer the net dividend payments after remitting tax at source to the ODB. On receipt of these payments, the ODB should distribute them to non-resident investors, proportionate to their holdings of GDRs/ADRs evidencing relevant shares. The holders may take credit for the tax deducted at source on the basis of certification by the ODB, if permitted by the country of their residence. All trading transactions of GDRs/ADRs outside India, among non-resident investors, would be free from any liability to income-tax in India on capital gains therefrom. If any capital gains arise from the transfer of the aforesaid shares in India to the non-resident investor, he would be liable to income tax under the provisions of the Income tax Act. If the aforesaid shares are held by the non-resident investor for a period of more than twelve months from the date of advice of their redemption by the ODB, the capital gains arising from the sale thereof would be treated as long-term capital gains and would be subject to income tax at the rate of 10 per cent under the provisions of Section 115-AC of the Income tax Act. If such shares are held for a period of less than twelve months from the date of redemption advice, the capital gains arising from the sale thereof would be treated as short-term capital gains and would be subject to tax at the normal rates of income tax applicable to non-residents under the provisions of the Income tax Act. After the redemption of GDRs/ADRs into underlying shares, during the period, if any, in which these shares are held by the redeeming non-resident foreign investor who has paid for them in foreign exchange at the time of its purchase, the rate of taxation of income by way of dividend on these shares would continue to be at the rate of 10 per cent, in accordance with Section 115-AC(1) of the Income tax Act. The long-term capital gains on the sale of these redeemed underlying shares held by non-resident investors in the domestic market would also be charged tax to the rate of 10 per cent, in accordance with the provisions of Section 115-AC(1). When the redeemed shares are sold on Indian stock exchanges against payment in rupees, these shares would go out of the purview of Section 115-AC of the Income tax Act and income therefrom would not be eligible for concessional tax treatment provided thereunder. After the transfer of shares, where consideration is in terms of rupees payment, normal tax rates would apply to the income arising or accruing from these shares. Deduction of tax at source on the amount of capital gains accruing from transfer of the shares would be made in accordance with Sections 195 and 196-C of the Income tax Act.

Application of Avoidance of Double Taxation Agreement in Case of Global/American Depository Receipts

During the period of fiduciary ownership of shares in the hands of the ODB, the provisions of Avoidance of Double Taxation Agreement, entered into by the Government of India with the country of residence of the ODB, would be applicable in the matter of taxation of income from dividends from underlying shares and interest on FCCBs. During the period, if any, when the redeemed underlying shares are held by the non-resident investor on transfer from the fiduciary ownership of the

ODB, before they are sold to resident purchasers, the Avoidance of Double Taxation Agreement entered into by the Government of India with the country of residence of the non-resident investor would be applicable in the matter of taxation of income from the dividends of the said underlying shares, or interest on FCCBs, or any capital gain arising out of transfer of underlying shares.

Gift Tax and Wealth Tax

Holding of GDRs/ADRs in the hands of non-resident investors and holding of the underlying shares by the ODB in a fiduciary capacity and the transfer of the GDRs/ADRs between non-resident investors and the ODB would be exempt from wealth tax under the Wealth tax Act, 1957, and from gift tax under the Gift tax Act, 1958.

LO 35.7 FOREIGN CURRENCY EXCHANGEABLE BONDS

A **foreign currency exchangeable bond** (FCEB) means a bond expressed in foreign currency, the principal and interest in respect of which is payable in foreign currency, issued by an Indian (issuing) company and subscribed to by a resident outside India and exchangeable into equity shares of another company (i.e. an **offered company** whose equity shares would be offered in exchange of the FCEB) in any manner either wholly or partly or on the basis of an equity related warrants attached to debt instruments. The main elements of the FCEB scheme, 2008 are discussed in this section.

- **FCEB**
- means a bond
- expressed in
- foreign currency,
- the principal and
- interest in respect
- of which is payable
- in foreign currency,
- issued by an Indian
- (issuing) company
- and subscribed to
- by a person who is
- a resident outside
- India in foreign
- currency and
- exchangeable into
- equity shares of
- another company.

Eligibility Conditions

The issuing company should be part of the promoter group of the offered company and hold the equity shares being offered at the time of issuance of the FCEBs. The offered company should be a listed company engaged in a sector eligible **(i)** for FDI and **(ii)** to issue/avail of FCCBs/ECBs. An Indian company, which is not eligible to raise funds from the Indian securities market and has been restrained from accessing the securities market by the SEBI, cannot issue the FCEBs. The subscribers to the FCEBs should comply with the FDI policy and adhere to the sectoral caps at the time of issuance of the FCEBs. Prior approval of the FIPB, if required under the FDI policy, should be obtained. **Entities** prohibited to buy/sell/deal in securities by the SEBI are not eligible to subscribe to the FCEBs.

End-Use Requirements

The proceeds of the FCEBs may be invested by the issuing company in the promoter group companies who can use the proceeds in accordance with the end-user prescribed under the ECBs policy. **(These are discussed in section 5 of this chapter)**. The investee promoter group company would not be able to utilise the proceeds/funds for investment in **(i)** the capital market, and **(ii)** real estate in India.

The issuing company may invest the proceeds of the FCEBs overseas by way of direct investment including in joint ventures/wholly owned subsidiaries subject to the guidelines in force in this respect.

In the following, I have given the results of the experiments on the effect of the concentration of the solution on the rate of the reaction. The results are given in the following table.

The results of the experiments on the effect of the concentration of the solution on the rate of the reaction are given in the following table. The results are given in the following table.

Operational Procedure

The issuance of the FCEBs, which may be denominated in any freely convertible currency, would require the prior approval of the RBI.

All-in-Cost, Pricing and Maturity

The rate of interest payable on the FCEBs and the issue expenses incurred in foreign currency should be within the all-in-cost ceiling specified by the RBI under the ECBs policy. At the time of issuance of the FCEBs, the exchange price of the offered listed equity shares should not be less than the higher of the average of the weekly high and low of the closing prices of the shares of the offered company quoted on the stock exchange during the **(i)** six months, and **(ii)** two weeks preceding in the **relevant date**, that is, the date on which the Board of Directors of the issuing company passes the resolution authorising the issue of the FCEBs.

