

About the Authors

M. Y. Khan is a former Professor of Finance, Department of Financial Studies, University of Delhi. He has served as the Head of Department of Financial Studies and Dean Faculty of Business, University of Delhi. He has also been the Head, Department of Commerce, University of Delhi. Professor Khan has more than 40 years of teaching and research experience and has authored/co-authored about a dozen books. Some of his other major publications are *Basic Financial Management*, *Management Accounting*, *Cost Accounting* (co-authored with Professor Jain), *Indian Financial System* and *Financial Services*. Most of these books have run through several editions/reprints; two of these have seen more than 60 reprints and six editions.

Professor Khan has several research papers, published in journals of national and international repute, to his credit which are widely cited in the academic literature. Having guided more than a dozen Ph.D. students in the area of finance and accounting, he has published several research studies and completed many research projects. Professor Khan has also held several positions as a member on the boards of banks, mutual funds, academic institutions and so on. He has been Director of the Indian Bank and a Trustee of the PNB Mutual Fund. He has also been a member of the Board of Governors of the National Institute of Bank Management (RBI) and National Institute of Financial Management (Government of India). Enjoying the reputation of being an excellent teacher, he has been invited by several institutions as a Visiting Professor. The select list includes Indian Institute of Foreign Trade (IIFT), New Delhi, and Indian Institute of Technology (IIT) Delhi. He has organised several Management Development Programmes (MDPs) both for public and private sector executives in the areas of financial management, financial and cost analysis, profit planning and cost control, investment decisions, etc. His contributions in the field of finance have been recognised at national and international level and he has been recipient of several awards and recognitions.

P. K. Jain is Emeritus Professor of Finance in the Department of Management Studies, IIT Delhi. He earlier served as the Head of Department of Management Studies and Coordinator of Dalmia Research Programme on Management in Asia. He was Modi Foundation Chair Professor as well as Dalmia Chair Professor. With a varied teaching experience of more than four decades, Professor Jain taught subject areas of management accounting, financial management, financial analysis, cost analysis and cost control. Earlier, he taught at the Foundation for Technical Institute, Basrah and University of Basrah, Iraq. He was Visiting Faculty at the University of Paris I, School of Management, Asian Institute of Technology, Bangkok and Howe School of Technology Management, Stevens Institute of Technology, New Jersey. He has also been Visiting Faculty at International Centre for Promotion of Enterprises, Ljubljana, Slovenia, to teach finance in its MBA (International) programme (since 1997 till 2010) and has been conferred the title of Honorary Visiting Professor by the Faculty of Economics, Ljubljana, Slovenia. He has been conferred the best teacher award by IIT Delhi in January 2012.

He has authored/co-authored more than 10 textbooks. The select list includes *Basic Financial Management*, *Management Accounting*, *Cost Accounting*, *International Financial Management*, *Financial Management Practices: An Empirical Study of Indian Corporates*, *Financial Management Practices in Select Private Corporate Enterprises: A Comparative Study of India, Thailand and Singapore*, *IFCI: A Study in Financial Management*, *Economic Crisis in South East Asia*. He has published more than 200 research papers in journals of national and international repute and has published 15 research books/ monographs. Having guided 25 Ph.D. students in the area of finance and accounting, Professor Jain has also been associated with several research projects and consultancy in the field of finance. He is on the boards of many academic institutions and has organised several Management Development Programmes (MDPs)/Continuing Education Programmes (CEPs) for both public and private sector executives. His contributions in the field of finance have been recognised at national and international level and several awards and recognition have been conferred on him.

Preface to the Eighth Edition

We are pleased to place before the readers this thoroughly revised edition of our highly successful reference-cum-text book: **Financial Management—Text, Problems and Cases**. The focus continues on equipping the readers with theories, concepts, and techniques that can be applied to corporate decision-making including strategic, analytical or simply routine decisions.

New Features in the Eighth Edition

Numerous changes distinguish this edition from the earlier edition.

Updated Chapter Contents The thrust is primarily on incorporating updates in the field of financial management as well as the regulatory and policy developments therein. The important chapter-wise updates are as follows:

<i>Chapter</i>	<i>Addition/Inclusion/Rewriting/Pruning/ Deletion</i>
4	Addition of equity returns in India
5	Updated cash flow statement of Reliance Industries Limited (RIL).
6	(i) Updated Financial Statement Analysis of RIL. (ii) Inclusion of two cases on ratio analysis: (a) Tata Motors Ltd and (b) ITC Limited
11	Updated treatment of dividend payment tax in India
17	The framework relating to factoring in India completely rewritten
18	Updated DOL, DFL and DCL of RIL
19	Addition of Indian practices relating to pecking-order theory
29	Deletion of Chapter 29 relating to corporate governance
30	Updation of (i) Bonus ratio of select companies, (ii) Split ratio of select companies, (iii) Shares buyback of select companies, (iv) Equity dividend, EPS, DPS, and retention per share of RIL and (v) Inclusion of shares repurchase practices in India
32	(i) The SEBI framework relating to acquisition/takeover completely rewritten and (ii) Inclusion of Mergers and Acquisitions practices in India
35	The framework of External Commercial Borrowings completely rewritten

Pedagogical Features

The time-tested pedagogical features of the text are listed below.

Learning Objectives Each chapter begins with a number of learning objectives to ensure broad understanding of the concepts, theories and techniques of financial management.

Mini Cases Another distinct feature is the inclusion of a large number of **mini cases**. These chapter-end cases can be used by the readers to synthesise and apply related concepts, theories, and techniques.

Multiple Choice Questions Multiple choice questions with answers is yet another distinct feature of the new edition.

Web Supplements Inclusion of comprehensive cases, additional solved problems, solutions to all numerical review questions, power point presentation and a guide for instructors, among others, is an important feature of new edition.

Spreadsheet/Excel-Application Spreadsheet solutions have been provided in a large number of chapters.

Special Features

To further develop the readers' ability of applying various financial principles and techniques, following special features have been added in this edition:

Up-to-date Comprehensive Coverage The book is structured around financial decision-making and comprehensively covers objectives of financial management, organisation of finance function, time value of money, valuation of bonds and shares, risk and return, option valuation, financial analysis, profit planning and cost control, capital budgeting decisions, cost of capital, capital structure decisions, dividend policy decisions, working capital management, business valuation, corporate restructuring, foreign exchange markets, foreign exchange risk management techniques, international financial management, risk management, corporate governance, Indian corporate practices related to corporate objectives and financial decision making.

Analytical Approach and Decisional Focus Consistent with the aim of the book, a careful and thorough presentation of the financial consequences of management decision is the underlying theme. The orientation is managerial with emphasis on identification and solution of financial problems confronting business enterprises.

Chapter Organisation Each chapter is related to the managerial decision-making perspective. We have not merely described a concept but have also related it to the overall goal of wealth maximisation. After describing a concept, its application is illustrated with the help of step-by-step examples to improve clarity. In the preparation of the text, we have kept readability constantly in mind and have accordingly used a clear and concise, and by and large, non-mathematical writing style, especially in the treatment of concepts requiring the use of mathematics.

Numerous Illustrations/Solved Problems and Review Questions A comprehensive set of real-life solved problems, at the end of each chapter, are intended to serve as a review guide to test the readers' understanding of the subject. Numerous end-of-chapter review questions are included together with answers to help them prepare detailed solutions.

Rearrangement of Solved Problems/Review Questions have been rearranged in order of level of difficulty, namely, easy, medium and difficult.

Reorganisation of chapter-contents in terms of **learning objectives** in place of section-wise presentation.

Procedural Orientation, Practice Discussion and Cases To enable the readers to understand the real world of finance, contemporary industry practices as also procedural aspects have been included at relevant places in reasonable detail. About 15 integrated (comprehensive) cases and 40 mini cases form the part of this edition, for this purpose.

Financial Tables and Bibliography A complete set of financial tables is included as a ready reckoner. A select bibliography would be of special interest to teachers/advance students of the subject.

Target

The book is primarily targeted at teachers/students of finance, management, commerce, accounting and related professional disciplines/courses. Practitioners/professionals would also find it an invaluable text.

The financial management discipline is constantly changing. It is both stimulating and far reaching. We hope that the eighth edition of this book with its comprehensive and up-to-date coverage would contribute to a better understanding of corporate finance. We sincerely look forward to the same overwhelming response from readers to this edition as to the previous edition.

Acknowledgements

We would express our intellectual debt of gratitude to the numerous authors who have enriched the stream of literature in finance on which we have liberally drawn. Some of the more specific references are indicated in the text itself.

Professor Jain would like to place on record his deep sense of gratitude to the encouragement by Prof. V. Ramgopal Rao, Director, IIT Delhi. His colleagues, Dr. R. K. Arora (International Management Institute, New Delhi), Dr. Alok Dixit (IIM Lucknow) and Dr. MV Shivaani (IIM, Nagpur) have helped in several ways, in particular, in contributing the spreadsheet solutions included in various chapters of the book. We gratefully acknowledge their contribution. We also thank Ms. Anita Sharma who has developed Excel-based templates for students (available on the OLC) for easier understanding and gaining experience using spreadsheets.

Our thanks are also due to our student friends, Dr. Chhavi Mehta, Dr. Vandana Bhama, Dr. Sadaf Anwar and Ms Samta Jain. The authors record a word of appreciation for Professor Surendra S. Yadav's contribution. The authors have also a word of appreciation for the excellent support from Mrs. Vibha Mahajan, Mr. Nikhil Wadhera, Mr. Shivkant Singhal, Ms. Malvika Shah and Mr. Atul Gupta of McGraw Hill Education India for the speedy and excellent publication of the book.

A special word of thanks and appreciation is due to Sanya Nadeem, 9-year Boston-based granddaughter of Professor Khan.

AUTHORS

Preface to the First Edition

This book, in a sense, is an outgrowth of our teaching experience. In our academic interaction with teachers, postgraduate students and practising financial executives, we have found that they face considerable difficulty in using the available foreign books in this growing academic discipline. The present volume, in a way, represents a modest attempt to provide a solution to their problems.

It is intended primarily for postgraduate students in commerce and chartered and cost accountancy. Those doing similar courses in business management or appearing in the restructured civil services and other competitive examinations will hopefully find it equally useful. Its usefulness, however, is not confined to academicians alone. It may also be of special interest to the practitioners in the field.

In keeping with the aims of the book, we have attempted to present the text in a lucid and simple style; the treatment is comprehensive and by and large non-mathematical. Another notable feature of this volume is that the discussions of the concepts and theories are invariably followed by exhaustive illustrative problems. To test the understanding of the readers as also to enable them to have sufficient practice, a large number of exercises have also been given at the end of the chapters. A select bibliography at the end of the book would be of special interest to the teachers of the subject.

The theme of Financial Management is structured round the decision-making in the three inter-related financial areas: investment—long-term as well as current assets; financing; and dividend policy. Also included are the important tools of financial planning and management. The main discussion is divided into six parts comprising twenty chapters.

Part I of the book, which provides the setting to the detailed discussions that follow subsequently, contains two chapters. Chapter 1 outlines the *nature* of financial management in terms of its emerging and contemporary scope and objectives. The concern of Chapter 2 is with the time value of money, i.e. compounding and discounting or present value techniques and their practical applications in financial decision-making, particularly capital budgeting.

Part II, comprising two chapters, is devoted to the tools of analysis in financial management. While Chapter 3 explains and illustrates the statement of changes in financial position (funds flow and cash flow), the financial statement analysis (ratio analysis) is described in Chapter 4.

The subsequent discussions relate to the important decision-making areas in financial management. Thus, Part III focusses on the first and the most important aspect, namely, the long-term investment decision or capital budgeting. It consists of five chapters. The first of these (Chapter 5) presents the general principles of capital budgeting with particular reference to the type of information required

(cash flow) and its essential ingredients. This is followed in Chapter 6 by a detailed account of the capital budgeting evaluation techniques, traditional as well as time-adjusted or discounted cash flow. The incorporation of risk and uncertainty into the capital budgeting exercise is elaborated in Chapter 7. Chapter 8 attempts to develop the concept and measurement of cost of capital—the most controversial element in financial management. The last chapter of this part (Chapter 9) dwells on the Indian corporate practices pertaining to capital expenditure decision-making in both the public and private sectors.

The second important decision involved in financial management (financing decision) is covered in the three chapters of Part IV. The discussions in Chapter 10 pertaining to the two inter-related aspects, i.e. operating and financial leverage, set the framework for the capital structure decisions of a firm. The capital structure theories, reflecting the controversy in the financial literature regarding the theoretical relationship between capital structure, cost of capital and value of a firm are examined in Chapter 11. In the light of the conclusions of this chapter, the considerations having a bearing on the designing of an appropriate capital structure are highlighted in the next chapter (Chapter 12).

Part V of the volume is devoted to the relevant dimensions of dividend policy decision. The first aspect, viz, the controversy in the academic literature as regards the relevance of dividend policy to the value of the enterprise, is the subject matter of Chapter 13. It is against the background of this theoretical discussion that Chapter 14 dwells on the determinants of an appropriate dividend policy.

Finally, Part VI of the book focusses on the management of current assets, more popularly designated as working capital management. The first three chapters of this part between them provide an overview of working capital management and deal respectively with the theory of working capital management in terms of the basic strategies for efficient management of current assets and current liabilities (Chapter 15), the planning and determinants of working capital (Chapter 16) and the financing and control of working capital in India with particular reference to the report of the Tandon Committee (Chapter 17). The next three chapters look into the management of the individual components of current assets. While cash management is the theme of Chapter 18, the various dimensions of receivables management are explained in Chapter 19. The last chapter (Chapter 20) discusses the relevant aspects of inventory management.

Detailed solutions of all the exercises included in each chapter of this book are provided in our book: *Management Accounting and Financial Management—Problems and Solutions*.

In the preparation of this book we have received encouragement and support from various quarters. In particular we would like to thank Mr. H.C. Jain, Librarian of the University South Campus Library for the excellent library support he provided to us at short notice. Mr. Subhash Chander deserves our thanks for speedy and accurate typing of the final draft.

Finally, we would be failing in our duty if we do not acknowledge the deep debt of gratitude that we owe to the various authors whose writings have provided an insight into the intricacies of the subject.

Part Preview

Each part begins with an overview that provides a glimpse of the contents in its chapters.

PART 1

FOUNDATION OF FINANCE

Chapter 1
**FINANCIAL MANAGEMENT—
AN OVERVIEW**

Chapter 2
TIME VALUE OF MONEY

Chapter 3
RISK AND RETURN

Chapter 4
**VALUATION OF BONDS AND
SHARES**

This part of the book dwells on the foundations of finance. Chapter 1 gives an overview of financial management in terms of its relationship with related disciplines, scope, objectives, agency problems, organisation of finance functions in a typical organisation and the organisation of finance function in India. Chapter 2 discusses a basic financial concept, namely, time value of money. It explains and illustrates the basic compounding and discounting techniques as well as their applications. While risk and return including multivariate and factor valuation is analysed in Chapter 3, Valuation of bonds and shares is covered in Chapter 4.

CHAPTER

1

Financial Management— An Overview

LEARNING OBJECTIVES

- | | |
|--------|---|
| LO 1.1 | Define finance and describe its major areas—financial management/managerial finance/corporate finance and financial services |
| LO 1.2 | Differentiate financial management from the closely-related disciplines of accounting and economics |
| LO 1.3 | Describe the scope of financial management and identify the key activities of the financial manager |
| LO 1.4 | Explain why wealth/value maximisation, rather than profit/EPS maximisation, is the goal of financial management and how economic value added (EVA) and focus on shareholders relate to its achievement and summarise the major objectives of corporate finance by Indian corporates |
| LO 1.5 | Discuss the agency problem/issue and measure to resolve it |
| LO 1.6 | Outline the organisation of finance function and the emerging role of finance managers in India |
| LO 1.7 | Outline the emerging role of finance managers in India |
| LO 1.8 | Present an overview of the book |

LO 1.1 FINANCE FUNCTION

Finance may be defined as the art and science of managing money. The major areas of finance are (1) financial services and (2) managerial finance/corporate finance/financial management. While financial services is concerned with the design and delivery of advice and financial products to individuals, businesses and governments within the areas of banking and related institutions, personal financial planning, investments, real estate, insurance and so on, financial management is concerned with the duties of the financial managers in the business firm. Financial managers actively manage the financial affairs of any type of business, namely, financial and non-financial, private and public, large and small, profit-seeking and not-for-profit.

Financial management: is concerned with the duties of the financial manager in the business firm.

Financial services: is concerned with the design and delivery of advice and financial products to individuals, businesses and governments within the areas of banking and related institutions, personal financial planning, investments, real estate, insurance and so on.

Financial management: is concerned with the duties of the financial managers in the business firm. Financial managers actively manage the financial affairs of any type of business, namely, financial and non-financial, private and public, large and small, profit-seeking and not-for-profit.

- Finance
- In an art and science of managing money.
- Financial services
- Is concerned with the design and delivery of advice and financial products to individuals, businesses and governments.

Learning Objectives

At the beginning of each chapter, the learning objectives outline what all the reader has to know when the chapter is completed.

WALKTHROUGH

Margin Notes

Important concepts and key terms are briefly summarised in the notes given in the margins.

However, two important issues are related to the value/share price-maximisation, namely, economic value added and focus on stakeholders.

Economic Value Added (EVA) It is a popular measure currently being used by several firms to determine whether an existing/proposed investment positively contributes to the owners/shareholders' wealth. The EVA is equal to after-tax operating profits of a firm less the cost of funds used to finance investments. A positive EVA would increase owners' value/wealth. Therefore, only investments with positive EVA would be desirable from the viewpoint of maximising shareholders' wealth. For instance, assuming an after-tax profit of ₹40 crore and associated cost of financing the investments of ₹38 crore, the EVA = ₹2 crore (₹40 crore - ₹38 crore). With a positive EVA, the investment would add value and increase the wealth of the owners and should be accepted. The corresponding after-tax operating profits attributable to the investment under consideration as well as the cost of funds used to finance it would, however, involve numerous accounting and financial issues.

The merits of EVA are: (a) its relative simplicity and (b) its strong link with the wealth maximisation of the owners. It *prima facie* exhibits a strong link to share prices, that is, positive EVA is associated with increase in prices of shares and vice versa. However, EVA is, in effect, a repackaged and well-marketed application of the NPV technique of investment decision. But EVA is certainly a useful tool for operationalising the owners' value maximisation goal, particularly with respect to the investment decision.

Focus on Stakeholders The shareholders' wealth maximisation as the primary goal notwithstanding, there is a broader focus in financial management to include the interest of the stakeholders as well as the shareholders. The stakeholders include employees, customers, suppliers, creditors and owners themselves who have a direct link to the firm. The implication of the focus on stakeholders is that the firm should avoid actions detrimental to them through the transfer of their wealth to the firm through its investments, although their wealth. The goal should be to preserve the well-being of the stakeholders through its maximisation.

The focus on the stakeholders does not, however, alter the shareholders' wealth maximisation goal. It tends to limit the firm's actions to preserve the wealth of the stakeholders. The stakeholders view is considered part of its "social responsibility" and is expected to provide maximum long-term benefits to the shareholders by maintaining positive stakeholders relationship which would minimise stakeholder turnover, conflict and litigation. In brief, a firm can better achieve its goal of shareholders' wealth maximisation with the cooperation of, rather than conflict with, its other stakeholders.

Shareholder Orientation in India Traditionally, the corporate industrial sector in India was dominated by group companies with close links with the promoter groups. Their funding primarily was through institutional borrowings from public development finance institutions like IFCI, ICICI, IDBI and so on. There was preponderance of loan capital in their financial structure and shareholders' equity played a rather marginal role. It was no wonder, therefore, that corporate India paid scant attention to shareholders' wealth maximisation with few exceptions such as Reliance Industries Ltd. In the post-90 liberalisation era, the goal of shareholders' wealth maximisation has emerged almost at the centre-stage. The main contributory factors have been (i) greater dependence on capital market, (ii) growing importance of institutional investors, (iii) tax concessions/incentives to shareholders and (iv) foreign exposure.

Time Value of Money

acceptable as it adds ₹90,000 as profit. However, when we take into account a rate of interest, say, of 10 per cent, the earlier conclusion will have to be revised as, without the project, the sum could have amounted to ₹11,00,000. Likewise, when the decision is made to raise a loan of ₹10,00,000 from a financial institution or by issuing debentures, for a period of 10 years, the firm is not only under obligation to meet interest payment as and when it becomes due on the debt at fixed intervals but also must make provisions so that it can repay ₹10,00,000 when the loan or debentures become due. Thus, time value of money is of crucial significance. This requires the development of procedures and techniques for evaluating future incomes in terms of the present.

There are two techniques for doing this: (1) Compounding, and (2) Discounting.

LO 2.2 COMPOUNDING TECHNIQUE

Interest is compounded when the amount earned on an initial deposit (the initial principal) becomes part of the principal at the end of the first compounding period. The term principal refers to the amount of money on which interest is received. Consider Example 2.1.

Example 2.1

If Mr X invests in a saving bank account ₹1,000 at 5 per cent interest compounded annually, at the end of the first year, he will have ₹1,050 in his account. This amount constitutes the principal for earning interest for the next year. At the end of the next year, there would be ₹1,102.50 in the account. This would represent the principal for the third year. The amount of interest earned would be ₹55.25. The total amount appearing in his account would be ₹1,157.825. Table 2.1 shows the compounding procedure.

TABLE 2.1 Annual Compounding

Year	1	2	3
Beginning amount	₹1,000.00	₹1,050.00	₹1,102.50
Interest rate	0.05	0.05	0.05
Amount of interest	50.00	55.25	55.125
Beginning principal	1,000.00	1,050.00	1,102.50
Ending principal	1,050.00	1,102.50	1,157.825

This compounding procedure will continue for an indefinite number of years. The compounding of interest can be calculated by the following equation:

$$A = P(1 + i)^n \quad (2.1)$$

in which

- A = amount at the end of the period
- P = principal at the beginning of the period
- i = rate of interest
- n = number of years

Examples

Solved examples help in the better understanding of concepts.

Boxed Items

Concepts and procedures can be better understood with the help of examples from the Indian financial sector, highlighted as boxed items in the text.

- Ensure profitable growth and enhance wealth of the shareholders
- Foster mutually beneficial relations with all our business operations
- Manage our operations with high concern for safety and environment
- Be a responsible corporate citizen

EDBIB 1.3 HLL's Corporate Purpose

- Our purpose in Unilever is to meet the everyday needs of people everywhere—to anticipate the aspirations of our consumers and customers and to respond creatively and compassionately with branded products and services which raise the Quality of Life.
- Our deep roots in local cultures and markets around the world are our unparalleled inheritance and the foundation for our future growth. We will bring our wealth of knowledge and international expertise to the service of local customer—a truly multi-local multinationals.
- Our long-term success requires a total commitment to exceptional standards of performance and productivity, to working together effectively and to a willingness to embrace new ideas and learn continuously.
- We believe that to succeed requires the highest standards of corporate behaviour towards our employees, consumers and the societies and world in which we live.
- This is Unilever's creed to create value, profitable growth for our business and long-term value creation for our shareholders and customers.

EDBIB 1.3 Vision of Future of Refractive Industries Ltd

- Refractive is an enterprise that contributes, in a modest way, to critical economic and social needs of India and playing global leadership in all of its major initiatives.
- During this vision, over the next few years, Refractive will pursue a strategy of:
- Redefining competitive advantage of existing businesses through new capacities and synergistic acquisitions
 - Seeking feasible opportunities in petroleum exploration and production
 - Focusing integrating into existing transportation fuels and creating new customer segments
 - Building the ESEES acquisition, new Refractive Energy, for a major electricity utility
 - Advancing the significant information and communications market opportunity to India and in the world
 - Leveraging its strong balance sheet, cash flows and managerial capacity to create value by adding new capacities, acquisitions and turnaround of under performing assets
 - Developing strategic alliances in technology and product-market domains with global players
 - Fostering new higher education institutions for knowledge creation and sharing
 - Leveraging its immense strengths beyond Indian borders
- In this endeavour, Refractive will undergo an upgradation:
- In addition to manufacturing products to developing manufacturing systems
 - From having a manufacturing orientation to providing technical solutions

SUMMARY

The cost of capital is an important tool of investment decisions as it is used to measure the worth of investment proposals. It is used as a discount rate in determining the present value of future cash flows associated with capital projects. Consequently, it is the minimum rate of return that a firm must earn on its investments or on its assets (understood in its broader meaning). It is also referred to as the cost of funds, marginal rate of return, required rate of return and so on.

In operational terms, it is defined as the weighted average cost of capital (WACC) or all long-term sources of finance. The major long-term sources of funds are (i) debt, (ii) preference shares, (iii) equity capital, and (iv) reserved earnings. Thus, it comprises of several components in terms of specific cost of each source of finance. When these specific costs are combined, it results in the weighted average cost of capital.

The cost of capital can be explicit or implicit. The explicit cost of capital is associated with the raising of funds from debt, preference shares and equity. The explicit cost of any source of capital (C) is the discount rate that equates the present value of the cash inflows (C_t) that are incremental to the raising of financing opportunity with the present value of its incremental cash outflows (CO_t) throughout its life.

$$C = \frac{CO}{C_t} \times \frac{1}{(1-C)^t}$$

In determination is similar to the determination of the internal rate of return (IRR). It is the internal rate of return that the firm pays to procure financing.

Retained earnings involve no future cash flows to, or from, the firm. Therefore, the retained earnings do not have explicit cost. However, they carry implicit cost in terms of the opportunity cost of the long-term investments opportunity at the rate of return at which the shareholders could have invested their funds had they been distributed as dividends to them.

There are two types of specific costs, namely, cost of debt (k_d), cost of preference shares (k_{ps}) and cost of equity capital (k_e), which are measured as follows:

The cost of debt is the interest rate on loans, interest payments for inclusion in computing the cost of funds. However, the effective rate is 80% or less than the actual interest payments made by the firm by the amount of tax that is payable. The debt cost is also referred to as pretax cost.

In the case of perpetual debt, it is computed by using effective interest rate (EIR), $1 - (1 - C) \times T$ amount of pretax payments is discounted to zero. EIR, therefore, $k_d = \frac{(1 - C) \times T}{1 - C}$

In the case of redeemable debt, the appropriate rate preference (CRP) when it is redeemed and kept for the period (CR) is given by the formula $k_d = \frac{(1 - C) \times T}{1 - C + CR}$

The cost of preference shares (k_{ps}) is computed as follows: When preference is paid in form of cash, $k_{ps} = \frac{C_{ps}}{P_{ps}}$ When preference is paid in form of stock, $k_{ps} = \frac{C_{ps}}{P_{ps}} + \frac{C_{ps}}{P_{ps}} \times \frac{1 - (1 - C)^n}{C}$

The cost of debt is generally the lowest among all sources partly because the risk involved is low but also because interest paid on debt is tax deductible.

Summary

Each chapter ends with a summary—a series of bulleted statements that restates the most important points that have been mentioned in the chapter. This feature will aid the readers in recapitulating what they have learnt earlier in the chapter.

WALKTHROUGH

Solved Problems

A number of solved problems at the end of every chapter will help the reader understand how to apply to problems the concepts discussed in the chapter.

Chapter 10: Additional Issues **10.21**

1. The example is given in Examples 10.14, Investment Decisions and Capital Costs: Project Costs, Engineering Costs, N.J. 1995, p. 25.
 2. The hypothetical example has been taken from Chatterjee, J., op. cit., pp. 75-74.
 3. Ross, S. A., et al., op. cit., pp. 595-9.

SOLVED PROBLEMS

Problem 10.21 involves an investment decision with the following data:

Initial cash outlay	€100,000
Annual cash inflow	€20,000
Residual value after 6 years	€10,000
Annual cash outflow	€0

The firm's cost of capital is 15 per cent, its tax rate is 35 per cent. The company follows the straight line method of depreciation and the sumo is accepted for its purposes. The management of the company is considering selling the machine. If it does so, the total cash operating costs to perform the work now done by the machine will increase by €40,000 per year to €70,000 per year. Advise whether the machine should be sold.

Recommendation The machine should not be sold.

Problem 10.22 involves an investment decision with the following data:

Initial cash outlay	€100,000
Annual cash inflow	€20,000
Residual value after 6 years	€10,000
Annual cash outflow	€0

The firm's cost of capital is 15 per cent, its tax rate is 35 per cent. The company follows the straight line method of depreciation and the sumo is accepted for its purposes. The management of the company is considering selling the machine. If it does so, the total cash operating costs to perform the work now done by the machine will increase by €40,000 per year to €70,000 per year. Advise whether the machine should be sold.

Recommendation The machine should not be sold.

Excel Spreadsheet Solution 3.1

The data on returns for asset X has been entered in the cells B2 to B9. The associated probabilities have been entered in cells C2 to C9 and expected returns have been entered in cells D2 to D9. The squared deviations for the cells E2 and E9 have been calculated by using the formula =B2-D2^2. The calculation has been repeated in the other two cells E4 and E9 by copying the formula to these cells. Finally, the variance has been calculated using the formula =SUMPRODUCT(C2:C9,E2:E9) in cell F1. We can see that variance is the same as found in Table 3.5. The same steps have been repeated to get the variance for Asset Y.

Coefficient of Variation

Coefficient of Variation is a measure of relative dispersion (risk) or a measure of risk per unit of expected return. It converts standard deviation of expected values into relative values to enable comparison of risks associated with assets having different expected values. The coefficient of variation (CV) is computed by dividing the standard deviation, σ , for an asset by its expected value, R . Symbolically,

$$CV = \frac{\sigma}{R} \quad (3.4)$$

The coefficient of variations for asset X and Y are respectively, 0.079 (0.029 ÷ 0.36) = 0.079 and 0.316 (0.099 ÷ 0.31).

The larger the CV, the larger the relative risk of the asset. As a rule, the use of the coefficient of variation for comparing asset risk is the best since it considers the relative size (expected value) of assets.

Excel Spreadsheet Solutions

A large number of problems have also been solved with the help of Excel spreadsheets.

Mini Case

Small case studies at the end of chapter will illustrate the theoretical inputs of the chapter.

9.58 Financial Management

MINI CASES

8.C1 (See Problem 8.B) The Great Seawind is one of the greatest tourist resorts in the United States. It has 1,100 rooms, the majority of which are in the city. It has a reputation for excellent service, excellent food, excellent entertainment, and excellent facilities. The Great Seawind is a very popular resort and is one of the most profitable in the industry. The following table shows the financial data for the Great Seawind for the year 1998.

Item	Number of Rooms	Rate per Room
Rooming	1,100	\$150.00
Food	1,100	\$25.00
Total	2,200	\$175.00

The company's financial ratios are summarized below:

Ratio	Value	Amount per annum per person	Total
1. Current ratio	1.5		
2. Debt to equity ratio	0.5		
3. Return on assets	15%		
4. Return on equity	25%		
5. Dividend yield	5%		
6. Payout ratio	40%		
7. Earnings per share	\$10.00		
8. Book value per share	\$20.00		
9. Market price per share	\$40.00		
10. Total assets	\$100,000,000		
11. Total liabilities	\$50,000,000		
12. Total equity	\$50,000,000		
13. Total debt	\$25,000,000		
14. Total equity	\$25,000,000		
15. Total assets	\$50,000,000		
16. Total liabilities	\$25,000,000		
17. Total equity	\$25,000,000		
18. Total assets	\$50,000,000		
19. Total liabilities	\$25,000,000		
20. Total equity	\$25,000,000		

(a) Profit before taxes: \$10,000,000
 (b) Profit after taxes: \$7,500,000
 (c) Profit after taxes and dividends: \$5,000,000
 (d) Profit after taxes and dividends: \$5,000,000

(i) Profitability ratios:

- Economy class: $200 \times 12,500 \times 350 \times 0.40$ (occupancy) = \$3,500,000
- Executive class: $100 \times 14,000 \times 350 \times 0.40$ = \$2,100,000
- Deluxe class: $25 \times 18,000 \times 350 \times 0.40$ = \$630,000

(ii) Annual maintenance cost (electricity charges, hotel tax, water fee, other utilities and other maintenance expenses): \$5,000,000
 (iii) Profit before tax (PAT/EBT): Total revenues - Total cost = \$18,250,000

(iv) Profit after tax (PAT/NET): Total revenues - Total cost - Total taxes = \$13,250,000

(v) Profit after taxes and dividends: \$13,250,000 - \$8,250,000 = \$5,000,000

(vi) Profit after taxes and dividends: \$5,000,000

(vii) Profit after taxes and dividends: \$5,000,000

(viii) Profit after taxes and dividends: \$5,000,000

(ix) Profit after taxes and dividends: \$5,000,000

(x) Profit after taxes and dividends: \$5,000,000

(xi) Profit after taxes and dividends: \$5,000,000

(xii) Profit after taxes and dividends: \$5,000,000

(xiii) Profit after taxes and dividends: \$5,000,000

(xiv) Profit after taxes and dividends: \$5,000,000

(xv) Profit after taxes and dividends: \$5,000,000

(xvi) Profit after taxes and dividends: \$5,000,000

(xvii) Profit after taxes and dividends: \$5,000,000

(xviii) Profit after taxes and dividends: \$5,000,000

(xix) Profit after taxes and dividends: \$5,000,000

(xx) Profit after taxes and dividends: \$5,000,000

REVIEW QUESTIONS

LOD: Easy

- RQ 9.1a)** Indicate whether the following statements are true or false.
- Two mutually exclusive projects (A and B) have been evaluated. Project A has an NPV of \$100,000 and an IRR of 16 per cent. Project B has NPV of \$75,000 but has an IRR of 18 per cent. Since Project B has higher IRR, it should be selected.
 - The cost of capital for new projects is 15 per cent. Two competing projects X and Y respectively have IRRs of 14 per cent and 13 per cent respectively, since IRR of project X is higher it should be selected.
 - A project requires an initial investment of \$10,000,000. The estimated cash inflows from the project are as follows: \$3 million (year 1), \$1 million (year 2), \$5 million (year 3), \$6 million (year 4) and \$4 million (year 5). The pay back of the project is 4 years.
 - A project requires an investment of \$20 million. The estimated profit after tax for years 1 to 5 are: \$3 million, \$5 million, \$6 million and \$6 million. The accounting rate of return is 21 per cent.
 - In the case of independent investment projects, if the NPV of the project is zero, IRR is equal to cost of capital.
 - A company's Return on Assets (ROA) is 15 per cent, Return on Equity (ROE) is 25 per cent, and the debt to equity ratio is 0.5. The company's Return on Capital Employed (ROCE) is 20 per cent.
 - The more distant the CFAT, the higher is the present value of such cash flows.
 - NPV is the best method of evaluating long-term investment proposals.
- (b) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - In the case of _____ investment proposals, IRR and NPV methods provide the same result.
- (c) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (d) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (e) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (f) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (g) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (h) Fill in the following blanks:
- _____ present value tables can be used only when cash flows are uniform to determine NPV.
 - _____ present value tables can be used only when cash flows are uniform to determine NPV.
- (i) Fill in the following blanks:

FOUNDATION OF FINANCE

Chapter 1
**FINANCIAL MANAGEMENT:
AN OVERVIEW**

Chapter 2
TIME VALUE OF MONEY

Chapter 3
RISK AND RETURN

Chapter 4
**VALUATION OF BONDS AND
SHARES**

This part of the book dwells on the foundations of finance. Chapter 1 gives an overview of financial management in terms of its relationship with related disciplines, scope, objectives, agency problems, organisation of finance functions in a typical organisation and the organisation of finance function in India. Chapter 2 discusses a basic financial concept, namely, time value of money. It explains and illustrates the basic compounding and discounting techniques as well as their applications. While risk and return including multivariate and factor valuation is analysed in Chapter 3, Valuation of bonds and shares is covered in Chapter 4.

CHAPTER

1

Financial Management: An Overview

LEARNING OBJECTIVES

LO 1.1	Define finance and describe its major areas—financial management/managerial finance/ corporate finance and financial services
LO 1.2	Differentiate financial management from the closely-related disciplines of accounting and economics
LO 1.3	Describe the scope of financial management and identify the key activities of the financial manager
LO 1.4	Explain why wealth/value maximisation, rather than profit/EPS maximisation, is the goal of financial management and how economic value added (EVA) and focus on shareholders relate to its achievement and summarise the major objectives of corporate finance by Indian corporates
LO 1.5	Discuss the agency problem/issue and measure to resolve it
LO 1.6	Outline the organisation of finance function in India
LO 1.7	Outline the emerging role of finance managers in India
LO 1.8	Present an overview of the book

LO 1.1 FINANCE FUNCTION

Finance may be defined as the art and science of managing money. The major areas of finance are: (1) financial services and (2) managerial finance/corporate finance/financial management. While **financial services** is concerned with the design and delivery of advice and financial products to individuals, businesses and governments within the areas of banking and related institutions, personal financial planning, investments, real estate, insurance and so on, **financial management** is concerned with the duties of the financial managers in the business firm. **Financial managers**

actively manage the financial affairs of any type of business, namely, financial and non-financial, private and public, large and small, profit-seeking and not-for-profit.

- firm.

They perform such varied tasks as budgeting, financial forecasting, cash management, credit administration, investment analysis, funds management and so on. In recent years, the changing

- Financial managers** actively manage the financial affairs of any type of business, namely, financial and non-financial, private and public, large and small, profit-seeking and not-for-profit.
- regulatory and economic environments coupled with the globalisation of business activities have increased the complexity as well as the importance of the financial managers' duties. As a result, the financial management function has become more demanding and complex. The main elements of the financial management function are:
 - Relationship of finance and related disciplines
 - Scope of financial management
 - Goal/objectives of financial management
 - Agency problem
 - Organisation of the finance function
 - Emerging role of finance managers in India

LO 1.2 FINANCE AND RELATED DISCIPLINES

Financial management, as an integral part of overall management, is not a totally independent area. It draws heavily on related disciplines and fields of study, such as economics, accounting, marketing, production and quantitative methods. Although these disciplines are interrelated, there are key differences among them. In this Section, we discuss these relationships.

Finance and Economics

The relevance of economics to financial management can be described in the light of the two broad areas of economics: macroeconomics and microeconomics.

Macroeconomics is concerned with the overall institutional environment in which the firm operates. It looks at the economy as a whole. Macroeconomics is concerned with the institutional structure of the banking system, money and capital markets, financial intermediaries, monetary, credit and fiscal policies and economic policies dealing with, and controlling level of, activity within an economy. Since business firms operate in the macroeconomic environment, it is important for financial managers to understand the broad economic environment. Specifically, they should **(1)** recognise and understand how monetary policy affects the cost and the availability of funds; **(2)** be versed in fiscal policy and its effects on the economy; **(3)** be aware of the various financial institutions/financing outlets; **(4)** understand the consequences of various levels of economic activity and changes in economic policy for their decision environment and so on.

- Marginal analysis** suggests that financial decisions should be made on the basis of comparison of marginal revenues and marginal costs/added benefits exceed added costs.
- Microeconomics deals with the economic decisions of individuals and organisations. It concerns itself with the determination of optimal operating strategies. In other words, the theories of microeconomics provide for effective operations of business firms. They are concerned with defining actions that will permit the firms to achieve success. The concepts and theories of microeconomics relevant to financial management are, for instance, those involving **(1)** supply and demand relationships and profit maximisation strategies, **(2)** issues related to the mix of productive factors, 'optimal' sales level and product pricing strategies, **(3)** measurement of utility preference, risk and the determination of value, and **(4)** the rationale of depreciating assets. In addition, the primary principle that applies in financial management is **marginal analysis**; it suggests that financial decisions should be made on the basis of comparison of marginal revenue

and marginal cost. Such decisions will lead to an increase in profits of the firm. It is, therefore, important that financial managers must be familiar with basic microeconomics.