The minimum maturity of the FCEBs should be five years for redemption purposes. The exchange option can be exercised at any time before redemption. While exercising the option, the holders of the FCEBs should take delivery of the offered shares. Cash (net) settlement would not be permissible.

Mandatory Requirements

The issuing company should comply with the provisions of the Companies Act and obtain necessary approvals of its Board of Directors/shareholders, if necessary. Similarly, the offered company should also obtain the approval of its Board of Directors in favour of the FCEBs proposal of the issuing company. The issuing company should comply with all the applicable provisions of the SEBI Act/Rules/Regulations/Guidelines with respect to disclosures of their shareholding in the offered company. It should **(i)** not transfer/mortgage/offer as collateral/trade in the offered shares, and **(ii)** keep the offered shares free from all encumbrances from the date of issuance of the FCEBs till the date of exchange/redemption.

Retention/Deployment of Proceeds

The proceeds of the FCEBs should be retained and/or deployed overseas by the issuing/promoter group companies in accordance with the policy for the proceeds of the ECBs. The issuing company should ensure that the FCEB proceeds are used by the promoter group company(ies) only for the permitted end-uses prescribed under the ECB policy. It should also submit audit trail of end-uses of the proceeds to the RBI duly certified by the designated AD bank.

Taxation

The interest payments on the FCEBs, until the exchange option is exercised, would be subject to deduction of tax at source under the provisions of Section 115-AC (1) of the Income Tax Act. The tax on dividend on the exchange portion of the FCEBs would be in accordance with the provisions of Section 115-AC (1) of the Income Tax. The exchange of the FCEBs into shares would not give rise to any capital gains liable to tax in India. The transfer of the FCEBs made outside between investors resident outside India would also not give rise to any capital gains liable to tax in India.

SUMMARY

International financial management is concerned with decisions related to multinational capital budgeting, cost of capital, working capital and sources of international finance.

Comparative cost advantage, financial diversification and tax/fiscal incentives are the major motivating factors for undertaking investment abroad by MNCs.

Foreign capital budgeting decisions are to deal with a number of complex issues/problems such as exchange rate risks, expropriation risk, blocked funds, foreign tax regulations and political risk. Therefore, they are relatively more difficult decisions to evaluate vis-à-vis domestic investment decisions.

Relevant data consisting of incremental cash outflows required to execute a foreign investment proposal and projected incremental cash inflows after taxes (CFAT) expected from the proposed foreign capital budgeting decision during its economic useful life are the major inputs for its evaluation.

Since total CFAT tends to overstate profitability of the foreign investment proposal, it is important to draw distinction between the total CFAT such an investment proposal generates and the incremental CFAT, the firm eventually has. The difference between the two sets of CFAT may arise due to: (i) cannibalisation, (ii) sales accretion, (iii) opportunity cost, (iv) treatment of fixed overheads and (v) fees and royalties.

LO 35.1

Cannibalisation implies the lost sales of the firm's existing product(s) on account of proposed foreign investment. Accordingly, the adverse effect of cannibalisation in terms of lost profit due to lost sales is to be deducted from total CFAT to arrive at incremental CFAT. In contrast, the positive impact of increased profits due to sales accretion of the existing products of the parent company should be reckoned in determining incremental CFAT.

While the allocation of the existing overheads and fees and royalties charged from the subsidiary by the parent merit exclusion, opportunity cost of existing resources used in undertaking a new investment proposal should be considered.

In foreign capital budgeting decisions, there may be a substantial difference between the CFAT of the foreign investment project at the subsidiary level vis-à-vis that of the parent firm. The major factors causing the difference are: (i) double taxation of foreign income accruing to the parent company without giving any credit for corporate taxes as well as withholding taxes paid by the subsidiary company in the host country, (ii) exchange controls affecting repatriation of funds, (iii) inflation and interest rate differentials between the host country and the parent country affecting exchange rates, and so on. Being so, it is suggested that cash flows should be determined at the level of parent corporate firm as well as at subsidiary level separately.

Political risk also has a profound influence on the overall risk of a foreign investment proposal. Political risk can range from mild interference to complete confiscation of all assets/or outright expropriation. In view of gravity of political risk, MNCs prefer investment in countries with stable governments, having stable economic policies and the least political risk of expropriation.

LO 35.2

Cost of capital (another major input) for foreign investment proposals (like domestic capital budgeting proposals) should be based on the weighted average cost of long-term sources of finance, namely, equity share capital, preference share capital, debentures, long-term loan/ debt and retained earnings. The weighted average (instead of simple average) is desired as the relative proportions of various sources of finance are different.

While retained earnings have implicit costs, other sources of long-term finance have explicit costs.

The explicit cost of any source of capital is the discount rate that equates the present value of the incremental cash inflows with the present value of its incremental cash outflows. In terms of equation:

$$Cf_0 = \sum_{t=1}^n \frac{CO_t}{(1+k)^t}$$

In the context of international finance, cash flows are to be adjusted for foreign exchange risk, flotation costs, corporate taxes, tax laws (regarding treatment of exchange losses and gains, withholding, repatriation of funds and amortisation of flotation costs), transfer costs involved in repatriation of funds, and so on.

Cost of capital applicable to investment proposals of foreign subsidiaries should be based both on the origin of funds and risk involved in such proposals.

Retained earnings represent undistributed profits of the corporate firm belonging to equity shareholders. Being so, the cost of retained earnings is equivalent to the opportunity cost of investing these funds in a similar risk-class of companies by the shareholders themselves. However, in effect, it is lower than the cost of equity as is evident from the following equation:

$$K_r = k_e (1 - Wt) (1 - f)$$

The dividend approach and the capital asset pricing model (CAPM) approach are used to compute cost of equity (k_e). According to the dividend approach, k_e is defined as the discount rate that equates the present value of all expected dividends per share with the net proceeds of the sale/market price of share. In equation terms:

$$P_0 (1 - f) = \sum_{t=1}^n \frac{D_t (1 + g)^{t-1}}{(1 + k_e)^t}$$

According to CAPM approach, the k_e is a function of (i) riskless rate of return (R_f), (ii) market rate of return (R_m) and (iii) beta. Symbolically,

$$K_e = R_f + b(R_m - R_f)$$

Where $b = \text{Covariance}(R_m, R_i) / \text{Variance } R_m$

Weighted average cost of capital (WACC/ k_0), in equation terms is:

$$K_0 = k_e W_e + k_p W_p + k_d W_d + k_r W_r$$

While market value weights (W) are theoretically superior to book value weights, book value weights are operationally convenient and more often used in practice.

Applying a single rate of discount (k_0) to evaluate capital budgeting proposals is not appropriate in case the risks are different for various foreign investment proposals. Adjusted present value (APV) approach is an alternative approach to the WACC.

According to the APV approach cash flows (CFAT) are to be discounted at an all equity rate (k_e^*) that reflects only the business work so as to exclude the impact of debt financing. To this present value (PV) are added (i) the PV of interest tax shield (TS) and (ii) the PV of subsidies/concessions on interest costs (S_i) associated with project-specific financing. In terms of equation:

$$APV = \left[\sum_{t=1}^n \frac{CFAT_t}{(1 + k_e^*)^t} + \sum_{t=1}^n \frac{TS_t}{(1 + k_i)^t} + \sum_{t=1}^n \frac{S_t}{(1 + k_i)^t} \right] - CO_0$$

The basic objectives of cash management of the MNCs (like domestic firm) is to meet the cash disbursement needs of the firm and to minimise funds committed to cash balances. For the purpose, the MNCs, *inter-alia*, should instruct foreign subsidiaries to remit cash as fast as possible when it is not needed to those places where it is needed (by using the netting system and currency center concept).

MNCs should hedge its undesirable cash and marketable securities against foreign exchange rate risks. Forward contracts are by far the most commonly used hedging technique; others are borrowing or lending in different currencies, future contracts and options.

LO 3.4	<p>In the context of credit management, the MNCs should ensure that (i) the risk/cost of default is lower than the incremental profits expected from granting credit, (ii) the risk from exchange rate fluctuations is hedged in particular for export credit sales to developing countries and (iii) the FERM technique ('leads and lags' indexation clause and others) are used as per the need.</p> <p>As far as inventory management is concerned, the MNCs (having subsidiaries all around the world) should maintain both working stocks and safety stocks at each user location as well as at the strategic storage centers. To ensure minimum payment of property taxes on assets (including inventories), it should hold safety stocks in different countries/locations at different times during the year.</p>
LO 35.5	<p>The Government of India permits Indian corporates to raise finance through external commercial borrowings (ECBs) only from internationally recognised sources. The ECBs include commercial bank loans, suppliers' credit securitised instruments such as floating rate notes (FRNs) and fixed rate bonds (FRBs) from non-resident lenders. The ECBs can be used for (i) investment, (ii) overseas client investment, (iii) first stage acquisition of shares in PSU disinvestments and (iv) lending to self-help groups/micro-finance. The RBI's operational guidelines relate to automatic route and approval route.</p>
LO 35.6	<p>Besides ECBs, Indian corporates are permitted to float their securities (known as euro issues) in the euro markets. There are two long-term euro issues: (i) Foreign Currency Bonds (FCCBs) and (ii) Global Depository Receipts (GDRs)/American Depository Receipts (ADRs).</p> <p>A FCCB means a bond subscribed by a non-resident in foreign currency and convertible into ordinary shares of the issuing company in India, wholly or in part, on the basis of any equity related warrants attached to the debt instruments.</p> <p>A GDR/ADR means any instrument in the form of a depository receipt/certificate, created by the Overseas Depository Bank outside India and issued to non-resident investors against the issue of ordinary shares or FCCBs of the issuing company.</p> <p>Issue of FCCBs and ordinary shares through the GDR/ADR mechanism by Indian companies are to conform guidelines issued by the Government/RBI in this regard. Among others, the guidelines relate to (i) issue structure (i.e., the number of GDRs/ADRs to be issued, the issue price, the interest rate payable on FCCBs, conversion price, coupon rate, and so on), (ii) listing, (iii) transfer and redemption, (iv) taxation.</p>
LO 35.7	<p>An Indian company can issue FCEB expressed in foreign currency the principal and interest in respect of which is payable in foreign currency and subscribed by a person who is resident outside India in foreign currency and exchangeable into equity shares of another company (i.e. offered company) in any manner, either wholly/partly or on the basis of any equity related warrants attached to a debt instrument.</p> <p>The proceeds of the FCEB may be invested by the issuing company in the promoter group companies which would use the proceeds in accordance with the end-users prescribed under the ECBs policy. They may also be invested overseas by way of direct investment including in JVs/WOS.</p> <p>The interest and the issue expenses should be within the all-in-cost ceiling specified by the RBI under the ECBs policy.</p> <p>The exchange price of the offered listed equity shares should not be less than the higher of the average of the weekly high and low of the closing prices quoted on the stock exchange during (i) six months, (ii) two weeks preceding the relevant date. The minimum maturity of the FCEB should be five years for redemption purposes.</p> <p>Interest payments on the FCEBs until the exchange option is exercised would be subject to deduction of tax at source. Tax on dividends on the exchanged portion of the FCEB would be in accordance with Section 115-AC(1) of the income-tax Act. The exchange of the FCEB into shares would not give rise to any capital gains tax.</p>

The first part of the document discusses the importance of maintaining accurate records. It emphasizes that proper record-keeping is essential for the efficient operation of any organization. The text outlines various methods for collecting and organizing data, including the use of standardized forms and regular audits. It also highlights the need for clear communication and collaboration among all staff members to ensure that information is shared and updated in a timely manner.

In addition, the document addresses the challenges of data management in a rapidly changing environment. It notes that as technology advances, the volume and complexity of data increase significantly. This requires organizations to invest in robust information systems and to provide ongoing training for their employees. The text also discusses the importance of data security and privacy, particularly in light of increasing regulatory requirements and public concern over data breaches.

Finally, the document concludes by reiterating the value of a data-driven approach to decision-making. It argues that by leveraging their data, organizations can gain valuable insights into their operations and market trends. This enables them to identify areas for improvement, optimize their processes, and develop more effective strategies. The document ends with a call to action, encouraging all stakeholders to take responsibility for their role in maintaining and improving the organization's data infrastructure.