To illustrate, the financial manager of a department store is contemplating to replace one of its online computers with a new, more sophisticated one that would both speed up processing time and handle a large volume of transactions. The new computer would require a cash outlay of ₹8,00,000 and the old computer could be sold to net ₹2,80,000. The total benefits from the new computer and the old computer would be ₹10,00,000 and ₹3,50,000 respectively. Applying marginal analysis, we get:

Benefits with new computer	₹10,00,000	
Less: Benefits with old computer	3,50,000	
Marginal benefits (a)		₹6,50,000
Cost of new computer	8,00,000	
Less: Proceeds from sale of old computer	2,80,000	
Marginal cost (b)		5,20,000
Net benefits [(a) – (b)]		1,30,000

As the store would get a net benefit of ₹1,30,000, the old computer should be replaced by the new one.

Thus, a knowledge of economics is necessary for a financial manager to understand both the financial environment and the decision theories which underline contemporary financial management. He should be familiar with these two areas of economics. Macroeconomics provides the financial manager with an insight into policies by which economic activity is controlled. Operating within that institutional framework, the financial manager draws on microeconomic theories of the operation of firms and profit maximisation. A basic knowledge of economics is, therefore, necessary to understand both the environment and the decision techniques of financial management.

Finance and Accounting

The relationship between finance and accounting, conceptually speaking, has two dimensions: **(i)** they are closely related to the extent that accounting is an important input in financial decision making; and **(ii)** there are key differences in viewpoints between them.

Accounting function is a necessary input into the finance function. That is, accounting is a subfunction of finance. Accounting generates information/data relating to operations/activities of the firm. The end-product of accounting constitutes financial statements such as the balance sheet, the income statement (profit and loss account) and the statement of changes in financial position/sources and uses of funds statement/cash flow statement. The information contained in these statements and reports assists financial managers in assessing the past performance and future directions of the firm and in meeting legal obligations, such as payment of taxes and so on. Thus, accounting and finance are functionally closely related. Moreover, the finance (treasurer) and accounting (controller) activities are typically within the control of the vice-president/director (finance)/chief financial officer (CFO) as shown in Fig. 1.2. These functions are closely related and generally overlap; indeed, financial management and accounting are often not easily distinguishable. In small firms the controller often carries out the finance function and in large firms many accountants are intimately involved in various finance activities.

But there are two key differences between finance and accounting. The first difference relates to the treatment of funds, while the second relates to decision making.

Treatment of Funds The viewpoint of accounting relating to the funds of the firm is different from that of finance. The measurement of funds (income and expenses) in accounting is based on the

Accrual method recognises revenue at the point of sale and expenses when they are incurred.

accrual principle/system. For instance, revenue is recognised at the point of sale and not when collected. Similarly, expenses are recognised when they are incurred rather than when actually paid. The accrual-based accounting data do not reflect fully the financial circumstances of the firm. A firm may be quite profitable in the accounting sense in that it has earned profit (sales less expenses) but it may not be able to meet current obligations owing to shortage of liquidity due to uncollectable receivables, for instance. Such a firm will not survive regardless of its levels of profits.

The viewpoint of finance relating to the treatment of funds is based on **cashflows**. The revenues are recognised only when actually received in cash (i.e. cash inflow) and expenses are recognised on actual payment (i.e. cash outflow). This is so because the financial manager is

Cashflow method recognises revenues and expenses only with respect to actual inflows and outflows of cash.

concerned with maintaining solvency of the firm by providing the cashflows necessary to satisfy its obligations and acquiring and financing the assets needed to achieve the goals of the firm. Thus, cashflow-based returns help financial managers avoid insolvency and achieve the desired financial goals.

To illustrate, total sales of a trader during the year amounted to ₹10,00,000 while the cost of sales was ₹8,00,000. At the end of the year, it has yet to collect ₹8,00,000 from the customers. The accounting view and the financial view of the firms performance during the year are given below.

<i>Accounting view (Income statement)</i>		<i>Financial view (Cash flow statement)</i>	
Sales	₹10,00,000	Cash inflow	₹2,00,000
Less: Costs	8,00,000	Less: Cash outflow	8,00,000
Net profit	2,00,000	Net cash outflow	(6,00,000)

Obviously, the firm is quite profitable in accounting sense, it is a financial failure in terms of actual cash flows resulting from uncollected receivables. Regardless of its profits, the firm would not survive due to inadequate cash inflows to meet its obligations.

Decision Making Finance and accounting also differ in respect of their purposes. The purpose of accounting is collection and presentation of financial data. It provides consistently developed and easily interpreted data on the past, present and future operations of the firm. The financial manager uses such data for financial decision making. It does not mean that accountants *never* make decisions or financial managers *never* collect data. But the primary focus of the functions of accountants is on collection and presentation of data while the financial manager's major responsibility relates to financial planning, controlling and decision making. Thus, in a sense, finance begins where accounting ends.

Finance and Other Related Disciplines

Apart from economics and accounting, finance also draws—for its day-to-day decisions—on supportive disciplines such as marketing, production and quantitative methods. For instance, financial managers should consider the impact of new product development and promotion plans made in marketing area since their plans will require capital outlays and have an impact on the projected cash flows. Similarly, changes in the production process may necessitate capital expenditures which the financial

managers must evaluate and finance. And, finally, the tools of analysis developed in the quantitative methods area are helpful in analysing complex financial management problems.

The marketing, production and quantitative methods are, thus, only indirectly related to day-to-day decision making by financial managers and are supportive in nature while economics and accounting are the primary disciplines on which the financial manager draws substantially.

The relationship between financial management and supportive disciplines is depicted in Fig 1.1.

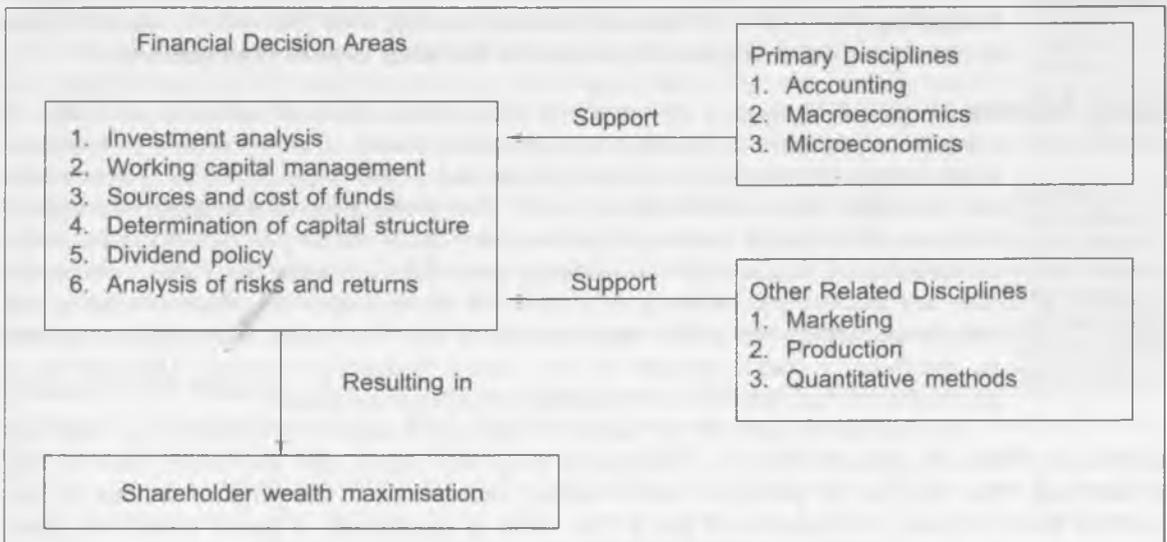

FIGURE 1.1 Impact of Other Disciplines on Financial Management

LO 1.3 SCOPE OF FINANCIAL MANAGEMENT

Financial management provides a normative, conceptual and analytical framework for financial decision making. The finance function covers both acquisition of funds as well as their allocations. Thus, apart from the issues involved in acquiring external funds, the main concern of financial management is the efficient and wise allocation of funds to various uses. Defined in a broad sense, it is viewed as an integral part of overall management.

The financial management framework is an analytical way of viewing the financial problems of a firm. The main contents of this approach are:¹ What is the total volume of funds an enterprise should commit? What specific assets should an enterprise acquire? How should the funds required be financed? Alternatively, the principal contents of the modern approach to financial management can be said to be: **(i)** How large should an enterprise be, and how fast should it grow? **(ii)** In what form should it hold assets? and **(iii)** What should be the composition of its liabilities?

The three questions posed above cover between them the major financial problems of a firm. In other words, the financial management, according to the new approach, is concerned with the solution of three major problems relating to the financial operations of a firm, corresponding to the three questions of investment, financing and dividend decisions. Thus, financial management, in the

modern sense of the term, can be broken down into three major decisions as functions of finance:

(i) The investment decision, (ii) The financing decision, and (iii) The dividend policy decision.

Investment Decision The **investment decision** relates to the selection of assets in which funds will be invested by a firm. The assets which can be acquired fall into two broad groups: (i) long-term assets which yield a return over a period of time in future, (ii) short-term or current assets, defined as those assets which in the normal course of business are convertible into cash without diminution in value, usually within a year. The first of these involving the first category of assets is popularly known in financial literature as **capital budgeting**. The aspect of financial decision making with reference to current assets or short-term assets is popularly termed as **working capital management**.

Investment decision relates to the selection of assets.

Capital Budgeting Capital budgeting is probably the most crucial financial decision of a firm. It relates to the selection of an asset or investment proposal or course of action whose benefits are likely to be available in future over the lifetime of the project. The long-term assets can be either new or old/existing ones. The *first* aspect of the capital budgeting decision relates to the choice of the new asset out of the alternatives available or the reallocation of capital when an existing asset fails to justify the funds committed. Whether an asset will be accepted or not will depend upon the relative benefits and returns associated with it. The measurement of the worth of the investment proposals is, therefore, a major element in the capital budgeting exercise. This implies a discussion of the methods of appraising investment proposals.

Capital budgeting relates to the selection of an asset whose benefits would be available over the project's life.

The *second* element of the capital budgeting decision is the analysis of risk and uncertainty. Since the benefits from the investment proposals extend into the future, their accrual is uncertain. They have to be estimated under various assumptions of the physical volume of sale and the level of prices. An element of risk in the sense of uncertainty of future benefits is, thus, involved in the exercise. The returns from capital budgeting decisions should, therefore, be evaluated in relation to the risk associated with it.

Finally, the evaluation of the worth of a long-term project implies a certain norm or standard against which the benefits are to be judged. The requisite norm is known by different names such as **cut-off rate**, **hurdle rate**, **required rate**, **minimum rate of return** and so on. This standard is broadly expressed in terms of the cost of capital. The concept and measurement of the cost of capital is, thus, another major aspect of capital budgeting decision. In brief, the main elements of capital budgeting decisions are: (i) the long-term assets and their composition, (ii) the business risk complexion of the firm, and (iii) the concept and measurement of the cost of capital.

Working Capital Management Working capital management is concerned with the management of current assets. It is an important and integral part of financial management as short-term survival is a prerequisite for long-term success. One aspect of working capital management is the trade-off between profitability and risk (liquidity). There is a conflict between profitability and liquidity. If a firm does not have adequate working capital, that is, it does not invest sufficient funds in current assets, it may become illiquid and consequently may not have the ability to meet its current obligations and, thus, invite the risk of bankruptcy. If the current assets are too large, profitability is adversely affected. The key strategies and considerations in ensuring a trade-off between profitability and liquidity is one major dimension of working capital management. In addition, the individual current assets should be efficiently managed so that neither inadequate nor unnecessary funds are locked up. Thus, the management of working capital has two basic ingredients: (1) an overview of working capital

Working capital management is concerned with the management of current assets.

management as a whole, and (2) efficient management of the individual current assets such as cash, receivables and inventory.

Financing Decision The second major decision involved in financial management is the financing decision. The investment decision is broadly concerned with the asset-mix or the composition of the assets of a firm. The concern of the financing decision is with the financing-mix or capital structure or leverage. The term **capital structure** refers to the proportion of debt (fixed-interest sources of financing) and equity capital (variable-dividend securities/source of funds).

The financing decision of a firm relates to the choice of the proportion of these sources to finance the investment requirements. There are two aspects of the financing decision. *First*, the theory of capital structure which shows the theoretical relationship between the employment of debt and the return to the shareholders. The use of debt implies a higher return to the shareholders as also the financial risk. A proper balance between debt and equity to ensure a trade-off between risk and return to the shareholders is necessary. A capital structure with a reasonable proportion of debt and equity capital

- **Financing decision**
- relates to the choice of the proportion of debt and equity sources of financing.

is called the **optimum capital structure**. Thus, one dimension of the financing decision whether there is an optimum capital structure and in what proportion should funds be raised to maximise the return to the shareholders? The second aspect of the financing decision is the determination of an appropriate capital structure, given the facts of a particular case. Thus, the financing decision covers two interrelated aspects: (1) the capital structure theory, and (2) the capital structure decision.

Dividend Policy Decision The third major decision area of financial management is the decision relating to the dividend policy. The dividend decision should be analysed in relation to the financing decision of a firm. Two alternatives are available in dealing with the profits of a firm: (i) they can be distributed to the shareholders in the form of dividends or (ii) they can be retained in the business itself. The decision as to which course should be followed depends largely on a significant element in the dividend decision, the **dividend-pay out ratio**, that is, what proportion of net profits should be paid out to the shareholders. The final decision will depend upon the preference of the shareholders and investment opportunities available within the firm. The second major aspect of the dividend decision is the factors determining dividend policy of a firm in practice.

To conclude, the traditional approach to the functions of financial management had a very narrow perception and was devoid of an integrated conceptual and analytical framework. It had rightly been discarded in the academic literature. The modern approach to the scope of financial management has broadened its scope which involves the solution of three major decisions, namely, investment, financing and dividend. These are interrelated and should be jointly taken so that financial decision making is optimal. The conceptual framework for optimum financial decisions is the objective of financial management. In other words, to ensure an optimum decision in respect of these three areas, they should be related to the objectives of financial management. The goals/objectives of financial management are discussed in Section 3.

Key Activities of the Financial Manager

The primary activities of a financial manager are: (i) performing financial analysis and planning, (ii) making investment decisions and (iii) making financing decisions.

Performing Financial Analysis and Planning The concern of financial analysis and planning is with (a) transforming financial data into a form that can be used to monitor financial condition, (b) evaluating the need for increased (reduced) productive capacity and (c) determining the

additional/reduced financing required. Although this activity relies heavily on accrual-based financial statements, its underlying objective is to assess cash flows and develop plans to ensure adequate cash flows to support achievement of the firm's goals.

Making Investment Decisions Investment decisions determine both the mix and the type of assets held by a firm. The mix refers to the amount of current assets and fixed assets. Consistent with the mix, the financial manager must determine and maintain certain optimal levels of each type of current assets. He should also decide the best fixed assets to acquire and when existing fixed assets need to be modified/replaced/liquidated. The success of a firm in achieving its goals depends on these decisions.

Making Financing Decisions Financing decisions involve two major areas: *first*, the most appropriate mix of short-term and long-term financing; *second*, the best individual short-term or long-term sources of financing at a given point of time. Many of these decisions are dictated by necessity, but some require an in-depth analysis of the available financing alternatives, their costs and their long-term implications.

LO 1.4 OBJECTIVES OF FINANCIAL MANAGEMENT

To make wise decisions a clear understanding of the objectives which are sought to be achieved is necessary. The objective provide a framework for optimum financial decision making. In other words, they are concerned with designing a method of operating the internal investment and financing of a firm. The term 'objective' is used in the sense of a goal or **decision criterion** for the three decisions involved in financial management. It implies that what is relevant is not the overall objective or goal of a business but a operationally useful criterion by which to judge a specific set of mutually interrelated business decisions, namely, investment, financing and dividend policy. Moreover, it provides a normative framework. That is, the focus in financial literature is on what a firm should try to achieve and on policies that should be followed if certain goals are to be achieved. The implication is that these are not necessarily followed by firms in actual practice. They are rather employed to serve as a basis for theoretical analysis and do not reflect contemporary empirical industry practices. Thus, the term is used in a rather narrow sense of what a firm *should attempt* to achieve with its investment, financing and dividend policy decisions.

Firms in practice state their vision, mission and values in broad terms and are also concerned about technology, leadership, productivity, market standing, image, profitability, financial resources, employees satisfaction and so on. Some illustrations of mission and values/corporate purpose/vision for future are depicted in Exhibits 1.1 to 1.3.

EXHIBIT 1.1 Ranbaxy's Missions and Values

MISSION

To become a research-based International Pharmaceutical Company.

VALUES

- Achieving customer satisfaction is fundamental to our business.
- Provide products and services of the highest quality.
- Practice dignity and equity in relationships and provide opportunities for our people to realise their full potential.

- Ensure profitable growth and **enhance wealth of the shareholders.**
- Foster mutually beneficial relations with all our business operations.
- Manage our operations with high concern for safety and environment.
- Be a responsible corporate citizen.

EXHIBIT 1.2 HLL's Corporate Purpose

- Our purpose in Unilever is to meet the everyday needs of people everywhere—to anticipate the aspirations of our consumers and customers and to respond creatively and competitively with branded products and services which raise the quality of life.
- Our deep roots in local cultures and markets around the world are our unparalleled inheritance and the foundation for our future growth. We will bring our wealth of knowledge and international expertise to the service of local customer—a truly multi-local multinational.
- Our long-term success requires a total commitment to exceptional standards of performance and productivity, to working together effectively and to a willingness to embrace new ideas and learn continuously.
- We believe that to succeed requires the highest standards of corporate behaviour towards our employees, consumers and the societies and world in which we live.
- This is Unilever's road to sustainable, profitable growth for our business and **long-term value creation for our shareholders** and employees.

EXHIBIT 1.3 Vision of Future of Reliance Industries Ltd

Reliance is an enterprise that contributes, in a modest way, to critical economic and social needs of India and attaining global leadership in all of its major initiatives.

Pursuing this vision, over the next few years, Reliance will pursue a strategy of:

- Reinforcing competitive advantage of existing businesses through new capacities and synergistic acquisitions
- Scaling sizeable opportunities in petroleum exploration and production
- Forward integrating into retailing transportation fuels and creating new customer experiences
- Building the BSES acquisition, now Reliance Energy, to a major electricity utility
- Addressing the significant information and communications market opportunity in India and in the world
- Leveraging its strong balance sheet, cash flows and managerial capacity to **create value** by adding new capacities, acquisitions and turnaround of under performing assets
- Developing strategic alliances in technology and product-market domains with global majors
- Fostering new higher education institutions for knowledge creation and sharing
- Leveraging its formidable strengths beyond Indian borders.

In this endeavour, Reliance will undergo an upgradation:

- In addition to manufacturing products to developing manufacturing systems
- From having a manufacturing orientation to providing technical solutions

- From being an intermediate goods producer to being a final goods and services provider
- From being a margin energy player to being a global energy major
- In addition to vertical integration in hydrocarbon energy markets to horizontal integration over diverse energy markets
- From licensing technology to developing technology
- From being an intellectual property user to an intellectual property creator
- In addition to operating in India to being a global company
- From building financial equity to fostering social equity

This change will entail creating new organisational competencies such as:

- Creating a customer-centric organisation
- Developing new products and technologies
- Exploring and producing oil and gas in demanding geological conditions
- Fostering and sustaining globally-oriented management talent
- Managing customer-oriented supply chains
- Developing and protecting intellectual capital
- Managing strategic technology and product-market relationships

Managing diversity in businesses, technologies, export markets and people is the primary challenge for Reliance, as it marches ahead in realising its vision.

This vision is the legacy of Shri Dhirubhai Ambani to all of us.

We are committed to pursue it with commitment and conviction.

Reliance is driven by his vision and continues to pursue a trajectory of growth, productivity and global leadership.

We discuss in this Section the alternative approaches in financial literature. There are two widely-discussed approaches: **(i)** Profit (total)/Earning Per Share (EPS) maximisation approach, and **(ii)** Wealth maximisation approach.

Profit/EPS Maximisation Decision Criterion

According to this approach, actions that increase profits (total)/EPS should be undertaken and those that decrease profits/EPS are to be avoided. In specific operational terms, as applicable to financial management, the profit maximisation criterion implies that the investment, financing and dividend policy decisions of a firm should be oriented to the maximisation of profits/EPS.

The term 'profit' can be used in **two** senses. As a *owner-oriented concept*, it refers to the *amount and share of national income* which is *paid to the owners of business*, that is, those who supply equity capital. As a *variant*, it is described as **profitability**. It is an operational concept² and signifies economic efficiency. In other words, profitability refers to a situation where output exceeds input, that is, the value created by the use of resources is more than the total of the input resources. Used in this sense, profitability maximisation would imply that a firm should be guided in financial decision making by one test; select assets, projects and decisions which are profitable and reject those which are not. In the current financial literature, there is a general agreement that profit maximisation is used in the second sense.

The rationale behind profitability maximisation, as a guide to financial decision making, is simple. Profit is a test of economic efficiency. It provides the yardstick by which economic performance can be judged. Moreover, it leads to efficient allocation of resources, as resources tend to be directed

to uses which in terms of profitability are the most desirable. Finally, it ensures maximum social welfare. The individual search for maximum profitability provides the famous 'invisible hand' by which total economic welfare is maximised. Financial management is concerned with the efficient use of an important economic resource (input), namely, capital. It is, therefore, argued that profitability maximisation should serve as the basic criterion for financial management decisions.

The profit maximisation criterion has, however, been questioned and criticised on several grounds. The reasons for the opposition in academic literature fall into two broad groups: (1) those that are based on misapprehensions about the workability and fairness of the private enterprise itself, and (2) those that arise out of the difficulty of applying this criterion in actual situations. It would be recalled that the term objective, as applied to financial management, refers to an explicit operational guide for the internal investment and financing of a firm and not the overall goal of business operations. We, therefore, focus on the second type of limitations to profit maximisation as an objective of financial management.³ The *main technical flaws* of this criterion are **ambiguity**, **timing of benefits**, and **quality of benefits**.

Ambiguity One practical difficulty with profit maximisation criterion for financial decision making is that the term profit is a vague and ambiguous concept. It has no precise connotation. It is amenable to different interpretations by different people. To illustrate, profit may be short-term or long-term; it may be total profit or rate of profit; it may be before-tax or after-tax; it may return on total capital employed or total assets or shareholders' equity and so on. If profit maximisation is taken to be the objective, the question arises, which of these variants of profit should a firm try to maximise? Obviously, a loose expression like profit cannot form the basis of operational criterion for financial management.

Timing of Benefits A more important technical objection to profit maximisation, as a guide to financial decision making, is that it ignores the differences in the time pattern of the benefits received over the working life of the asset, irrespective of when they were received. Consider Table 1.1.

TABLE 1.1 Time-Pattern of Benefits (Profits)

Time	Alternative A (₹ in lakh)	Alternative B (₹ in lakh)
Period I	150	50
Period II	100	100
Period III	50	150
Total	300	300

It can be seen from Table 1.1 that the total profits associated with the alternatives, A and B, are identical. If the profit maximisation is the decision criterion, both the alternatives would be ranked equally. But the returns from both the alternatives differ in one important respect, while alternative A provides higher returns in earlier years, the returns from alternative B are larger in later years. As a result, the two alternative courses of action are not strictly identical. This is primarily because a basic dictum of financial planning is **the earlier the better** as benefits received sooner are more valuable than benefits received later. The reason for the superiority of benefits now over benefits later lies in the fact that the former can be reinvested to earn a return. This is referred to as time value of money. The profit maximisation criterion does not consider the distinction between returns received in different time periods and treats all benefits irrespective of the timing, as equally valuable. This is not true in actual practice as benefits in early years should be valued more highly

than equivalent benefits in later years. The assumption of equal value is inconsistent with the real world situation.

Quality of Benefits Probably the most important technical limitation of profit maximisation as an operational objective, is that it ignores the quality aspect of benefits associated with a financial course of action. The term **quality** here refers to the degree of

Quality
refers to the degree of certainty with which benefits can be expected.

certainty with which benefits can be expected. As a rule, the more certain the expected return, the higher is the quality of the benefits. Conversely, the more uncertain/fluctuating is the expected benefits, the lower is the quality of the benefits. An uncertain and fluctuating return implies **risk** to the investors. It can be safely assumed that the investors are **risk-aversers**, that is, they want to avoid or at least minimise risk. They can, therefore, be reasonably expected to have a preference for a return which is more certain in the sense that it has smaller variance over the years.

Risk
is the chance that actual outcomes may differ from those expected.

The problem of uncertainty renders profit maximisation unsuitable as an operational criterion for financial management as it considers only the size of benefits and gives no weight to the degree of uncertainty of the future benefits. This is illustrated in

Risk-aversers
want to avoid risk.

Table 1.2.

TABLE 1.2 Uncertainty About Expected Benefits (Profits)

State of Economy	Profit (₹ crore)	
	Alternative A	Alternative B
Recession (Period I)	90	0
Normal (Period II)	100	100
Boom (Period III)	110	200
Total	300	300

It is clear from Table 1.2 that the total returns associated with the two alternatives are identical in a normal situation but the range of variations is very wide in case of alternative B, while it is narrow in respect of alternative A. To put it differently, the earnings associated with alternative B are more uncertain (risky) as they fluctuate widely depending on the state of the economy. Obviously, alternative A is better in terms of risk and uncertainty. The profit maximisation criterion fails to reveal this.

To conclude, the profit maximisation criterion is inappropriate and unsuitable as an operational objective of investment, financing and dividend decisions of a firm. It is not only vague and ambiguous but it also ignores two important dimensions of financial analysis, namely, risk, and time value of money. It follows from the above that an appropriate operational decision criterion for financial management should **(i)** be precise and exact, **(ii)** be based on the '**bigger the better**' principle, **(iii)** consider both quantity and quality dimensions of benefits, and **(iv)** recognise the time value of money. The alternative to profit maximisation, that is, wealth maximisation is one such measure.

Wealth Maximisation Decision Criterion

This is also known as value maximisation or net present worth maximisation. In current academic literature value maximisation is almost universally accepted as an appropriate operational decision criterion for financial management decisions as it removes the technical limitations which characterise

the earlier profit maximisation criterion. Its operational features satisfy all the three requirements of a suitable operational objective of financial course of action, namely, exactness, quality of benefits and the time value of money.

The value of an asset should be viewed in terms of the benefits it can produce. The worth of a course of action can similarly be judged in terms of the value of the benefits it produces less the cost of undertaking it. A significant element in computing the value of a financial course of action is the precise estimation of the benefits associated with it. The wealth maximisation criterion is based on the concept of cash flows generated by the decision rather than accounting profit which is the basis of the measurement of benefits in the case of the profit maximisation criterion. Cash-flow is a precise concept with a definite connotation. Measuring benefits in terms of cash flows avoids the ambiguity associated with accounting profits. This is the first operational feature of the net present worth maximisation criterion.

The second important feature of the wealth maximisation criterion is that it considers both the quantity and quality dimensions of benefits. At the same time, it also incorporates the time value of money. The operational implication of the uncertainty and timing dimensions of the benefits emanating from a financial decision is that adjustments should be made in the cash-flow pattern, firstly, to incorporate risk and, secondly, to make an allowance for differences in the timing of benefits. The value of a stream of cash flows with value maximisation criterion is calculated by discounting its element back to the present at a capitalisation rate that reflects both time and risk. The value of a course of action must be viewed in terms of its worth to those providing the resources necessary for its undertaking. In applying the value maximisation criterion, the term **value** is used in terms of worth to the owners, that is, ordinary shareholders. The **capitalisation (discount) rate** that is employed is, therefore, the rate that reflects the time and risk preferences of the owners or suppliers of capital. As a measure of quality (risk) and timing, it is expressed in decimal notation. A discount rate of, say, 15 per cent is written as 0.15. A large capitalisation rate is the result of higher risk and longer time period. Thus, a stream of cash flows that is quite certain might be associated with a rate of 10 per cent, while a very risky stream may carry a 15 per cent discount rate.

For the above reasons, the net present value maximisation is superior to the profit maximisation as an operational objective. As a decision criterion, it involves a comparison of value to cost. An action that has a discounted value—reflecting both time and risk—that exceeds its cost can be said to create value. Such actions should be undertaken. Conversely, actions, with less value than cost, reduce wealth and should be rejected. In the case of mutually exclusive alternatives, when only one has to be chosen, the alternative with the greatest net present value should be selected. In the words of Ezra Solomon,⁴

The gross present worth of a course of action is equal to the capitalised value of the flow of future expected benefit, discounted (or capitalised) at a rate which reflects their certainty or uncertainty. Wealth or net present worth is the difference between gross present worth and the amount of capital investment required to achieve the benefits being discussed. Any financial action which creates wealth or which has a net present worth above zero is a desirable one and should be undertaken. Any financial action which does not meet this test should be rejected. If two or more desirable courses of action are mutually exclusive (i.e. if only one can be undertaken), then the decision should be to do that which creates most wealth or shows the greatest amount of net present worth.

Using Ezra Solomon's symbols and methods, the net present worth can be calculated as shown below:

$$(i) \quad W = V - C \quad (1.1)$$

Where W = Net present worth
 V = Gross present worth
 C = Investment (equity capital) required to acquire the asset or to purchase the course of action

$$(ii) \quad V = E/K \quad (1.2)$$

Where E = Size of future benefits available to the suppliers of the input capital
 K = The capitalisation (discount) rate reflecting the quality (certainty/uncertainty) and timing of benefits attached to E

$$(iii) \quad E = G - (M + I + T) \quad (1.3)$$

Where G = Average future flow of gross annual earnings expected from the course of action, before maintenance charges, taxes and interest and other prior charges like preference dividend
 M = Average annual reinvestment required to maintain G at the projected level
 T = Expected annual outflow on account of taxes
 I = Expected flow of annual payments on account of interest, preference dividends and other prior charges

The operational objective of financial management is the maximisation of W in Eq. (1.1). Alternatively, W can be expressed symbolically by a short-cut method as in Eq. (1.4). Net present value (worth) or wealth is

$$W = \frac{A_1}{(1+K)} + \frac{A_2}{(1+K)^2} + \dots + \frac{A_n}{(1+K)^n} - C \quad (1.4)$$

where A_1, A_2, \dots, A_n represents the stream of cash flows expected to occur from a course of action over a period of time;
 K is the appropriate discount rate to measure risk and timing; and
 C is the initial outlay to acquire that asset or pursue the course of action.

It can, thus, be seen that in the value maximisation decision criterion, the time value of money and handling of the risk as measured by the uncertainty of the expected benefits is an integral part of the exercise. It is, moreover, a precise and unambiguous concept, and therefore, an appropriate and operationally feasible decision criterion for financial management decisions.

It would also be noted that the focus of financial management is on the value to the owners or suppliers of equity capital. The wealth of the owners is reflected in the market value of shares. So wealth maximisation implies the maximisation of the market price of shares. In other words, net present value maximisation (as a decision criterion in investment decisions), is the operational substitute for maximisation of the market price of shares.

In brief, what is relevant is not the overall goal of a firm but a decision criterion which should guide the financial course of action. Profit/EPS maximisation was initially the generally accepted theoretical criterion for making efficient economic decisions, using profit as an economic concept and defining profit maximisation as a criterion for economic efficiency. In current financial literature, it has been replaced by the wealth maximisation decision criterion because of the shortcomings of the former as an operational criterion, as **(i)** it does not take account of uncertainty of risk, **(ii)** it ignores the time value of money, and **(iii)** it is ambiguous in its computation. Owing to these technical limitations, profit maximisation cannot be applied in real world situations. Its modified form is the value maximisation criterion. It is important to note that value maximisation is simply extension of profit maximisation to a world that is uncertain and multiperiod in nature. Where the time period is short and degree of uncertainty is not great, value maximisation and profit maximisation amount to essentially the same thing.⁵

However, two important issues are related to the value/share price-maximisation, namely, **economic value added** and **focus on stakeholders**.

Economic Value Added (EVA) It is a popular measure currently being used by several firms to determine whether an existing/proposed investment positively contributes to the owners'/shareholders' wealth. The **EVA** is equal to after-tax operating profits of a firm less the cost of funds used to finance investments. A positive EVA would increase owners' value/wealth. Therefore, only investments with positive EVA would be desirable from the viewpoint of maximising shareholders' wealth. To illustrate, assuming an after-tax profit of ₹40 crore and associated costs of financing the investments of ₹38 crore, the $EVA = ₹2 \text{ crore} (\text{₹}40 \text{ crore} - \text{₹}38 \text{ crore})$. With a positive EVA, the investment would add value and increase the wealth of the owners and should be accepted. The computation of the after-tax operating profits attributable to the investment under consideration as well as the cost of funds used to finance it would, however, involve numerous accounting and financial issues.

- Economic value added
- is equal to after-tax operating profits of a firm less the cost of funds used to finance investments.

The **merits** of EVA are: **(a)** its relative simplicity and **(b)** its strong link with the wealth maximisation of the owners. It *prima facie* exhibits a strong link to share prices, that is, positive EVA is associated with increase in prices of shares and *vice versa*. However, EVA is, in effect, a repackaged and well-marketed application of the NPV technique of investment decision. But EVA is certainly a useful tool for operationalising the owners' value maximisation goal, particularly with respect to the investment decision.

Focus on Stakeholders The shareholders wealth maximisation as the primary goal notwithstanding, there is a broader focus in financial management to include the interest of the stakeholders as well as the shareholders. The **stakeholders** include employees, customers, suppliers, creditors and owners and others who have a direct link to the firm. The implication of the focus on stakeholders is that a firm should avoid actions detrimental to them through the transfer of their wealth to the firm and, thus, damage their wealth. The goal should be to preserve the well-being of the stakeholders and not to maximise it.

- Stakeholders include groups such as employees, customers, suppliers, creditors, owners and others who have a direct link to the firm.

The focus on the stakeholders does not, however, alter the shareholders' wealth maximisation goal. It tends to limit the firm's actions to preserve the wealth of the stakeholders. The stakeholders view is considered part of its "social responsibility" and is expected to provide maximum long-term benefit to the shareholders by maintaining positive stakeholders relationship which would minimise stakeholder turnover, conflict and litigation. In brief, a firm can better achieve its goal of shareholders' wealth maximisation with the cooperation of, rather than conflict with, its other stakeholders.

Shareholder Orientation in India Traditionally, the corporate industrial sector in India was dominated by group companies with close links with the promoter groups. Their funding primarily was through institutional borrowings from public/ development finance institutions like IFCI, ICICI, IDBI and so on. There was preponderance of loan capital in their financial structure and shareholders equity played a rather marginal role. It was no wonder, therefore, that corporate India paid scant attention to shareholders' wealth maximisation with few exceptions such as Reliance Industries Ltd. In the post-90 liberalisation era, the goal of shareholders' wealth maximisation has emerged almost at the centre-stage. The main contributory factors have been **(i)** greater dependence on capital market, **(ii)** growing importance of institutional investors, **(iii)** tax concessions/incentives to shareholders and **(iv)** foreign exposure.

With the gradual decline in the significance of the development/public financial/term lending institutions over the years and their disappearance from the Indian financial scene recently (as a result of their conversion into banks) and the consequent emergence of the capital market as the main source of corporate financing, shareholders' wealth maximisation is emerging as the prime goal of corporate financial management. Secondly, as a result of the institutionalisation of savings, institutional investors such as mutual funds, insurance organisations, foreign institutional investors and so on dominate the structure of the Indian capital market. To cater to the requirements of these institutional investors, corporates are pursuing more shareholder-friendly policies as reflected in their efforts to focus on shareholders' wealth maximisation. Thirdly, the abolition of wealth tax on equity shares and other financial assets coupled with tax exemption on dividends in recent years has provided an incentive to corporates to enhance share prices and, thus, focus on shareholders' wealth. Finally, the family-owned corporates are also undergoing major transformation. The scions of most business families are acquiring higher professional education in India and abroad. With the foreign exposure, they also appreciate the importance of shareholders' wealth. Thus, shareholder orientation is unmistakably visible in the corporate India.

PRIMARY OBJECTIVE OF CORPORATE MANAGEMENT

The major objective of corporate finance by Indian corporates are summarised as follows:

- The two most important objectives of management decision making in corporate finance in India are: (i) maximisation of earnings before interest and tax (EBIT) and earnings per share (EPS) (85 per cent) and (ii) maximisation of the spread between return on assets (ROA) and weighted average cost of capital (WACC), that is, economic value added (EVA) (76 per cent).
- Large firms (on the basis of sales, assets and market capitalisation), high growth firms and firms with high exports significantly focus on maximising EVA than small, low growth and low exports firms respectively.
- There is no significant difference in the EVA as a corporate finance objective followed by the firms in public and private sectors.
- The spread between cash flow return on investment (CFROI) and the WACC, that is, cash value added (CVA) is the third most important objective (54 per cent) of corporate finance management for large firms based on market capitalisation.
- Yet another important objective is the maximisation of market capitalisation. The MVA (market value added) objective is more likely to be followed by public sector units than by private sector firms.
- The overwhelming majority of corporates (70 per cent) consider maximising per cent return on investment in assets as the most important.
- Another preferred goal is desired growth rate in EPS/maximise aggregate earnings.
- Wealth maximisation/maximisation of share prices is the least preferred goal of the sample corporates.

LO 1.5 AGENCY PROBLEM

A characteristic feature of corporate enterprise is the separation between ownership and management as a corollary of which the latter enjoys substantial autonomy in regard to the affairs of the firm. With widely-diffused ownership, scattered and ill-organised shareholders hardly exercise any control/influence on management which may be inclined to act in its own interest rather than those of the owners. However, shareholders as owners of the enterprise have the right to change the management. Due to the threat of being dislodged/dismissed for poor performance, the management would have a natural inclination to achieve a minimum acceptable level of performance to satisfy the shareholders' requirements/goals, while focusing primarily on their own personal goals. Thus, in furtherance of their objective of survival, management would aim at **satisfying** instead of **maximising** shareholders' wealth.

Resolving the Agency Problem

From this conflict of management objective of survival (personal goals) and maximising owners value arises the agency problem, that is, the likelihood that managers may place personal goals ahead of corporate goals. The **agency problem** can be prevented/minimised by acts of **(i)** market forces and **(ii)** agency costs.

- **Agency problem**
- is the likelihood
- that managers may
- place personal
- goals ahead of
- corporate goals.

Market Forces Market forces act to prevent/minimise agency problems in two ways: **(1)** behaviour of security market participants and **(2)** hostile takeovers.

Behaviour of Security Market Participants The security market participants/ shareholders in general and large institutional investors like mutual funds, insurance organisations, financial institutions and so on which hold large blocks of shares of corporates, in particular, actively participate in management. To ensure competent management and minimise agency problems, they have in recent years actively exercised their voting rights to replace more competent management in place of under-performing management. In addition to exercising their legal voting rights, the large institutional shareholders also from time to time communicate with, and exert pressure on, corporate management to perform or face replacement.

- **Hostile takeover**
- is the acquisition
- of the firm (target)
- by another firm
- (the acquirer) that
- is not supported by
- management.

Hostile Takeovers Another market force that has in recent years threatened corporate management to perform in the best interest of the owners/shareholders is the possibility of a **hostile** takeover, that is, the acquisition of the (target) firm by another firm/group (i.e. acquirer) that is not supported by management. Such takeovers typically occur when the acquirer is of the view that the target firm is undervalued due to poor management and that its acquisition at its current low price may result in the enhancement of its value (i.e. share price) through restructuring its management, operations and financing. The constant threat of a takeover would motivate management to act in the best interests of the owners despite the fact that techniques are available to defend against a hostile takeover.

- **Agency costs**
- are costs borne
- by shareholders to
- prevent/minimise
- agency problems
- as to contribute to
- maximise owners
- wealth.

Agency Costs To respond to potential market forces by preventing/maximising agency problems and contributing to the maximisation of owners' wealth/value, the shareholders/owners have to incur four types of costs: **(i)** monitoring, **(ii)** bonding, **(iii)** opportunity and **(iv)** structuring.

Monitoring Expenditures Such expenditures relate to monitoring the activities of the management (agents) to prevent a **satisfying** in contrast to **share price maximising** behaviour by them. The

monitoring outlays relate to payment for audit and control procedures to ensure that managerial behaviour is tuned to actions that tend to be in the best interest of the shareholders.

Fidelity bond

is a contract in which a bonding company agrees to re-imburse a firm upto a stated amount for financial losses caused by dishonest acts of managers.

Bonding Expenditures They protect the owners against the potential consequences of dishonest acts by management/managers. The firm pays to obtain a **fidelity bond** from a third-party bonding company to the effect that the latter will compensate the former up to a specified amount for financial losses caused by dishonest acts of manager(s).

Opportunity Costs Such costs result from the inability of large corporates from responding to new opportunities. Due to the organisational structure, decision hierarchy, and control mechanism, the management may face difficulties in seizing upon profitable investment opportunities quickly.

Incentive plans

tie management compensation to share price.

Structuring Expenditure The structuring expenditures are the most popular, powerful and expensive agency costs incurred by corporates. They relate to structuring managerial compensation to correspond with share price maximisation. The objective is to offer incentives/compensation to management to act in the best interests of the owners. The restructured higher compensation packages to managers also enable corporates to hire the best available managers. The management compensation plans fall into two groups: **(a)** incentive plans and **(b)** performance plans.

Stock options

allow management to purchase shares at a special/concessional price.

Incentive Plans They tie management compensation to share price. The most widely-used incentive plan is **stock options** which confer on management the right to acquire shares of the corporate at a special/concessional price. A higher future price would result in larger management compensation. However, share prices may be affected by economic and behavioural "market forces" over which management may have no control. Despite positive management performance, market prices may decline.

Performance plans

compensate management on the basis of proven performance.

Performance Plans These plans compensate management on the basis of its proven performance measured by EPS, growth in EPS and other ratios related to return. Based on these, performance shares may be given to management for meeting the stated performance goals. Another form of performance-based compensation is cash bonuses, that is, cash payments tied to the achievement of certain performance goals.

Performance shares

are given to management for meeting the stated performance goals.

In brief, unconstrained managers may have other goals in addition to share price maximisation, but there are enough evidence to suggest that due to agency costs and market forces, share price maximisation is the primary goal of most firms.

LO 1.6 ORGANISATION OF FINANCE FUNCTION

The responsibilities for financial management are spread throughout the organisation in the sense that financial management is, to an extent, an integral part of the job for the managers involved in planning, allocation of resources and control. For instance, the production manager (engineer) shapes the investment policy (proposal of a new plant); the marketing manager/analyst provides inputs in forecasting and planning; the purchase manager influences the level of investment in inventories; and the sales manager has a say in the determination of receivables policy.

Nevertheless, financial management is highly specialised in nature and is handled by specialists. Financial decisions are of crucial importance. It is, therefore, essential to set up an efficient organisation for financial management functions.

Since finance is a major/critical functional area, the ultimate responsibility for carrying out financial management functions lies with the top management, that is, board of directors/managing director/chief executive or the committee of the board. However, the exact nature of the organisation of the financial management function differs from firm to firm depending upon factors such as size of the firm, nature of its business, type of financing operations, ability of financial officers and the financial philosophy, and so on. Similarly, the designation of the chief executive of the finance department also differs widely in case of different firms. In some cases, they are known as finance managers while in others as vice-president (finance), director (finance), and financial controller and so on. He reports directly to the top management. Various sections within the financial management area are headed by managers such as controller and treasurer.

Figure 1.2 depicts the organisation of the financial management function in a large typical firm.

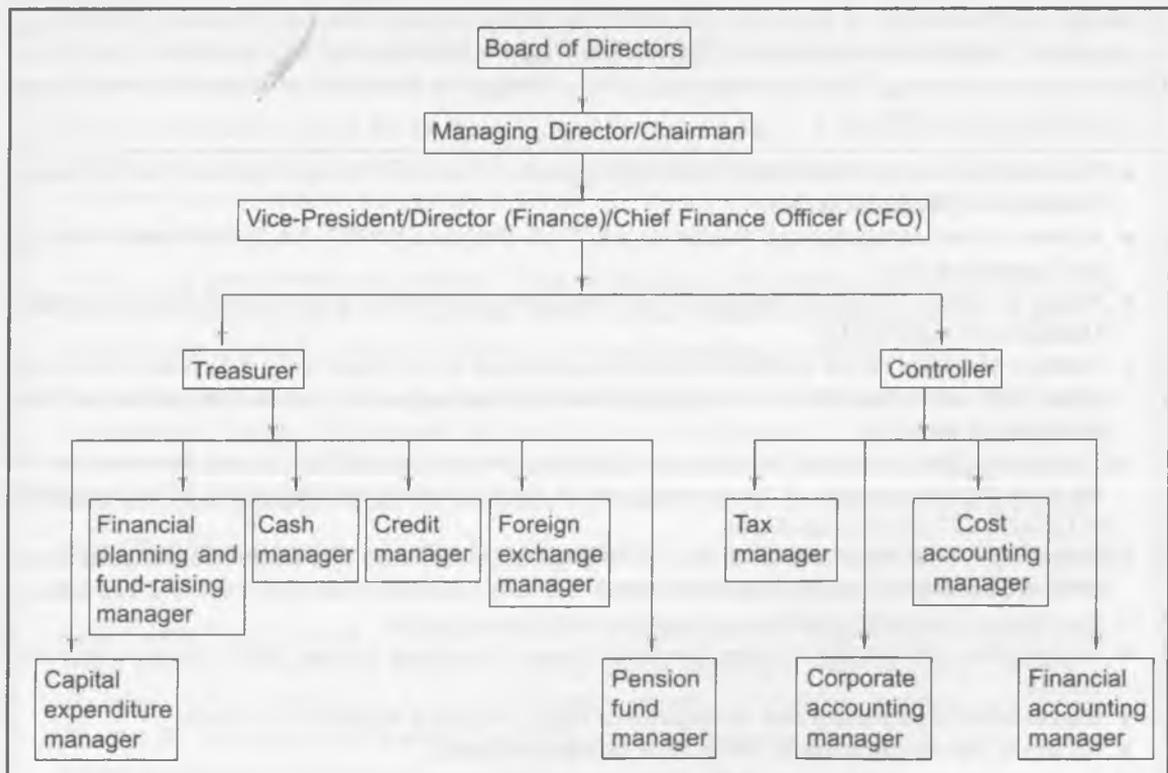

FIGURE 1.2 Organisation of Financial Management Function

The *job of the chief financial executive* does not cover only routine aspects of finance and accounting. As a member of top management, he is closely associated with the formulation of policies as well as decision making. Under him are controllers and treasurers, although they may

be known by different designations in different firms. The tasks of financial management and allied areas like accounting are distributed between these two key financial officers. Their functions are described below.

The main concern of the treasurer is with the financing activities of the firm.

The **main concern of the treasurer** is with the financing activities of the firm. Included in the range of his functions are: **(i)** obtaining finance, **(ii)** banking relationship, **(iii)** investor relationship, **(iv)** short-term financing, **(v)** cash management, **(vi)** credit administration, **(vii)** investments, and **(viii)** insurance.

The functions of the controller are related mainly to accounting and control.

The **functions of the controller** are related mainly to accounting and control. The typical functions performed by him include: **(i)** financial accounting, **(ii)** internal audit, **(iii)** taxation, **(iv)** management accounting and control, **(v)** budgeting, planning and control, and **(vi)** economic appraisal and so on.

LO 1.7 EMERGING ROLE OF FINANCE MANAGERS IN INDIA

Reflecting the emerging economic and financial environment in the post-liberalisation era, the role/job of financial managers in India has become more important, complex and demanding. The key challenges are, *inter-alia*, in the areas specified below: **(a)** financial structure, **(b)** foreign exchange management, **(c)** treasury operations, **(d)** investor communication, **(e)** management control and **(f)** investment planning. The main elements of the changed economic and financial environment, *inter alia*, are the following:

- Considerable relaxation in industrial licensing framework in terms of the modifications in the Industries Development (Regulations) Act;
- Abolition of the Monopolies and Restrictive and Trade Practices (MRTP) Act and its replacement by the Competition Act;
- Repeal of Foreign Exchange Regulation Act (FERA) and enactment of a liberalised Foreign Exchange Management Act (FEMA);
- Abolition of Capital Issues (Control) Act and the setting-up of the Securities and Exchange Board of India (SEBI) under the SEBI Act for the regulation and development of the securities market and the protection of investors;
- Enactment of the Insurance Regulatory and Development Authority (IRDA) Act and the setting-up of the IRDA for the regulation of the insurance sector and the consequent dismantling of the monopoly of LIC and GIC and its subsidiaries;
- Emergence of the capital market at the centre-stage of the financing system and the disappearance of the erstwhile development/public financial/term lending institutions from the Indian financial scene;
- Emergence of a highly articulate and sophisticated money market;
- Globalisation, convertibility of rupee, liberalised foreign investments in India, Indian foreign investment abroad;
- Market-determined interest rate, emergence of highly innovative financial instruments;
- Growth of mutual funds; credit rating, other financial services;
- Rigorous prudential norms, credit risk management framework for banks and financial institutions;
- Access to Euro-issues, American Depository Receipts (ADRs);
- Privatisation/disinvestment of public sector undertakings.

LO 1.8

AN OVERVIEW OF THE BOOK

This book discusses the theory of financial management, outlines the relevant tools and techniques for analysing financial decisions, presents information about environment relevant for corporate finance in India and assesses the managerial finance practices by Indian corporates. Each major decision area is presented in terms of both return and risk factors and their potential impact on the owners wealth as reflected in share prices. Each chapter begins with a number of learning goals/issues to ensure a broad understanding of the theories, concepts, techniques and practices of managerial finance. At the end of each chapter, there are chapter summaries, review questions, solved problems and self-test problems that can be used to test the readers' understanding of each key theory, concept, technique and practice. The chapter-end mini and comprehensive cases can be used to synthesize and apply related concepts and techniques. The activities of the financial managers are described in ten separate but related parts briefly outlined below.

Part 1 Foundation of Finance Chapter 1 provides an overview of financial management/corporate finance/managerial finance. Chapter 2 dwells on time value of money in terms of compounding and discounting and their applications. Chapter 3 explains the risk and return concepts. Chapter 4 discusses the valuation of bonds and shares.

Part 2 Financial Analysis, Profit Planning and Control Chapter 5 focuses on preparation of cash-flow statement. The techniques of financial statement analysis are covered in Chapter 6. The volume-cost-profit analysis is explained in Chapter 7. Chapter 8 presents various tools of budgeting and profit planning.

Part 3 Long-Term Investment Decision Chapter 9 analyses the general principles and techniques of capital budgeting. Chapter 10 explores some complex issues in capital budgeting. Chapter 11 explains cost of capital. Chapter 12 dwells on risk and uncertainty in capital budgeting.

Part 4 Current Assets Management Chapter 13 provides an overview of working capital management. Chapter 14 presents the tool for cash management. Chapter 15 discusses the important aspects of receivables/credit management. Chapter 16 dwells on the various facets of inventory management. Chapter 17 describes the various sources of financing working capital.

Part 5 Financing Decision Chapter 18 covers operating, financial and combined leverage. Capital structure theories and capital structure decisions are discussed in Chapters 19 and 20 respectively.

Part 6 Long-Term Finance Chapter 21 examines capital markets. Chapter 22 discusses equity share financing. Chapter 23 explains analytical issues relating to debt financing. Chapter 24 discusses hybrid financing in terms of preference shares, convertibles, warrants and options. Chapter 25 analyses lease financing and hire-purchase financing. Chapter 26 covers venture capital financing.

Part 7 Risk Management Chapter 27 deals with option valuation. Chapter 28 is devoted to a discussion of derivatives as a tool for managing financial risk.

Part 8 Dividend Decision Chapter 29 analyses the relationship between dividend and valuation. Chapter 30 discusses the various practical aspects of dividend policy.

Part 9 Valuation and Corporate Restructuring Chapter 31 explains the various approaches to business valuation. Chapter 32 explains corporate restructuring in detail.

Part 10 International Finance Chapters 33-35 discuss foreign exchange markets, foreign exchange risk management and international financial management.

SUMMARY

LO1.1	Financial management/corporate finance/managerial finance is concerned with the duties of the finance manager in a business firm. He performs such varied tasks as budgeting, financial forecasting, cash management, credit administration, investment analysis and funds procurement. The recent trends towards globalisation of business activity has created new demands and opportunities in managerial finance.
LO1.2	Finance is closely related to both macroeconomics and microeconomics. Macroeconomics provides an understanding of the institutional structure in which the flow of finance takes place. Microeconomics provides various profit maximisation strategies based on the theory of the firm. A financial manager uses these to run the firm efficiently and effectively. Similarly, he depends on accounting as a source of information/data relating to the past, present and future financial position of the firm. Despite this interdependence, finance and accounting differ in that the former is concerned with cash flows, while the latter provides accrual-based information; and the focus of finance is on the decision making but accounting concentrates on collection of data.
LO1.3	The financial management function covers decision making in three inter-related areas, namely, investment including working capital management, financing and dividend policy. The three key activities of the financial manager are (1) performing financial analysis; (2) making investment decisions and (3) making financing decisions.
LO1.4	The goal of the financial manager is to maximise the owners/shareholders wealth as reflected in share prices rather than profit/EPS maximisation because the latter ignores the timing of returns, does not directly consider cash flows and ignores risk. As key determinants of share price, both return and risk must be assessed by the financial manager when evaluating decision alternatives. The EVA is a popular measure to determine whether an investment positively contributes to the owners wealth. However, the wealth maximising action of the finance managers should be consistent with the preservation of the wealth of stakeholders, that is, groups such as employees, customers, suppliers, creditors, owners and others who have a direct link to the firm. Corporate India paid scant attention to the goal of shareholders wealth maximisation till the eighties. In the post-liberalisation era, it has emerged at the centre-stage of corporate financial practices, the contributory factors being greater dependence on capital market, growing importance of institutional investors and foreign exposure.
LO1.5	An agency problem results when managers as agents of owners place personal goals ahead of corporate goals. Market forces and the threat of hostile takeover tend to act to prevent/minimise agency problems. In addition, firms incur agency costs in the form of monitoring and bonding expenditures, opportunity costs and structuring expenditures which involve both incentive and performance-based compensation plans to motivate management to act in the best interest of the shareholders.
LO1.6	The importance of the finance function depends on the size of the firm. Financial management is an integral part of the overall management of the firm. In small firms, the finance functions are generally performed by the accounting departments. In large firms, there is a separate department of finance headed by a specialist known by different designations such as vice-president, director of finance, chief finance officer and so on.

LO 1.7

Reflecting the emerging economic and financial environment in the post-liberalisation era since the early nineties, the role/job of finance managers in India has become more important, complex and demanding. The key challenges are in the areas of (1) financial structure, (2) foreign exchange management, (3) treasury operations, (4) investor communication, (5) management control and (6) investment planning.

REVIEW QUESTIONS

LOD: Easy

RQ.1.1 (a) Indicate whether the following statements are True or False.

[LO 1.3, 4, 5, 6]

- (i) Financial management deals with two major decisions, namely, investment and financing decisions.
- (ii) Profit/EPS maximization is the sole objective of financial management.
- (iii) Agency problem occurs when the management tries to fulfil its own interests at the cost of value of the firm.
- (iv) Agency cost consists of (a) monitoring (b) binding (c) opportunity and (d) structuring cost such as stock options and cash bonuses, etc.

[Answers: (i) False (ii) False (iii) True (iv) True]

(b) In the following multiple choice questions select the correct answers.

- (i) The only viable goal of financial management is

(a) profit maximization	(b) wealth maximization
(c) sales maximization	(d) assets maximization.
- (ii) The basic objective of financial management is
 - (a) maximisation of profits
 - (b) maximisation of shareholder's wealth
 - (c) ensuring financial discipline in the organization
 - (d) none of the above.
- (iii) Finance function involves
 - (a) procurement of finance only
 - (b) expenditure of funds only
 - (c) safe custody of funds only
 - (d) procurement and effective utilization of funds.
- (iv) The goal of wealth maximization takes into consideration

(a) risk related to uncertainty of returns	(b) timing of expected returns
(c) amount of returns expected	(d) all the above.

- (v) Financial management is mainly concerned with
- (a) arrangement of funds
 - (b) all aspects of acquiring and utilizing means of financial resources for firm's activities
 - (c) efficient management of every business
 - (d) none of the above.

[Answers: (i) b (ii) b (iii) d (iv) d (v) b]

- RQ.1.2** Briefly explain the three key activities of the financial manager. [LO 1.3]
- RQ.1.3** Briefly describe the three basic reasons why profit/EPS maximisation fails to be consistent with wealth maximisation. [LO 1.4]
- RQ.1.4** What is economic value added (EVA)? How is it used? [LO 1.4]
- RQ.1.5** Describe the three broad areas of financial decision making. [LO 1.3]
- RQ.1.6** What are the primary objectives of corporate management in India? [LO 1.4]

LOD: Medium

- RQ.1.7** Describe the close relationship between finance and economics and explain why the finance manager should possess a basic knowledge of economics. What is the primary economic principle used in managerial finance? [LO 1.2]
- RQ.1.8** What are the major differences between accounting and finance with respect to (a) emphasis on cash flows and (b) decision making? [LO 1.2]
- RQ.1.9** What is the goal of the firm? Discuss how to measure achievement of this goal. [LO 1.4]
- RQ.1.10** What is the agency problem? How do market forces act to prevent/minimise this problem? [LO 1.5]
- RQ.1.11** Define agency costs and explain why firms incur them. Describe and differentiate between incentives and performance compensation plans. [LO 1.5]
- RQ.1.12** Comment on the emerging role of the finance manager in India. [LO 1.7]
- RQ.1.13** How is the finance function typically organised in a large organisation? [LO 1.6]

LOD: Difficult

- RQ.1.14** Who are a firm's stakeholders and what consideration is often given to them in pursuing the firm's goal? Why? [LO 1.4]
- RQ.1.15** "Value maximisation is simply extension of profit maximisation to a world that is uncertain and multiperiod in nature." Elucidate the Statement with appropriate examples. [LO 1.4]
- RQ.1.16** Outline the factors behind Indian companies according greater importance to the goal of shareholders wealth maximisation. [LO 1.4]

CHAPTER

2

Time Value of Money

LEARNING OBJECTIVES

LO 2.1	Discuss the role/rationale of time value of money in finance particularly future (compound) value and present (discounted) value
LO 2.2	Understand the concept of future value, its calculation for a single amount, compounding of interest more frequently than annually and find the future value of annuities
LO 2.3	Explain the concept of present value, its calculation for a single amount and determine the present value of a mixed stream of cashflows, an annuity and a perpetuity
LO 2.4	Describe procedures involved in determining deposits to accumulate a future sum, loan amortisation, computation of growth rates as well as develop further aspects of application of compounding and discounting techniques, namely, effective and nominal rates of interest and discount, present value of an annuity payable monthly/quarterly/half-yearly, and effective and flat rates of interest

INTRODUCTION

The object of this Chapter is to illustrate the basics of the mathematics of finance, that is, the time value of money. Recognition of the time value of money in financial decision making is extremely important. It was observed in Chapter 1 that wealth maximisation, as an objective of financial management, is superior to profit maximisation because, among other things, the former incorporates the timing of benefits received while the latter ignores it. Given the objective of wealth maximisation, much of the subject-matter of financial management is future-oriented. A financial decision taken today has implications for a number of years, that is, it spreads into the future. For example, firms have to acquire fixed assets for which they have to pay a certain sum of money to the vendors. The benefits arising out of the acquisition of such assets will be spread over a number of years in the future, till the working life of the assets. On the other hand, funds have to be procured from different sources such as raising of capital through new issues, bank borrowings, term loans from financial institutions, sale of debentures and so on. These involve a cash inflow at the time of raising

funds as well as an obligation to pay interest/dividend and return the principal in future. It is on the basis of a comparison of the cash outflows (outlays) and the benefits (cash inflows) that financial decisions are made. For a meaningful comparison, the two variables must be strictly comparable. One basic requirement of comparability is the incorporation of the time element in the calculations. In other words, in order to have a logical and meaningful comparison between cash flows that accrue in different time periods, it is necessary to convert the sums of money to a common point of time. This chapter is devoted to a discussion of the techniques for doing so. The chapter explains the meaning of, and rationale underlying, the time value of money. The technique employed in adjusting the timing aspect of financial decision making through compounding and discounting is explained subsequently. The important applications of these techniques are also demonstrated. The effective rates of interest and discount, nominal rates of interest and discount, present value of annuity payable for the period less than a year (PTHLY), loan repayment schedule and effective flat rates of interest are discussed in *Appendix 2-A*. Finally, the main points are recapitulated in the summary.

LO 2.1 RATIONALE OF TIME VALUE OF MONEY

Conceptually, 'time value of money' means that the value of a unit of money is different in different time periods. The value of a sum of money received today is more than its value received after some time. Conversely, the sum of money received in future is less valuable than it is today. In other words, the present worth of a rupee received after some time will be less than a rupee

Time value of money means that the value of a unit of money is different in different time periods.

received today. Since a rupee received today has more value, rational investors would prefer current receipt to future receipts. The time value of money can also be referred to as **time preference for money**.

The main reason for the time preference for money is to be found in the reinvestment opportunities for funds which are received early. The funds so invested will earn a rate of return; this would not be possible if the funds are received at a later time. The time preference for money is, therefore, expressed generally in terms of a rate of return or more popularly as a discount rate. The expected rate of return as also the time value of money will vary from individual to individual depending, *inter alia*, on his perception. The time value of money can be illustrated using a simple example.

Suppose, Mr X is given the choice of receiving ₹1,000 either now or one year later. His choice would obviously be for the first alternative as he can deposit the amount in his saving bank account and earn a nominal rate of interest, say, five per cent. At the end of the year, the amount will accumulate to ₹1,050. In other words, the choice before Mr X is between ₹1,050 and ₹1,000 at the end of the year. As a rational person, Mr X should be expected to prefer the larger amount (i.e. ₹1,050 here). Here we say that the time value of money, that is, the rate of interest is five per cent. It may, thus, be seen that future cash flows are less valuable because of the investment opportunities of the present cash flows.

What applies to an individual applies equally, if not in greater measure, to a business firm. It is because business firms make decisions which have ramifications extending beyond the period in which they were taken. For instance, the capital budgeting decision generally involves the current cash outflows in terms of the amount required for purchasing a new machine or launching a new project and the execution of the scheme generates future cash inflows during its useful life. Let us assume that the project cost (current cash outflows) is ₹10,00,000. To keep the illustration simple, it is assumed that the project has a useful life of only one year in which it is estimated to have cash inflows of ₹10,80,000 (at the end of the first year). The project appears to be *prima facie*

acceptable as it adds ₹80,000 as profit. However, when we take into account a rate of interest, say, of 10 per cent, the earlier conclusion will have to be revised as, without the project, the sum could have amounted to ₹11,00,000. Likewise, when the decision is made to raise a loan of ₹10,00,000 from a financial institution or by issuing debentures, for a period of 10 years, the firm is not only under obligation to meet interest payment as and when it becomes due on the debt at fixed intervals but also must make provisions so that it can repay ₹10,00,000 when the loan or debentures become due. Thus, time value of money is of crucial significance. This requires the development of procedures and techniques for evaluating future incomes in terms of the present.

There are two techniques for doing this: (1) Compounding, and (2) Discounting.

LO 2.2 COMPOUNDING TECHNIQUE

Interest is compounded when the amount earned on an initial deposit (the initial **principal**) becomes part of the principal at the end of the first compounding period. The term principal refers to the amount of money on which interest is received. Consider Example 2.1.

Example 2.1

If Mr X invests in a saving bank account ₹1,000 at 5 per cent interest compounded annually, at the end of the first year, he will have ₹1,050 in his account. This amount constitutes the principal for earning interest for the next year. At the end of the next year, there would be ₹1,102.50 in the account. This would represent the principal for the third year. The amount of interest earned would be ₹55.125. The total amount appearing in his account would be ₹1,157.625. Table 2.1 shows this compounding procedure:

TABLE 2.1 Annual Compounding

Year	1	2	3
Beginning amount	₹1,000.00	₹1,050.00	₹1,102.500
Interest rate	0.05	0.05	0.050
Amount of interest	50.00	52.50	55.125
Beginning principal	1,000.00	1,050.00	1,102.500
Ending principal	1,050.00	1,102.50	1,157.625

This compounding procedure will continue for an indefinite number of years. The compounding of interest can be calculated by the following equation:

$$A = P(1 + i)^n \quad (2.1)$$

in which

A = amount at the end of the period

P = principal at the beginning of the period

i = rate of interest

n = number of years

- **Compound interest**
- is the interest earned on a given deposit/principal that has become a part of the principal at the end of a specified period.

- **Principal**
- refers to the amount of money on which interest is received.

The amount of money in the account at the end of various years is calculated by using Eq. 2.1.

Amount at the end of year 1 = ₹1,000	$(1 + .05) = ₹1,050$
2 = ₹1,050	$(1 + .05) = ₹1,102.50$
3 = ₹1,102.50	$(1 + .05) = ₹1,157.625$

The amount at the end of year 2 can be ascertained by substituting ₹1,000 $(1 + .05)$ for ₹1,050, that is, ₹1,000 $(1 + .05) (1 + .05) = ₹1,102.50$. Similarly, the amount at the end of year 3 can be determined in the following way: ₹1,000 $(1 + .05) (1 + .05) (1 + .05) = ₹1,157.625$.

Thus, after substituting the actual figures for the investment of ₹1,000 in the formula $A = P(1 + i)^n$, we arrive at the same result as in Table 2.1. This is the fundamental equation of compound interest. The formula is useful as it can be applied quite readily for wide ranges of i and n . However, the calculations involved will be tedious and time-consuming if the number of years involved is large, say, 15 years or 20 years. To find the compound value of ₹1,000, assuming the rate of interest to be 5 per cent, the compounding factor 1.05 is to be raised to fifteenth power or twentieth power. In order to simplify the compound interest calculations, compound interest tables for values $(1 + i)^n$ for wide ranges of i and n have been compiled. Table A-1 given in *Appendix I* at the end of the book gives compound value interest factor of one rupee at different rates of interest for different time periods. The compounded values can be readily calculated with the help of Table A-1. For instance, if Mr X wishes to find out how much his savings, ₹1,000, will accumulate to in 15 years at 5 per cent rate of interest, application of the formula will require solving 1.05 raised to the power of fifteen: ₹1,000 $(1.05)^{15} = A$

Using Table A-1, we find that the compound value interest factor (CVIF) of ₹1 at 5 per cent interest rate for 15 years is 2.079. Multiplying the initial principal (₹1,000) by 2.079, we obtain ₹2,079. With the help of the table, it is possible to calculate the compounded value for any combination of interest rate, i and number of years, n . Let us take another illustration.

The compound interest phenomenon is most commonly associated with various savings institutions. These institutions emphasise the fact that they pay compound interest on savings deposited with them. If an investor deposits ₹20,000 with a bank which is paying interest at 8 per cent on a 15-year time deposit, we consult Table A-1 and read the relevant value in the 15th row (time period) in the column of 8 per cent (rate of interest). This value is 3.172. Multiplying this factor by the actual deposit of ₹20,000, we find his savings will accumulate to ₹63,440.

Two important observations can be made from the Table A-1 for the sum of ₹ one. The first is that as the interest rate increases for any given year, the compound interest factor also increases. Thus, the higher the interest rate, the greater is the future sum. The second point is that for a given interest rate, the future sum of a rupee increases with the passage of time. Thus, the longer the period of time, the higher is the compound interest factor. However, it should be borne in mind that for an interest rate of zero per cent, the compound interest factor always equals 1 and, therefore, the future amount always equals the initial principal.

Alternatively, the calculation of the compounded value can be carried out using Microsoft Excel (Spreadsheet).

Spreadsheet Solution 2.1

	A	B	C	D	E	F	G	H	I
1	Interest rate	0.05							
2	Time	0	1	2	3				
3	Cash flow	-1,000							
4	Future value		1,050	1,102.50	1,157.63				
5									

Interest rate is entered in cell B1 as a decimal number 0.05. Periods for the time line are entered in row 2. Instead of entering values in all the cells in row 2, you can enter 0 in cell B2, the formula $B2+1$ in cell C2 and then copy the formula in the remaining cells of row 2. Cash flows are entered in row 3. The single cash flow in this example has been shown in cell B3. The formula in equation 2.1 has been entered in cell C4 as $=-B3*(1+B1)^{C2}$. The minus sign is used in the formula because the cash flow in cell B3 bears a negative sign. The formula is then copied in cells D4 and E4. Cell E4 shows that the future value of ₹1,000, compounded for 3 years at 5 per cent per year is ₹1,157.625.

Future Value can also be found using the function wizard in Microsoft Excel. The equation of this function in Excel format is FV (Rate, Nper, Pmt, Pv, Type). In this equation, Rate stands for rate of interest per period; Nper stands for number of payment periods; Pmt stands for payment made each period and Pv is the present value, or the lump-sum amount that a series of future payments is worth right now. If Pv is omitted, it is assumed to be 0 (zero), and you must include the Pmt argument. A Type code is to be entered to indicate the time at which the payments are due. The code is 0 if the payments are due at the end of the period and 1 if the payments are due in the beginning of the period.

To use the function wizard, put the cursor on cell E2 and click; click the function wizard, a window 'insert function' will appear; choose 'Financial' from the category of functions, a list of financial functions will appear; scroll down to FV and then click OK, you will see the FV dialogue box. Enter 0.05 or \$B1 for Rate, C2 for Nper, 0 or leave blank for Pmt as there are no periodic payments, -1,000 or \$B3 for Pv and 0 or leave blank to indicate that payments occur at the end of the period. When you click OK after entering the data, you get the future value of ₹1,050 after 1 period. Copy the formula of cell E2 in cells E3 and E4 to get the FV values for the years 2 and 3 respectively.

Semi-annual and Other Compounding Periods In the above examples, we have assumed annual compounding of interest at the end of the year. Very often the interest rates are compounded more than once in a year. Savings institutions, particularly, compound interests semi-annually, quarterly and even monthly.

Semi-annual Compounding means that there are *two compounding periods* within the year. Interest is actually paid after every six months at a rate of one-half of the annual (stated) rate of interest.

Example 2.1

Assume Mr X places his savings of ₹1,000 in a two-year time deposit scheme of a bank which yields 6 per cent interest compounded semi-annually. He will be paid 3 per cent interest compounded over four periods—each of six months' duration. Table 2.2 presents the calculations of the amount Mr X will have from the time deposit after two years.

- Semi-annual
- compounding
- means two
- compounding
- periods within a
- year.

TABLE 2.2 Semi-annual Compounding

Year	6 months	1 Year	18 months	2 years
Beginning amount	₹1,000.00	₹1,030.00	₹1,060.90	₹1,092.73
Interest rate	0.03	0.03	0.03	0.03
Amount of interest	30.00	30.90	31.83	32.78
Beginning principal	1,000.00	1,030.00	1,060.90	1,092.73
Ending principal	1,030.00	1,060.90	1,092.73	1,125.51

Table 2.2 reveals that his savings will amount to ₹1,060.90 and ₹1,125.51 respectively at the end of the first and second years.

Spreadsheet Solution 2.2

In line with the earlier spreadsheet application, the spreadsheet can be straight away applied to solve the Example 2.1.

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.03							
2	Time	0	1	2	3	4			
3	Cash Flow	-1,000							
4	FV		1,030	1,060.90	1,092.73	1,125.51			
5									

Quarterly Compounding means that there are *four compounding periods* within the year. Instead of paying the interest once a year, it is paid in four equal instalments after every three months. Using the above illustration, there will be eight compounding periods and the rate of interest for each compounding period will be 1.5 per cent, that is (1/4 of 6 per cent).

Quarterly compounding means four compounding periods in a year. Table 2.3 presents the relevant calculations regarding the amount he will have at the end of two years, when interest is compounded quarterly. At the end of the first year, his savings will accumulate to ₹1,061.363 and at the end of the second year he will have ₹1,126.49.

TABLE 2.3 Quarterly Compounding

Period (months)	Beginning amount	Interest factor	Amount of interest	Beginning principal	Ending principal
3	₹1,000.000	0.015	₹15.000	₹1,000.000	₹1,015.000
6	1,015.000	0.015	15.225	1,015.000	1,030.225
9	1,030.225	0.015	15.453	1,030.225	1,045.678
12	1,045.678	0.015	15.685	1,045.678	1,061.363
15	1,061.363	0.015	15.920	1,061.363	1,077.283

(Contd.)

(Contd.)

18	1,077.283	0.015	16.159	1,077.283	1,093.442
21	1,093.442	0.015	16.401	1,093.442	1,109.843
24	1,109.843	0.015	16.647	1,109.843	1,126.490

Table 2.4 presents a comparative picture of Mr X's savings at the end of two years when they are compounded annually, half-yearly and quarterly. The table warrants the generalisation that the more frequently the interest is compounded, the greater is the amount of money accumulated. This is primarily because interest is earned more frequently.

Spreadsheet Solution 2.3

	A	B	C	D	E	F	G	H	I
1	Interest Rate	Cash Flow	Time	FV					
2	0.015	-1,000	0						
3			1	1,015					
4			2	1,030.23					
5			3	1,045.68					
6			4	1,061.36					
7			5	1,077.28					
8			6	1,093.44					
9			7	1,109.84					
10			8	1,126.49					
11									

TABLE 2.4 Comparison of Annual, Semi-annual and Quarterly Compounding

End of year	Compounding period		
	Annual	Half-yearly	Quarterly
1	₹1,060.00	₹1,060.90	₹1,061.36
2	1,123.60	1,125.51	1,126.49

The effect of compounding more than once a year can also be expressed in the form of a formula. Equation 2.1 can be modified as Eq. 2.2.

$$P \left\{ 1 + \frac{i}{m} \right\}^{mn} = A \quad (2.2)$$

in which m is the number of times per year compounding is made. For semi-annual compounding, m would be 2, while for quarterly compounding it would equal 4 and if interest is compounded monthly, weekly and daily, would equal 12, 52 and 365 respectively.

The general applicability of the formula can be shown as follows, assuming the same figures of Mr X's savings of ₹1,000:

$$1. \text{ For semi-annual compounding, } ₹1,000 \left\{ 1 + \frac{0.06}{2} \right\}^{2 \times 2} = ₹1,000 (1 + 0.03)^4 = ₹1,125.51$$

$$2. \text{ For quarterly compounding, } ₹1,000 \left\{ 1 + \frac{0.06}{4} \right\}^{4 \times 2} = ₹1,000 (1 + 0.015)^8 = ₹1,126.49$$

The table of the sum of ₹1 (Table A-1) can also be used to simplify calculations when compounding occurs more than once a year. We are required simply to divide the interest rate by the number of times compounding occurs, that is $(i \times m)$ and multiply the years by the number of compounding periods per year, that is, $(m \times n)$. In our example, we have to look at Table A-1 for the sum of rupee one under the 3 per cent column and in the row for the fourth year when compounding is done semi-annually, the respective rate and year figures would be 1.5 per cent and the eighth year in quarterly compounding.

The compounding factor for 3 per cent and 4 years is 1.126 while the factor for 1.5 per cent and 8 years is 1.127. Multiplying each of the factors by the initial savings deposit of ₹1,000, we find ₹1,126 (₹1,000 × 1.126) for semi-annual compounding and ₹1,127 (₹1,000 × 1.127) for quarterly compounding. The corresponding values found by the long method are ₹1,125.51 and ₹1,126.49 respectively. The difference can be attributed to the rounding off of values in Table A-1.

Future/Compounded Value of a Series of Payments So far we have considered only the future value of a single payment made at time zero. In many instances, we may be interested in the future value of a series of payments made at different time periods. For simplicity, we assume that the compounding time period is one year and payment is made at the end of each year. Suppose, Mr X deposits each year ₹500, ₹1,000, ₹1,500, ₹2,000 and ₹2,500 in his saving bank account for 5 years. The interest rate is 5 per cent. He wishes to find the future value of his deposits at the end of the 5th year. Table 2.5 presents the calculations required to determine the sum of money he will have.

TABLE 2.5 Annual Compounding of a Series of Payments

End of year	Amount deposited	Number of years compounded	Compounded interest factor from Table A-1	Future value (2) × (4)
1	2	3	4	5
1	₹500	4	1.216	₹608.00
2	1,000	3	1.158	1,158.00
3	1,500	2	1.103	1,654.50
4	2,000	1	1.050	2,100.00
5	2,500	0	1.000	2,500.00
				8,020.50

Column 3 of Table 2.5 indicates that since the deposits are made at the end of the year, the first deposit will earn interest for four years, the second for three years and so on. The last payment of ₹2,500 comes at the end of the fifth year and, therefore, the future value remains ₹2,500. The future value of the entire stream of payments is the sum of the individual future values, that is, ₹8,020.50. The graphic presentation of these values is shown in the following time scale diagram which shows the equivalence of money sums (Fig. 2.1).

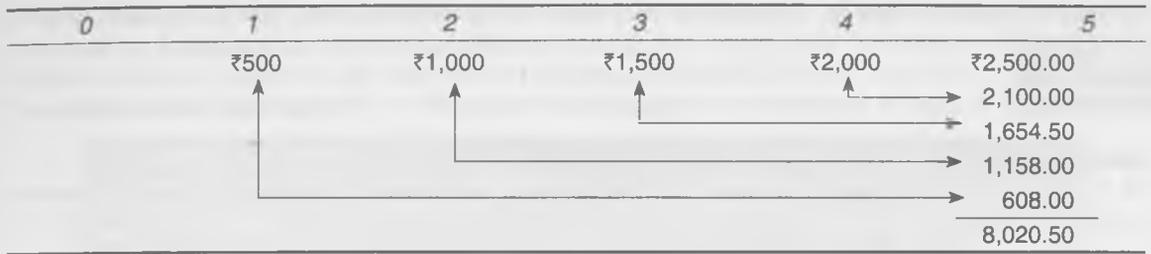

FIGURE 2.1 Graphic Illustration of Compounding Values

It may be noted here that we are making use of the compound interest formula for each payment separately. For instance, ₹500 put in at the end of the first year compounds for four years, and has a future value of ₹608 at 5 per cent interest [$₹500(1 + 0.05)^4$]. Similarly, ₹1,000 deposited at $n = 2$ compounds for 3 years and amounts to ₹1,158 [$₹1,000(1 + 0.05)^3$] and so on.