The second part of the document focuses on the implementation of data management practices. It provides a detailed overview of the key components of a successful data management strategy. This includes the selection of appropriate software solutions, the establishment of clear data governance policies, and the implementation of strong access controls. The text also discusses the importance of regular data backups and disaster recovery planning to ensure business continuity in the event of a system failure.

Furthermore, the document explores the role of data in driving innovation and growth. It highlights how data analysis can uncover new opportunities and identify potential risks. By using predictive analytics and other advanced data tools, organizations can anticipate market changes and respond proactively. The text also emphasizes the need for a culture of data literacy, where all employees understand the value of data and are equipped with the skills to use it effectively.

In conclusion, the document stresses that data management is not just a technical task, but a strategic imperative. It is a continuous process that requires ongoing attention and investment. By following the principles and best practices outlined in this document, organizations can ensure that their data is a source of strength and competitive advantage. The document ends with a final note of encouragement, reminding readers that with the right approach, they can harness the full power of their data.

SOLVED PROBLEMS

P.35.1 A US MNC is planning to install a manufacturing unit to produce 5,00,000 units of an automobile component in India. Setting up of the manufacturing plant will involve an investment outlay of ₹50 million. The plant is expected to have a useful life of 5 years with ₹10 million salvage value. MNC will follow the straight-line method of depreciation. To support the running of

LO 35.1 LOD M

business, working capital of ₹5 million, will have to be invested; variable cost of production and sales will be ₹20 per unit. Additional fixed cost per annum are estimated at ₹2 million. The forecasted selling price is ₹70 per unit. The MNC will be subjected to 40 per cent tax rate in India and its required rate of return is 15 per cent.

It is forecasted that the rupee will depreciate in relation to US dollar @ 3 per cent per annum, with an initial exchange rate of ₹58/\$. Accordingly, the exchange rates for the relevant 5-year period of the project will be as follows:

Year	Exchange rate
0	₹58/\$
1	59.74/\$
2	61.53/\$
3	65.80/\$
4	67.24/\$
5	69.26/\$

Advise the MNC regarding the financial viability of the proposal.

Solution**Financial viability of proposal (NPV method)**

I. Incremental cash outflow at $t = 0$		
Cost of the plant		₹50,000,000
Working capital		5,000,000
		<u>55,000,000</u>
Equivalent to \$ (₹55,000,000/₹58)		<u>\$948,275</u>
II. Incremental CFAT for year $t = 1-5$		
Sales revenue (500,000 × ₹70)		₹35,000,000
Less: Costs:		
Variable (500,000 × ₹20)		10,000,000
Fixed cost		2,000,000
Depreciation (₹40 million/5 years)		8,000,000
Earning before tax		<u>15,00,000</u>
Less: Taxes (0.40)		6,000,000
EAT		9,000,000
Add: Depreciation		8,000,000
CFAT ($t = 1$ to 5)		<u>17,000,000</u>
Additional CFAT in the 5th year		
Release of working capital		5,000,000
Salvage value of plant		10,000,000
		<u>15,000,000</u>

Conversion of rupees into \$

Year	CFAT	Exchange rate	CFAT
1	₹17,000,000	₹59.74/\$	\$284,566
2	17,000,000	61.53/\$	276,287
3	17,000,000	65.80/\$	258,358
4	17,000,000	67.24/\$	252,825
5	32,000,000	69.26/\$	462,027

III. Determination of NPV

Year	CFAT (\$)	PV factor at 15 per cent	Total PV (\$)
1	284,566	0.870	247,572
2	276,287	0.750	207,215
3	258,358	0.658	169,999
4	252,825	0.572	144,616
5	462,027	0.497	229,627
Gross present value			<u>999,029</u>
Less: Cash outflow			<u>948,275</u>
Net present value			50,754

IV. **Recommendation** Since the NPV is positive, the project should be accepted.

P.35.2 An Indian company is planning to set up a subsidiary in the US. The initial project cost is estimated to be US dollar 400 million; working capital requirements are estimated at US dollar 40 million. The Indian company follows the straight-line method of depreciation.

LO 35.1 

The finance manager of the Indian company estimated data in respect of the project as follows: (i) variable cost of production and sales \$25 per unit, (ii) fixed cost per annum are estimated at \$30 million (iii) plant will be producing and selling 50 million units at \$100 per unit and (iv) the expected economic useful life of the plant is 5 years with no salvage value.

The subsidiary of the Indian company is subject to 40 per cent corporate tax rate in the US and the required rate of return of such a project is 12 per cent. The current exchange rate between the two countries is ₹58/US dollar and the rupee is expected to depreciate by 3 per cent per annum for next five years.

APPENDIX

The following table shows the results of the experiments conducted during the period from 1910 to 1912, inclusive, at the Agricultural Experiment Station, University of California, Davis, California.

The experiments were conducted under the following conditions: The soil was a heavy loam, the climate was that of the Sacramento Valley, and the plants were raised in the open field. The results are given in the following table, and are expressed in terms of the yield of the crop per acre.

EXPERIMENT

Year	Plant	Yield per acre
1910	Wheat	100
1911	Wheat	110
1912	Wheat	120

The following table shows the results of the experiments conducted during the period from 1910 to 1912, inclusive, at the Agricultural Experiment Station, University of California, Davis, California.

The following table shows the results of the experiments conducted during the period from 1910 to 1912, inclusive, at the Agricultural Experiment Station, University of California, Davis, California.

EXPERIMENT

Year	Plant	Yield per acre
1910	Wheat	100
1911	Wheat	110
1912	Wheat	120

The following table shows the results of the experiments conducted during the period from 1910 to 1912, inclusive, at the Agricultural Experiment Station, University of California, Davis, California.

The subsidiary will be allowed to repatriate 70 per cent of the CFAT every year along with the accumulated arrears of blocked funds at year-end 5, the withholding taxes are 10 per cent. The blocked funds will be invested in the USA money market by the subsidiary, earning 4 per cent (free of tax) per year.

Determine the feasibility of having a subsidiary company in the USA, assuming no tax liability in India on earnings received by the parent from the US subsidiary.

Solution

(i)	Cash outflows ($t = 0$)	(figures in million)
	Cost of plant and machinery	\$400
	Working capital requirement	40
		<u>440</u>
	Incremental cash outflow in rupees (\$440 million \times ₹58)	₹25,520

(ii)	Cash inflows after taxes	(figures in million)
	Sales revenue (5.0 million units \times \$100)	500
	Less: Costs:	
	Variable cost (5.0 million units \times \$25)	\$125
	Fixed cost	30
	Depreciation (\$400 million/5 year)	<u>80</u>
	Earning before taxes	265
	Less: Taxes (0.40)	<u>106</u>
	Earning after taxes	159
	Add: Depreciation	80
	CFAT ($T = 1 - 4$)	<u>239</u>
	CFAT in 5th year:	
	Operating CFAT	239
	Add: Release of working capital	<u>40</u>
		279

Determination of NPV

(amount in million)

Particulars	Year				
	1	2	3	4	5
Operating CFAT	\$239	\$239	\$239	\$239	\$239
Less: Retention	71.7	71.7	71.7	71.7	—
Repatriation made	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>	<u>167.3</u>
Less: Withholding tax	16.7	16.7	16.7	16.7	23.9
Accessible funds to parent	150.6	150.6	150.6	150.6	215.1
Add: Repatriation of blocked funds*	—	—	—	—	274
Add: Recovery of working capital	—	—	—	—	40
₹/\$ exchange rate	59.74	61.53	65.80	67.24	69.26
Rupee equivalent	8,997	9,266	9,909	10,126	50,497
PV factor (0.12)	0.893	0.797	0.712	0.636	0.567
Present value	<u>8,034</u>	<u>7,385</u>	<u>7,055</u>	<u>6,440</u>	<u>28,632</u>
Total present value					57,546
Less: Cash outflow					<u>25,520</u>
Net present value					₹32,026

Recommendation Since the NPV is positive, having a subsidiary in the US is financially viable for the Indian company.

* Repatriation of blocked funds after withholding taxes

Future value in year 5 of blocked funds of 71.7 million each during $t = 1$ to 4 years invested at 4 per cent per year = 4.246×71.7 million = 304.44 million – 30.44 million withholding tax = 274 million.

P.35.3 A US based plastic manufacturer is considering a proposal to produce of high quality plastic glasses in India. The necessary equipment to manufacture the glasses would cost ₹1 lakh in India and it would last 5 years. The tax relevant rate of depreciation is 25 per cent on written down value. LO 35.1 LO D

The expected salvage value is ₹10,000. The glasses will be sold at ₹4 each. Fixed cost will be ₹25,000 each year and variable cost ₹2 per glass. The manufacturer estimates it will sell 75,000 glasses per year; tax rate in India is 35 per cent. The US manufacturer assumes 20 per cent cost of capital for such a project. Additional working requirement will be ₹50,000.

Spot	₹60/\$
Year-end 1	60
2	60
3	62
4	62
5	62

The US manufacturer will be allowed 100 per cent repatriation each year with a withholding tax rate of 10 per cent. Should the proposal of setting up a manufacturing unit in India be accepted by the US manufacturer? Spot and expected exchange rates are as follows:

Solution

Cash outflow	
Cost of production equipment	₹1,00,000
Additional working capital	50,000
	1,50,000
Cash outflow in dollar (1 \$ = ₹60)	\$2,500

Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5

Total present value ($t = 1 - 5$)					\$4,225
Less: Cash outflow					2,500
Net present value					1,725

* $(₹1,00,000 - ₹68,359, \text{ accumulated depreciation} - ₹10,000, \text{ salvage value}) \times 0.35 = ₹7,574.$

Recommendation As the NPV is positive the US manufacturer is advised to take up the proposal.

P.35.4 A USA based company is planning to set up a software development unit in India. Software developed at the Indian unit will be bought back by US parent at transfer price of US dollar 10 million. The unit will remain in existence in India for one year; as the software is expected to get developed within this time frame.

LO 35.1

The US based company will be subject to corporate tax of 30 per cent and withholding tax of 10 per cent in India and will not be eligible for tax credit in the US. The software developed will be sold in the US market for US dollar 12.0 million. Other estimates are as follows:

Rent for fully furnished unit with necessary hardware in India	₹15,00,000
Man power cost (80 software professional will be working for 10 hours each day)	₹400 per man hour
Administrative and other costs	12,00,000

Advise US company on financial viability of the project. The rupee-dollar rate is ₹60/\$.

Solution

Proforma profit and loss account of the Indian software development unit.

Revenue		₹60,00,00,000
Less: Costs:		
Rent	₹15,00,000	
Manpower (₹400 × 80 × 10 × 365)	11,68,00,000	
Administrative and other costs	12,00,000	11,95,00,000
Earning before tax		48,05,00,000
Less: Tax		14,41,50,000
Earning after tax		33,63,50,000
Less: Withholding tax		3,36,35,000
Repatriation amount (in rupees)		30,27,15,000
Repatriation amount (in dollars)		\$5.04 million

So the cost of developing software in India for the US based company is \$5.04 million. And as the USA based Company is expected to sell the software in the US at \$12.0 million, it is advised to develop the software in India.

P.35.5 The Indian subsidiary of an American multinational is planning to raise ₹100 million to finance its investment requirement by issuing 5 year bonds in the Indian market. The coupon rate of the bond will be 10 per cent, payable annually. The principal amount will be repaid at the end of the 5th year. The flotation cost is 5 per cent and the subsidiary is subject to 35 per cent tax in India. The current exchange rate is ₹58/US dollar and the rupee is expected to depreciate in relation to the US dollar at the rate of 3 per cent each year, for the next 5 years

LO 35.2

Determine the effective cost of debt to the US parent MNC. Assume tax laws in India allow full amortisation of flotation costs in the year in which it is incurred.