Future value of a series of payments can be calculated using the formula

$$FV_n = \sum_{t=1}^n CF_t(1 + i)^{n-t} \tag{2.2A}$$

Where CF_t is the cash flow occurring at time t , i is the interest rate per period and n is the number of periods.

Spreadsheet Solution 2.4

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.05							
2	Time	0	1	2	3	4	5	Total	
3	Cash Flow		500	1,000	1,500	2,000	2,500		
4	FV		607.75	1,157.63	1,653.75	2,100.00	2,500.00	8,019.13	
5	NPV	6,283.20							
6	FV	8,019.13							
7									

In cell C4 of the spreadsheet, enter the formula =C3*(1+\$B1)^(G2-C2). Copy this formula in cells D4 to G4. The sum of future values of each year's cash flow is calculated in cell H4 by entering the function =SUM(C4:G4).

The difference in the future value as per the numerical solution and as per the spreadsheet solution is due to approximations in the manual calculations.

Future value of a series of payments can also be calculated in an alternate way. First, the NPV of the cash flows is calculated using the NPV function from the function wizard. To use this function, there is a need to specify the interest rate and the series of payments. In the cell B5, enter the function =NPV(B1,C3:G3) to get the NPV. Then, the future value of the series of payments can be computed using the formula =NPV(1+i)^n. This step has been performed in cell B6 using the function =B5*(1+B1)^G2.

Compound Sum of an Annuity An **annuity** is a stream of equal annual cash flows. Annuities involve calculations based upon the regular periodic contribution or receipt of a fixed sum of money. The calculations required to find the sum of an annuity on which interest is paid at a specified rate compounded annually are illustrated in Example 2.3.

Annuity is a stream of equal annual cash flows.

Example 2.3

Mr X deposits ₹2,000 at the end of every year for 5 years in his saving account paying 5 per cent interest compounded annually. He wants to determine how much sum of money he will have at the end of the 5th year.

Solution

Table 2.6 presents the relevant calculations.

TABLE 2.6 Annual Compounding of Annuity

End of year	Amount deposited	Number of years compounded	Compounded interest factor from Table A-1	Future value (2) × (4)
1	2	3	4	5
1	₹2,000	4	1.216	₹2,432
2	2,000	3	1.158	2,316
3	2,000	2	1.103	2,206
4	2,000	1	1.050	2,100
5	2,000	0	1.000	2,000
				11,054

The calculations in this case can be cut short and simplified since the compound interest factor is to be multiplied by the same rupee amount (₹2,000) each year as shown in the following calculations:

Amount at the end of 5 years = ₹2,000 (1.216) + ₹2,000 (1.158) + ₹2,000 (1.103) + ₹2,000 (1.050) + ₹2,000 (1.000)

Taking out the common factor ₹2,000, = ₹2,000 (1.216 + 1.158 + 1.103 + 1.050 + 1.000)
= ₹2,000 (5.527) = ₹11,054.

From the above, it follows that in order to find the sum of the annuity, the annual amount must

Compound/future interest factor for an annuity is the multiplier used to calculate the future/compound value of an annuity at a specified rate over a given period of time.

be multiplied by the sum of the appropriate **compound interest factor** annuity (CVIFA). Such calculations are available for a wide range of i and n . They are given in Table A-2, labelled as the sum of an annuity table. To find the answer to the annuity question of Example 2.3, we are required to look for the 5 per cent column and the row for the fifth year and multiply the factor by the annuity amount of ₹2,000. From the table we find that the sum of annuity of ₹1 deposited at the end of each year for 5 years is 5.526 (CVIFA). Thus, when multiplied by ₹2,000 annuity (A) we find the total sum as ₹11,052.

$$\text{Symbolically, } Sn = CVIFA \times A$$

where A is the value of annuity, and $CVIFA$ represents the appropriate factor for the sum of the annuity of ₹1 and Sn represents the compound sum of an annuity. The answer which we get from the long method was ₹11,054. This discrepancy can be attributed to the rounding off of values in Table A-2. Moreover, it may be noted that the sum of an annuity is

always larger than the number of years the annuity runs, unless of course, when interest rate is zero; in the latter case it will equal the number of years.

Spreadsheet Solution 2.5

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.05							
2	Time	0	1	2	3	4	5		
3	Cash Flow		2,000	2,000	2,000	2,000	2,000		
4	FV							11,051.26	
5									

In Microsoft Excel, there is an inbuilt function, FV, for finding the future value of an annuity. The function has already been explained in Example 2.1. In cell H4, enter the function =FV(B1,G2,-2000,0,0) to get the future value of the annuity. The difference in future value as per the spreadsheet solution and as per the numerical solution is due to approximations.

Annuity tables are of great help in the field of investment banking as they guide the depositors and investors as to what sum an amount (X) paid for number of years, n , will accumulate to at a stated rate of compound interest. Let us illustrate. Mr X wishes to know the sum of money he will have in his saving account which pays 5 per cent interest at the end of 12 years if he deposits ₹1,000, at the end of each year for the next twelve years. The appropriate factor for the sum of a twelve-year annuity at 5 per cent as given in Table A-2 is 15.917. Multiplying this factor by ₹1,000 deposit, we find the resultant sum to be ₹15,917.

LO 2.3 PRESENT VALUE OR DISCOUNTING TECHNIQUE

The concept of the present value is the exact opposite of that of compound value. While in the latter approach money invested now appreciates in value because compound interest is added, in the former approach (present value approach) money is received at some future date and will be worth less because the corresponding interest is lost during the period. In other words, the present value of a rupee that will be received in the future will be less than the value of a rupee in hand today. Thus, in contrast to the compounding approach where we convert present sums into future sums, in **present value** approach future sums are converted into present sums. Given a positive rate of interest, the present value of future rupees will always be lower. It is for this reason, therefore, that the procedure of finding present values is commonly called **discounting**. It is concerned with determining the present value of a future amount, assuming that the decision maker has an opportunity to earn a certain return on his money. This return is designated in financial literature as the discount rate, the cost of capital or an opportunity cost. These concepts are elaborated in Chapter 11. Let us illustrate the discounting procedure by an example (2.4).

- **Present value** is the current value of a future amount. The amount to be invested today at a given interest rate over a specified period to equal the future amount.

- **Discounting** is determining the present value of a future amount.

Example 2.4

Mr X has been given an opportunity to receive ₹1,060 one year from now. He knows that he can earn 6 per cent interest on his investments. The question is: what amount will he be prepared to invest for this opportunity?

To answer this question, we must determine how many rupees must be invested at 6 per cent today to have ₹1,060 one year afterwards.

Let us assume that P is this unknown amount, and using Eq. 2.1 we have: $P(1 + 0.06) = ₹1,060$

Solving the equation for P , $P = \frac{₹1,060}{1.06} = ₹1,000$

Thus, ₹1,000 would be the required investment to have ₹1,060 after the expiry of one year. In other words, the present value of ₹1,060 received one year from now, given the rate of interest of 6 per cent, is ₹1,000. Mr X should be indifferent to whether he receives ₹1,000 today or ₹1,060 one year from today. If he can either receive more than ₹1,060 by paying ₹1,000 or ₹1,060 by paying less than ₹1,000, he would do so.

Mathematical Formulation Since finding present value is simply the reverse of compounding, the formula for compounding of the sum can be readily transformed into a present value formula. As shown in the preceding section, according to the compounding formula, $A = P(1 + i)^n$. Therefore, the present value equation becomes:

$$P = \frac{A}{(1 + i)^n} = A \left\{ \frac{1}{(1 + i)^n} \right\} \quad (2.3)$$

Present value interest factor is the multiplier used to calculate at a specified discount rate the present value of an amount to be received in a future period.

in which P is the present value for the future sum to be received or spent; A is the sum to be received or spent in future; i is interest rate, and n is the number of years. Thus, the present value of money is the reciprocal of the compounding value.

Present Value Tables In order to simplify the present value calculations, tables are readily available for various ranges of i and n . Table A-3 in the Appendix gives the **present value interest factors (PVIF)** for various discount rates and years. Since the factors in Table A-3 give the present value of one rupee for various combinations of i and n , we can find the present value of the future lump sum by multiplying it with

the appropriate present value interest factor (PVIF) from Table A-3.

In terms of a formula, it will be:

$$P = A(PVIF) \quad (2.4)$$

Example 2.5

Mr X wants to find the present value of ₹2,000 to be received 5 years from now, assuming 10 per cent rate of interest. We have to look in the 10 per cent column of the fifth year in Table A-3. The relevant PVIF as per Table A-3 is 0.621.

Therefore, present value = ₹2,000 (0.621) = ₹1,242

Spreadsheet Solution

The screenshot shows a Microsoft Excel spreadsheet with the following data:

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.1							
2	Time	0	1	2	3	4	5		
3	Cash Flow						2,000		
4	Present Value	1,241.84							

Present value of a future cash flow can be found using the formula in equation 2.3. This formula has been entered in cell B4 as =G3/(1+B1)^G2. Cell B4 shows that the present value of ₹2,000, discounted for 5 years at 10 per cent per year is ₹1,241.84. (This value is different from the value in the numerical solution due to approximations). Present Value can also be found using the PV function in Microsoft Excel. The inputs required by the PV function are similar to those of the FV function. The only difference is that there is need to provide present value (FV) instead of future value (PV).

Some points may be noted with respect to present values. First, the expression for the present value factor for n years at i per cent, $1 / (1 + i)^n$ is the reciprocal or inverse of the compound interest factor for n years at i per cent, $(1 + i)^n$. This observation can also be confirmed by finding out the reciprocal of the relevant present value factor of Example 2.5. The reciprocal of 0.621 is 1.610. The compound interest factor from Table A-1 for 5 years at 10 per cent is 1.611. The difference is due to rounding off of values in Table A-1.

In other words, in Example 2.5, the sum of ₹1,242 will be compounded to ₹2,000 in five years at 10 per cent rate of interest [$₹1,242 \times 1.611 = ₹2,000.862$]. The difference of ₹0.862 is attributable to the fact that the table values are rounded figures. This indicates that both the methods, compounding and discounting of adjusting time value of money, yield identical results. Second, Table A-3 shows that the farther in the future a sum is to be received, the lower is its present value. See, for instance, the following extract from Table A-3:

Time (years)	2	4	6	8	10
5 per cent discount factor	0.907	0.823	0.711	0.677	0.614

Finally, the perusal of Table A-3 also reveals that the greater is the discount rate, the lower is its present value. Observe in this connection the following:

Discount rate	4	8	12	16	20
5 years time period	0.822	0.681	0.567	0.476	0.402

Thus, the higher the discount rate, the lower is the present value factor; and the longer the period of time, and correspondingly, the lower is the present value factor and *vice versa*. At the discount rate of zero per cent, the present value factor always equals one and, therefore, the future value of the funds equals their present value. But this aspect is only of academic importance as in actual practice the business firms can rarely, if ever, obtain the resources (capital) at zero rate of interest.

Present Value of a Series of Cash Flows So far we have considered only the present value of a single receipt at some future date. In many instances, especially in capital budgeting decisions, we may be interested in the present value of a series of receipts received by a firm at different time periods. Like compounding, in order to determine the present value of such a **mixed stream** of cash inflows, all that is required is to determine the present value of each future payment and then to aggregate them to find the total present value of the stream of cash flows. Symbolically,

- Mixed stream
- is a stream
- of cashflows
- that reflects no
- particular pattern.

$$P = \frac{C_1}{(1+i)} + \frac{C_2}{(1+i)^2} + \frac{C_3}{(1+i)^3} + \dots + \frac{C_n}{(1+i)^n} = \sum_{t=1}^n \frac{C_t}{(1+i)^t} \quad (2.5)$$

in which P = the sum of the individual present values of separate cash flows; $C_1, C_2, C_3 \dots C_n$, refer to cash flows in time periods 1, 2, 3 ... n .

This is the general form of the present value formula. To put the formula in a more practical perspective, we will have

$$P = C_1(IF_1) + C_2(IF_2) + C_3(IF_3) + \dots + C_n(IF_n) = \sum_{t=1}^n C_t (IF_t) \quad (2.6)$$

in which $IF_1, IF_2, IF_3, \dots IF_n$ represents relevant present value factors in different time periods, 1,2, 3 ... n .

If the time value of money is 10 per cent, we can easily find the present value of the following series of yearly payments (Example 2.6).

Example 2.6

In order to solve this problem, the present value of each individual cash flow discounted at 10 percent for the appropriate number of years is to be determined. The sum of all these individual values is then calculated to get the present value of the total stream. The present value factors required for the purpose are obtained from Table A-3. The results are summarised in Table 2.7.

Year	Cash flows
1	₹500
2	1,000
3	1,500
4	2,000
5	2,500

TABLE 2.7 Present Value of a Mixed Stream of Cash Flows

Year end	Cash flows	Present value factor (2) × (3)	Present value
1	2	3	4
1	₹500	0.909	₹454.50
2	1,000	0.826	826.00
3	1,500	0.751	1,126.50
4	2,000	0.683	1,366.00
5	2,500	0.621	1,552.50
			5,325.50

Spreadsheet Solution 2.6

The screenshot shows a Microsoft Excel spreadsheet with the following data:

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.1							
2	Time	0	1	2	3	4	5	Total	
3	Cash Flow		500	1,000	1,500	2,000	2,500		
4	Present Value		454.55	826.45	1,126.97	1,366.03	1,552.30	5,326.29	
5	NPV	5,326.29							
6									

In cell C4 of the spreadsheet, enter the formula $=C3/(1+B1)^A2$. Copy this formula in cells D4 to G4. The sum of present values of each year's cash flow is calculated in cell H4 by entering the function $=SUM(C4:G4)$. Present value of a series of payments can also be calculated by using the NPV function of Microsoft Excel. The function is entered in the cell B5. The results in cells H4 and B5 are identical.

Annuity We have already defined an annuity as a series of equal cash flows of an amount each time. Due to this nature of an annuity, a short cut is possible. Example 2.7 clarifies this method.

Example 2.7

Mr X wishes to determine the present value of the annuity consisting of cash inflows of ₹1,000 per year for 5 years. The rate of interest he can earn from his investment is 10 per cent.

Solution

Table 2.8 shows the required calculations:

TABLE 2.8 Long Method for Finding Present Value of an Annuity of ₹1,000 for Five Years

Year end	Cash flows	Present value factor	Present value (2) × (3)
1	2	3	4
1	₹1,000	0.909	₹909.00
2	1,000	0.826	826.00
3	1,000	0.751	751.00
4	1,000	0.683	683.00
5	1,000	0.621	621.00
			3,790.00

Table 2.8 shows the long way of determining the present value of annuity. This method is the same as the one adopted for mixed stream. This procedure yields a present value of ₹3,791. However, calculations can be greatly cut short as the present value factor for each year is to be multiplied by the annual amount of ₹1,000. This method of calculating the present value of the annuity can also be expressed as an equation:

$$P = ₹1,000 (0.909) + ₹1,000 (0.826) + ₹1,000 (0.751) + ₹1,000 (0.683) + ₹1,000 (0.621) = ₹3,790.$$

Simplifying the equation by taking out 1,000 as common factor outside the equation,

$$P = ₹1,000 (0.909 + 0.826 + 0.751 + 0.683 + 0.621) = ₹1,000 (3.790) = ₹3,790$$

Thus, the present value of an annuity can be found by multiplying the annuity amount by the sum of the present value factors for each year of the life of the annuity. Such ready-made calculations are available in Table A-4. This table presents the sum of present values for an annuity (PVIFA)/annuity discount factor (ADF) of ₹1 for wide ranges of interest rates, i , and number of years, n . From Table A-4 the sum ADF for five years at the rate of 10 per cent is found to be 3.791. Multiplying this factor by annuity amount (C) of ₹1,000 in this example gives ₹3,791. This answer is the same as the one obtained from the long method.

Now we can write the generalised formula to calculate the present value of an annuity:

$$P = \frac{C_1}{(1+i)} + \frac{C_2}{(1+i)^2} + \frac{C_3}{(1+i)^3} + \dots + \frac{C_n}{(1+i)^n}$$

$$= C \left\{ \frac{1}{(1+i)} + \frac{1}{(1+i)^2} + \frac{1}{(1+i)^3} + \dots + \frac{1}{(1+i)^n} \right\} = C \left\{ \sum_{t=1}^n \frac{1}{(1+i)^t} \right\} \quad (2.7)$$

The expression within brackets gives the appropriate annuity discount factor. Therefore, in more practical terms the method of determining present value is

$$P = C (ADF) = ₹1,000 (3.791) = ₹3,791$$

It may be noted that the interest factor for the present value of an annuity is always less than the number of years the annuity runs, whereas in case of compounding the relevant factor is larger than the number of years the annuity runs. The facts given in Example 2.7 can be shown graphically (Fig. 2.2).

• Present value
• interest factor
• for an annuity
• is the multiplier
• to calculate the
• present value of
• an annuity at a
• specified discount
• rate over a given
• period of time.

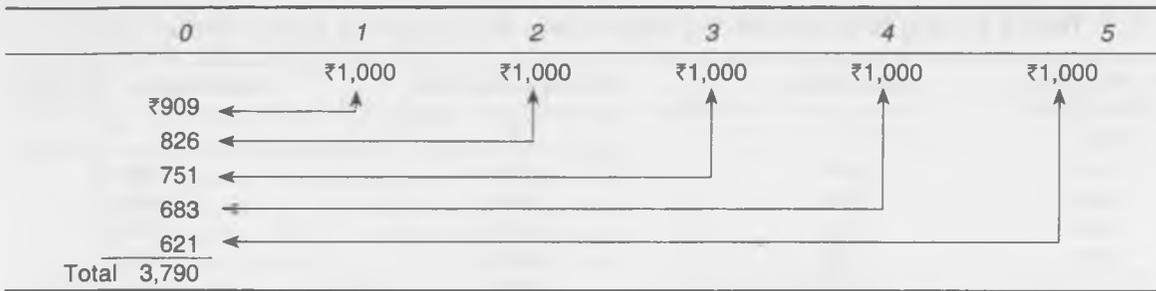

FIGURE 2.2 Graphic Illustration of Present Values

Spreadsheet Solution 2.7

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.1							
2	Time	0	1	2	3	4	5		
3	Cash Flow		1,000	1,000	1,000	1,000	1,000		
4	PV	3,790.79							
5									

In Microsoft Excel, there is an inbuilt function, PV, for finding the present value of an annuity. In cell B4, enter the function $=PV(B1,G2,-1000,0,0)$ to get the present value of the annuity.

Table A-4 can be easily applied to other problems relating to annuity also as shown in Example 2.8.

Example 2.8

The ABC company expects to receive ₹1,00,000 for a period of 10 years from a new project it has just undertaken. Assuming a 10 per cent rate of interest, how much would be the present value of this annuity?

Solution

The appropriate ADF (annuity discount factor) of a 10 year annuity at 10 per cent is to be found from the 10th row (representing time period) against the 10 per cent interest column from Table A-4. This value is 6.145. Multiplying this factor by the annuity amount of ₹1,00,000, we find that the sum of the present value of annuity is ₹6,14,500.

Let us take an example to clarify how the problems involving varying cash inflows are to be worked out (Example 2.9).

Example 2.9

If ABC company expects cash inflows from its investment proposal it has undertaken in time period zero, ₹2,00,000 and ₹1,50,000 for the first two years respectively and then expects annuity payment of ₹1,00,000 for the next eight years, what would be the present value of cash inflows, assuming a 10 per cent rate of interest?

Solution

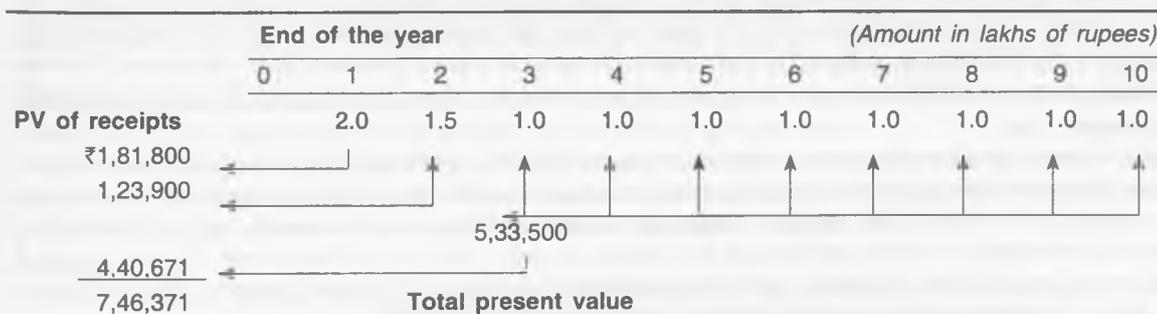

We can solve the problem by applying the long method of finding the present values for each year's amount by consulting Table A-3. But we would like to apply the short-cut procedure as most of the payments are part of an annuity. Table 2.9 presents the relevant calculations:

TABLE 2.9 Present Value of Uneven Cash Inflows Having Annuity

1. Present value of ₹2,00,000 due in year 1 = $(₹2,00,000 \times 0.909)^a$	= ₹1,81,800
Present value of ₹1,50,000 due in year 2 = $(₹1,50,000 \times 0.826)^a$	= ₹1,23,900
2. Present value of eight year annuity with ₹1,00,000 receipts:	
(A) Present value at the beginning of year 3 = ₹1,00,000 (5.335) ^b	= ₹5,33,500
(B) Present value at the beginning of year 1 = ₹5,33,500 (0.826)	= ₹4,40,671 ^c
3. Present value of total series =	₹7,46,371

^a Present value factor at 10 per cent from Table A-3.
^b Present value factor at 10 per cent from Table A-4.
^c $(6.145 - 1.736) \times ₹1,00,000$

It may be noted that the present values (PV) of ₹2,00,000 and ₹1,50,000 (uneven cash flows) received at the end of the first and second years respectively are to be determined with reference to Table A-3. The present value of subsequent cash inflows of ₹1,00,000 each for 8 years is found in Table A-4. The value of an annuity of ₹1,00,000 for 8 years is found to be ₹5,33,500. The most important point to note here is that ₹5,33,500 is the present value at the beginning of the third year (end of year 2). Therefore, its present worth in time period zero would obviously be less than ₹5,33,500. This amount would have to be discounted back for two years at 10 percent. The present value factor for 2 years at 10 per cent discount is 0.826. Multiplying this sum by ₹5,33,500 we get ₹4,40,671. When the present values of the first two payments are added to the present value of the annuity component, we obtain the sum of the present value of the entire investment. For a better understanding of the problem, a graphic representation of the procedure of calculating the present value (PV) of such a problem has been given in Fig. 2.3.

**FIGURE 2.3** Graphic Presentation of Present Value of Mixed Streams

Spreadsheet Solution 2.8

	A	B	C	D	E	F	G	H
1	Interest Rate	0.1						
2	Time	0	1	2	3 to 10	Total		
3	Cash Flow		2,00,000	1,50,000	1,00,000			
4	PV at the end of year 2				5,33,492.62			
5	PV at the end of year 0		1,81,818.18	1,23,966.94	4,40,902.99	7,46,688.12		
6								

The problem is solved in two steps. First, the present values of cash flows for years 3 to 10 is found in cell E4 using the function =PV(B1,8,-100000,0,0). In the next step, the present value of this cash flow is found at the end of year 0 using the formula =E4/(1+B1)^2 in cell E5. The present values of cash flows in year 1 is found using the formula =C3/(1+B1)^C2 in cell C5. This formula is then copied to cell D5. Finally, the total present value is found in cell F5 using the formula =SUM(C5:E5).

Perpetuity
is an annuity with
an indefinite life,
making continuous
annual payments.

Present Value of an Infinite Life Annuity (Perpetuities) An annuity that goes on for ever is called a **perpetuity**. The present value of a perpetuity of ₹C amount is given by the formula:

$$C/i \quad (2.8)$$

This is because as the length of time for which the annuity is received increases, the annuity discount factor also increases but if the length goes on extending, this increase in the annuity factor slows down. In fact, as annuity life becomes infinitely long ($n \rightarrow \infty$), the annuity discount factor approaches an upper limit. Such a limit is $1/i$. In other words, the appropriate factor is found by merely dividing 1 by the discount rate. The validity of this method can be seen by looking at the facts in Table A-4 for discount rates of 8, 12, 16 and 20 percent for a period of 50 years. As the number of years approaches 50, the value of these factors approaches, 12.23, 8.31, 6.25 and 5.00 respectively. Substituting 0.08, 0.12, 0.16 and 0.20 into our upper discount limit formula of $1/i$, we find the factors for finding the present value of perpetuities at these rates as 12.5, 8.33, 6.25 and 5.00.

Example 2.10

Mr X wishes to find out the present value of investments which yield ₹500 in perpetuity, discounted at 5 per cent. The appropriate factor can be calculated by dividing 1 by 0.05. The resulting factor is 20. That is to be multiplied by the annual cash inflow of ₹500 to get the present value of the perpetuity, that is, ₹10,000. This should, obviously, be the required amount if a person can earn 5 per cent on investments. It is so because if the person has ₹10,000 and earns 5 per cent interest on it each year, ₹500 would constitute his cash inflow in terms of interest earnings, keeping intact his initial investments of ₹10,000.

LO 2.4 PRACTICAL APPLICATIONS OF COMPOUNDING AND PRESENT VALUE TECHNIQUES

In the preceding sections we have outlined compounding and discounting techniques. These techniques have a number of important applications, relevant to the task of the financial manager and investors. Some of these are illustrated here.

1. A financial manager is often interested in determining the size of annual payments to accumulate a future sum to repay an existing liability at some future date or to provide funds for replacement of an existing machine/asset after its useful life. Consider Example 2.11.

Example 2.11

Company XYZ is establishing a sinking fund to retire ₹5,00,000, 8 per cent debentures, 10 years from today. The company plans to put a fixed amount into the fund each year for 10 years. The first payment will be made at the end of the current year. The company anticipates that the funds will earn 6 per cent a year. What equal annual contributions must be made to accumulate ₹5,00,000, 10 years from now?

Solution

The solution to this problem is closely related to the process of finding the compounded sum of an annuity. Table A-2 indicates that the annuity factor for 10 years at 6 per cent is 13.181. That is, one rupee invested at the end of each year for 10 years will accumulate to ₹13.181 at the end of the 10th year. In order to have ₹5,00,000 the required amount would be $₹5,00,000 \div 13.181 = ₹37,933.39$. If ₹37,933.39 is deposited at the end of each year for ten years, there will be ₹5,00,000 in the account.

Spreadsheet Solution 2.9

	A	B	C	D	E	F	G	H	I
1	Interest Rate	0.06							
2	Time	10							
3	Cash Flow	5,00,000							
4	Payment	37,933.98							
5									
6									

To find out the sinking fund payment, Excel function PMT can be used. The equation of this function in Excel format is $PMT(\text{rate}, \text{nper}, \text{PV}, \text{FV}, \text{type})$. Enter the rate of interest in cell B1, number of years in cell B2, and the amount to be accumulated in cell B3. In cell B4 enter the function $=PMT(B1, B2, 0, -B3, 0)$. Since sinking fund accumulation represents a future value, the PV is to be entered as 0 and the sum to be accumulated is entered as FV. The result would be the amount of the sinking fund payment.

2. When the amount of loan taken from financial institutions or commercial banks is to be repaid in a specified number of equal annual instalments, the financial manager will be interested in determining the amount of the annual instalment. Consider Example 2.12.

Example 2.12

A limited company borrows from a commercial bank ₹10,00,000 at 12 per cent rate of interest to be paid in equal annual end-of-year instalments. What would the size of the instalment be? Assume the repayment period is 5 years.

Solution

The problem relates to loan amortisation. The loan amortisation process involves finding out the future payments over the term of the loan whose present value at the interest rate just equals the initial principal borrowed. In this case, the company has borrowed ₹10,00,000 at 12 per cent. In order to determine the size of the payments, the 5-year annuity discounted at 12 per cent that has a present value of ₹10,00,000 is to be determined.

Present value, P , of an n year annuity of amount C is found by multiplying the annual amount, C , by the appropriate annuity discount factor (ADF) from Table A-4, that is, $P = C(\text{ADF})$, or $C = P/\text{ADF}$ in which P is the amount of loan, that is, (₹10,00,000), ADF is the present value of an annuity factor corresponding to 5 years and 12 per cent. This value is 3.605 as seen from Table A-4. Substituting the values, we have

$$C = ₹10,00,000/3.605 = ₹2,77,393$$

Thus, ₹2,77,393 is to be paid at the end of each year for 5 years to repay the principal and interest on ₹10,00,000 at the rate of 12 per cent.

Spreadsheet Solution 2.10

	A	B	C	D	E	F	G	H	I
1	Interest rate	0.12							
2	Time	5							
3	Cash Flow	10,00,000							
4	Payment	2,77,409.73							
5									
6									
7									
8									

The solution is similar to that in the previous example. There is only one difference. In the preceding example, the sum to be accumulated represented a future value. In this problem, the loan represents a present value. While using the PMT function, PV is to be entered as B3 and FV is to be entered as 0. The entry in cell B4 will be =PMT(B1,B2,-B3,0,0). The result would be the amount of annual installment.

3. An investor may often be interested in finding the rate of growth in dividend paid by a company over a period of time. It is because growth in dividends has a significant bearing on the price of the shares. In such a situation compound interest tables are used. Let us illustrate it by an Example (2.13).

Example 2.13

Mr X wishes to determine the rate of growth of the following stream of dividends he has received from a company:

Year	Dividend (per share)
1	₹2.50
2	2.60 } 1
3	2.74 } 2
4	2.88 } 3
5	3.04 } 4

Solution

Growth has been experienced for four years. In order to determine this rate of growth, the amount of dividend received in year 5 has been divided by the amount of dividend received in the first year. This gives us a compound factor which is 1.216 (₹3.04 ÷ ₹2.50). Now, we have to look at Table A-1 which gives the

compounded values of ₹1 at various rates of interest (for our purpose the growth rate) and number of years. We have to look to the compound factor 1.216 against fourth year in the row side. Looking across year 4 of Table A-1 shows that the factor for 5 per cent is exactly 1.216; therefore, the rate of growth associated with the dividend stream is 5 per cent.

Spreadsheet Solution 2.11

	A	B	C	D	E	F	G	H	I
1	Time	1	2	3	4	5			
2	Cash Flow	-2.5	2.6	2.74	2.88	3.04			
3	Growth rate	0.05							
4									
5									

To find out the growth rate, the Excel function RATE can be used. The equation of this function in Excel format is RATE(nper, PMT, PV, FV, Type, Guess). The initial figure is entered as a negative figure as has been done in cell B2. In cell B3, the function is entered as =RATE((F1-B1),0,B2,F2,0). The 'guess' input is to be left blank. The result would be the growth rate.

4. To determine the current values of debentures, the present value Tables A-3 and A-4 can be of immense use. The cash flow from a debenture consists of two parts: first, interest inflows at periodic intervals, say, semi-annually or annually and, second, the repayment of the principal on maturity. Since the interest payments on a debenture are made periodically throughout its life, it is easy to calculate the present value of this annuity type interest inflow by consulting Table A-4 and the present value of the face value of the debentures can be ascertained by discounting it at the market rate of interest by consulting Table A-3. The sum of the two values so obtained will be current worth of a debenture. If the interest is paid after six months, the factors are obtained for one-half of the discount rate and the number of years is doubled. Consider Example 2.14.

Example 2.14

Suppose a particular debenture pays interest at 8 per cent per annum. The debenture is to be paid after 10 years at a premium of 5 per cent. The face value of the debenture is ₹1,000. Interest is paid after every six months. What is the current worth of the debenture, assuming the appropriate market discount rate on debentures of similar risk and maturity is equal to the debenture's coupon rate, that is, 8 per cent?

Solution

Since the interest is compounded semi-annually over 10 years, the relevant compounding period equals to 20 and the discount rate will be one-half (4 per cent) of the yearly interest of 8 per cent. In other words, the investor will have an annuity of ₹40 (4 per cent of ₹1,000) for a compounding period of 20 years. The present value factor for 20 years and 4 per cent from Table A-4 is 13.59 which, when multiplied by ₹40, gives us a present value for the interest cash flows of ₹543.60. The present value of a maturity value of ₹1,050 (as the debenture is to be redeemed at 5 per cent premium) will be found by multiplying ₹1,050 by the factor for the present value of ₹1 to be received 20 years from now at 4 per cent. The relevant present value factor from Table A-3 is 0.456. Multiplied by ₹1,050 maturity value, it gives us a present sum of ₹478.8. The total value of the debentures would be equal to the total of these two values, that is, ₹543.60 + ₹478.8 = ₹1,022.4.

Spreadsheet Solution 2.12

	A	B	C	D	E	F	G	H
1	Interest rate per period	0.04						
2	Number of payments	20						
3	Face Value	1,000						
4	Coupon	40						
5	Redemption Value	1,050.00						
6	PV of coupons	543.61						
7	PV of Redemption Value	479.21						
8	Current Price	1,022.82						
9								

Enter the interest rate per period in cell B1. Since the yearly rate of interest is 8 per cent and is payable half-yearly, the interest rate per period will be 4 per cent. Over a period of 10 years, 20 coupon payments will be received. Therefore, 20 will be entered in cell B2. The face value of the debenture is entered in cell B3. Coupon per period is calculated in cell B4 using the formula $=B1*B3$. In cell B5, the redemption value of the debenture will be entered. Cell B6 calculates the present value of coupon payments using the Excel function PV. The present value of the redemption value is calculated in cell B7 using the formula $=B5/(1+B1)^{B2}$. The current price is the sum of cells B6 and B7 and this is calculated in cell B8 using the formula $=SUM(B6:B7)$.

APPENDIX 2-A

This Appendix further develops some aspects of application of compounding and discounting techniques. Those not interested in the detailed treatment of these aspects may skip over the Appendix.

Effective Rates of Interest and Discount

The effective rate of discount is used in computing the present values of certain types of annuities. Assuming i as the rate of interest per annum, an investor who deposits ₹1 at the beginning of the year would receive ₹ $(1 + i)$ at the end of the year. If he demands the interest payment in the beginning of the period, as money has time value, he would obviously get an amount less than i (assumed to be d). He would effectively lend ₹ $(1 - d)$ at the beginning of the year and get back ₹1 after one year. The relationship between i and d is called the effective rate of discount per annum. Symbolically,

$$d = \frac{i}{(1 + i)} \quad (2-A.1)$$

Example 2-A.1

Given that $PVIF(i, 1) = 0.95$ find the value of i and d .

Solution

$$PVIF(i, 1) = 0.95$$

$$\text{or} \quad \frac{1}{(1 + i)} = 0.95 \quad i = 0.0526$$

$$d = \frac{i}{(1 + i)} = \frac{0.0526}{1.0526} = 0.05 = 5 \text{ per cent}$$

Nominal Rates of Interest and Discount

When compounding/discounting has to be done at intervals less than a year, a distinction should be made between (i) nominal and (iii) effective rates of interest. The coupon rate of interest is called the *nominal rate of interest*. The nominal rate of interest differs from the effective rate of interest due to the frequency of compounding (e.g. annual, half-yearly, quarterly, monthly) with the nominal rate. With annual compounding/conversion, the nominal rate and the effective rate would be the same. The effective rate of interest is higher and increases with an increase in the frequency of compounding. Consider Example 2-A.2.

Example 2-A.2

The Premier Bank Ltd (PBL) offers 10 per cent interest on a deposit of one year. Assuming (i) annual, (ii) half-yearly and (iii) quarterly frequency of interest payments, compute the effective rates of interests in the three alternatives.

Solution

Assuming a deposit of ₹1,000, the computation of the effective rates of interest is shown below.

	Frequency of compounding		
	Annual	Half-yearly	Quarterly
Beginning amount	₹1,000.00	₹1,000.00	₹1,000.00
Interest	100.00	102.50	103.82
Effective rate of interest	0.10*	0.1025**	0.1038***
	*(₹100 ÷ ₹1,000)	***(₹102.50 ÷ ₹1,000)	****(₹103.82 ÷ ₹1,000)

We can determine the effective rate given the nominal rate and *vice-versa*. Denoting the nominal rate of interest compounded/convertible PTHLY (where P represents the frequency of payments during the year such as 12 for monthly payment, 4 for quarterly payment and two for half-yearly payment) as $i^{(P)}$ and the corresponding effective rate of interest as i , symbolically

$$i = \left[1 + \frac{i^{(P)}}{P} \right]^P - 1 \quad (2-A.2)$$

or

$$i = \left[1 + \frac{i^{(P)}}{P} \right]^P - 1 \quad (2-A.3)$$

Example 2-A.3

Assuming (a) $i = 0.0125$ and (b) $i^{(2)} = 0.1025$, find the values of (1) $i^{(4)}$ and (2) $i^{(12)}$.

Solution

$$(a) \quad i^{(4)} = [(1.0125)^4 - 1] \cdot 4 \\ = 0.0988 = 9.88 \text{ per cent}$$

$$(b) \quad i = \left[1 + \frac{0.1025}{2} \right]^2 - 1 = 0.0151 = 10.51 \text{ per cent}$$

$$i^{(12)} = [(1.0151)^{12} - 1] \cdot 12 = 0.1004 = 10.04 \text{ per cent}$$

Similar to the relationship between the nominal and effective rates of interest, the mathematical relationship between effective and nominal rates of discount is given by Equations 2-A.4 and 2-A.5. The nominal rates of interest and discount rate employed in computing the present value of annuities payable P-thly.

$$d = 1 - \left[1 - \frac{d^{(P)}}{P} \right]^P \quad (2-A.4)$$

and

$$d^{(P)} = [1 - (1 - d)^{1/P}] \cdot P \quad (2-A.5)$$

where

$$d = \frac{i}{1 + i} \quad (2-A.1)$$

Example 2-A.4

Assuming $d^{(12)} = 0.12$ and $(i)^2 = 0.12$ find the value of (a) d and (b) $d^{(4)}$

Solution

$$(a) \quad d = \left[1 - \left(1 - \frac{0.12}{12} \right)^{12} \right] = 0.1136 = 11.36 \text{ per cent}$$

$$(b) \quad (i)^2 = 0.12 \\ i = \{(1.06)^2 - 1\} = 0.1236$$

$$d = \frac{0.1236}{1.1236} = 0.1100 = 11 \text{ per cent}$$

$$d^{(4)} = [1 - (1 - 0.11)^{1/4}] \times 4 = 0.1148 = 11.48 \text{ per cent}$$

$$\text{Alternatively, } d^{(1)} = \left[1 - \left(1 + \frac{i^{(p)}}{p} \right)^{-p} \right]$$

$$\text{Therefore } d^{(4)} = \left[1 - \left(1 + \frac{0.12}{2} \right)^{-2/4} \right]$$

$$= [1 - (1.06)^{-1/2}] \times 4 = 0.1148 = 11.48 \text{ per cent}$$

The relationship between various nominal and effective rates of interest and discount is given in Table A.5.

Present Value of an Annuity Payable PTHLY

An annuity payable PTHLY refers to equated/level payments to be made in advance (beginning)/ arrears (end) at intervals less than one year where p denotes the frequency of payment (e.g. 12 for monthly payment, 4 for quarterly payment and 2 for half-yearly payment). The present values of an annuity payable PTHLY in (a) arrears and (b) advance respectively are computed using Equations 2-A-6 and 2-A.7.

$$\text{PVIFA } (i, n) = \frac{i}{i^{(p)}} \text{ PVIFA } (i, n) \quad (2-A.6)$$

$$\text{PVIFA}_{\bar{p}} (i, n) = \frac{i}{d^{(p)}} \text{ PVIFA } (i, n) \quad (2-A.7)$$

The value of $\frac{i}{i^{(p)}}$ and $\frac{i}{d^{(p)}}$ are given in Table A-5.

Example 2-A.5

The current lease rates quoted by the First Leasing Ltd (FLL) on its lease contracts are: (i) ₹18/₹1,000/month and (ii) ₹12.5/₹1,000/month for 3-year and 5-year terms respectively. While the monthly lease rentals on the 3-year contract are payable in arrears, those for the 5-year contract are payable in advance. Assuming 10 per cent marginal cost of debt to the lessee, calculate the present values of the lease payments.

Solution

(a) Present value of lease payments on the 3-year contract (in arrears)

$$= (\text{₹}18 \times 12) \times \text{PVIFA}_{12} (10, 3)$$

$$= \text{₹}216 \times \frac{i}{i^{(12)}} \times \text{PVIFA } (i, 3) \text{ where } i = 0.10 (10\%)$$

$$= \text{₹}216 \times 1.045 \text{ (Table A.5)} \times 2.487 \text{ (Table A-4)} = \text{₹}561$$

(b) Present value of lease payments on the 5-year contract (in advance)

$$= (\text{₹}12.5 \times 12) \times \text{PVIFA}_{12} (10, 3)$$

$$= \text{₹}150 \times \frac{i}{d^{(p)}} \times \text{PVIFA}_{\bar{p}} (i, 5) \text{ where } i = 0.10$$

$$= \text{₹}150 \times 1.0534 \text{ (Table A-5)} \times 3.791 \text{ (Table A-4)} = \text{₹}599$$

Loan Repayment Schedule for Annuities

Each instalment of an annuity payable PTHLY has two components: (i) the capital (repayment of principal) and (ii) the interest component. To identify these two components, a loan repayment schedule is to be developed. We illustrate below loan repayment schedule with reference to annuities payable (a) once a year and (b) PTHLY.

Example 2-A.6

The lease rentals for a 5-year contract are ₹300/₹1,000 payable annually in arrears. Assuming no salvage value, compute the rate of interest implied by the contract and develop a lease amortisation schedule.

Solution

The implied rate of interest, i , = ₹300 × PVIFA (i , 5) = ₹1,000

PVIFA (i , 5) = 3.333 (The PVIFA closet to 3.333 is 3.52 at 15 per cent)

PVIFA (15, 5) (Table A-4) = 3.352

Therefore, $i = 0.15 = 15$ per cent.

Lease Amortisation Schedule

Year	Outstanding amount at the beginning	Instalment	Interest content (0.15)	Capital content
1	₹1,000	₹300	₹150	₹150
2	850	300	128	172
3	678	300	102	198
4	480	300	72	228
5	252	300	38	262

Example 2-A.7

A hire-purchase plan requires a hirer to pay ₹91.68 per thousand per month (ptpm) in arrear over a 12-month period. Assuming a cash purchase price of ₹1,000 and no salvage value (a) compute the effective rate of interest implied by the plan, (b) develop the repayment schedule from the viewpoint of the hirer and (c) calculate the effective and the nominal rates of interest per annum.

Solution

(a) The implied effective rate of interest, i_m

$$₹91.68 \times \text{PVIFA}(i_m, 12) = ₹1,000$$

$$\text{PVIFA}(i_m, 12) = 10.9075$$

$$\text{PVIFA}(1, 12) = 11.255 \text{ (Table A-4) and } \text{PVIFA}(2, 12) = 10.5753 \text{ (Table A-4)}$$

By interpolation,

$$i_m = 0.01 + \left[0.01 \times \left\{ \frac{10.9075 - 11.2551}{10.5753 - 11.251} \right\} \right]$$

$$= 0.01 + \left[0.01 \times \left\{ \frac{0.3476}{0.6798} \right\} \right] = 0.015 = 1.5 \text{ per cent}$$

(b)

Loan Repayment Schedule

Month	Beginning amount	Instalment	Interest content (1.5)	Capital content
1	₹1,000	₹91.68	₹15.00	₹76.68
2	923.32	91.68	13.85	77.83
3	845.49	91.68	12.68	79.00
4	768.49	91.68	11.50	80.18

(Contd)

(Contd)

5	686.31	91.68	10.29	81.38
6	604.93	91.68	9.07	82.61
7	522.32	91.68	7.83	83.85
8	438.47	91.68	6.58	85.10
9	353.37	91.68	5.30	86.38
10	266.99	91.68	4.00	87.67
11	179.32	91.68	2.69	88.99
12	90.33	91.68	1.35	90.33

(c) Effective rate of interest and nominal rate of interest per annum

$$\text{Effective rate of interest} = (1.015)^{12} - 1 = 0.1956 = 19.56 \text{ per cent}$$

$$\text{Nominal rate of interest per annum} = 0.015 \times 12 = 0.18 = 18 \text{ per cent}$$

Example 2-A.8

A lease contract involves payment of ₹27 pm at the end of every month over a 5-year period. Develop a annual repayment schedule inherent in the contract.

Solution

$$\text{Annual rate of interest } (i) = (\text{₹}27 \times 12) \times PVIFA_{12}(i, 5) = \text{₹}1,000$$

$$PVIFA_{12}(i, 5) = 3.086 [\text{₹}1,000 \div \text{₹}324 (\text{₹}27 \times 12)]$$

$$\text{or } \frac{i}{i^{(12)}} \times PVIFA(i, 5) = 3.086$$

PVIFA (22,5) = 3.142 (Table A-4) and PVIFA (24,5) = 3.035 (Table A-4) are the closest values to 3.086

By interpolation,

$$i = 0.22 + \left[0.02 \times \left(\frac{3.086 - 3.142}{3.035 - 3.142} \right) \right] = 0.2305 = 23.05 \text{ per cent}$$

$$i^{(12)} = [(1.2305)^{1/12} - 1] \times 12 = 0.2092 = 20.92 \text{ per cent}$$

Equivalent annual interest instalment

$$= \text{₹}27 \times 12 \times \frac{0.2305}{0.2305^{(12)}} = \text{₹}357$$

Repayment Schedule Based on Equivalent Annual Instalments

Year	Outstanding amount at the beginning	Equivalent annual instalment	Interest content (0.2305)	Capital content
1	₹1,000.0	₹357	₹230.5	₹126.5
2	873.5	357	201.3	155.7
3	717.8	357	165.5	191.5
4	526.3	357	121.3	235.7
5	290.6	357	67.0	290.6

The required repayment schedule can be obtained by deducting the interest on interest of ₹33 [i.e. ₹357 - (₹27 + 12)] from the interest and instalment amount of the repayment schedule based on equivalent annual instalments.

Required Repayment Schedule

Year	Outstanding amount at the beginning	Equivalent annual instalment	Interest content (0.2305)	Capital content
1	₹1,000.0	₹324	₹197.5	₹126.5
2	873.5	324	168.3	155.7
3	717.8	324	132.5	191.5
4	526.3	324	88.3	235.7
5	290.6	324	34.0	290.6

Effective and Flat Rates of Interest

As shown above in the loan repayment/amortisation schedule, effective rate of interest (also called annual percentage rate, APR) is applied to the diminishing balances of the loan amount to determine the interest content of each instalment. When the rate of interest is applied to the original amount of the loan to determine the interest component, the interest rate is called as the **flat rate**. The computation of the flat rate of interest and the APR/effective rate of interest is illustrated below.

Example 2-A.9

(Flat Rate and APR) From the undermentioned facts, develop the repayment schedule for the three consumer financing schemes (A), (B) and (C) using the flat rate of interest. Also, compute the effective rate of interest (APR) using both long and short-cut approaches.

- Loan amount, ₹2,40,000
- Repayment period, 3 years
- Rate of interest (flat), 6 per cent
- Repayment pattern: Scheme (A), loan to be repaid in three equal instalments; Scheme (B), loan with interest to be repaid in three equated annual instalments; and Scheme (C), loan with interest to be repaid in three equal instalments.

Solution

Repayment Schedule for Scheme A

Year	Capital content	Interest content	Instalment amount	Loans outstanding after repayment
(1)	(2)	(3)	(4)	(5)
1	₹80,000	₹14,400	₹94,400	₹1,60,000
2	80,000	14,400	89,600	80,000
3	80,000	14,400	84,800	—

Repayment Schedule for Scheme B

Year	Instalment ^{@@} amount	Interest content	Capital content	Loans outstanding after repayment
(1)	(2)	(3)	(4)	(5)
1	₹89,787	₹14,400	₹75,387	₹1,64,613
2	89,787	9,877	79,910	84,703
3	89,787	5,082	84,705	—

^{@@}₹2,40,000 + 2.673 [i.e. PVIFA (6,3)] = ₹89,787

Repayment Schedule for Scheme C

Year	Instalment** amount	Interest content	Capital content	Loans outstanding after repayment
(1)	(2)	(3)	(4)	(5)
1	₹94,400	₹14,400	₹80,000	₹1,60,000
2	94,400	14,400	80,000	80,000
3	94,400	14,400	80,000	—

**Annual instalment = (Loan amount + Interest for 3 years) ÷ 3 = [₹2,40,000 + ₹43,200 (₹2,40,000 × 0.06 × 3)] ÷ 3 = ₹2,83,200 ÷ 3 = ₹94,400

Computation of APR/Effective Rate of Interest, i :

$$₹94,400 \times PVIFA(i, 3) = ₹2,40,000$$

or $PVIFA(i, 3) = ₹2,40,000 \div ₹94,400 = 2.542$

At $i = 0.08 = PVIFA = 2.577$ (Table A-4)

$i = 0.09 = PVIFA = 2.531$ (Table A-4)

By Interpolation, $i = 9$ per cent

Computation of APR, using short-cut approach:

$$i = 2F \left[\frac{n}{n+1} \right] \quad (2-A.8)$$

$$\text{or } i = \frac{2F}{\frac{n+1}{n} + F \left(\frac{n-3m+2}{3m} \right)} \quad (2-A.9)$$

where $i = \text{APR}$

$F = \text{flat rate}$

$n = \text{total number of repayments}$

$m = \text{number of repayments per unit of time}$

Substitution the values, the APR = 9.7 per cent.

SUMMARY

LO 2.1

Money has time value. A rupee today is more valuable than a rupee a year hence. A rupee a year hence has less value than a rupee today. Money has, thus, a future value and a present value. Although alternatives can be assessed by either compounding to find future value or discounting to find present value, financial managers rely primarily on present value techniques as they are at zero time ($t = 0$) when making decisions.

LO 2.2

Future value relies on compound interest to measure the value of future amounts. When interest is compounded, the initial principal/deposit in one period, along with the interest earned on it, becomes the beginning principal of the following period and so on. Interest can be compounded annually, semi-annually (half-yearly), quarterly, monthly and so on. The more frequently interest is compounded, the larger the future amount that would be accumulated and the higher the effective interest rate. The interest rate formula and the basic equation for the future value of a single amount are given below:

- (i) Basic formula of compounding: $A = P(1 + i)^n$
- (ii) Compounding more than once a year: $P[1 + i/n]^{mn} = A$
- (iii) Compounded sum of an annuity: $S_n = CVIFA \times A$

Present value represents an opposite of future value. The present value of a future amount is the amount of money today equivalent to the given future amount on the basis of a certain return on the current amount. The interest factor formula and the basic equation of the present value are given below:

(i) Basic formula: $A[1/(1+i)^n]$

(ii) Present value of a series of cash flows: $= \sum_{t=1}^N \frac{C_t}{(1+i)^t} = \sum_{t=1}^n C_t (IF_t)$

(iii) Present value of an annuity: $C \left[\sum_{t=1}^N \frac{1}{(1+i)^t} \right]$

The annual deposit to accumulate a given future sum can be found by solving the equation for the future value of an annuity for the annual payment. A loan can be amortised into equal payments by solving the equation for the present value of an equity for the annual payment. Interest or growth rates can be estimated by finding the unknown interest in the equation for the present value of either a single amount or an annuity.

The effective rate of discount (d) is used in computing the present values of certain types of annuities.

Symbolically, $d = \frac{i}{1+i}$

The coupon rate of interest is called nominal rate of interest. With more frequent compounding, effective rate of interest is different from the nominal rate of interest. Symbolically,

$$i = \left[1 + \frac{i^{(p)}}{p} \right]^p - 1 \quad \text{or} \quad i = [(1+i)^{1/p} - 1]p$$

A typical lease/hire-purchase contract calls for equated (level) payments to be made either in advance or in arrears at intervals less than one year. Such payments are annuity payable PTHY, where P denotes the frequency of payment such as half-yearly, quarterly and so on. Symbolically, the present value of a level annuity payable PTHLY in arrear and advance are:

$$PVIFA_p(i, n) = \frac{i}{i^{(p)}} PVIFA(i, n)$$

$$PVIFA_p(i, n) = \frac{i}{d^{(p)}} PVIF(i, n)$$

If the rate of interest is applied to the original amount of the loan, to determine the interest of each loan, we refer to the rate as the flat rate. When the rate of interest is applied to the diminishing balances of the loan amount to determine the interest content of each instalment, it is called the effective rate of interest. Symbolically, effective rate of interest/annual percentage rate (APR) is given by the following equation:

$$i = 2F \left[\frac{n}{n+1} \right] \quad \text{or} \quad i = \frac{2F}{\frac{n+1}{n} + F \left(\frac{n-3m+2}{3m} \right)}$$

SOLVED PROBLEMS

P.2.1 An investor deposits ₹100 in a bank account for 5 years at 8 per cent interest. Find out the amount which he will have in his account if interest is compounded (a) annually (b) semi-annually (6-monthly), (c) quarterly and (d) continuously.

LO 2.2 LOD E

Solution $F_n = P(1 + i/m)^{n \times m} = P \times \text{FVIF}_{i/m, n \times m}$

(a) Annual compounding ($m = 1$): $F_5 = ₹100(1 + 0.08/1)^5 = ₹100(1.4693) = ₹146.93$

(b) Semi-annual compounding ($m = 2$): $F_5 = ₹100(1 + 0.08/2)^{5 \times 2} = P \times \text{FVIF}_{4, 10} = ₹100(1.4802) = ₹148.02$

(c) Quarterly compounding ($m = 4$): $F_5 = ₹100(1 + 0.08/4)^{5 \times 4} = P \times \text{FVIF}_{2, 20} = ₹100(1.4859) = ₹148.59$

(d) Continuous compounding: $F_n = P \times e^{i \times n} = F_5 = ₹100(2.71828)^{0.08 \times 5} = ₹100(2.71828)^{0.4} = ₹100(1.4918) = ₹149.18$

P.2.2 If the discount/required rate is 10 per cent, compute the present value of the cashflow streams detailed below: (a) ₹100 at the end of year 1; (b) ₹100 at the end of year 4; (c) ₹100 at the end of (i) year 3 and (ii) year 5 and (d) ₹100 for the next 10 years (for years 1 through 10).

LO 2.3 LOD M

Solution $P = F_n [1/(1+i)^n] = F_n \times \text{PVIF}_{i, n}$

(a) ₹100 at the end of year 1 = $₹100[1/(1.10)^1] = ₹100 \times \text{PVIF}_{10, 1} = ₹100 \times 0.9091 = ₹90.91$

(b) ₹100 at the end of year 4 = $₹100[1/(1.10)^4] = ₹100 \times \text{PVIF}_{10, 4} = ₹100 \times 0.683 = ₹68.3$

(c) ₹100 at the end of (i) year 3 and (ii) year 5 = $₹100[1/(1.10)^3] + ₹100[1/(1.10)^5] = (₹100 \times \text{PVIF}_{10, 3}) + (₹100 \times \text{PVIF}_{10, 5}) = (₹100 \times 0.7513) + (₹100 \times 0.6209) = ₹75.13 + ₹62.09 = ₹137.22$

(d) ₹100 for the next 10 years (annuity)

$$P_n = A \times \text{PVIFA}_{i, n} = ₹100 \times \text{PVIFA}_{10, 10} = ₹100(6.1446) = ₹614.46$$

P.2.3 Compute the present/discounted value of the following future cash inflows, assuming a required rate of 10 per cent: (a) ₹100 a year for years 5 through 10 and (b) ₹100 a year for years 1 through 3, nil in years 4 through 5 and ₹100 a year for years 6 through 10.

LO 2.3 LOD M

Solution

(a) $P = ₹100(\text{PVIFA}_{10, 10}) - ₹100(\text{PVIFA}_{10, 4}) = ₹100(6.1446) - ₹100(3.1699) = ₹614.46 - ₹316.99 = ₹297.47$

(b) $P = ₹100(\text{PVIFA}_{10, 3}) + [₹100(\text{PVIFA}_{10, 10}) - ₹100(\text{PVIFA}_{10, 5})] = (₹100 \times 2.4869) + [(₹100 \times 6.1446) - (₹100 \times 3.7908)] = ₹248.69 + (₹614.46 - ₹379.08) = ₹248.69 + ₹235.38 = ₹484.07$

P.2.4 An executive is about to retire at the age of 60. His employer has offered him two post-retirement options: (a) ₹20,00,000 lump sum, (b) ₹2,50,000 for 10 years. Assuming 10 per cent interest, which is a better option?

LO 2.4 LOD M

Solution $P_n = A \times \text{PVIFA}_{i, n} = P_{10} = ₹2,50,000(\text{PVIFA}_{10, 10}) = ₹2,50,000(6.1446) = ₹15,36,150$. Since the lumpsum of ₹20,00,000 is worth more now, the executive should opt for it.

P.2.5 Compute the present value of a perpetuity of ₹100 year if the discount rate is 10 per cent.

LO 2.3 LOD E

Solution Present value of a perpetuity = $A/i = ₹100/0.10 = ₹1,000$.

P.2.6 ABC Ltd has ₹10 crore bonds outstanding. Bank deposits earn 10 per cent per annum. The bonds will be redeemed after 15 years for which purpose ABC Ltd wishes to create a sinking fund. How much amount should be deposited to the sinking fund each year so that ABC Ltd would have in the sinking fund ₹10 crore to retire its entire issue of bonds?

LO 2.4 LOD M

Solution $A = S_n/\text{FVIFA}_{i, n} = S_{15} = ₹10 \text{ crore}/\text{FVIFA}_{10, 15} = ₹10 \text{ crore}/31.772 = ₹3,14,742.54$.

P.2.7 ABC Ltd has borrowed ₹30,00,000 from Canbank Home Finance Ltd to finance the purchase of a house for 15 years. The rate of interest on such loans is 24 per cent per annum. Compute the amount of annual payment/instalment.

LO 2.4 LOD M

Solution $P_n = A \times PVIFA_{i, n}$
 $A = P_n / PVIFA_{i, n} = P_{15} / PVIFA_{24, 15} = ₹30,00,000 / 4.0013 = ₹7,49,756.32.$

P.2.8 XYZ Ltd has borrowed ₹5,00,000 to be repaid in five equal annual payments (interest and principal both). The rate of interest is 16 per cent. Compute the amount of each payment.

LO 2.4 LOD M

Solution $A = P_n / PVIFA_{i, n} = P_5 / PVIFA_{16, 5} = ₹5,00,000 / 3.2743 = ₹1,52,704.39$

P.2.9 Assume the rate of interest is 12 per cent. Compute the annual percentage/effective rate (AP/ER) if interest is paid (a) annually, (b) semi-annually, (c) quarterly and (d) monthly. What are the implications of more frequent payments of interest?

LO 2.4 LOD D

Solution $AP/ER = (1 + r/m)^m - 1.0$

(a) Interest paid at the end of the year ($m = 1$):

$$AP/ER = (1 + 0.12/1)^1 - 1.0 = 1.12 - 1.0 = 0.12 = 12 \text{ per cent}$$

(b) Interest paid at the end of each 6-month period ($m = 2$):

$$AP/ER = (1 + 0.12/2)^2 - 1.0 = (1.06)^2 - 1.0 = 1.1236 - 1.0 = 0.1236 = 12.36 \text{ per cent.}$$

(c) Interest paid at the end of each quarter ($m = 4$):

$$AP/ER = (1 + 0.12/4)^4 - 1.0 = (1.03)^4 - 1.0 = 1.1255 - 1.0 = 0.1255 = 12.55 \text{ per cent.}$$

(d) Interest paid at the end of each month ($m = 12$):

$$AP/ER = (1 + 0.12/12)^{12} - 1.0 = (1.01)^{12} - 1.0 = 1.1268 - 1.0 = 0.1268 = 12.68 \text{ per cent.}$$

Implications: More frequent payments increase the effective annual cost (AP/ER) paid by the borrower-company.

P.2.10 The earnings of Fairgrowth Ltd were ₹3 per share in year 1. They increased over a 10-year period to ₹4.02. Compute the rate of growth or compound annual rate of growth of the earnings per share.

LO 2.4 LOD D

Solution

$$F_n = P \times FVIF_{i, n}$$

$$FVIF_{i, n} = F_n / P$$

$$FVIF_{i, 10} = ₹4.02 / ₹3 = 1.340$$

According to Table-1 (Appendix), an FVIF of 1.340 at 10 years is at 3 per cent interest. The compound annual rate of growth in earnings per share is, therefore, 3 per cent.

P.2.11 Mr X has ₹1,00,000 to deposit in a bank account for 3 years. Assuming (i) annual compounding, (ii) semi-annual compounding and (iii) quarterly compounding at a stated annual interest rate of 4 per cent, compute (a) the amount he would have at the end of the third year, leaving all interest paid on deposits in the bank, (b) the effective rate of interest he would earn on each alternative, and (c) which plan should he choose?

LO 2.4 LOD D

Solution

(a) (i) Compound/future value (FV_3) = ₹1,00,000 × FVIFA (4,3)
 $= ₹1,00,000 \times 1.125 = ₹1,12,500$

(a) (ii) $FV_3 = ₹1,00,000 \times FVIFA (4/2, 2 \times 3) = ₹1,00,000 \times FVIFA (2,6)$
 $= ₹1,00,000 \times 1.126 = ₹1,12,600$

(a) (iii) $FV_3 = ₹1,00,000 \times FVIFA (4/4, 3) = ₹1,00,000 \times FVIFA (1,12)$
 $= ₹1,00,000 \times 1.127 = ₹1,12,700$

(b) (i) Effective rate of interest = $(1 + 4\%)^1 - 1 = (1.04)^1 - 1$
 $= 1.04 - 1 = 0.04 = 4 \text{ per cent}$

(b) (ii) = $(1 + 4\%/2)^2 - 1 = (1.02)^2 - 1 = 1.0404 - 1$
 $= 0.0404 = 4.04 \text{ per cent}$

- (b) $(iii) = (1 + 4\%/4)^4 - 1 = (1 + 0.01)^4 - 1 = 1.0406 - 1 = 0.0406 = 4.06$ per cent.
 (c) Mr. X should choose alternative (iii). The quarterly compounding of interest has resulted in the highest future value as a result of the corresponding highest effective rate of interest.

REVIEW QUESTIONS

LOD: Easy

RQ.2.1 (a) Indicate whether the following statements are True or False.

[LO 2.2, 3, 4]

- (i) Time value of money signifies that the value of a unit of money remains unchanged during different time periods.
- (ii) Time value of a unit of money is different over different periods on account of the reinvestment opportunities with the firms.
- (iii) Cash flows accruing to the firms at different time periods are directly comparable.
- (iv) Either compounding or discounting technique can be used, to make heterogeneous cash flows comparable.
- (v) Effective and nominal rate of interest remain the same irrespective of the frequency of compounding.
- (vi) Effective rate of interest is positively correlated with frequency of compounding.
- (vii) To arrive at the present value of cash flows, discounting is done at the rate which represents opportunity cost of funds.
- (viii) Present value tables for annuity can be directly applied to mixed stream of cash flows.
- (ix) To facilitate comparison of cash flows that are occurring at different time periods, the technique of either compounding all cash flows to the terminal year or discounting all cash flows to the time zero period can be adopted.

**[Answers: (i) False (ii) True (iii) False (iv) True (v) False
 (vi) True (vii) True (viii) False (ix) True]**

(b) In the following multiple choice questions select the correct answers.

- (i) Time value of money explains that
 - (a) a unit of money received today is worth more than a unit received in future
 - (b) a unit of money received today is worth less than a unit received in future
 - (c) a unit of money received today and at some other time in future is equal
 - (d) none of them.
- (ii) Time value of money facilitates comparison of cash flows occurring at different time periods by
 - (a) compounding all cash flows to a common point of time
 - (b) discounting all cash flows to a common point of time
 - (c) using either (a) or (b)
 - (d) Neither (a) nor (b).
- (iii) If the nominal rate of interest is 10 per cent per annum and frequency of compounding is 4 i.e. quarterly compounding, the effective rate of interest will be

(a) 10.25% per annum	(b) 10.38% per annum
(c) 10% per annum	(d) none of them.
- (iv) Relationship between annual effective rate of interest and annual nominal rate of interest is, if frequency of compounding is more than 1,

(a) Effective Rate < Nominal rate	(b) Effective Rate > Nominal rate
(c) Effective Rate = Nominal rate	(d) None of these.
- (v) If annual effective rate of interest is 10.25 % per annum and nominal rate of return is 10 per cent per annum what is the frequency of compounding

(a) 1	(b) 3	(c) 2	(d) None of these.
-------	-------	-------	--------------------

- (vi) A student takes a loan of ₹50,000 from SBI. The rate of interest being charged by SBI is 10 per cent per annum. What would be the amount of equal annual instalment if he wishes to pay it back in five instalments and first instalment he will pay at the end of year 5?
 (a) ₹11,000 (b) ₹19,310 (c) ₹15,000 (d) None of these.
- (vii) How much amount should an investor invest now in order to receive five annuities starting from the end of this year of ₹10,000 if the rate of interest offered by bank is 10% per annum?
 (a) ₹40,000 (b) ₹45,000 (c) ₹37,910 (d) none.
- (viii) If, in case of question (vii), he wishes to receive ₹10,000 forever, investment amount required is
 (a) ₹75000 (b) cannot be determined (c) ₹1,00,000 (d) none.
- (ix) A company wants to retire a loan of ₹5,00,000, 10 years from today. What amount should it invest each year for 10 years if the funds can earn 8 per cent per annum. The first investment will be made at the beginning of this year.
 (a) ₹50,000 (b) ₹31,950 (c) ₹40,000 (d) None of these.

[Answers: (i) a (ii) c (iii) b (iv) b (v) c (vi) b (vii) c (viii) c and (ix) b]

- RQ.2.2 Briefly explain and illustrate the concept of 'time value of money'. [LO 2.1]
 RQ.2.3 What is the difference between the future value and present value? [LO 2.2]
 RQ.2.4 A person would need ₹100, 5 years from now. How much amount should he deposit each year in his bank account, if the yearly interest rate is 10 per cent? [LO 2.4]

LOD: Medium

- RQ.2.5 What is annuity? Explain how can future value of an annuity be determined? [LO 2.2]

CHAPTER

3

Risk and Return

LEARNING OBJECTIVES

LO 3.1	Understand the fundamentals of risk and return
LO 3.2	Describe procedure for assessing and measuring the risk of a single asset
LO 3.3	Review the procedure to assess and measure the risk-return of a portfolio
LO 3.4	Discuss the selection of the optimal portfolio based on the Markowitz model
LO 3.5	Explain the capital asset pricing model (CAPM) as a framework for basic risk-return trade-off
LO 3.6	Examine the factors having a bearing on extended CAPM
LO 3.7	Describe the arbitrage pricing theory (APT) as a model of security/asset pricing as an alternative to CAPM

INTRODUCTION

The two key determinants of share/security prices are expected risk and expected return. The financial managers must understand these concepts as they have a bearing on the share prices as well as the valuation of the firm. This Chapter presents a framework for an explicit and quantitative understanding of these concepts and the nature of relationship between them.

The return and risk related to a single security/asset are examined first. The portfolio risk and return is covered subsequently. The selection of optimum portfolio is also explained. The theories/models, namely, Capital Asset Pricing Model (CAPM), extended CAPM, and the Arbitrage Pricing Theory (APT) explaining the relationship between the expected return and risk are also examined in subsequent discussions. The major points are also summarised by way of recapitulation.

LO 3.1 RISK AND RETURN

Return is the actual income received plus any change in market price of an asset/investment.

The (rate of) **return** on an asset/investment for a given period, say a year, is the annual income received *plus* any change in market price, usually expressed as a per cent of the opening market price. Symbolically, the one-period actual (expected) return, R

$$R = \frac{D_t + (P_t - P_{t-1})}{P_{t-1}} \quad (3.1)$$

where D_t = annual income/cash dividend at the end of time period, t

P_t = security price at time period, t (closing/ending security price)

P_{t-1} = security price at time period, $t - 1$ (opening/beginning security price)

Example 3.1

Risk is the variability of actual return from the expected return associated with a given asset.

If the price of a share on April 1 (current year) is ₹25, the annual dividend received at the end of the year is ₹1 and the year-end price on March 31 is ₹30, the rate of return = $[\frac{₹1 + (₹30 - ₹25)}{₹25}] = 0.24 = 24$ per cent. The rate of return of 24 per cent has two components:

(i) **Current yield**, i.e. annual income ÷ beginning price = $\frac{₹1}{₹25} = 0.04$ or 4 per cent and (ii)

Capital gains/loss = (ending price - beginning price) ÷ beginning price = $(₹30 - ₹25) / 25 = 0.20 = 20$ per cent.

The variability of the actual return from the expected returns associated with a given asset/investment is defined as **risk**. The greater the variability, the riskier the security (e.g. shares) is said to be. The more certain the return from an asset (e.g. T-bills), the less the variability and, therefore, the less the risk.

LO 3.2 RISK AND RETURN OF A SINGLE ASSET

Sensitivity analysis is a behavioural approach to assess risk using a number of possible return estimates to obtain a sense of the variability among outcomes.

The risk associated with a single asset is assessed from both a **behavioural** and a **quantitative/statistical point** of view. The behavioural view of risk can be obtained by using (i) sensitivity analysis and (ii) probability (distribution). The statistical measures of risk of an asset/security are (1) standard deviation and (2) coefficient of variation.

Sensitivity Analysis

Sensitivity Analysis takes into account a number of possible outcomes/returns estimates while evaluating an asset/assessing risk. In order to have a sense of the variability among return estimates, a possible approach is to estimate the worst (pessimistic), the expected (most likely) and the best (optimistic) return associated with the asset. Alternatively, the level of outcomes may be related to the state of the economy, namely, recession, normal and boom conditions. The difference between the optimistic and the pessimistic outcomes is the **range** which, according to the sensitivity analysis, is the basic measure of risk. The greater the range, the more variability (risk) the asset is said to have. Consider the facts in Table 3.1.

Range is a measure of risk which is found by subtracting the pessimistic (worst) outcome from the optimistic (best) outcome.

TABLE 3.1 Sensitivity Analysis (Amount in ₹ crore)

Particulars	Asset X	Asset Y
Initial outlay ($t = 0$)	50	50
Annual return (per cent):		
Pessimistic	14	8
Most likely	16	16
Optimistic	18	24
Range (optimistic-pessimistic)	4	16

On the basis of the range of annual returns, asset Y is more risky.

The sensitivity analysis provides more than one estimate of return (range) to assess the risk involved, but it is a crude/rough basis of risk assessment.

Probability Distribution

The risk associated with an asset can be assessed more accurately by the use of **probability distribution** than sensitivity analysis. The probability of an event represents the likelihood/percentage chance of its occurrence. For instance, if the expectation is that a given outcome (return) will occur seven out of ten times, it can be said to have a seventy per cent (0.70) chance of happening; if it is certain to happen, the **probability** of happening is 100 per cent (1). An outcome which has a probability of zero will never occur.

- **Probability distribution**
- is a model that relates probabilities to the associated outcome.

Based on the probabilities assigned (probability distribution of) to the rate of return, the **expected value** of the return can be computed. The expected rate of return is the weighted average of all possible returns multiplied by their respective probabilities. Thus, probabilities of the various outcomes are used as weights. The expected return, \bar{R}

- **Probability**
- is the chance that a given outcome will occur.

$$= \sum_{i=1}^n R_i \times Pr_i \quad (3.2)$$

where R_i = return for the i th possible outcome

Pr_i = probability associated with its return

n = number of outcomes considered

The expected rate of return calculation using the returns for assets X and Y are presented in Table 3.2.

TABLE 3.2 Expected Rates of Returns (Probability Distribution)

Possible outcomes	Probability	Returns (per cent)	Expected returns [(2) × (3)]
(1)	(2)	(3)	(4)
Asset X			
Pessimistic (recession)	0.20	14	2.8
Most likely (normal)	0.60	16	9.6
Optimistic (boom)	0.20	18	3.6
	<u>1.00</u>		<u>16.0</u>

(Contd)

(Contd.)

Asset Y			
Pessimistic (recession)	0.20	8	1.6
Most likely (normal)	0.60	16	9.6
Optimistic (boom)	0.20	24	4.8
	<u>1.00</u>		<u>16.0</u>

Standard Deviation of Return

Standard deviation measures the dispersion around the expected value.

Risk refers to the dispersion of returns around an expected value. The most common statistical measure of risk of an asset is the **standard deviation** from the mean/expected value of return. It represents the square root of the average squared deviations of the individual returns from the **expected returns**. Symbolically, the standard deviation, σ

Expected value of a return is the most likely return on a given asset/security.

$$= \sqrt{\sum_{i=1}^n (R_i - \bar{R})^2 \times Pr_i} \quad (3.3)$$

Table 3.3 presents the calculation of the standard deviation for the return of asset X and asset Y.

TABLE 3.3 Standard Deviation of Returns

Asset X						
i	R_i	\bar{R}	$R_i - \bar{R}$	$(R_i - \bar{R})^2$	Pr_i	$(R_i - \bar{R})^2 \times Pr_i$
1	14%	16%	(-2)%	4%	0.20	0.80%
2	16	16	0	0	0.60	0
3	18	16	2	4	0.20	0.80
						<u>1.6</u>

$$\sigma_{r_x} = \sqrt{\sum_{i=1}^3 (R_i - \bar{R})^2 \times Pr_i} = \sqrt{1.6} = 1.26 \text{ per cent}$$

Asset Y						
1	8	16	(-8)	64	0.20	12.8
2	16	16	0	0	0.60	0
3	24	16	8	64	0.20	12.8
						<u>25.6</u>

$$\sigma_{r_y} = \sqrt{25.6} = 5.06 \text{ per cent}$$

The greater the standard deviation of returns, the greater the variability/dispersion of returns and the greater the risk of the asset/investment. However, standard deviation is an absolute measure of dispersion and does not consider variability of return in relation to the expected value. It may be misleading in comparing the risk surrounding alternative assets if they differ in size of expected returns.

Spreadsheet Solution 3.1

Alternatively, the calculation of risk can be carried out using Microsoft Excel (Spreadsheet). For the purpose, relevant data have been entered in the spreadsheet.

	A	B	C	D	E	F	G	H	I
1	Asset X								
2	i	Ri(%)	Pri	E(R)	$[Ri - E(R)]^2$				
3	1	14	0.2	16	4				
4	2	16	0.6	16	0				
5	3	18	0.2	16	4	1.6			
6	Asset Y								
7	i	Ri(%)	Pri	E(R)	$[Ri - E(R)]^2$				
8	1	08	0.2	16	64				
9	2	16	0.6	16	0				
10	3	24	0.2	16	64	25.6			
11									
12									

The data on returns for asset X has been entered in the cells B3 to B5. The associated probabilities have been entered in cells C3 to C5 and expected returns have been entered in cells D3 to D5. The squared deviation for the cell E3 has been calculated by using the formula $= (B3 - D3)^2$. The calculation has been extended to the other two cells D4 and D5 by copying/ dragging the formula to these cells. Finally, the variance has been calculated using the formula $= \text{SUMPRODUCT}(C3:C5, E3:E5)$ in cell F5. We can see that answer is the same as found in Table 3.3. The same steps have been repeated to get the variance for Asset Y.

Coefficient of Variation

Coefficient of Variation is a measure of *relative dispersion* (risk) or a measure of **risk per unit of expected return**. It converts standard deviation of expected values into relative values to enable comparison of risks associated with assets having different expected values. The **coefficient of variation (CV)** is computed by dividing the standard deviation, σ_r , for an asset by its expected value, \bar{R} . Symbolically,

$$CV = \frac{\sigma_r}{\bar{R}} \tag{3.4}$$

- Coefficient of variation
- is a measure of relative dispersion
- used in comparing the risk of assets
- with differing expected returns.

The coefficient of variations for assets X and Y are respectively, 0.079 (1.26% + 16%) and 0.316 (5.06% + 16%).

The larger the CV, the larger the relative risk of the asset. As a rule, the use of the coefficient of variation for comparing asset risk is the best since it considers the relative size (expected value) of assets.

LO 3.3 RISK AND RETURN OF PORTFOLIO

A **portfolio** means a combination of two or more securities (assets). A large number of portfolios can be formed from a given set of assets. Each portfolio has risk-return characteristics of its own. Portfolio theory, originally developed by Harry Markowitz, shows that portfolio risk, unlike portfolio return, is more than a simple aggregation of the risks of individual assets. This depends on the interplay between the returns on assets comprising the portfolio. As investors construct a portfolio of investment rather than invest in a single asset, this Section extends the analysis of risk and return associated with portfolio investments.

Portfolio is a collection/combination/group of assets/securities.

Portfolio Expected Return

The expected rate of return on a portfolio is the weighted average of the expected rates of return on assets comprising the portfolio. The weights, which add up to 1, reflect the fraction of total portfolio invested in each asset. Thus, there are two determinants of portfolio return: expected rate of return on each asset and the relative share of each asset in the portfolio. Symbolically, the expected return for a n-asset portfolio is defined by Equation 3.5.

$$E(r_p) = \sum w_i E(r_i) \tag{3.5}$$

where $E(r_p)$ = Expected return from portfolio
 w_i = Proportion invested in asset i
 $E(r_i)$ = Expected return for asset i
 n = Number of assets in portfolio

Example 3.2

Suppose the expected return on two assets, L (low-risk low-return) and H (high-risk high-return), are 12 and 16 per cents respectively. If the corresponding weights are 0.65 and 0.35, the expected portfolio return is = $[0.65 \times 0.12 + 0.35 \times 0.16] = 0.134$ or 13.4 per cent.

Portfolio Risk (Two-Asset Portfolio)

Total risk is measured in terms of variance (σ^2 , pronounced sigma square) or standard deviation (σ , pronounced sigma) of returns. Unlike portfolio expected return, portfolio variance (or standard deviation) is *not* the weighted average of variance (or standard deviation) of returns on individual assets (securities) in the portfolio. The overall risk of the portfolio includes the interactive risk of an asset relative to the others, measured by the covariance of returns. The covariance, in turn, depends on the **correlation** between returns on assets in the portfolio. The total risk of a portfolio made up of two assets is defined by the Equation 3.6.