Solution

Cash inflow at $t = 0$

(i) Issue of debt		₹100 million
Less: Effective flotation cost (₹100 million × 0.05)	₹5 million	
Tax advantage on flotation cost (₹5 million × 0.35)	1.75	3.25
	96.75	
In dollar terms (₹96.75 million/₹58)		US \$1,668,103

Year	Cash Outflow			Exchange rate	Cash outflow in US dollar
	Interest	Tax advantage	Effective interest paid (cash outflows)		
1	₹10	₹3.5	₹6.5	₹59.74/US \$	US \$108,804
2	10	3.5	6.5	61.5322	105,635
3	10	3.5	6.5	63.3781	102,559
4	10	3.5	6.5	65.2795	99,571
5	10	3.5	6.5	67.2379	96,671
5	100*	—	—	69.2550	1,443,939

* Principal payment

So, if K_d is effective cost of debt, then

$$(CI)t = 0 = \frac{CO_1}{(1+k_d)^1} + \frac{CO_2}{(1+k_d)^2} + \frac{CO_3}{(1+k_d)^3} + \frac{CO_4}{(1+k_d)^4} + \frac{CO_5}{(1+k_d)^5}$$

$$\$1,668,103 = \frac{\$108,804}{(1+k_d)^1} + \frac{\$105,635}{(1+k_d)^2} + \frac{\$102,559}{(1+k_d)^3} + \frac{\$99,571}{(1+k_d)^4} + \frac{96,671}{(1+k_d)^5} + \frac{1,443,939}{(1+k_d)^5}$$

'or' $K_d = 3.15$ per cent.

P.35.6 An Indian company has borrowed \$1 million at 5 per cent from the US market for two years. The Indian company has covered its debt exposure on the forward market. The rates are as follows: spot rate—₹61/US dollar, one year forward—₹61.50/US dollar and two year forward—₹62/US dollar. Interest is to be paid annually. The principal amount will be paid at the end of year two. The tax rate applicable for the company is 35 per cent. What is the effective cost of debt?

LO 35.2 LOD M

Solution

Cash inflow at ($t = 0$)

in dollars = \$1,000,000 in rupees = ₹48,000,000

Year	Particulars	Dollar amount	Exchange rate	Rupee amount	Tax shield on interest	Net rupee outflow
1	Interest payment	\$50,000	₹61.5/US dollar	₹3,075,000	₹10,76,250	₹19,98,750
2	Interest payment	50,000	62	3,100,000	10,85,000	20,15,000
2	Principal repayment	1,000,000	62	62,000,000	—	62,000,000

$$K_d = (CI)_{t=0} = \frac{CO_1}{(1+k_d)^1} + \frac{CO_2}{(1+k_d)^2}$$

$$₹61 \text{ million} = \frac{₹19,98,750}{(1+k_d)^1} + \frac{₹20,15,000}{(1+k_d)^2} + \frac{₹62,000,000}{(1+k_d)^2}$$

Or $K_d = 2.75$ per cent.

P.35.7 An Indian subsidiary of an American multinational borrows in India at the rate of 11 per cent. The subsidiary is subject to a tax rate of 35 per cent. The anticipated average annual devaluation of the Indian rupee in relation to US dollar is 2 per cent. Compute the cost of debt to the multinational.

LO 35.2 LOD E

Solution $K_d = K_i(1 - t)(1 - d) - d$

Where K_i = Interest/Coupon rate

$$t = \text{Corporate tax rate}$$

$$d = \text{Expected currency depreciation}$$

$$K_d = (0.11)(1 - 0.35)(1 - 0.02) - 0.02 = 0.05 \text{ or } 5 \text{ per cent.}$$

P.35.8 The liabilities in the balance sheet of a US based company are:

LO 35.2 LOD M

The cost of equity capital is 15 per cent and the cost of debt is 6 per cent in the US. The US based company is planning to start a subsidiary in India. The Indian subsidiary will be making an investment of ₹100 million. The interest rate in India is 10 per cent and the Indian rupee is expected to depreciate at the rate of 3 per cent per year. Tax rate in India is 35 per cent. The US company wants to maintain the capital structure of the Indian subsidiary in line with the parent's capital structure. What will be the cost of capital if the subsidiary is financed by the parent company and through Indian loans?

Owner's capital	US dollar 400 million
Debts	600
Total	1,000

Solution Debt and equity are in the proportion of 3:2 in the capital structure of the parent company. This implies that the Indian subsidiary will have ₹40 million of equity and ₹60 million of debt.

The cost of the equity capital is that of the parent, i.e., 15 per cent; the cost of debt would be $0.10(1 - 0.35)(1 - 0.03) - 0.03 = 0.033$ or 3.3 per cent.

So, the *weighted average cost of capital* would be: $(15 \times 40/100 + 3.3 \times 60/100) = 7.98$ per cent.

P.35.9 In year 1 a US based MNC floated an euro denominated bond issue in Europe with a coupon rate of 3 per cent, sold at par. In year 2 the euro appreciated against the US dollar by 2 per cent. What was the effective borrowing cost in year 2, given that the US based MNC has a marginal income tax rate of 40 per cent? If in year 1, the MNC could have sold a similar bond issued in the US (denominated in US dollar) at par with coupon rate of 4.5 per cent, which market could have afforded a lower borrowing cost?

LO 35.2 LOD M

Solution

- (i) Effective borrowing cost in euro-denominated bonds
 $k_d = 3\%(1 - 0.4)(1 + 0.02) + 2\% = 3.836$ per cent
- (ii) Cost of the US bonds issued at par with a coupon rate of 4.5 per cent
 $(0.045)(1 - 0.4) = 0.027$ or 2.7 per cent

Evidently, the US bond market would have afforded a lower borrowing cost.

P.35.10 ICM Computers Inc. has a subsidiary in country X producing computer components and it sells them to another subsidiary in country Y. The subsidiary in country Y uses those components to produce computers. The tax rate in country X is 40 per cent and in country Y, the tax rate is 20 per cent. The proforma income statement of the ICM subsidiaries are shown below:

LO 35.3 LOD D

ICM Computers income statement

Particulars	Subsidiary X	Subsidiary Y	Consolidated figures
Sales	\$1,000,000	\$2,500,000	\$3,500,000
Cost of goods sold	500,000	1,000,000	1,500,000
Gross profit	500,000	1,500,000	2,000,000
Operating expenses	250,000	500,000	750,000
EBIT	250,000	1,000,000	1,250,000
Interest expenses	50,000	250,000	300,000
EBT	200,000	750,000	950,000
Taxes	80,000	150,000	230,000
EAT	120,000	600,000	720,000

If ICM Computers adjusts its transfer pricing policy so that sales by subsidiary X are reduced from \$1,000,000 to \$750,000, determine the effect on the net profit of ICM Computers from the two subsidiaries. Should ICM Computers go ahead with the proposal?