Correlation is a statistical measure of the relationship between series of numbers representing data of any kind.

$$\sigma_p^2 = w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2 + 2w_1 w_2 (\sigma_{12}) \tag{3.6}$$

Alternatively,

$$\sigma_p^2 = (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 + 2w_1 w_2 (\rho_{12} \sigma_1 \sigma_2) \tag{3.7}$$

where σ_p^2 = Var (r_p) or variance of returns of the portfolio
 w_1 = Fraction of total portfolio invested in asset 1
 w_2 = Fraction of total portfolio invested in asset 2
 σ_1^2 = Variance of asset 1
 σ_1 = Standard deviation of asset 1

σ_2^2 = Variance of asset 2

σ_2 = Standard deviation of asset 2

σ_{12} = Covariance between returns of two assets (= $\rho_{12} \sigma_1 \sigma_2$)

ρ_{12} = Coefficient of correlation (pronounced *Rho*) between the returns of two assets.

Example 3.3

Let us assume that standard deviations of assets *L* and *H*, of our Example 3.2 are 16 and 20 per cents respectively. If the coefficient of correlation between their returns is 0.6 and the two assets are combined in the ratio of 3:1, the expected return of the portfolio is determined as follows:

$$\begin{aligned} E(r_{\text{portfolio}}) &= w_L E(r_L) + w_H E(r_H) \\ &= (0.75 \times 12\%) + (0.25 \times 16\%) = 9.0\% + 4.0\% = 13 \text{ per cent} \end{aligned}$$

The variance of the portfolio is given by:

$$\begin{aligned} \sigma_p^2 &= (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 + 2 w_1 w_2 (\rho_{12} \sigma_1 \sigma_2) \\ &= (0.75 \times 16)^2 + (0.25 \times 20)^2 + 2 (0.75) (0.25) [(0.6) (16 \times 20)] \\ &= 144 + 25 + (0.375)(192) = 144 + 25 + 72 = 241 \end{aligned}$$

Thus, $\sigma_p = 15.52$ per cent $\left[\sqrt{241} \right]$

The above discussion shows that the portfolio risk depends on three factors: (a) Variance (or standard deviation) of each asset in the portfolio; (b) Relative importance or weight of each asset in the portfolio; (c) Interplay between returns on two assets or interactive risk of an asset relative to other, measured by the covariance of returns. Among these only weights can be controlled by the investor/portfolio manager. Thus, the primary task of a portfolio manager is to decide the proportion of each security in the portfolio.

The portfolio's expected rate of return and standard deviation (risk), for various combinations of assets *L* and *H*, with different degrees of correlation between their returns, are summarised in Table 3.4.

TABLE 3.4 Portfolio Return and Risk for Different Weights and Correlation Coefficients

(Figures are in per cent)

Weights		Portfolio return	Portfolio risk (s_p) when correlation coefficient is				
<i>L</i>	<i>H</i>	$E(R_p)$	$\rho = 1.0$	$\rho = 0.5$	$\rho = 0$	$\rho = -0.5$	$\rho = -1.0$
100	0	12.0	16.00	16.00	16.00	16.00	16.00
90	10	12.4	16.40	15.50	14.54	13.51	12.40
80	20	12.8	16.80	15.20	13.41	11.34	8.80
70	30	13.2	17.20	15.12	12.71	9.71	5.20
60	40	13.6	17.60	15.26	12.50	8.91	1.60
50	50	14.0	18.00	15.62	12.81	9.17	2.00
40	60	14.4	18.40	16.18	13.60	10.40	5.60
30	70	14.8	18.80	16.92	14.80	12.32	9.20
20	80	15.2	19.20	17.82	16.32	14.66	12.80
10	90	15.6	19.60	18.85	18.07	17.26	16.40
0	100	16.0	20.00	20.00	20.00	20.00	20.00

A perusal of the Table 3.4 leads to the following notable inferences:

- (i) Two assets/securities can be combined in such a way that the portfolio risk is less than the risk of individual assets comprising the portfolio. For example, portfolio standard deviation is 15.20 per cent when **correlation coefficient** (ρ) is 0.5 and *L* and *H* are combined in the ratio of 80:20. This is lower than the standard deviation of *L* (16 per cent) and *H* (20 per cent).

• **Correlation coefficient** is a measure of the degree of correlation between two series.

- (ii) For given weights, portfolio standard deviation declines as correlation coefficient moves from + 1.0 to - 1.0. For example, when L and H are combined in the ratio of 80:20, the range of portfolio standard deviation is 16.80 per cent for perfect positive correlation ($\rho = +1.0$) to 8.80 per cent for perfect negative correlation ($\rho = -1.0$).
- (iii) When returns have less than perfect positive correlation, some combinations are more efficient than others; they do not involve risk-return trade-off. For correlation coefficient 0.5, increase in the weight of H from 0 per cent to 30 per cent raises the expected return from 12 per cent to 13.2 per cent, but standard deviation (risk) declines from 16 per cent to 15.12 per cent.
- (iv) For given correlation coefficient, there is a **minimum variance** or **minimum risk portfolio**. The minimum variance portfolio has a standard deviation smaller than that of either of the individual component assets (securities). The optimal weights (w^*) that produce the minimum variance may be obtained from Equation (3.8) and Equation (3.9):

$$w_1^* = [\sigma_2^2 - (\rho_{12} \sigma_1 \sigma_2)] / [\sigma_1^2 + \sigma_2^2 - 2(\rho_{12} \sigma_1 \sigma_2)] \quad (3.8)$$

$$w_2^* = 1 - w_1^* \quad (3.9)$$

where w_1^* = Optimal weight of asset 1

w_2^* = Optimal weight of asset 2

σ_1^2 = Variance of asset 1

σ_2^2 = Variance of asset 2

$\rho_{12} \sigma_1 \sigma_2$ = Covariance of returns

ρ_{12} = Coefficient of correlation between the returns of two assets

Example 3.4

Determine optimal weights, at zero correlation, for the data provided in Example 3.3.

Solution

Optimal weights are:

$$w_L^* = [(20)^2 - (0)(16)(20)] / [(16)^2 + (20)^2 - 2(0)(16)(20)] \\ = (400) / (256 + 400) = (400) / (656) = 0.61 = 61 \text{ per cent}$$

$$w_H^* = 1 - 0.61 = 0.39 = 39 \text{ per cent}$$

The portfolio standard deviation with these weights is smaller than the standard deviations of assets included in the portfolio. This may be verified using Equation 3.7.

$$\sigma_p^2 = (0.61 \times 16)^2 + (0.39 \times 20)^2 + 2(0.61)(0.39)[(0)(16 \times 20)] \\ = 95.26 + 60.84 = 156.1$$

$$\sigma_p = 12.5 \text{ per cent}$$

Spreadsheet Solution 3.2

The calculation of portfolio return and risk for different portfolio weights and different levels of correlations can be performed using a spreadsheet as well (see **Spreadsheet on next page 3.9**).

The data on risk and return for the assets L and H has been entered in the cells B2 through C3. The weights for asset L have been entered in the cells A5 to A15. The weight for the asset H in cell B5 has been calculated using the formula =100-A5; the formula has been copied to the cells B6 to B15 for calculating the rest of the weights. The portfolio return for the first combination of weights has been calculated using the formula =A5*B\$2+B5*B\$3. The formula has been copied to cells C6 through C15 to determine returns for the rest of the combinations of the two assets. Finally, the portfolio risks have been calculated. The different levels of association between the two assets have been entered in cells D4 to H4. To start with, the portfolio risk for the first combination of weights and $\rho = 1.0$ has been determined using the formula =SQRT(((\$A5*\$C\$2)^2

+\$B5*\$C\$3)^2)+2*\$A5*\$B5*\$C\$2*\$C\$3*\$D\$4). For calculating the portfolio risks for the other combinations the formula has been copied to the rest of the cells.

Portfolio Risk and Correlation

The effect of interaction (covariance and correlation) between returns on assets and portfolio risk is at the heart of modern portfolio theory. The degree and direction of correlation between asset returns have far-reaching effects on the reduction of portfolio risk through diversification. The correlation coefficient takes values between positive unity (perfect positive correlation) and negative unity (perfect negative correlation). The more negative (or less positive) is the correlation between asset returns, the greater is the risk-reducing benefits of diversification. Thus, for better understanding of the effect of correlation between asset returns on portfolio risk, we shall examine three special cases: (i) perfect positive correlation, (ii) perfect negative correlation and (iii) zero correlation.

Perfect Positive Correlation ($\rho = +1.0$) In this case, portfolio standard deviation is the weighted average of the standard deviation of returns on individual assets. Portfolio variance is given by the Equation 3.10.

$$\sigma_p^2 = (w_1 \sigma_1 + w_2 \sigma_2)^2 \quad (3.10)$$

Thus, standard deviation becomes:

$$\sigma_p = w_1 \sigma_1 + w_2 \sigma_2 \quad (3.11)$$

Portfolio standard deviation when L ($\sigma = 16$) and H ($\sigma = 20$) are combined in equal proportions is:

$$\sigma_p = (0.5) (16) + (0.5) (20) = 8 + 10 = 18 \text{ per cent}$$

Perfect positive correlation between asset returns yields a direct and linear relationship between risk and return of portfolio (Figure 3.1). This implies a risk-return trade-off. As the proportion of high return and high risk asset is increased, higher return on portfolio comes with higher risk. For instance, for every 1 per cent increase in return, portfolio risk also goes up by 1 per cent (Table 3.4).

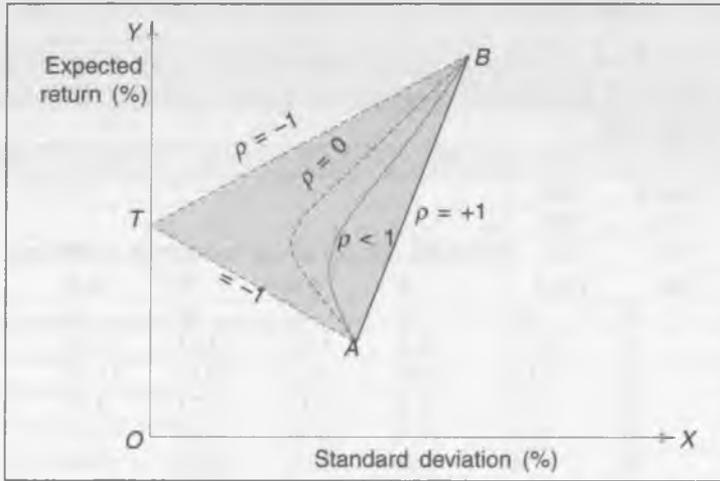

FIGURE 3.1 Portfolio Opportunities Set for Different Degrees of Correlation

Thus, diversification *per se* does not lead to reduction of risk for given level of return. Besides, diversification does not lower the portfolio risk below the risk of individual assets comprising the portfolio. For example, if the assets comprising the portfolio have equal risk, say, standard deviation of 10 per cent, the portfolio standard deviation is also 10 per cent ($= w_1 \times 10 + w_2 \times 10$; where $w_1 + w_2 = 1$).

Perfect negative correlation describes two negatively correlated series that have a correlation coefficient of -1.

Perfect Negative Correlation ($\sigma = -1.0$) In this case, portfolio standard deviation is the difference (non-negative value) caused by the standard deviation of returns on individual assets weighted by their respective shares in the portfolio. Portfolio variance is given by the Equation (3.12):

$$\sigma_p^2 = (w_1 \sigma_1 - w_2 \sigma_2)^2 \tag{3.12}$$

Thus, standard deviation becomes:

$$\sigma_p = w_1 \sigma_1 - w_2 \sigma_2 \tag{3.13}$$

This equation shows that when the correlation coefficient between asset returns is negative unity, it is possible to combine them in a manner that will eliminate all risk. The portfolio contains two risky assets, but the portfolio risk (standard deviation) can be reduced to zero. The weights for such a minimum variance portfolio can be directly obtained from Equation (3.14):

$$w^*_1 = \sigma_2 / (\sigma_1 + \sigma_2) \tag{3.14}$$

The calculation of optimal weights, for **perfect negative correlation** in Example 3.3, is illustrated below.

$$\begin{aligned} w^*_L &= [(20)^2 - (-1.0) (16) (20)] / [(16)^2_1 + (20)^2 - 2 (-1.0) (16) (20)] \\ &= (400 + 320) / (256 + 400 + 640) = (720) / (1296) = 0.5556 \\ &= 55.56 \text{ per cent} \\ w^*_H &= 1 - 0.5556 = 0.4444 = 44.44 \text{ per cent} \end{aligned}$$

The portfolio variance and, hence, standard deviation with these weights are zero. This may be verified using Equation 3.4.

$$\begin{aligned}\sigma_p^2 &= (0.5556 \times 16)^2 + (0.4444 \times 20)^2 + 2(0.5556)(0.4444)[(-1.0)(16 \times 20)] \\ &= 79.02 + 79.00 + (0.4938)(-320) = 158.02 - 158.02 = 0\end{aligned}$$

When two assets with perfect negative correlation between their returns are combined in different proportions, the relationship between risk and return of these portfolios forms a V-shaped image with its tip resting on the axis of return (Figure 3.1). The clockwise movement of the risk-return relationship along this image implies that with gradual increase in the weight of an asset with high-risk and high-return, and with simultaneous decrease in the overall risk, the expected return from the portfolio increases. The process continues till the risk is completely eliminated (point T). After that, higher expected returns, with increase in the weight of the riskier asset, come with higher portfolio risk only.

When the risk-return relationship for various combinations of two assets under the assumption of perfect positive correlation is combined with the corresponding relationship for perfect negative correlation, a triangle ATB is formed (Figure 3.1). Points A and B, which are common to the two cases, represent pure or undiversified portfolio. Since the correlation coefficient takes values between positive unity to negative unity, this triangle specifies the limits for diversification. All portfolios represented by the three line segments are feasible but some are more efficient than others. The risk-return relationship for all other values of correlation coefficient will lie in this space only.

Zero Correlation ($\rho = 0$) When the returns on two assets are uncorrelated, their correlation and, hence, covariance terms become zero. In this case, portfolio variance is the sum of the square of standard deviation of each asset weighted by its proportion in the portfolio. Thus,

$$\sigma_p^2 = w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2 \quad (3.15)$$

Alternatively,

$$\sigma_p^2 = (w_1 \sigma_1)^2 + (w_2 \sigma_2)^2 \quad (3.16)$$

Thus,

$$\sigma_p = (w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2)^{1/2} \quad (3.17)$$

We extend Example 3.3 and assume that assets *L* ($\sigma = 16$) and *H* ($\sigma = 20$) are combined in equal parts. The portfolio standard deviation in this case is:

$$\begin{aligned}\sigma_p &= [(0.5 \times 16)^2 + (0.5 \times 20)^2]^{1/2} \\ &= (64 + 100)^{1/2} = 12.81 \text{ per cent}\end{aligned}$$

Again, diversification has helped in reducing the risk. The risk of the portfolio is less than the risk of either of the two assets in the portfolio.

In brief, the risk of an asset in the portfolio is the contribution it makes to overall risk. The true risk of an asset may be judged at the level of a portfolio only. A highly risky asset may act as portfolio risk stabiliser when returns on it bear low or negative correlation with returns on other assets in the portfolio.

Limit of Diversification Gains

We have seen that when two assets with less than perfectly correlated returns are combined in a portfolio, the variability of return can be reduced without compromising on the level of return. However, investors invariably hold more than two assets. How does the addition of the third asset to the portfolio affect the portfolio risk (standard deviation)? How far can diversification gains be achieved through successive addition of more assets to the portfolio? Is it possible to reduce

• **Zero correlation**
• describes two
• series that lack any
• relationship and
• have correlation
• coefficient close to
• zero.

portfolio risk to zero level just by increasing the number of assets in the portfolio? The answer to these questions depends on the nature of diversification—naïve versus Markowitz.

Naïve Diversification **Naïve diversification** means a portfolio consisting of stocks chosen at random. This is the familiar 'do not put all your eggs in one basket' approach. Intuitively, as the number of stocks in the portfolio increases, individual fluctuations in asset returns are cancelled out. Thus, the variance of returns on a portfolio should vary inversely with the number of securities in the portfolio. However, it is not possible to reduce portfolio risk to zero by increasing the number of assets in the portfolio. Equation 3.18 shows that when there are just two securities there are an equal number of variance and covariance terms. As the number of securities increases, the number of covariance terms increases much faster. In a portfolio of N securities, there are N variance terms, but $N^2 - N$ covariance terms. If the securities in the portfolio have equal weights, the portfolio variance is given by Equation 3.18.

Naïve diversification means a portfolio consisting of stock chosen at random.

$$\text{Portfolio variance} = 1/N \times \text{average variance} + (1 - 1/N) \text{ average covariance} \quad (3.18)$$

As N increases, the portfolio variance steadily approaches to average covariance. This is the **limit**—the level of systematic risk—below which portfolio risk cannot be reduced through naïve diversification. **Systematic risk** refers to the overall market risk that affects all securities and cannot be diversified away. Empirical studies have shown that this limit is reached at a relatively low level of diversification; say 10 to 15 securities can eliminate most of the **non-systematic risk** of the portfolio.¹ Non-systematic risk is firm or specific and can be avoided by diversification.

Systematic risk implies the overall market risk that affects all securities and cannot be diversified away.

Markowitz Diversification In Markowitz diversification, the emphasis shifts from the number of securities to the covariance among them. In a portfolio of assets/securities that have strong negative covariance, it is possible to reduce the portfolio risk below the level of systematic risk. In fact, it can completely eliminate the portfolio risk, that is, reduce it to zero level in a portfolio of only two assets with perfect negative correlation between their return. As most securities have positive covariance, an important conclusion emerging from Markowitz diversification is that with an increase in the number of securities in the portfolio, the portfolio risk approaches the level of

Non-systematic risk is firm specific and can be avoided by diversification.

systematic risk.

LO 3.4 PORTFOLIO SELECTION

The selection of the optimal portfolio based on the mean variance model developed by Harry Markowitz is discussed below. The model/procedure has two parts: (i) Technical—determination of the set of efficient portfolios from the available feasible set. (ii) Personal—choosing the best risk-return opportunity from the efficient set, which is consistent with the investor's attitude towards risk.

Depending upon the treatment of the technical part, there are two broad approaches to explain the portfolio theory, namely, one-step optimisation and two-step optimisation.

One-Step Optimisation This approach begins with the delimitation of efficient portfolios having one or more risky assets (securities) and culminates with the capital market line (CML). The CML is a straight line that represents the efficient portfolios that can be formed by combining a risky asset (portfolio of securities and/ or other assets) with risk-free lending (investment in risk-free asset) and borrowing opportunities.

Two-Step Optimisation This is also termed as the 'top-down' approach. It is more structured and preferred by institutional investors. This approach identifies three distinct stages in the selection of an optimal portfolio. The process of portfolio construction begins with the **capital allocation decision**, that is, apportionment of the total investible funds between a risk-free asset and the optimal portfolio of risky assets. The second stage, called the **asset allocation decision**, involves the construction of the optimal risky portfolio, referred to at the capital allocation decision stage. This consists of the distribution of the risky investment across broad asset classes—shares (stocks), debt instruments (bonds), real assets and so on. The final stage is the security selection decision, that is, choice of securities within each asset class.

It is called the two-step or **top-down optimisation** approach as the focus of the top management is on independent optimisation of risky portfolios, namely, the asset-class portfolios and security portfolios within each asset-class. Hence, the investment manager cannot benefit from low covariance between securities belonging to different asset classes. This deficiency is overcome by concentrating on covariance between various classes of assets. The weights of a risky portfolio vis-à-vis a risk-free asset, or various asset portfolios, are frequently adjusted to take advantage of forecasted changes in market conditions—an activity termed as the **market timing**.

The one-step optimisation is elaborated below.

Efficient Portfolios

As noted above, the first step or the 'technical' aspect of optimal portfolio selection is to determine the risk-return opportunities available to an investor. This is also referred to as the determination of the **feasible set of portfolios** or the **portfolio opportunity set** or the **minimum-variance portfolio opportunity set** (not to be confused with minimum-variance portfolio of two risky assets, as discussed earlier). Graphically, these are summarised by the minimum-variance frontier of risky assets (Figure 3.2). Each point along the minimum-variance frontier represents the lowest possible variance that can be attained for a given portfolio's expected return. The point to the extreme left on the minimum-variance frontier represents the **global minimum variance portfolio**. Similarly, the highest point represents the **global maximum return portfolio**. The line segment between the global minimum variance portfolio and global maximum return portfolio constitutes the efficient frontier. It represents efficient portfolios, that is, portfolios having maximum return at each level of risk (standard deviation). Efficient portfolios dominate all other portfolios and individual assets, which lie below the efficient frontier. By definition, dominant portfolios offer maximum return for the given level of risk or, conversely, the minimum risk for the selected rate of return.

It may be noted that the efficient frontier is convex towards the vertical axis (axis of expected return) as all assets have a correlation between positive unity and negative unity. It may be recalled from the discussion on portfolio diversification that assets with perfect positive correlation can only generate a linear combination of risk and return. The efficient frontier can never be concave to the vertical axis.

Delineation of the efficient frontier through the Markowitz portfolio analysis discussed above rests on four basic assumptions about asset selection behaviour of investors.²

- (a) The rate of return from an investment is the most important outcome. Investors conceptualise the possible rates of return from an investment as a probability distribution of rates of return either consciously or subconsciously.
- (b) Investors are averse to risks. They seek the highest level of return for a given risk class.
- (c) Investors estimate risk in terms of the variability of expected returns.
- (d) Investors base their decisions solely on two decision parameters—expected return and variance (or its square root standard deviation).

Investors who conform to the preceding assumptions are termed Markowitz diversifiers. They prefer efficient frontier portfolios.

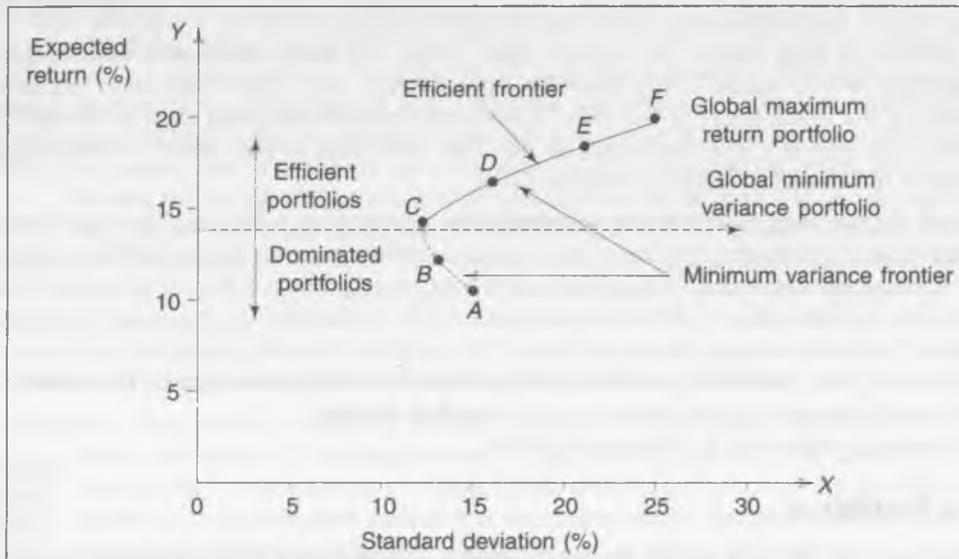

FIGURE 3.2 Minimum Variance Frontier of Risky Assets

Example 3.5

To illustrate the concepts of dominance and efficient frontier, let us take a simple example with two assets X (expected return 10 per cent, standard deviation 15 per cent) and Y (expected return 20 per cent, standard deviation 26 per cent). Low positive correlation between their returns permits diversification gains. A large number of portfolios can be formed by blending these assets in different proportions. Table 3.5 presents six such portfolios with their expected returns and risk. Figure 3.2 shows a graph of these portfolios in risk-return space. Line segment AF depicts the minimum-variance portfolio opportunity set or the minimum-variance frontier of risky assets. Points A and F represent pure holdings (100 per cent) of assets X and Y respectively. There is an inflection at point C . This is the point to the extreme left on the minimum-variance frontier. Thus, it represents the global minimum variance portfolio. Point F represents global maximum return portfolio. All portfolios along line segment CF are more efficient than portfolios along line segment AC . Thus, it is the efficient frontier. Portfolios A and B are inefficient or dominated portfolios.

TABLE 3.5 Dominated and Efficient Portfolios

Portfolio	Expected return (%)	Risk, σ (%)	Dominated or not	Efficient or not
A	10	15	Yes, by B, C	No
B	12	13	Yes, by C	No
C	13	12	No	Yes
D	15	16	No	Yes
E	18	22	No	Yes
F	20	26	No	Yes

Short sales
is the selling of a
borrowed asset/
security.

Efficient Frontier with Margined Short Sales A **short sale** occurs when a person sells a second person an asset (security) borrowed from a third person (broker). A short seller seeks to profit from the expected fall in price, which may or may not take

place. The **margin** here means the specified percentage of the market value of the transaction that the short seller (borrower of security), deposits with the lender (broker), effecting the transaction.

Edward A Dyl³ has pointed out that when margined short sales are feasible, it is possible to construct portfolios that offer the same expected return with lower variance, that is, the efficient frontier with margined short sales dominates the efficient frontier without such sales (Figure 3.3).

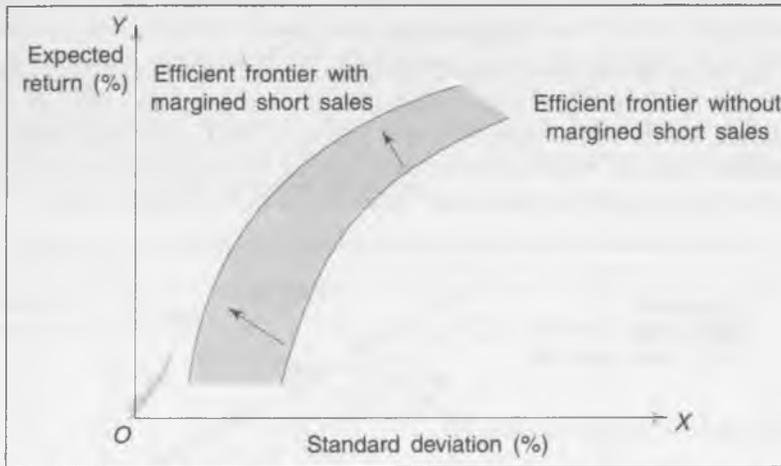

FIGURE 3.3 Effect of Margined Short Sales on Efficient Frontier

Efficient Frontier with One Risk-free Asset A **risk-free security** is one that has zero variance and, hence, standard deviation (square root of variance). James Tobin⁴ has pointed out that: (a) Portfolios made up of risky assets and one risk-free asset generate investment opportunities (portfolio opportunity set) with linear relationship between expected return and risk; (b) One such portfolio opportunity set will dominate the portfolios formed by mixing only risky assets (securities and/or portfolios of securities/other assets).

• Risk free
• security
• has zero variance.

To facilitate further discussion, let us denote a risk-free portfolio by F, a risky portfolio by M, and a complete portfolio formed by combining them as C. Further, w is the fraction of the overall portfolio invested in M, and the remaining ($= 1 - w$) in F. The expected return of the complete portfolio may be calculated by using Equation 3.19

$$E(r_c) = r_f + w[E(r_m) - r_f] \tag{3.19}$$

- where $E(r_c)$ = Expected rate of return on complete portfolio
- r_f = Risk-free rate of return
- w = Fraction of complete portfolio, C, invested in risky asset M
- $E(r_m)$ = Expected return for risky asset M
- $E(r_m) - r_f$ = Risk premium of the risky portfolio

The standard deviation of the complete portfolio is given by:

$$\sigma_c = w\sigma_m \tag{3.20}$$

- where σ_c = Standard deviation of complete portfolio C
- w = Fraction of complete portfolio, C, invested in risky asset M
- σ_m = Standard deviation of risky portfolio M

Solving the two equations for w and setting them as equal, we get the precise relationship between expected return and standard deviation:

$$E(r_c) = r_f + (\sigma_c/\sigma_m) [E(r_m) - r_f] \tag{3.21}$$

Rearranging the terms, we get

$$E(r_c) = r_f + \sigma_c \{ [E(r_m) - r_f] / \sigma_m \} \quad (3.22)$$

This is the equation of portfolio opportunity set or portfolio possibility lines with one risk-free asset. It is termed as the **capital allocation line** (CAL). The slope of the CAL shows reward to variability ratio, that is, increase in the expected return of the portfolio per unit of additional standard deviation (variability). Symbolically,

$$\text{Slope} = [E(r_c) - r_f] / \sigma_m \quad (3.23)$$

Capital allocation line shows the reward to variability ratio in terms of additional beta.

Figure 3.4 shows three capital allocation lines originating from point *F* and passing through *A*, *M* and *Z*. Point *F* represents a pure portfolio (100 per cent holding) of risk-free assets, with expected rate of return $E(r_f)$ and zero standard deviation of expected returns. Point *A* is the lower end of the minimum variance frontier of risky assets. Point *Z* is the top end of the minimum variance frontier of risky assets.

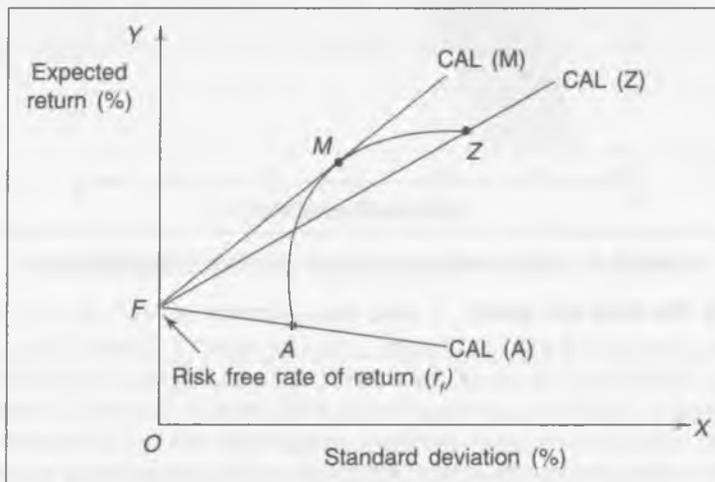

FIGURE 3.4 Portfolio Opportunities Set Risk-free Asset (CAL)

It is obvious from the figure that the highest CAL supported by the efficient frontier of the risky assets is tangential at point *M*. In other words, combinations of portfolio *M* with risk-free asset *F* offer the best risk-return trade-off. Point *M* represents the pure portfolio (100 per cent holding) of a risky asset, with expected return $E(r_m)$ and standard deviation σ_m . The investor can obtain any combination of risk and return on line segment *FM* by combining the risk-free asset *F* with a portfolio of risky assets, namely, *M*. Thus, portfolio *M* is the best risky portfolio to be combined with a risk-free asset. Portfolios represented by line segment *FM* are known as lending portfolios.

Efficient Frontier with Borrowing So far, portfolios have been constructed from owned funds. With owned funds, the efficient frontier of a portfolio with one risk-free asset ends at point *M*. Extending *FM* beyond *M* shows further opportunities for higher return. Are these opportunities real or hypothetical? What should an investor do to exploit these opportunities?

These are real opportunities, which the investor can avail of by borrowing funds at a risk-free rate, R_f and investing the same in the risky asset, *M*. This is known as creating a **leveraged, margined** or **borrowing portfolio**. With borrowings, the weight of the risky asset in the portfolio exceeds one. Negative weight for risk-free asset ensures that the sum of weights equals unity. Negative weight for risk-free assets shows that the investor has created a leveraged portfolio

by borrowing funds. For example, an investor has ₹2,00,000. He borrows an additional sum of ₹1,00,000 and invests it in the risky asset. The weight of the risky asset in the overall portfolio is 1.5 ($= ₹3,00,000/₹2,00,000$). The weight of the risk-free asset becomes -0.5 ($= 1.5 - 1.$), which means borrowings are 50 per cent of the owned funds.

It may be noted that the steepest CAL with borrowing and lending portfolios completely dominates the efficient frontier of risky assets (Figure 3.5). Thus, CAL tangential to the efficient frontier of risky assets constitutes the new efficient frontier with one risk-free asset. A very significant conclusion of the model is the **identical optimal risky portfolio (M)** for all investors, irrespective of their risk preference. The investor's risk aversion simply determines the exact point along the CAL. A risk-averse investor assigns greater weight to the risk-free asset in his portfolio than an investor with greater risk tolerance. However, both use identical sets of two assets—one risk-free and another risky. This result is called the **separation theorem**.⁵

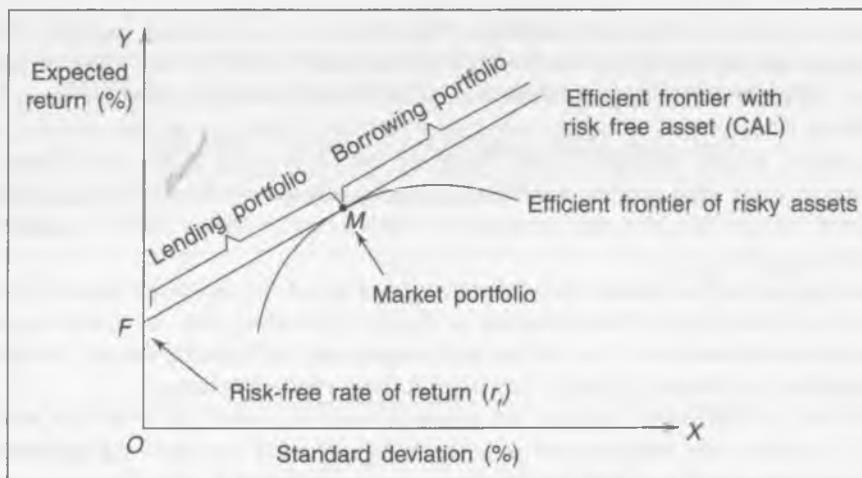

FIGURE 3.5 Efficient Frontier with One Risk-free Asset

Market Portfolio In the preceding discussion on the CAL, portfolio M was identified as the universally desirable portfolio of risky assets. It has the property of maximising return per unit of risk (standard deviation) as the steepest CAL passes through it. What is the nature of this portfolio M? How is it constructed?

Portfolio **M** refers to the **market portfolio**—a theoretical construct credited to Prof. Eugene Fama.⁶ When we add up the portfolios of all individual investors, borrowing and lending cancel out each other, and the value of an aggregate risky portfolio is the entire wealth of the economy. Thus, market portfolio is a huge portfolio that includes all traded assets in exactly the same proportion in which they are supplied in equilibrium. The return on the market portfolio is the weighted average of return on all capital assets.

For simplicity, a portfolio containing all securities is used as a proxy for the market portfolio. Since all investors hold the same risky portfolio, (a) no security from it will be left out and (b) the proportion of each security in the market portfolio equals the market value of the security divided by the total market value of all securities. If these conditions are not fulfilled, prices adjust until the value of the security becomes consistent with its proportion in portfolio M. The concept of the capital market line in the capital asset pricing model rests on the notion of the market portfolio.

Capital Market Line The capital market line (CML) is a capital allocation line (CAL) provided by one-month T-bills as a risk-free asset and a market-index portfolio like Dow Jones, Standard and Poor's and NYSE, as the risky asset.⁷ It is one of the two elements of the CAPM, the other being the security market line (SML). All investors end up somewhere along the CML. The CML indicates:

- (i) The locus of all efficient portfolios (those plotting along CML). Not all securities and portfolios lie along the CML.
- (ii) Risk-return relationship and measure of risk for efficient portfolios.
- (iii) The appropriate measure of risk for the portfolio is standard deviation of returns on portfolios.
- (iv) The relationship between risk (standard deviation) and expected return for efficient portfolios is linear.

Investor's Risk Preference

Rational investors invest in efficient portfolios. The choice of an optimal portfolio from efficient portfolios depends on the risk-return tradeoff for the investor. A risk-averse investor seeks risk-free opportunities or considers risky opportunities with positive risk premium (compensation for additional risk). Other things being equal, a highly risk-averse investor holds a portfolio on the lower end of the efficient frontier. As the aversion to risk weakens, one moves up along the efficient frontier. In Example 3.5, an investor who prefers portfolio C is more risk-averse than one who prefers portfolio E. Between these two points, the risk premium is 5 per cent (= 18% – 13%) for additional risk of 10 per cent (22% – 12%).

Is the risk-return tradeoff available and implicit in the slope of the efficient frontier (CML) adequate? Are all investors satisfied by it? Determination of the risk premium that the investor can expect in well functioning capital markets is one of the prime concerns of financial theory. However, the risk premium sought by an investor depends on his risk preference/tolerance.

Utility functions, or indifference curves, are normally used to portray an investor's attitude towards risk. Figure 3.6 portrays the indifference map for a hypothetical investor. All portfolios along an indifference curve are equally satisfactory to the concerned investor. The higher is the curve, the higher is the satisfaction. Many systems have been developed to measure the satisfaction or utility score of a portfolio. The investor is administered risk questionnaires containing questions on the investing experience of the person, financial security and tendency to make risky or conservative choices. The scores obtained are converted into a risk aversion index. The approach followed by the Association of Investment Management and Research (AIMR) combines the investor's risk aversion with the expected return and variance of returns to assign a utility score. The utility score (U) for a portfolio is defined as:⁸

$$U = E(r) - 0.005A\sigma^2 \quad (3.24)$$

Where $E(r)$ = Expected return

A = Index of the investor's risk aversion

σ^2 = Variance of returns

0.005 = Scaling factor that allows expected return and standard deviation in the equation as percentages

Table 3.6 presents expected return, standard deviation of returns and utility scores for some portfolios that yield the same satisfaction to an investor, given his risk aversion index; this value is assumed as equal to 2. All portfolios lie along the same indifference curve with a utility score of 4. It is obvious that utility scores vary directly with expected return and inversely with variance (risk). The higher the utility score, the more attractive is the risk-return profile of a portfolio.

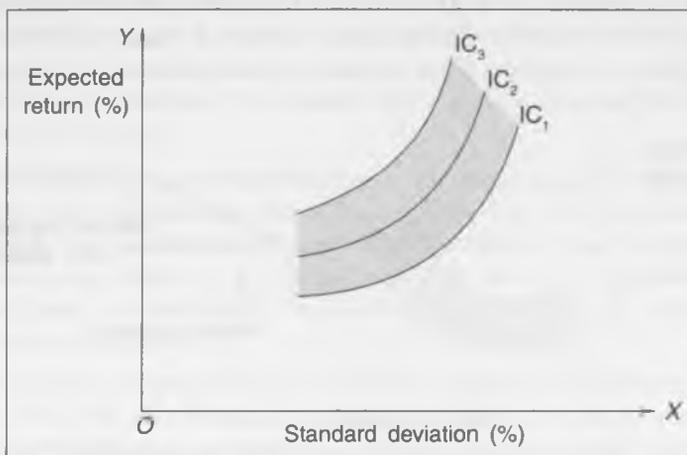

FIGURE 3.6 Risk-return Indifference Curves for a Hypothetical Investor

TABLE 3.6 Portfolios on the Same Indifference Curve

Expected return, $E(r)$ (%)	Standard deviation, σ (%)	Utility = $E(r) - 0.005A\sigma^2$
5	10.0	$4 = 5 - 0.005 \times 2 \times 100$
10	24.5	$4 = 10 - 0.005 \times 2 \times 600$
15	33.2	$4 = 15 - 0.005 \times 2 \times 1102$
20	40.0	$4 = 20 - 0.005 \times 2 \times 1600$
25	45.8	$4 = 25 - 0.005 \times 2 \times 2098$

Optimal Portfolio

Indifference curve maps an investor's utility with respect to expected return and risk.

A rational investor seeks an **efficient portfolio** tangent to the highest attainable indifference curve. It may be noted that the shape of the **indifference curve** may be linear or curvilinear. The point of tangency between the efficient frontier and risk-return indifference curve corresponds to the optimal portfolio for the concerned investor. In Figure 3.7 (p.3.20), indifference curve IC_2 is tangent to the efficient frontier at point P, which represents the optimal portfolio.

- **Efficient portfolio** maximises returns for a given level of risk or minimises risk for a given level of return.

- **CAPM** is an equilibrium model of the trade-off between expected portfolio return and unavoidable (systematic) risk; the basic theory that links together risk and return of all assets.

LO 3.5 CAPITAL ASSET PRICING MODEL (CAPM)

The capital asset pricing model (**CAPM**), as the name suggests, is a theory that explains how asset prices are formed in the market place. It is a logical and major extension of the portfolio theory of Markowitz by William Sharpe (1964),⁹ John Lintner (1965)¹⁰ and Jan Mossin (1967).¹¹

The capital asset pricing model provides the framework for determining the equilibrium expected return for risky assets. It uses the results of capital market theory to derive the relationship between expected return and systematic risk of individual assets/securities and portfolios. Capital market theories, also referred to as asset pricing theories, deal with how asset

prices are determined if investors behaved the way Markowitz's portfolio theory suggests. A price reflects the expected return and risk associated with an asset. Thus, the CAPM has implications for:

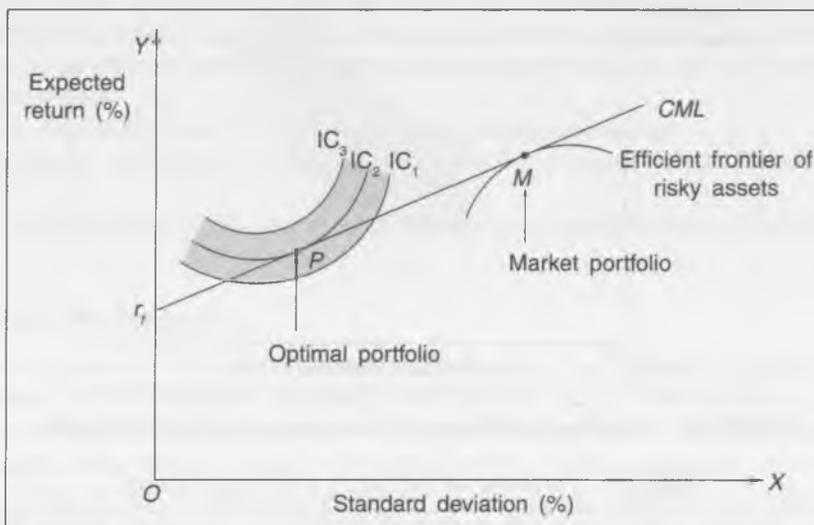

FIGURE 3.7 Determination of Optimal Portfolio with One Risk-free Asset

- (a) Risk-return relationship for an efficient portfolio
- (b) Risk-return relationship for an individual asset/security
- (c) Identification of under- and over-valued assets traded in the market
- (d) Pricing of assets not yet traded in the market
- (e) Effect of leverage on cost of equity (rate of return required by equity shareholders)
- (f) Capital budgeting decisions and cost of capital
- (g) Risk of the firm through diversification of project portfolio

Assumptions

To grapple with the complexities of the real world, the CAPM makes certain simplifying assumptions. Some of these may be relaxed later.

1. All investors are price-takers. Their number is so large that no single investor can affect prices.
2. All investors use the mean-variance portfolio selection model of Markowitz.
3. Assets/securities are perfectly divisible.
4. All investors plan for one identical holding period.
5. Homogeneity of expectation for all investors results in identical efficient frontier and optimal portfolio.
6. Investors can lend or borrow at an identical risk-free rate.
7. There are no transaction costs and income taxes.

Elements of the Model

Capital market line depicts the risk-return relationship for efficient portfolios.

The capital asset pricing model consists of two elements: the capital market line (CML) and the security market line (SML). The **capital market line**, as discussed before, represents the efficient frontier formed by combining one-month T-bills with a broad index of common stocks. Its serves two functions. *First*, it depicts the

risk-return relationship for efficient portfolios available to investors. *Second*, it shows that the appropriate measure of risk for an efficient portfolio is the standard deviation of return on the portfolio. The security market line, on the other hand, pertains to all portfolios (which plot on and below CML) as well as individual securities. This makes CML a special case of SML. We explore below SML and its implications in detail.

Security Market Line (SML) We know that risk averse investors seek risk premium to assume the risk embedded in risky assets. The risk is variability in return. The total risk consists of two components: **systematic risk** and **unsystematic risk**. In a portfolio of risky assets, the investor can eliminate unsystematic risk through diversification, as suggested by Markowitz. Systematic risk is unavoidable; this is the contribution of an individual asset to the risk of market portfolio.

According to the capital market theory, the market compensates or rewards for systematic risk only. The level of systematic risk in an asset is measured by the beta coefficient (β). The CAPM links beta to the level of required return. Graphic depiction of the CAPM—the expected return-beta relationship—is referred to as the **Security Market Line (SML)**. This is illustrated in Figure 3.8. SML is a linear relationship defined by Equation 3.25.

- Security market line
- is a graphic depiction of CAPM and describes the market price of risk in capital markets.

$$E(r_i) = r_f + \beta [E(r_m) - r_f] \tag{3.25}$$

Expected return = Risk-free return + (Beta × Risk premium of market) (3.26)

on security i = Intercept + (Beta × Slope of SML) (3.27)

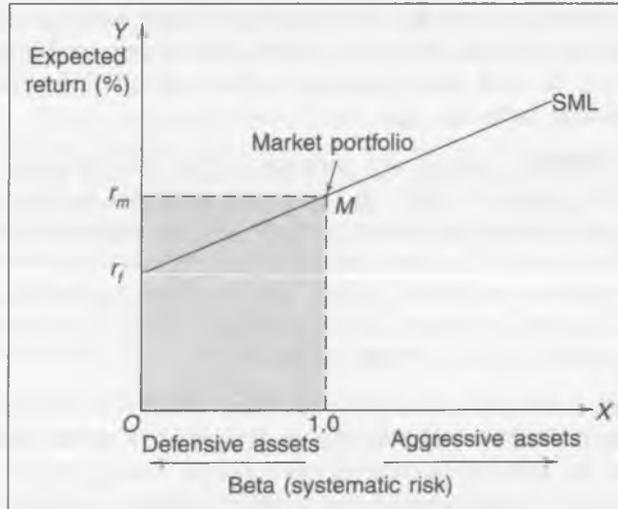

FIGURE 3.8 Security Market Line (SML)

The more familiar form of the SML:

$$E(r_i) - r_f = \beta [E(r_m) - r_f] \tag{3.28}$$

Risk premium on security i = Beta × Risk premium of market (3.29)

where $E(r_i)$ = Expected or required rate of return on asset i

r_f = Risk-free rate of return, vertical axis intercept

β = Systematic risk of the asset, beta

$E(r_m)$ = Expected return on market portfolio

Example 3.6 illustrates the application of CAPM.

Example 3.6

There are three assets—Defensive, Moderate, and Aggressive—with beta values of 0.5, 1.0 and 1.5, respectively. The risk-free rate is assumed to be 5 per cent and the market return is expected to be 15 per cent. The expected return of 3 securities may be worked out as shown below:

$$E(r_i) = r_f + \beta \times E(r_m) - r_f$$

$$E(r_D) = 5 + 0.5 \times (15-5) = 5 + 5 = 10 \text{ per cent}$$

$$E(r_M) = 5 + 1.0 \times (15-5) = 5 + 10 = 15 \text{ per cent}$$

$$E(r_A) = 5 + 1.5 \times (15-5) = 5 + 15 = 20 \text{ per cent}$$

Expected return in a CAPM context is the risk-free rate plus a premium for systematic risk based on beta.

Risk-return Relationship In the CAPM, the **expected return** on an asset varies directly with its systematic risk (β) and the risk premium of the market portfolio. In other words, the risk premium for an asset or portfolio is a function of its beta. The risk premium added to the risk-free rate is directly proportional to beta. The risk premium of a market portfolio, also referred to as **reward**, depends on the level of risk-free return and return on the market portfolio. In short, information related to the following three aspects are needed to apply the CAPM: risk-free rate, risk premium on market portfolio and beta.

Risk-Free Rate The rate of return available on assets like T-bills, money market funds or bank deposits is taken as the proxy for risk-free rate. The maturity period of T-bills and bank deposits is taken to be less than one year, usually 364 days. Such assets have very low or virtually negligible default risk and interest rate risk. However, under inflationary conditions, they are risk-less in nominal terms only. In fact, the real return (nominal return minus inflation rate) may become zero, even negative, when inflation picks up.

Risk-Premium on Market Portfolio Market risk premium or the risk premium on market portfolio is the difference between the expected return on the market portfolio and the risk-free rate of return. The CAPM holds that in equilibrium, the market portfolio is the unanimously desirable risky portfolio. It contains all securities in exactly the same proportion in which they are supplied, that is, each security is held in proportion to its market value. It is an efficient portfolio, which entails neither lending nor borrowing. The risk premium on the market portfolio is proportional to its risk (σ^2_M) and the degree of risk aversion of the average investor.

Beta It measures the risk (volatility) of an individual asset relative to the market portfolio. Accordingly, **beta** is the covariance of the asset's return with the market portfolio's return, divided by the variance of market portfolio ($\beta = \text{Cov}_{im}/\sigma^2_m$). It may be recalled that the covariance of two assets is the product of their correlation coefficient (ρ_{im}) and respective standard deviations ($\text{Cov}_{im} = \rho_{im} \sigma_i \sigma_m$). The covariance of the market portfolio with itself is the variance of the portfolio. Thus, the beta of the market portfolio is one. This classifies all others portfolios and assets in two risk classes. Assets with beta less than one are called **defensive assets**. Assets with beta greater than one are called **aggressive assets**. Risk-free assets have a beta equal to zero.

It may be noted that the beta of a portfolio is the weighted average of the betas of assets included in the portfolio. The weights are the relative share of assets in the portfolio. The concept is illustrated in Example 3.7.

Example 3.7

Two assets with beta values of 0.8 and 1.2 have been combined in the proportion 3:1. The beta of the resultant portfolio will be 0.9 ($= 0.8 \times 0.75 + 1.2 \times 0.25$). If the standard deviation of market portfolio is 30 per cent, the standard deviation of the portfolio would be 27 per cent ($= 0.9 \times 30$). This shows portfolio risk (standard deviation) is driven by security betas.

Unlevering and Relevering Beta It may be recalled that the beta of a portfolio formed by combining two assets is the weighted average of their betas. If we view all the assets of a firm as a portfolio of debt and equity (the two sides of the balance sheet of the firm), the market value of the firm (V) equals the asset value as well as the sum total of the market values of debt (D) and equity (E). Therefore, the weighted average of debt and equity betas should be equal to the assets beta.

$$\beta_{\text{assets}} = \beta_{\text{portfolio}} = (D/V) \beta_{\text{debt}} + (E/V) \beta_{\text{equity}} \quad (3.30)$$

It is evident from the above equation that in an all-equity or unlevered firm, the value of equity beta is equal to the assets beta. This is referred to as the *unlevered beta*. Determination of assets beta from observed securities betas is termed as *unlevering of beta*. *Relevering of beta* involves determination of equity beta, with given assets beta, for the proposed financing structure, using equation 3.31 (similar to the determination of K under net operating income (NOI) approach).

$$\beta_{\text{equity}} = \beta_{\text{assets}} + (\beta_{\text{assets}} - \beta_{\text{debt}}) D/E \quad (3.31)$$

These concepts are relevant in the context of the determination of (i) the required rate of return for a new project/firm and (ii) the required rate of return on equity shares (cost of equity) with change in the financing structure. When the new project does not entail any change in business and financial risks of the firm, the beta of the existing assets of the firm may be used as a proxy for the project beta. Similarly, the required rate of return on the initial public offer (IPO) of a company may be determined based on the observed betas of a comparable firm (consider Example 3.8).

Example 3.8

To illustrate this point, let us assume equity beta of Rely India Ltd. is 1.5 and debt beta is zero. Its present debt-equity is 1:2. A new firm, Progress India Ltd., which is similar in size and risk of operations, plans to issue equity shares for the first time. However, Progress India's financing structure has debt and equity in equal proportions. The equity beta of Progress India may be obtained by unlevering the equity beta of Rely India and then relevering for the proposed financing structure of Progress India, as explained below.

The unlevered or assets beta is obtained as

$$\beta_{\text{assets}} = (1/3) \times 0 + (2/3) \times 1.5 = 0.0 + 1.0 = 1.0$$

For the proposed debt-equity ratio of 1:1, the equity beta is

$$\beta_{\text{equity}} = 1.0 + (1.0 - 0.0) (1/1) = 1.0 + 1.0 = 2.0$$

Now the CAPM (SML) equation may be used to determine the expected rates of return for relevered beta values.

Under- and Over-valued Assets

If individual assets/securities and portfolios are priced correctly, they lie exactly on the SML. Assets plotting off the SML indicate mispricing of assets by the market. Assets that plot above the SML are undervalued. They offer higher expected return than assets of a similar risk class. Hence, they are attractive. The buying pressure for such assets will push up their price and lower the return, until they are correctly priced. Similarly, assets that plot below are unattractive because they are overpriced.

In a well functioning market, an investor can obtain the 'fair return' predicted by the SML for a given risk by mixing the risk-free asset and the market portfolio in the right proportions. Suppose,

an investor expects that stock X with beta 0.5 would yield return of 6 per cent. If the risk-free rate is 5 per cent and the market risk premium is 6 per cent, the required rate of return is 8 per cent ($5 + 0.5 \times 6 = 5 + 3$). Clearly, the stock is overpriced. The investor can obtain the SML indicated return of 8 per cent by mixing the risk-free asset and the market portfolio in equal proportions to create a portfolio that has beta of 0.5. Why a mixture of risk-free asset and the market portfolio? The reason is that, these opportunities are available to all investors. The only way to create beta 0.5 is to mix the two securities in equal proportions, that is, $(0.5 \times 0 + 0.5 \times 1 = 0.5)$. As the expected return on the market portfolio is 11 per cent ($= 5 + 1 \times 6$), the expected return on the new portfolio would be 8 per cent ($= 0.5 \times 5 + 0.5 \times 11$).

Let us take another example, the investor expects 15 per cent return on stock Y , which has a beta of 2. This time the SML determined required rate is 17 per cent. Again, the stock is overvalued. The investor can still earn 17 per cent by creating a leveraged portfolio with a beta of 2. For this, the investor needs to borrow funds equal to his owned funds and invest the entire amount in the market portfolio. The beta of this portfolio is 2 ($= -1 \times 0 + 2 \times 1$). The expected return is 17 per cent ($= -1 \times 5 + 2 \times 11$). Thus, when defensive stock is overvalued, the investor should combine market portfolio with lending (risk-free asset). When aggressive stock is overvalued, he should combine market portfolio with borrowing.

The vertical distance between the fair return predicted by the SML and return actually expected by an investor is called the *alpha* (α) of the asset. Thus, undervalued assets have a positive alpha, and overvalued assets have a negative alpha. For example, if the risk-free rate is 5 per cent and market return is expected to be 15 per cent, fair return, stipulated by the CAPM, on a security with beta of 1.2 will be 23 per cent ($= 5 + 1.2 \times 10$). If a person expects the return to be 25 per cent, the implied alpha is 2 per cent. The security is undervalued and attractive. If the security is expected to return 20 per cent, the alpha is negative at 3 per cent, the security is mispriced and overvalued. The essence of security analysis is to search for securities with positive alpha.

In practice, minor deviations on both sides of the SML indicate the effect of transaction costs and taxes. Besides, due to imperfect information, investors fail to notice these opportunities and prices hover around their equilibrium level. Thus, SML is more of a band than a precise relationship between beta and the expected rate of return.

Validity of the CAPM

CAPM
Despite challenges
the CAPM is widely
used because
it is a practical
equilibrium model.

The capital asset pricing model is a rigorously derived equilibrium model. Like any other economic model, it is an abstraction and simplification of reality. It has been widely used and hailed. Its popularity may be ascribed to a set of four factors. *First*, the risk-return trade-off—the direct proportional relationship between the two—has a distinct intuitive appeal. *Second*, transition from the capital market line (CML) to the security market line (SML) shows that the undiversifiable nature of the systematic risk makes it the relevant risk for pricing of securities and portfolios. *Third*, beta, the measure of systematic risk, is easy to compute and use. *Finally*, the model shows that investors are content to put their money in a limited number of portfolios, namely, a risk-free asset like Treasury bills and a risky asset like a market index fund.

However, CAPM is beset with a number of problems. One of these relates to the maturity of the risk-free asset, namely, interest rate on a short-term government security like a T-bill or a long-term rate like that on a treasury bond or an intermediate term-rate like that on a 3 year treasury securities. The second problem relates to whether the market premium should be the expected or historical. Yet another problem relates to the use of an appropriate market index. The faulty use of

a market index is likely to result in faulty measurement of security measurement. Finally, there is the question if beta is the appropriate risk measure. To provide a solution to these challenges, an extended CAPM and alternative models have emerged. These models incorporate multiple variables and factors. They are briefly discussed in the next Section.

LO 3.6 EXTENDED CAPM

The CAPM is essentially a single-factor model in that the security's expected return depends on a single factor, namely, beta. But there may be other factors, apart from beta, which may affect required returns. Therefore, the inclusion of these factors in the CAPM equation would provide better explanation of the variables impacting security returns. The major factors are: **(i)** taxes, **(ii)** inflation, **(iii)** liquidity, **(iv)** market capitalisation size and **(v)** price-earnings and market-to-book value ratios. These factors (showing extensions to the CAPM) are briefly explained in this Section.

Extended
CAPM
adds variables
additional to beta to
the model.

Taxes

The investor receives return on security in the form of dividend income and capital gains or losses. Accordingly, the tax liability of the investors is of two types: **(i)** tax on dividend income and **(ii)** tax on capital gains. In cases when both the types of income are either free-of-tax or they are taxed at the same rates, the CAPM results hold true whether company pays more or less dividends. However, in practice, capital gains are normally taxed at lower rates than dividend income.* Moreover, capital gain tax is payable only when securities are actually sold; the tax on capital gains is deferred till the actual sale of the securities. The different tax treatment of dividend and capital gains means that with less dividend (and more capital appreciation), the investor's tax liability would be lower—an attribute unrecognised by the CAPM.

Example 3.9

Suppose the investor is expected to have return of 15 per cent (consisting of a dividend yield of 10 per cent and a 5 per cent capital gain on initial value) by holding securities in Company X. Company Y is expected to provide dividend yield of 11 per cent and capital appreciation of 3.5 per cent (total return of 14.5 per cent). Assume further that dividend income is taxed at 30 per cent and capital gain at 20 per cent. Though the before-tax return from company X's securities higher at 15 per cent, the after-tax return (effective/real return) is higher in the case of company Y at 11.25 per cent (Table 3.7)

TABLE 3.7 After-tax Return from Securities of Companies X and Y

Particulars	Return from Company X			Return from Company Y		
	Before-tax	Tax rate	After-tax	Before-tax	Tax rate	After-tax
Dividend yield	10%	30%	7%	3.5%	30%	2.45
Capital gain	5	20	4	11	20	8.80
Expected return	15%		11%	14.5%		11.25%

It is apparent from Table 3.7 that in spite of the lower expected return before taxes (14.5%) of company Y, its expected after-tax return is higher on account of the fact that a higher proportion of income/return consists of capital gains. Evidently, the tax-paying investor prefers securities of

*Dividend income from domestic companies and mutual funds in India is exempt from tax in the hands of the shareholders and investors.

company Y to those of company X; in contrast, the tax-exempt investor will have a preference for company X, all other things being the same.

As a logical corollary of the above follows that high dividend paying securities may be required to provide higher expected returns before taxes *vis-à-vis* the low dividend paying securities to offset the tax effect.

In view of the above, the CAPM equation for determining expected return is to be modified to include dividend yield and tax effect, as shown in Equation 3.32.

$$K_j = R_f + bB_j + t(D_j - R_f) \quad (3.32)$$

Where R_f = Required rate of return on security, j
 b = Coefficient showing the relative importance of beta
 B_j = Beta of security, j
 t = Coefficient showing the relative importance of the tax effect.
 D_j = Dividend yield on security, j

It is apparent from equation 3.32 that the higher is the dividend yield, the higher is the expected before-tax return the security may be expected to provide. In other words, if there is a systematic bias in the market in favour of capital gains, the expected return on a security is affected by beta as well as its dividend yield. Clearly, taxes, *albeit* indirectly, affect the required return from a security.

Inflation

In the event of the economy being subject to inflation, the realised *real return* for a security tends to be lower. In case inflation is highly predictable, the expected return is equal to the real required return plus inflation premium. However, in practice, this prediction of inflation may not be easy task. In other words, inflation is unpredictable or it is uncertain. Obviously, in such a situation investor will have a preference for securities which provide **hedge** against inflation. (The term 'hedge' implies that the return on the security increases with *unanticipated* increase in inflation). This desirable property of providing protection against inflation reduces the systematic risk of the security in *real* terms and, hence, the investor's expected return on such securities may be lower.

In statistical terms, the greater is the **covariance** (positive) of the return of a security with unanticipated changes in inflation, the lower is the expected nominal return the market requires on such a security or *vice-versa*. In other words, the expected nominal return of a security is a positive function of its beta and a negative function of its covariance with unanticipated inflation. Evidently, positive covariance with inflation is a desirable property and may reduce the required return on the part of the investor; in contrast, the securities with negative covariance (between return and inflation) are likely to raise the investor's nominal required return from such securities.

Covariance with unexpected inflation is desirable from the standpoint of the investor.

Liquidity

Liquidity refers to the ability to transform a security readily into cash without loss or at negligible loss (if any). The spread between the buying (bid) price and the selling (ask) price of a security may be regarded as a useful measure of its liquidity. In general, the lower is the spread between the two prices, the higher is the liquidity and *vice-versa*. Unforeseen events in future may require early redemption/conversion of securities into cash. Investors, presumably, therefore prefer more liquid securities. If this is so, the investors required return on liquid securities may be relatively

lower *vis-à-vis* non-liquid securities, other things being equal. The factor of liquidity again causes distortion in CAPM.

Market Capitalisation Size

Market capitalisation is the product of the number of shares outstanding and the market price of the share. In general, the higher the market capitalisation of a corporate firm, the more secured the investor feels in investing in securities of such a company. Presumably, the higher the market capitalisation size of a corporate firm, the safer is considered the investments. Therefore, to offset the additional risk, the investors normally may require higher return from the securities belonging to 'small' corporate firms. In other words, the investors place premium on the securities of large-sized firms and may require lower returns on investments in such securities, other things being equal.

Price-Earnings and Market-to-Book Value Ratios

Van Horne states that the price/earnings (P/E) ratio effect has been observed in realised returns from securities/equity shares. Holding constant beta, observed returns tend to be higher for low P/E ratio shares and lower for high P/E ratio shares. In simple words, shares with low P/E ratio earn higher returns than predicted by CAPM and shares with high P/E ratio earn less returns than what the CAPM would predict. The modified CAPM equation with inclusion of the P/E ratio is 3.33.

$$K_j = R_f + bB_j - p (P/E_j - P/E_m) \quad (3.33)$$

Where p = Coefficient showing the relative importance of a security's price/earnings ratio

P/E_j = Price-earnings ratio of the security under consideration.

P/E_m = Weighted average price/earnings ratio for the market portfolio.

The equation 3.33 points out two facts: (i) the required return increases with beta and decreases with the P/E ratio and (ii) beta does not capture all the risk associated with holding a security; inclusion of P/E ratio adds explanatory power to the CAPM.

Closely related to the P/E ratio is the market-to-book (M/B) value ratio which has been employed to explain security return. The M/B ratio is obtained dividing the market value of all claims on a corporate firm by the book value of its assets. Van Horne mentions that observed returns tend to be higher for low M/B ratio securities/shares than for high M/B ratio securities, holding beta constant. It may be noted that the results are similar to those observed in the relationship between returns on a security and the P/E ratio. It is perhaps for this reason that either P/E ratio or M/B ratio is used to explain security returns.

It is worth noting that among all the variables used to extend CAPM, market capitalisation size and the P/E ratio or the M/B ratio (not both) have been observed to be the most consistent and significant in their effect. For multiple variables, required rate of return is given by equation 3.34.

$$K_j = R_f + bB_j + c (\text{factor } 2) + d (\text{factor } 3) + e (\text{factor } 4) + \dots + m (\text{factor } n) \quad (3.34)$$

Where b , c , d , e and m are coefficients reflecting the relative importance of the factors involved. When these factors are added along with beta, a better explanation of security's total return (in the case of some securities) is obtained.

The extensions to the CAPM approach made in this section should not undermine the importance of the CAPM framework to explain the security return as beta continues to be the major determinant of the security returns. The merit of the CAPM extension exercise is that it provides a better insight into the market equilibrium process as well as more precise (comprehensive) measurement of the expected return from a specific share/security; it is supplementing in nature.

LO 3.7 ARBITRAGE PRICING THEORY

Although CAPM approach has been widely accepted as a determinant of required return of a security (asset), it is beset with a number of restrictive assumptions, affecting its application in practice. For instance, the CAPM framework assumes that there exists a market portfolio consisting of all risky assets. Apart from the unobservable aspect of such a portfolio, the portfolio itself may provide different results. For instance, portfolio in India (the rate of return earned on which is used as proxy of R_m in CAPM) may consist of the RBI's share price index, the Economic Times share price index, the Financial Express share price index, Sensex of BSE and the NIFTY of NSE. Obviously, the rates of return of these portfolios are not likely to be equal; the required return of the security will vary.

The **Arbitrage Pricing Theory (APT)** is an alternative model of asset/security pricing which has received considerable attention in the financial literature in recent year as it is devoid of the CAPM assumptions. The APT model was developed in the 1970s by Ross. As the name implies, the APT is based on the concept of arbitrage. In the context of pricing of (return from) securities, arbitrage implies finding/availability of two securities which are essentially the same (having different prices/returns). In such a situation, it will be profitable for the investor to sell the expensive one. The theory is based on the premise that security prices adjust as investors form portfolios in search of arbitrage profits. When such opportunities of earning arbitrage profits are completely exhausted, the prices of securities are said to be in equilibrium. This leads to the state of capital market efficiency, free of arbitrage opportunities. In other words, arbitrage will ensure that riskless assets (or securities) provide the same expected return in competitive financial markets¹⁷.

Arbitrage pricing theory has markets equilibrating across securities through arbitrage driving out mispricing.

Multifactor Linear Model

Another useful way of explaining the APT is that it relates the returns of security within a multivariate framework in which the return relationships are linear. Multivariate framework implies that there are a variety of different factors which influence security returns. However, the theory does not specify these factors on the basis of conceptual argument. The argument presumably is that factors may not be the same for all securities. Therefore, the factors to be used in APT model are to be identified empirically; the factor analysis, a statistical method, has been suggested to identify relevant factors.

The factors in the context of APT can be classified into two broad groups, namely, macroeconomic factors having a pervasive influence and micro (firm specific) factors. Viewed from this perspective, the APT model (as shown in equation 3.35) is akin to an extended CAPM model.

$$\text{Return} = R_f + \beta_{j1} (\bar{r}_{f1} - r_f) + \beta_{j2} (\bar{r}_{f2} - r_f) + \dots + \beta_{jk} (r_{jk} - r_f) \quad (3.35)$$

Where K = Number of factors that affect an asset (security) return

$\bar{r}_{f1}, \bar{r}_{f2}, \dots, \bar{r}_{jk}$ = Expected returns to factors 1, 2, ... K

$\beta_{j1}, \beta_{j2}, \dots, \beta_{jk}$ = Sensitivities of an asset (security) to factors 1, 2, ... K .

Factors It may be emphasised here that the APT framework normally includes the market risk premium (return on the market portfolio minus risk free rate) as one of the factors; it may be recapitulated that market risk premium is the sole factor used in the CAPM. The other factors included are macroeconomic and firm specific, while the major macroeconomic factors are inflation, interest rates, growth rate in gross domestic product, GDP/general economic conditions, the firm specific

factors include strikes, availability or otherwise of raw materials, competition, unique government regulations (say increase in the custom duty on the raw materials imported), and so on.

Example 3.10

Suppose the riskless return is 5 per cent and the market portfolio's expected return (r_m) is 11 per cent. Assume further that beta coefficients for security j are $\beta_1 = 1.3$ (in relation to market portfolio, $\beta_2 = 0.3$ (in relation to growth rate of GDP) and $\beta_3 = 0.2$ (in relation to inflation). The expected growth rate in GDP is 8 per cent and inflation is 3 per cent/ Determine the expected return of security j .

$$\begin{aligned} \text{Return} &= 5\% + 1.3 (r_m - 5\%) + 0.3 (r_{gdp} - 5\%) + 0.2 (r_i - 5\%) \\ &= 5\% + 1.3 (11\% - 5\%) + 0.3 (8\% - 5\%) + 0.2 (3\% - 5\%) \\ &= 5\% + 7.8\% + 0.9\% - 0.4\% = 13.3\% \end{aligned}$$

Though the APT is intuitively appealing, it is difficult to be applied in practice. For instance, the identification of the relevant factors (not specified in the APT model) itself is the formidable task. Moreover, the relative importance of the factors (identified) may change over time. Because of these difficulties, the researchers have found difficulties in testing the APT. As a result, there is a lack of practical acceptance of APT. In other words, the superiority of the APT to the CAPM has not been conclusively established or *vice-versa*. Both models involve expectations of risks and of returns which need to be estimated and these estimates are subject to wide error¹⁸.

SUMMARY

LO 3.1	Risk refers to the variability of expected returns associated with a given security or asset.
LO 3.2	The absolute return on an investment for a given period of time, say a year, consists of annual income plus change in the market price of the investment (capital appreciation or loss); total annual income (loss) in terms of the rate of return is expressed as a percentage of the opening market value of the investment.
LO 3.3	The two major concerns of an investor, while choosing a security (asset) as an investment, are the expected return from holding the security and the risk that the realised return may fall short of the expected return. Two commonly used approaches to assess risk from a behavioural point of view are sensitivity analysis and probability distribution. To obtain a more concrete measure of risk, two statistical measures of variability of return, namely, standard deviation and coefficient of variation, can be used.
LO 3.4	The term, portfolio refers to the collection of securities/assets held by an investor for investment purposes. The risk of a portfolio is measured in much the same way as the risk of a single asset. However, in the context of a portfolio, the risk of any single proposed investment in a security/asset is not to be viewed independent of other assets/securities already held; additional investments are considered in the light of their effect on the risk and return of the portfolios as a whole. The correlation among assets in portfolio affects the overall risk of the portfolio. The assets (or securities) whose returns are negatively correlated provides the best combination to minimise overall risk. In a way, the concept of correlation constitutes an integral part of the process of diversification that is used to develop an efficient portfolio of assets/securities. An efficient portfolio is a maximum return portfolio, at a given level of risk.
LO 3.4	Diversification through a combination of securities that are not perfectly positively correlated helps to reduce the overall risk of a portfolio. Total portfolio risk has two components: (i) systematic/non-diversifiable/unavoidable risk and (ii) unsystematic/diversifiable/avoidable risk. The systematic risk is caused by factors that affect all the securities/overall market. Therefore, even an investor who holds a well-diversified portfolio is exposed to this type of risk. In contrast, the unsystematic risk is unique to a particular company/industry/security. This kind of risk can be reduced by diversification and can be eliminated even completely through efficient diversification.

LO 3.5	The non-diversifiable risk is the only relevant risk for which the investors are to be compensated. The higher is such a risk, the higher is the required/expected return of the investor. This risk-return trade-off is the theme of the capital asset pricing model (CAPM). The non-diversifiable risk is measured by beta coefficient. The CAPM uses beta to relate a security's risk relative to the market to determine the security's/asset's required rate of return.
LO 3.6	<p>The CAPM is essentially a single factor model, based on beta. It may be extended to include other variables affecting security's expected return. The major factors in this regard are: (i) taxes, (ii) inflation, (iii) liquidity, (iv) market capitalisation size and (v) price-earnings and market-to-book value ratios.</p> <p>The differential tax treatment of dividend and capital gains may affect the effective return expected from the security. Since the investors are concerned with inflation, they may require the lower return on securities which provide hedge against inflation. Likewise, the liquid securities and the securities of companies having high market capitalisation size are preferred and may require a lower return on the part of investors. Finally, it has been observed that returns tend to be higher for low price-earning (P/E) ratio securities as well as for low market-to book (M/B) ratio securities. Of these multiple variables, market capitalisation size and either the P/E ratio or M/B ratio have been observed to be the most significant in their effect on security returns.</p>
LO 3.7	The Arbitrage Pricing Theory (APT) is an alternative model of asset/security pricing. The APT is based on the concept of arbitrage. By eliminating arbitrage opportunities, the arbitragers help in developing the state of capital market efficiency in which all riskless securities yield the same expected return. This apart, the theory attempts to relate the return of a security within a multivariate framework in which the return relationships are linear.

SOLVED PROBLEMS

P.3.1 Hilt share is quoted at ₹60. Nitin expects the company to pay a dividend of ₹3 per share, one year from now. The expected price one year from now is ₹78.50.

LO 3.1 LOD
M

- (a) What is the expected dividend yield, rate of price change and holding period yield (HPY)?
- (b) If the beta of the share is 1.5, the risk-free rate is 6 per cent and the market risk premium is 10 per cent, what is the required rate of return?
- (c) What is the intrinsic value of the share? How does it compare with the current market price?

Solution

(a) Dividend yield = ₹3/₹60 = 5 per cent

Rate of capital appreciation = (₹78.50 – ₹60)/₹60 = 30.83 per cent

Holding period yield = Dividend yield + Rate of capital appreciation
= 5 + 30.83 = 35.83 per cent

(b) Required return = Risk-free rate + β (Risk premium)

= 6% + 1.5 (10%) = 6% + 15% = 21 per cent

(c) Intrinsic value = (Dividend + Future price)/(1 + Required rate)

= (₹3 + ₹78.50)/(1 + 0.21) = ₹81.50/1.21 = ₹67.36

The share is being traded at a price higher than its intrinsic value. It is a selling signal.

P.3.2 From the following information, isolate efficient portfolios from dominated ones.

LO 3.4 LOD
D

Portfolio	A	B	C	D	E	F	G
Expected return (%)	10	15	20	13	16	18	13
Standard deviation (%)	15	10	25	15	15	20	25

Solution Table showing dominated and efficient portfolios

Portfolio	Expected return (%)	Risk, σ (%)	Dominated?	Efficient?
A	10	15	Yes, by B, D, E	No
B	15	10	No	Yes
C	20	25	No	Yes
D	13	15	Yes, by B, E	No
E	16	15	No	Yes
F	18	20	No	Yes
G	13	25	Yes, by B, D	No

P.3.3 An investor with risk aversion coefficient $A = 3$ desires utility level (u) of 5 per cent. If standard deviation of returns for a portfolio is 10 per cent, what is the required rate of return?

LO 3.4 LOD
M

Solution

$$U = E(r) - 0.005A\sigma^2$$

$$E(r) = U + 0.005A\sigma^2$$

$$E(r) = 5 + 0.005 \times 3 \times (10)^2 = 5 + 1.5 = 6.5 \text{ per cent.}$$

P.3.4 Mr Brij Bhushan has two investment options before him. Portfolio M offers risk-free expected return of 8 per cent. Portfolio N, which offers an expected return of 24 per cent has standard deviation of 25 per cent. His risk aversion index is 4. Given these parameters what is the rational choice for him? What is the maximum level of risk aversion for which he will continue to prefer the risky portfolio?

LO 3.4 LOD
M

Solution The utility score for a portfolio is given by the following equation:

$$U = E(r) - 0.005A\sigma^2$$

$$U(M) = 8 - 0.005 \times 4 \times (0)^2 = 8 - 0 = 8 \text{ per cent}$$

$$U(N) = 24 - 0.005 \times 4 \times (25)^2 = 24 - 12.5 = 11.5 \text{ per cent}$$

Since the utility score for N is higher, he will derive greater satisfaction from the risky portfolio. The portfolio will continue to be more attractive so long as its utility score for the given risk level exceeds 8 per cent. Thus, the maximum level of risk aversion for which the risky asset will continue to be attractive can be obtained by solving $U(N) = 8$ as a function of A.

$$8 = 24 - 0.005 \times (25)^2 \times A$$

$$A = (8 - 24)/[-0.005 \times (25)^2] = (-16)/(-3.125) = 5.12$$

The risk-free portfolio M will be more attractive than N, when Brij Bhushan's risk aversion index exceeds 5.12.

P.3.5 Suppose the required rate of return on a portfolio with beta of 1.2 is 18 per cent and the risk-free rate is 6 per cent. According to the CAPM:

LO 3.5 LOD M

- What is the expected rate of return on the market portfolio?
- What is the expected return of a zero beta security?
- Suppose you choose to buy a stock Z for ₹50. The stock is expected to pay ₹2 as dividend next year and is hoped to sell at ₹53. The stock has been evaluated at $\beta = -0.5$. Is the stock fairly priced? What is the implication of including stock Z in the portfolio?
- A stock Delta, with beta of 1.5, sells for ₹50. One year from now, it is expected to yield a dividend income of ₹6. What price do investors expect after one year?

Solution

$$(a) E(r_p) = r_f + \beta(r_m - r_f)$$

$$18\% = 6\% + 1.2(r_m - 6\%)$$

$$r_m = 6\% + (18\% - 6\%)/(1.2) = 6\% + 10\% = 16 \text{ per cent}$$

(b) The expected rate of return on zero beta security is the risk-free rate, that is 6 per cent.

(c) Total income = Dividend +/- Price change = ₹2 + (₹53 - ₹50) = ₹5

Expected return = Total income / Initial price = ₹5/50 = 10 per cent

Required return = $E(r_p) = 6\% + -0.5(16\% - 6\%) = 6\% - 5\% = 1 \text{ per cent}$

The expected rate of return (10%) is ten times the required rate of return (1%). Clearly the stock is highly undervalued. Inclusion of stock in the portfolio will reduce the portfolio beta and the required return.

(d) $E(r_{\text{Delta}}) = 6\% + 1.5(16\% - 6\%) = 6\% + 15\% = 21 \text{ per cent}$

For 21 per cent return, the total income from Delta should be ₹50 × 21% = ₹10.5. Out of this, the dividend component is ₹6. The expected price appreciation over ₹50 is ₹4.5. Thus, the expected price is ₹54.5.

P.3.6 An investment manager has chanced upon a couple of securities with identical variance of 25 per cent, but zero covariance between their returns.

LO 3.3 LOD D

- Calculate portfolio risk when any two securities are combined in equal proportions.
- Calculate portfolio risk when any three securities are combined in equal proportions.
- Generalise your results for the n-security case and examine its implications for an insurance company.