Solution If ICM Computers adjusts its transfer pricing policy, cost of goods of subsidiary Y will come down from \$1,000,000 to \$750,000 and the income statement (revised) will be as follows:

ICM Computers income statement

Particulars	Subsidiary X	Subsidiary Y	Consolidated figures
Sales	\$750,000	\$2,500,000	\$3,250,000
Cost of goods sold	500,000	750,000	1,250,000
Gross profit	250,000	1,750,000	2,000,000
Operating expenses	250,000	500,000	750,000
EBIT	0	1,250,000	1,250,000
Interest expenses	50,000	250,000	300,000
EBT	(50,000)	1,000,000	950,000
Taxes	0	200,000	200,000
EAT	(50,000)	800,000	750,000

Recommendation Transfer pricing policy is beneficial as the total profit from the two subsidiaries is increased for ICM Computers.

REVIEW QUESTIONS

LOD: Easy

RQ.35.1(a) Indicate whether the following statements are true or false:

[LO 35.1-6]

- (i) International firms/MNCs and domestic firms are guided by the same fundamental goal, that is, maximisation of shareholders' wealth.
- (ii) In multinational capital budgeting decisions, there is no distinction between the total CFAT that the new foreign investment project generates and the incremental CFAT the firm eventually has.
- (iii) In determining the incremental cash inflows after tax for a new foreign capital budgeting proposal, the allocation of existing fixed overheads of the parent should be included.
- (iv) Foreign exchange earnings are generally subject to tax at a single stage.
- (v) The concept of single discount rate (based on weighted average cost of capital) is not appropriate for evaluating foreign projects subject to different risks.
- (vi) Indian corporates can raise finance through ECBs only from recognised sources such as banks, export credit agencies etc.
- (vii) Trusts and non-profit making organisations can raise finance through ECBs.
- (viii) Funds raised through ECBs can be used for investment in the capital market.
- (ix) The ordinary shares underlying the GDRs can be denominated in any freely convertible foreign currency.

[Answers: (i) True (ii) False (iii) False (iv) False (v) True (vi) True (vii) False (viii) False (ix) False]

(b) Fill in the blanks with the correct answer (out of the choices provided).

- (i) Profitability from an investment in a country is adversely affected if the currency of that country is subject to (appreciation/depreciation).
- (ii) Under the Adjusted Present Value Approach to evaluating foreign investment proposals, each project is assessed _____ (with/without) reference to the firm's other investments.
- (iii) When a foreign subsidiary is located in a country having a high rate of inflation, it is advisable to keep _____ (more/less) stocks at that location.
- (iv) Both working stocks and safety stocks should be kept at the location of a subsidiary that is _____ (near to/far from) the market supplying the goods.

RQ.35.2 Write short notes on the following:

[LO 35.3,6]

- (i) Foreign currency bonds (FCCBs)
- (ii) Global Depository Receipts (GDRs)
- (iii) Guidelines for disinvestment of shares by Indian companies in the overseas market

RQ.35.3 An Indian software company having a subsidiary in the US borrows at 4 per cent in the US. If the US dollar is expected to appreciate by 2 per cent, what is the effective rate of interest for the Indian software company?

[LO 35.2]

LOD: Medium

RQ.35.4 "Instead of total cash flows, incremental cash flows should be the basis of evaluating foreign capital budgeting projects". Elucidate the statement with suitable examples.

[LO 35.1]

RQ.35.5 Explain the rationale of using weighted average cost of capital to evaluate foreign investments. Do you think it always provides the best results?

[LO 35.2]

RQ.35.6 What is adjusted present value approach? Specify the situation(s) when APV approach provides better results than the NPV approach, based on WACC.

[LO 35.3]

RQ.35.7 "We should avoid borrowing in a currency that is likely to appreciate". True or false? Explain.

[LO 35.2]

RQ.35.8 In what respects are cash management, credit management and inventory management of a multinational enterprise different from those of a domestic company?

[LO 35.4]

RQ.35.9 Describe in brief the main elements of the ECB (external commercial borrowings) guidelines currently in force in India.

[LO 35.5]

RQ.35.10 The capital budget department of the ABC Inc. of the USA has developed the following data for the purpose of determining the financial feasibility of an investment proposal to be carried out in India.

[LO 35.1]

- (a) Purchase of land requires ₹3,00,000 to be paid at the time of purchase ($t = 0$) and two instalments of ₹2,00,000 each to be made at the end of the next 2 years ($t = 1-2$)
- (b) Construction of the factory is to be completed in 2 years The contractor is to be paid ₹12,00,000 in two equal instalments at the end of year ($t = 2-3$); (c) Equipment cost to be incurred at the start of year 4 ($t = 3$) is ₹12,00,000; (d) Operations will begin at the start of year 5 ($t = 4$). It is expected that there will be a need for working capital investments. The details are: ₹3,00,000 accounts receivable; ₹15,00,000, inventories; current liabilities will also increase by ₹2,00,000.

Operations will begin in year 5 and will continue for 12 years, through year 16. The sales revenues and operating costs are assumed to come at the end of each year ($t = 5 - 16$). The following additional assumptions are made:

- (a) The building and equipment will be depreciated over 12 years starting in year 5. After 12 years the factory building is estimated to have a salvage value of ₹6,00,000. The plant, however, is expected to have no salvage value. The company expects to sell the land at ₹8,00,000, when the plant is closed down. The company uses the straight-line method of depreciation and the same is allowed for tax purposes.
- (b) Its cost of capital is 8 per cent.
- (c) Annual sales are ₹28,00,000.
- (d) Annual variable operating costs are ₹10,00,000.
- (e) Annual fixed operating costs, excluding depreciation, are ₹2,00,000.
- (f) The normal tax rate in India is 35 per cent.
- (g) The company projects depreciation of the Indian rupee; to compensate for exchange rate loss, it adds a premium of 200 basis point on its cost of capital for any project to be carried out in India.

Should the company accept the project? Use the NPV method for the purpose of calculations.

- RQ.35.11** Endalco Ltd. of India is planning to buy a small aluminum plant in the United States of America. The dollar cost of buying the aluminum plant is 50,000. Expected life of the plant is 5 years and it has no salvage value. The company uses the straight-line method of depreciation and the same is allowed for tax purposes. Estimated earning after taxes are \$ 5,000 each year for 5 years.

[LO 35.1]

Dollar-Rupee rate is expected to be

Spot	₹62/\$
After 1 year	62/\$
After 2 year	62.5/\$
After 3 year	62.5/\$
After 4 year	62.5/\$
After 5 year	63/\$

Determine the IRR and payback period of the capital budgeting proposal. Will you accept the proposal if the required rate of return on such a project is 11 per cent?

LOD: Difficult

- RQ.35.12** "A foreign capital budgeting project that is profitable from the point of view of a subsidiary is also profitable from the perspective of the parent." True or false? Explain. [LO 35.1]
- RQ.35.13** Explain why a corporate finance manager would be unwise to follow a policy of always borrowing in a currency that offers the lowest rate of interest. [LO 35.2]

ANSWERS

- 35.3** Effective rate of interest is 6.8 per cent.
- 35.10** Company should accept the project (NPV ₹21,50,884).
- 35.11** (i) Project is profitable as IRR (15.54 per cent) is higher than required rate of return (11 per cent);
(ii) Payback period is 3.3 years.

(Contd.)

Handwritten text on the left page, organized into several lines. The text is dense and appears to be a list or a series of entries. Some lines are separated by vertical bars on the left side, possibly indicating a margin or a specific section. The handwriting is cursive and somewhat difficult to decipher due to the image quality.

Handwritten text on the right page, organized into several lines. Similar to the left page, it appears to be a list or a series of entries. The text is dense and cursive. There are some vertical lines on the left side of the text block, possibly indicating a margin or a specific section. The handwriting is consistent with the left page.

(Contd.)

1. The first part of the document discusses the importance of maintaining accurate records. It emphasizes that proper record-keeping is essential for the smooth operation of any organization.

2. In the second section, the author outlines the various methods used to collect and analyze data. This includes both qualitative and quantitative approaches, each with its own strengths and limitations.

3. The third section focuses on the challenges faced by researchers in the field. These challenges often stem from limited resources, time constraints, and the complexity of the subjects being studied.

4. Finally, the document concludes by highlighting the need for continuous improvement and innovation in research practices. It encourages researchers to stay abreast of the latest developments in their field.

Let x and y be the two numbers. We are given that the sum of the two numbers is 10, and the sum of their squares is 58. We can write these conditions as a system of equations:

$$\begin{cases} x + y = 10 \\ x^2 + y^2 = 58 \end{cases}$$

From the first equation, we can express y in terms of x :

$$y = 10 - x$$

Substituting this into the second equation, we get:

$$x^2 + (10 - x)^2 = 58$$

$$x^2 + 100 - 20x + x^2 = 58$$

$$2x^2 - 20x + 100 = 58$$

$$2x^2 - 20x + 42 = 0$$

$$x^2 - 10x + 21 = 0$$

Factoring the quadratic equation, we find:

$$(x - 3)(x - 7) = 0$$

Thus, $x = 3$ or $x = 7$. If $x = 3$, then $y = 7$. If $x = 7$, then $y = 3$. Therefore, the two numbers are 3 and 7.

Lash's

Let x and y be the two numbers. We are given that the sum of the two numbers is 10, and the sum of their squares is 58. We can write these conditions as a system of equations:

$$\begin{cases} x + y = 10 \\ x^2 + y^2 = 58 \end{cases}$$

From the first equation, we can express y in terms of x :

$$y = 10 - x$$

Substituting this into the second equation, we get:

$$x^2 + (10 - x)^2 = 58$$

$$x^2 + 100 - 20x + x^2 = 58$$

$$2x^2 - 20x + 100 = 58$$

$$2x^2 - 20x + 42 = 0$$

$$x^2 - 10x + 21 = 0$$

Factoring the quadratic equation, we find:

$$(x - 3)(x - 7) = 0$$

Thus, $x = 3$ or $x = 7$. If $x = 3$, then $y = 7$. If $x = 7$, then $y = 3$. Therefore, the two numbers are 3 and 7.

Let x and y be the two numbers. We are given that the sum of the two numbers is 10, and the sum of their squares is 58. We can write these conditions as a system of equations:

$$\begin{cases} x + y = 10 \\ x^2 + y^2 = 58 \end{cases}$$

From the first equation, we can express y in terms of x :

$$y = 10 - x$$

Substituting this into the second equation, we get:

$$x^2 + (10 - x)^2 = 58$$

$$x^2 + 100 - 20x + x^2 = 58$$

$$2x^2 - 20x + 100 = 58$$

$$2x^2 - 20x + 42 = 0$$

$$x^2 - 10x + 21 = 0$$

Factoring the quadratic equation, we find:

$$(x - 3)(x - 7) = 0$$

Thus, $x = 3$ or $x = 7$. If $x = 3$, then $y = 7$. If $x = 7$, then $y = 3$. Therefore, the two numbers are 3 and 7.

Let x and y be the two numbers. We are given that the sum of the two numbers is 10, and the sum of their squares is 58. We can write these conditions as a system of equations:

$$\begin{cases} x + y = 10 \\ x^2 + y^2 = 58 \end{cases}$$

From the first equation, we can express y in terms of x :

$$y = 10 - x$$

Substituting this into the second equation, we get:

$$x^2 + (10 - x)^2 = 58$$

$$x^2 + 100 - 20x + x^2 = 58$$

$$2x^2 - 20x + 100 = 58$$

$$2x^2 - 20x + 42 = 0$$

$$x^2 - 10x + 21 = 0$$

Factoring the quadratic equation, we find:

$$(x - 3)(x - 7) = 0$$

Thus, $x = 3$ or $x = 7$. If $x = 3$, then $y = 7$. If $x = 7$, then $y = 3$. Therefore, the two numbers are 3 and 7.