Solution

$$(a) \sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + 2\rho_{ab} w_a \sigma_a w_b \sigma_b$$

Since covariance ($\sigma_{12} = \rho_{12} w_1 \sigma_1 w_2 \sigma_2$) between securities is zero

$$\sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 = (0.5)^2 \times (25) + (0.5)^2 \times (25) = 6.25 + 6.25$$

$$= 12.5 \text{ per cent}$$

$$(b) \sigma_p^2 = w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + w_c^2 \sigma_c^2 + 2\rho_{ab} w_a \sigma_a w_b \sigma_b + 2\rho_{ac} w_a \sigma_a w_c \sigma_c + 2\rho_{bc} w_b \sigma_b w_c \sigma_c$$

For zero covariance term

$$\begin{aligned}\sigma_p^2 &= w_a^2 \sigma_a^2 + w_b^2 \sigma_b^2 + w_c^2 \sigma_c^2 = (1/3)^2 \times (25) + (1/3)^2 \times (25) + (1/3)^2 \times (25) \\ &= 2.78 + 2.78 + 2.78 = 8.34 \text{ per cent}\end{aligned}$$

- (c) The generalisation involves three conditions: (i) identical variance (σ^2), (ii) zero covariance and (iii) weight is equal to $1/n$.

$$\begin{aligned}\text{Portfolio variance} &= \sigma_p^2 = (w\sigma)^2 + (w\sigma)^2 + \dots \text{ } n\text{-times} \\ &= n(1/n)^2 \sigma^2 = \sigma^2/n = 25/n\end{aligned}$$

It is obvious that as the number of assets increases, the portfolio risk approaches zero. Based on this result, one is tempted to conclude that the insurance companies can reduce risk to zero level by increasing the number of policies sold. However, it is not so. As more assets with uncorrelated returns are entered into the portfolio, portfolio risk approaches zero, provided the size of wealth (portfolio) remains fixed. As insurance companies sell more policies, the size of portfolio increases. In this case, it is more appropriate to determine mean and standard deviation in value (rupee) terms rather than rates. Insurance companies pool risk (accumulate independent risky projects) by selling policies, which does not eliminate the risk of the insurance company.

P.3.7 Consider the following information.

LO 3.3 LOD M

	Share Moon	Share Mars
Expected return (%)	15	20
Standard deviation (%)	10	15
Covariance (%)	120	

- (a) What is the correlation between the two shares?
 (b) What is the expected return and risk of a portfolio in which Moon and Mars have been combined in equal proportions?

Solution

(a) Correlation (ρ) = Covariance of Moon and Mars / $\sigma_{\text{Moon}} \sigma_{\text{Mars}}$
 $= 120 / (10 \times 15) = 0.8$

(b) Expected return = $w_{\text{Moon}} \times \text{return}_{\text{Moon}} + w_{\text{Mars}} \times \text{return}_{\text{Mars}}$
 $= 0.5 \times 20\% + 0.5 \times 15\% = 17.5 \text{ per cent}$

$$\begin{aligned}\text{Risk } (\sigma) &= (w_{\text{Moon}}^2 \sigma_{\text{Moon}}^2 + w_{\text{Mars}}^2 \sigma_{\text{Mars}}^2 + 2\rho_{\text{Moon, Mars}} w_{\text{Moon}} \sigma_{\text{Moon}} w_{\text{Mars}} \sigma_{\text{Mars}})^{1/2} \\ &= [(0.5 \times 15\%)^2 + (0.5 \times 20\%)^2 + 2 \times 120\%]^{1/2} = (56.25 + 100 + 240)^{1/2} \\ &= (369.25\%)^{1/2} = 19.9 \text{ per cent}\end{aligned}$$

P.3.8 Ajay held equity shares of Xenon Ltd. (expected return = 14%, standard deviation = 18%). Vijay has gifted him shares of identical market value of Year Ltd. (expected return = 20%, standard deviation = 24%). Determine the risk and return of the securities portfolio held by Ajay, if the correlation between the returns on the two securities is 0.8.

LO 3.3 LOD M

Solution

$$\begin{aligned}E(r_p) &= w_a r_a + w_b r_b \\ &= 0.5 \times 14\% + 0.5 \times 20\% = 7\% + 10\% = 17 \text{ per cent}\end{aligned}$$

$$\begin{aligned}\sigma_p^2 &= (w_a \sigma_a)^2 + (w_b \sigma_b)^2 + 2\rho_{ab} w_a \sigma_a w_b \sigma_b \\ &= (0.5 \times 18\%)^2 + (0.5 \times 24\%)^2 + 2(0.8)(0.5 \times 18\%)(0.5 \times 24\%) \\ &= 81\% + 144\% + 172.8\% = 397.8\%\end{aligned}$$

$$\sigma_p = 19.95 \text{ per cent}$$

P.3.9 Mr. Azad holds the following portfolio

LO 3.3 LOD M

Share	Beta	Investment
Alpha	0.6	₹3,00,000
Beta	1.0	1,80,000
Carrot	1.2	1,20,000

What is the expected rate of return on his portfolio, if the risk-free rate is 6 per cent and the expected return on market portfolio is 15 per cent?

Solution For given beta (β), the required rate of return is obtained as

$$\begin{aligned} E(r_p) &= r_f + \beta (r_m - r_f) \\ &= 0.06 + \beta (0.15 - 0.06) = 0.06 + 0.09\beta \end{aligned}$$

Share	Beta	$E(r) = r_f + \beta (r_m - r_f)$	Investment	Weight	Weighted return
Alpha	0.6	0.114	₹3,00,000	0.5	0.0570
Beta	1.0	0.150	1,80,000	0.3	0.0450
Carrot	1.2	0.168	1,20,000	0.2	0.0336
Portfolio	0.84	0.1356	6,00,000	1.0	0.1356

Portfolio beta is the simple weighted average of the betas of three shares.

$$\beta_{\text{portfolio}} = 0.6 \times 0.5 + 1 \times 0.3 + 1.2 \times 0.2 = 0.3 + 0.3 + 0.24 = 0.84$$

P.3.10 Determine the given beta values.

LO 3.3 LOD E

- Standard deviation of stock of Sunshine Ltd. (σ_s) = 10 per cent
Standard deviation of market portfolio (σ_m) = 8 per cent
Correlation of share with the market (r_{sm}) = +0.7
- Standard deviation of the portfolio (σ_p) = 3 per cent
Standard deviation of market portfolio (σ_m) = 2.5 per cent
Correlation of portfolio with the market (r_{pm}) = +0.9

Solution

- Beta of Sunshine Ltd. share is obtained as
 $\beta_s = (\sigma_s \sigma_m r_{sm}) / \sigma_m^2 = (10 \times 8 \times 0.7) / (8)^2 = 0.875$
- Beta of Sunshine Ltd. share is obtained as
 $\beta_s = (\sigma_p \sigma_m r_{pm}) / \sigma_m^2 = (3 \times 2.5 \times 0.9) / (2.5)^2 = 1.08$

P.3.11 Risk-return features of two securities X and Y are given below

LO 3.4 LOD D

Portfolio	$E(r)$	σ	W
X (%)	12	16	0.5
Y (%)	20	24	0.5

- If the desired portfolio standard deviation is 20 per cent, determine the correlation coefficient that would yield the desired level of risk.
- Find the portfolio standard deviation if X and Y are mixed in the ratio of 3:1. Comment on the results.
- What should the correlation be, if the desired portfolio standard deviation of 18 per cent and assets are combined in equal proportion?
- What should the correlation be, if the desired portfolio standard deviation is 12 per cent and assets are combined in equal proportion?

Solution

- $\sigma_p^2 = (w_x \sigma_x)^2 + (w_y \sigma_y)^2 + 2 \sigma_x w_x \sigma_y w_y \rho$
 $(20)^2 = (0.5 \times 16)^2 + (0.5 \times 24)^2 + 2 (0.5) (0.5) (16 \times 24 \times \rho)$

$$400 = 64 + 144 + 192\rho$$

$$192\rho = 400 - 208$$

$$\rho = 192/192 = 1.$$

There should be perfect positive correlation between X and Y.

$$(b) \sigma_p^2 = (0.75 \times 16)^2 + (0.25 \times 24)^2 + 2(1.0 \times 16 \times 24)(0.75 \times 0.25)$$

$$= 144 + 36 + 144 = 324 \text{ per cent}$$

$$\sigma_p = 18 \text{ per cent.}$$

(c) For perfect positive correlation between X and Y, the portfolio standard deviation ranges between σ_x and σ_y .

$$\sigma_p^2 = (18)^2 = (0.5 \times 16)^2 + (0.5 \times 24)^2 + 2(0.5 \times 0.5)(16 \times 24)\rho$$

$$324 = 64 + 144 + 192\rho$$

$$\rho = 324 - 64 - 144 = 0.604$$

$$(d) (12)^2 = 64 + 144 + 192\rho$$

$$192\rho = 144 - 208 = -64$$

$$\rho = -64/192 = -0.33$$

P.3.12 GTE Ltd is a renowned company in telecommunication industry. The company has a consistent profitability record for the last five years. Mr Satnam wishes to invest in this company, however, he wants to know how this company is expected to fare vis-à-vis the overall market. He has been advised by a financial expert to use beta for understanding the movement of any share vis-à-vis the market. The following data is available with Mr Satnam for analysis.

σ GTE Ltd – 25 per cent

σ Nifty – 15 per cent

Correlation coefficient between returns in GTE Ltd. and Nifty index – 0.92.

As an advisor to Mr Satnam, calculate the beta and interpret the results.

LO 3.3

Solution

$$\text{Beta GTE Ltd} = \frac{\sigma_{\text{GTE Ltd}} \sigma_{\text{Nifty}} \text{Correlation (GTE Ltd Nifty)}}{\sigma_{\text{Nifty}}^2}$$

$$= 25 \times 15 \times 0.92 / 15 \times 15 = 1.53$$

The beta of GTE Ltd is 1.53, which indicates that GTE Ltd has a more risky share vis-à-vis the market portfolio, represented by the Nifty index. In case the Nifty index rises by 10 per cent, the return on this share is expected to rise by around 15.3 per cent and vice-versa.

P.3.13 Ranbaxy Ltd is a well-known company in the pharmaceutical industry. Based on the monthly data for the last 4 years from 1 January, 1999 to December 31, 2002, its beta appears equal to 1.75. During this period, the company has deployed an average debt-equity ratio of around 40 per cent in its capital structure. Looking at the challenges being posed by the new patent regime, the company has realised the need for making more investment in research and development activities. For meeting its funding requirement, the company is planning to raise additional funds from the market. The chief finance manager, CFO of the company, is exploring the option of raising the debt level to 60 per cent. However, he is concerned that a rising additional debt may increase the risk proposition of the company, as measured by beta.

Calculate the beta of the firm at 50 per cent and 60 per cent debt level and comment upon the increase in the risk level.

Solution The increase in debt causes an increase in the equity beta in view of the increased financial risk resulting from the increase in the obligated payments on debt.

Let us first of calculate the beta for Ranbaxy Ltd as an unlevered firm:

$$\beta_{\text{Unlevered}} = \text{Current Beta} / [1 + \text{Debt/Equity}] = 1.75 / [1 + 0.40] = 1.75 / 1.40 = 1.25$$

LO 3.5

$$\beta \text{ Levered} = \beta \text{ Unlevered} [1 + \text{Debt/Equity}]$$

$$\beta \text{ Levered (at D/E ratio of 50 per cent)} = 1.25 (1 + 0.5) = 1.875.$$

$$\beta \text{ Levered (at D/E ratio of 60 per cent)} = 1.25 (1 + 0.6) = 2.0.$$

With increase in the debt level in Ranbaxy Ltd, the beta would increase from 1.75 (current) to 1.875 (for 50 per cent debt-equity ratio) and 2.0 (for 60 per cent debt-equity ratio). Risk of the company is independent of the financing decision. Only the risk of equityholders increases with the use of debt.

P.3.14 RR Ltd is a diversified conglomerate that has major interests in agro based business, food processing and cement. Currently, the beta of this company, based on past two year weekly market price, is 1.45. The company is currently planning to hive off its cement division and get out of this business. Based on the trends prevailing in the industry, a comparable cement company would have a beta of around 1.86 with an average debt-equity ratio of 30 per cent.

LO 3.5,6

What would the beta be for the cement division of RR Ltd, which employs, a debt-equity ratio of 70 per cent?

Solution First of all, let us calculate the unlevered beta for the comparable company, as follows:

$$\beta \text{ Unlevered Equity} = \text{Current Equity } \beta / (1 + \text{Debt/Equity}) = 1.86 / [1 + 0.30] = 1.86 / 1.30 = 1.43.$$

Based on the unlevered beta of the comparable, the beta for cement division of RR Ltd can be calculated as:

$$\begin{aligned} \beta \text{ Levered Equity} &= \beta \text{ Unlevered Equity} (1 + \text{Debt/Equity}) \\ &= 1.43 (1 + 0.70) = 1.43 \times 1.70 = 2.43 \end{aligned}$$

MINI CASES

3.C.1 Mr. Alok Dixit is interested in investing in equity shares of Wipro and Dabur. Being conservative in nature, he wants to determine the risk associated with investments. In specific terms, he wants to seek data related to both levered and unlevered beta of these companies. He approaches Ankit Shah, a financial consultant to do the needful. Ankit has collected the relevant information detailed below.

(i) Monthly returns on equity shares of Wipro and Dabur for a period of 2 years (w.e.f. October 200X to September 200Y) along with portfolio of S&P CNX NIFTY.

Number (MONTHS)	WIPRO*	DABUR*	S&P CNX NIFTY**
1	0.1455	0.0432	0.0654
2	0.1291	0.307	0.1536

*Based on CMIE database

**Based on NSE website

- (ii) Return on 364-days treasury bills issued by Government of India for the period 2004-05 is 5.15 per cent per annum and 0.419 per month. This rate is to be used as a proxy for risk-free rate of return.
- (iii) Debt-equity ratio (based on the average of 2001 to 2005) is 1.6 per cent for Wipro and 31.4 per cent for Dabur.
- (iv) Corporate tax is 35 per cent.

Required Compute the beta and interpret it for Alok.

Solution Determination of Beta

It is based on bi-variate regression analysis using SPSS, statistical package.

Wipro

- Beta calculations for Wipro Ltd.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.500	.250	.214	.070662541

a Predictors: (Constant), Returns on index

Coefficients

Model	Unstandardized Coefficients Beta	Std. Error	Standardized Coefficients Beta	t	Sig.	95% Confidence Interval for B Lower Bound	Upper Bound
1 (Constant)	1.006E-02	.016		.637	.531	-.023	.043
Returns on index	.616	.233	.500	2.646	.015	.132	1.100

a Dependent Variable: Returns on Wipro Ltd

Since Wipro is a firm using both equity and debt in its capital structure, the beta reflects business as well as financial risk. By calculating unlevered beta, the financial risk can be separated and beta value can be viewed in light of business risk only. The calculations are as under:

Here $\beta_L = 0.616$, and β_U for Wipro can be calculated (assuming tax rate = 35%)

$$\beta_L = \beta_U [1 + (1 - t)(D/E)]$$

$$0.616 = \beta_U [1 + (1 - 0.35)(.016)]$$

$\beta_U = 0.6096$, which represents business risk component of Wipro Limited.

Interpretations: (i) The beta (levered) value of 0.616 implies that equity shares of Wipro is defensive in nature in that the returns on Wipro shares would change by 0.616 per cent with 1 per cent change in the returns on market portfolio (represented by S&P CNX NIFTY).

(ii) The R-square value of 0.25 or 25 per cent implies that only one-fourth of total risk is systematic/market risk and three-fourth of total risk is firm specific risk.

Dabur

- Beta calculations for Dabur Ltd.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.650	.422	.395	.070506822

a Predictors: (Constant), Returns on index

Coefficients

Model	Unstandardized Coefficients Beta	Std. Error	Standardized Coefficients Beta	t	Sig.	95% Confidence Interval for B Lower Bound	Upper Bound
1 (Constant)	2.232E-02	.016		1.415	.172	-.010	.055
Returns on index	.910	.232	.650	3.916	.001	.427	1.393

a Dependent Variable: Returns on Dabur Ltd

Since Dabur is also a firm using both equity and debt in its capital structure, the beta reflects both business and financial risk. By calculating unlevered beta, the financial risk can be separated and beta value can be viewed in light of business risk only. The calculations are as under:

Here $\beta_L = 0.91$, and β_U for Dabur can be calculated (assuming tax rate = 35%)

$$\beta_L = \beta_U [1 + (1 - t)(D/E)]$$

$$0.9 = \beta_U [1 + (1 - 0.35)(.314)]$$

$\beta_U = 0.7558$, which represents business risk component of Dabur India Ltd.

Interpretation: (i) The beta (levered) value is 0.91. It means that the equity share of Dabur is less defensive vis-a-vis that of Wipro as its value is close to one. One per cent change in the market portfolio will cause 0.91 per cent change in returns of Dabur's equity shares.

(ii) The R-square value of 0.422 or 42.2 per cent signifies that 42.2 per cent of total risk is systematic/ market risk and 57.8 per cent of total risk is unsystematic/diversifiable risk.

3.C.2 (Risk/Beta Analysis) The month-wise data of the S&P CNX Nifty and stock values of the HDFC Bank Ltd and the ICICI Bank Ltd for the past one are year presented below.

Date	S&P CNX Nifty	ICICI Bank Ltd	HDFC Bank Ltd
11/3/200X	2,755.10	327.69	878.36

10/1/200Y	4,711.70	793.00	1,625.00

Required An investor seeks your advice as a financial consultant about the relative riskiness of the investments in the shares of the HDFC Ltd and the ICICI Ltd. What advice would you give him and why?

Solution

The relative risks would be reflected in the respective betas of the shares of the HDFC Bank Ltd and ICICI Bank Ltd.

^{@@}Percentage change in ICICI Stock Value

$$\text{Beta} = 10(2,734.05) - (5.44 \times 10.448) - (10 \times 1,390.32) - (5.44)^2 = 1.97$$

Advice: The investor would be well advised to acquire the shares of the HDFC Bank, the reason being that the risk as reflected in its low beta (0.91) compared to the ICICI's (1.97) is much lower.

REVIEW QUESTIONS

LOD: Easy

RQ.3.1 (a) Indicate whether the following statements are True or False.

[LO 3.1,2,3,4,5]

- (i) Return on any financial asset consists of current yield and capital yield.
- (ii) Risk of an individual financial asset refers to variability of its returns around its mean returns.
- (iii) Return of a portfolio is simply weighted average of returns on individual securities in the portfolio multiplied by their corresponding proportions (weights) in the portfolio.
- (iv) For a given correlation coefficient, a minimum variance portfolio can be created, for which risk of portfolio will be less than the risk of any security in the portfolio.
- (v) Correlation among the securities in the portfolio has nothing to do with the risk of portfolio.
- (vi) If a portfolio consists of two securities, which are perfectly positively correlated, the risk of portfolio will simply be the weighted average of the standard deviations of individual securities.
- (vii) A portfolio consisting of two risky securities can be made riskless, if the securities are perfectly negatively correlated.
- (viii) Efficient frontier consists of those portfolios which offer maximum risk for a given level of expected returns.
- (ix) In CAPM, Beta represents total risk, i.e., systematic and unsystematic risk.
- (x) The point of tangency between the efficient frontier and risk-return indifference curve provides optimal portfolio for the investor concerned.
- (xi) Security market line (SML) and Capital market line (CML) are the same.

[Answers: (i) True (ii) True (iii) True (iv) True (v) False (vi) True (vii) True (viii) False (ix) False (x) True (xi) False]

(b) In the following multiple choice questions select the correct answers.

- (i) Risk of two securities having different expected return can be compared with
 - (a) standard deviation of securities (b) variance of securities (c) coefficient of variation
 - (d) None of these.
- (ii) A portfolio consists of two securities and the expected return on two securities is 12 per cent and 16 per cent respectively. Calculate return of portfolio if first security accounts for 40 per cent of portfolio.
 - (a) 14 per cent (b) 14.4 per cent (c) 16 per cent (d) 12 per cent.
- (iii) Calculate risk for the above portfolio (ii), given $\sigma_1 = 10\%$, $\sigma_2 = 12\%$ and $\sigma_{12} = 75$
 - (a) 11 per cent (b) 15.62 per cent (c) 12.17 per cent (d) None.
- (iv) What is the risk of a portfolio consisting of two securities which are perfectly positively correlated?
 - (a) $(\sigma_1^2 - \sigma_2^2)$ (b) $(w_1\sigma_1 + w_2\sigma_2)^2$ (c) $w_1\sigma_1^2 + w_2\sigma_2^2$ (d) None.
- (v) What is the risk of portfolio in situation (iv) if two securities are perfectly negatively correlated
 - (a) $(\sigma_1^2 - \sigma_2^2)$ (b) $(w_1\sigma_1 + w_2\sigma_2)^2$ (c) $w_1\sigma_1^2 + w_2\sigma_2^2$ (d) None.
- (vi) To create a minimum variance portfolio, in what proportion should the two securities be mixed if the following information is given $\sigma_1 = 10\%$, $\sigma_2 = 12\%$, $P_{12} = 0.6$?
 - (a) .72 and .28 (b) .70 and .30 (c) .60 and .40 (d) none of the above.
- (vii) A portfolio consisting of two risky securities can be made risk less i.e., $\sigma_p = 0$, if
 - (a) the securities are perfectly positively correlated (b) the securities are perfectly negatively correlated (c) if the correlation ranges between 0 to 1 (d) none of the above.

- (viii) Efficient portfolios are those portfolios, which offer (for a given level of risk)
 - (a) maximum return (b) minimum return (c) average return (d) none.
- (ix) Efficient frontier consists of
 - (a) Efficient portfolios (b) Both efficient and inefficient portfolios (c) Portfolios that are positively correlated securities (d) Portfolios that are negatively correlated securities.
- (x) Capital market line is
 - (a) capital allocation line of a risk free asset (b) capital allocation line of a market portfolio (c) capital allocation line of risk-free asset and market portfolio both (d) none.
- (xi) The point of tangency between efficient frontier and risk-return indifference curve depicts
 - (a) sub-optimal portfolio (b) optimal portfolio (c) efficient portfolio (d) none of them.
- (xii) CAPM accounts for
 - (a) systematic risk (b) unsystematic risk (c) both (d) none.

[Answers: (i) c (ii) b (iii) c (iv) b (v) b (vi) a (vii) b (viii) a (ix) a (x) c (xi) b (xii) a]

- RQ.3.9** Distinguish (a) Realised and expected return (b) Diversifiable and non-diversifiable risk (c) Capital market and security market line. **[LO 3.4, 5]**
- RQ.3.10** "Diversification of risk in the asset selection process allows the investor to combine risky assets in a way that risk of a portfolio is less than the risk of the individual assets." Elaborate the statement with appropriate example. **[LO 3.3]**
- RQ.3.11** Why is the non-diversifiable risk only relevant risk? How is such a risk measured? **[LO 3.5]**
- RQ.3.12** Explain with example the process of determining the expected return on a portfolio. **[LO 3.4]**
- RQ.3.13** What is the CAPM? What are the components of CAPM equation? Explain the meaning of each component. What does it tell us about the required return on a risky investment? **[LO 3.5]**
- RQ.3.14** How could an investor identify the best of a set of efficient portfolios of equity shares? Assume the investor can borrow or lend at the risk-free interest rate. **[LO 3.3, 4]**
- RQ.3.15** Describe in brief the Arbitrage Pricing Theory (APT). What is its major contribution and limitation? **[LO 3.7]**

RQ.3.16 The following facts are available:

[LO 3.2,3]

- Risk-free rate, 9 per cent
- Required rate of return on market portfolio, 18 per cent
- Beta coefficient of the shares of ABC Ltd, 1.5
- Expected dividend during the next year, ₹3
- Growth rate in dividends/earnings, 8 per cent

Compute the price at which the shares of ABC Ltd should sell.

RQ.3.17 The probability distribution of expected future returns is as follows:

[LO 3.2]

Probability	Return on shares (percentage)	
	X	Y
0.1	(16)	(18)
0.2	2	12
0.4	8	18
0.2	12	32
0.1	20	40

Compute the (a) standard deviation of expected returns of each share, (b) coefficient of variation. Which share is more risky? Why?

RQ.3.18 The rate on T-bill (risk-free return, r_f) is currently 7.75 per cent, while the expected market return (r_m) is 14.25 per cent. Compute the required rate of return of each security listed below:

[LO 3.2,3]

Security	Beta
X_1	1.5
X_2	1.2
X_3	1.00
X_4	0.90

LOD: Difficult

RQ.3.19 An efficient market means identical returns on all securities. Do you agree? Explain.

[LO 3.4]

RQ.3.20 "Beta is not the sole factor affecting security required rate of return." Elucidate the statement and also state the other factors which should be considered for determining required returns.

[LO 3.6,7]

RQ.3.21 The total market value of the equity share of ORE Company is ₹60,00,000 and the total value of the debt is ₹40,00,000. The treasurer estimates that the beta of the stock is currently 1.5 and that the expected risk premium on the market is 10 per cent. The treasury bill rate is 8 per cent.

[LO 3.3]

Required: (i) What is the beta of the company's existing portfolio of assets? (ii) Estimate the company's cost of capital and the discount rate for an expansion of the company's present business.

RQ.3.22 The expected return (\bar{r}) and standard deviation (σ) of shares of X Ltd and Y Ltd are:

[LO 3.3]

	\bar{r}	σ
X Ltd	0.14	0.20
Y Ltd	0.09	0.30

Required: If the expected correlation between the two shares (p_{xy}) is (a) 0.1, (b) -1, compute the return and risk for each of the following portfolios: (i) X, 100 per cent, (ii) Y, 100 per cent, (iii) X, 50 per cent and Y, 50 per cent.

RQ.3.23 The aggregate average r_f and r_m for a 3-year period are 10 per cent and 18 per cent respectively.

The results for four portfolios during the same period are summarised as follows:

[LO 3.5]

Portfolio	Average return (per cent)	Beta
X_1	18	0.90
X_2	18	1.12
X_3	24	1.50
X_4	16	0.95

Using the CAPM, compute the expected return for each portfolio and compare the actual and expected returns. Which portfolio has performed the best?

ANSWERS

3.7 r_m 11.87 per cent

3.8 b 1.7

3.16 Expected price ₹20.7

3.17 (a) Standard deviation

X	8.94%
Y	14.98%

(b) Coefficient of variation

X	1.4
Y	0.82

Share X is more risky.

3.18 X_1 17.50 per cent

X_2 15.55 per cent

X_3 14.25 per cent

X_4 13.60 per cent

3.21 (i) Beta 0.9

(ii) Cost of debt 8%; cost of capital 17%

3.22 (a) (i) 1.43

(ii) 3.33

(iii) \bar{r}_p 11.5 per cent

σ_p 18.84 per cent

(b) (i) and (ii) same as in (a)(i) and (ii)

(iii) \bar{r}_p 11.5 per cent

σ_p 5 per cent

3.23 X_1 17.2 per cent; 18 per cent

X_2 19.0 per cent; 18 per cent

X_3 22.0 per cent; 24 per cent

X_4 17.6 per cent; 16 per cent

X_3 has shown the best performance.

Valuation of Bonds and Shares

LEARNING OBJECTIVES

- | | |
|--------|---|
| LO 4.1 | Explain the basic valuation model to value bonds/debentures, preference shares and equity shares |
| LO 4.2 | Apply the basic valuation model to bonds/debentures to evaluate the relationship between both required return and time to maturity and bond values |
| LO 4.3 | Discuss the valuation of perpetual and redeemable preference shares applying the basic valuation model |
| LO 4.4 | Understand basic share valuation under each of three cases—zero growth, constant growth and variable growth |
| LO 4.5 | Discuss three other approaches—book value, liquidation value and price-earnings/multiple—that are used to estimate shares values |
| LO 4.6 | Review the relationship between the impact of financial decisions on both expected return and risk and their combined effect on the value of a firm |
| LO 4.7 | Describe equity returns in India |

INTRODUCTION

Valuation is the process that links risk and return to determine the worth of an asset. It can be applied to expected benefits from real/physical as well as financial assets/securities to determine their worth at a given point of time. This Chapter focusses on valuation of two financial assets, namely, bonds/debentures and shares, ordinary as well as preference. To value them, we have to use the time value techniques (discussed in Chapter 2) and the risk and return framework (discussed in Chapter 3). The key inputs to the valuation process are (i) expected returns in terms of cash flows together with their timing and (ii) risk in terms of the required return. The value of an asset depends on the return (cash flow) it is expected to provide over the holding/ownership period. The cash flow stream can be (1) annual, (2) intermittent and (3) even one-time. In addition to the total cash flow estimates, their timing/pattern (e.g. amount year-wise) is also required to identify the return expected from

- **Valuation**
- is the process that
- links risk and return
- to determine the
- worth of an asset.

the bond/share. The required return is used in the valuation process to incorporate risk into the analysis/exercise. Risk denotes the chance that an expected outcome (return/cashflow) would not be realised (Chapter 3). The level of risk associated with a given cash flow/return has a significant bearing on its value, that is, the greater the risk, the lower the value and *vice versa*. Higher risk can be incorporated into the valuation analysis by using a higher required/capitalisation/ discount rate (Chapter 2) to determine the present value. With CAPM (Chapter 3), the greater the Beta, β , the higher the required return. It is against this background that the present chapter dwells on the valuation of bonds/debentures and shares. We first describe the basic valuation model. It can be used in valuing bonds, preference shares, and ordinary/equity shares. Valuation of bonds is illustrated later. Valuation of preference shares and ordinary shares is discussed subsequently. In addition to the basic stock valuation equation (dividend valuation model), there are other approaches to the valuation of shares. They are briefly covered. The relationship among financial decisions, returns, risk and share value are examined. Finally, the main points are summarised.

LO 4.1 BASIC VALUATION MODEL

The value of an asset/security is the present/discounted value of all future cash flows (returns) associated with it over the relevant/specified period. The expected returns (cash inflows) are discounted, using the required return commensurate with the risk of the asset as the appropriate discount rate. Symbolically,

$$V = \frac{A_1}{(1+k)^1} + \frac{A_2}{(1+k)^2} + \dots + \frac{A_n}{(1+k)^n} \quad (4.1)$$

where V = value of the asset/security at time zero ($t = 0$)

A_t = cash flow streams expected at the end of year t

k = appropriate required/capitalisation/discount rate

Alternatively, if the expected cash flow is a mixed stream

$$V = [(A_1 \times PVIF_{k1}) + (A_2 \times PVIF_{k2}) + \dots + (A_n \times PVIF_{kn})] \quad (4.2)$$

where

$PVIF_1$, $PVIF_2$ and $PVIF_n$ = present value interest factor in different periods at discount rate k .

If the expected cash flow is an annuity,

$$V = A \times PVIFA_{(k,n)} \quad (4.2.1)$$

Example 4.1

Assuming a discount rate of 10 per cent, and the associated cash flows detailed below, compute the value of the assets X and Y.

Year	Cash flows (expected returns)	
	X	Y
1	₹10,000	₹5,000
2	10,000	10,000
3	10,000	15,000

Solution

Value of asset X: = ₹10,000 × $PVIFA_{(10,3)}$ = ₹10,000 × 2.487 = ₹24,870

Value of asset Y: = [(₹5,000 × $PVIF_{(10,1)}$) + (₹10,000 × $PVIF_{(10,2)}$) + (₹15,000 × $PVIF_{(10,3)}$)]
 = [(₹5,000 × 0.909) + (₹10,000 × 0.826) + (₹15,000 × 0.751)]
 = ₹4,545 + ₹8,260 + ₹11,265 = ₹24,070.

LO 4.2 VALUATION OF BONDS/DEBENTURES

A bond/debenture is a long-term debt instrument used by the government/government agency (ies) and business enterprises to raise a large sum of money. A detailed account of the main attributes of bonds is given in Chapter 23. Most bonds, particularly corporate bonds (i) pay interest half-yearly (semi-annually) at a stated coupon interest rate, (ii) have an initial maturity of 10-years and (iii) have a par/face value of ₹1,000 that must be repaid at maturity. **Par value** is the value on the face of the bond. It represents the amount the entity borrows and promises to repay at the time of maturity. **Coupon rate** is the specified interest rate. The interest payable to the bondholder is equal to par value × coupon rate. **Maturity period** refers to the number of years after which the par value is payable to the bondholder. To illustrate, a firm has issued a 10 per cent coupon interest rate, 10-year bond with a ₹1,000 par value that pays interest semi-annually. A bondholder would have the contractual right to (1) ₹100 annual interest (0.10, coupon rate interest × ₹1,000, par value) paid as ₹50 (½ × ₹100) at the end of every 6 months and (2) ₹1,000 par value at the end of the 10th year. We illustrate in this Section the valuation of bonds with reference to (i) basic bond valuation, (ii) yield to maturity, and (iii) semi-annual interest and bond values.

- **Par value**
- is value on the face of the bond.
- **Coupon rate**
- is the specified interest rate
- **Maturity period**
- is the number of years after which the par/specified value is payable to the bondholders.

Basic Bond Valuation

The value of a bond is the present value of the contractual payments its issuer (corporate) is obliged to make from the beginning till maturity. The appropriate discount rate would be the required return commensurate with risk and the prevailing interest rate. Symbolically,

$$B = I \left[\sum_{t=1}^n \frac{1}{(1 + k_d)^t} \right] + M \times \left[\frac{1}{(1 + k_d)^n} \right] \quad (4.3)$$

$$= I \times (PVIFA_{k_d, n}) + M \times (PVIF_{k_d, n}) \quad (4.3-A)$$

where

B = value of the bond at $t = 0$

I = annual interest paid

n = number of years to maturity (term of the bond)

M = par/maturity value

k_d = required return on the bond

Example 4.2

For the data given above and assuming interest is paid annually, compute the value of the bond.

Solution

$$\begin{aligned} B_0 &= [\text{₹}100 \times (PVIFA_{10,10}) + \text{₹}1,000 (PVIF_{10,10})] \\ &= (\text{₹}100 \times 6.145) + (\text{₹}1,000 \times 0.386) \\ &= \text{₹}614.5 + \text{₹}386 = \text{₹}1,000 \end{aligned}$$

The bond value is equal to the par value. As a general proposition, **when the required return is equal to the coupon rate, the bond value equals the par value**. However, the market value of the bond is rarely equal to its par value. Several external factors over which bondholders or issuers have no control tend to affect bond values. We discuss below the impact of two factors on bond values, namely, (i) required return and (ii) time to maturity.¹

Impact of Required Return on Bond Values When the required return on a bond differs from its coupon rate, the value of a bond would differ from its par/face value. The reason for the differences in the required return and the coupon interest rate may be (i) change in the basic cost of long-term funds or (ii) change in the basic risk of the firm. When the required return (RR) is more than the coupon rate of interest (CR), the bond value would be less than its par value, that is, the bond would sell at a **discount** equal to $(M - B)$. Conversely, in case the RR is less than CR, the bond value would be more than the par value, that is, the bond would sell at a **premium** equal to $(B - M)$. Consider Example 4.3.

Discount is the amount by which a bond sells below its par/face value.

Premium is the amount by which a bond sells at a value higher than its par/face value.

Example 4.3

Assuming for the facts in Example 4.2 the required return is (i) 12 per cent and (ii) 8 per cent, find the value of the bond.

Solution

$$\begin{aligned} \text{(i)} \quad B &= [\text{₹}100 \times (PVIFA_{12,10}) + \text{₹}1,000 \times (PVIF_{12,10})] \\ &= [(\text{₹}100 \times 5.650) + (\text{₹}1,000 \times 0.322)] \\ &= \text{₹}565 + \text{₹}322 = \text{₹}887 \end{aligned}$$

The bond would sell at a discount of ₹113 (₹887 – ₹1,000)

$$\begin{aligned} \text{(ii)} \quad B &= [\text{₹}100 \times (PVIFA_{8,10}) + \text{₹}1,000 \times (PVIF_{8,10})] \\ &= [(\text{₹}100 \times 6.710) + (\text{₹}1,000 \times 0.463)] \\ &= \text{₹}671 + \text{₹}463 = \text{₹}1,134 \end{aligned}$$

The bond would sell at a premium of ₹134 (₹1,134 – ₹1,000).

Impact of Maturity on Bond Value When the required return (RR) is different from the coupon rate of interest (CR), the time to maturity would affect value of bonds even though the RR remains constant till maturity. The relationship among (i) time to maturity, (ii) the RR and (iii) the bond value are related to (a) constant RR and (b) changing RR.

Constant Required Returns In such a situation the value of the bond would approach its par value as the passage of time moves the value of the bond closer to maturity.

Changing Required Returns The shorter the time period until a bond's maturity, the less responsive is its market value to a given change in the required return. In other words, short maturities have less "interest rate risk" than do long maturities when all other features, namely, CR, par value and frequency of interest payment, are the same.²

To illustrate, the results relating to the bonds values for various required returns of the computations in Examples 4.2 and 4.3 are summarised in Table 4.1 and graphically depicted in Figure 4.1.

Figure 4.2 depicts the behaviour of these bond values. Each of the three required returns (i.e. 12, 10, and 8) is assumed to remain constant over the 10 years to its maturity. In each case, the value ultimately equals the par value of ₹1,000 at its maturity. At the 12 per cent RR, its discount declines with the passage of time as its value increases from ₹887 to ₹1,000. When the 10 per cent RR equals the CR, its value remains unchanged at ₹1,000. Finally, at the 8 per cent RR, its premium will decline as its value drops from ₹1,134 to ₹1,000.

TABLE 4.1 Bond Values for Various Required Returns

Required returns (k_d)	Bond value (B)	Status
12	₹887	Discount
10	1,000	At par
8	1,134	Premium

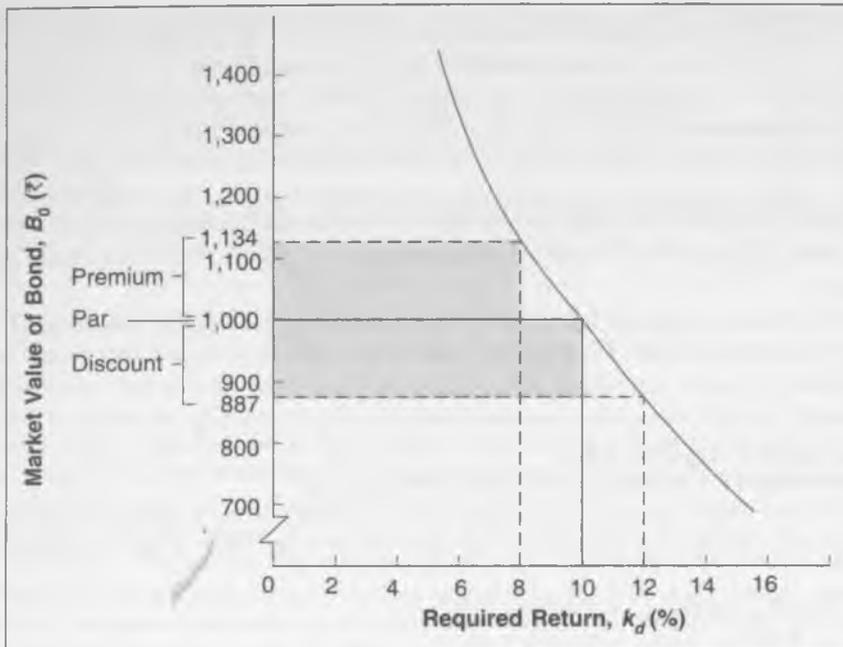

FIGURE 4.1 Bond Values and Required Returns

Thus, the value of a bond approaches ₹1,000 par/maturity value as the time to maturity declines.

The effect of changing RRs on bonds of differing maturities is also depicted in Fig 4.2, denoted by the dotted line.

The main conclusion is that **the shorter the time to maturity, the smaller the impact on bond value caused by a given change in the required return.**

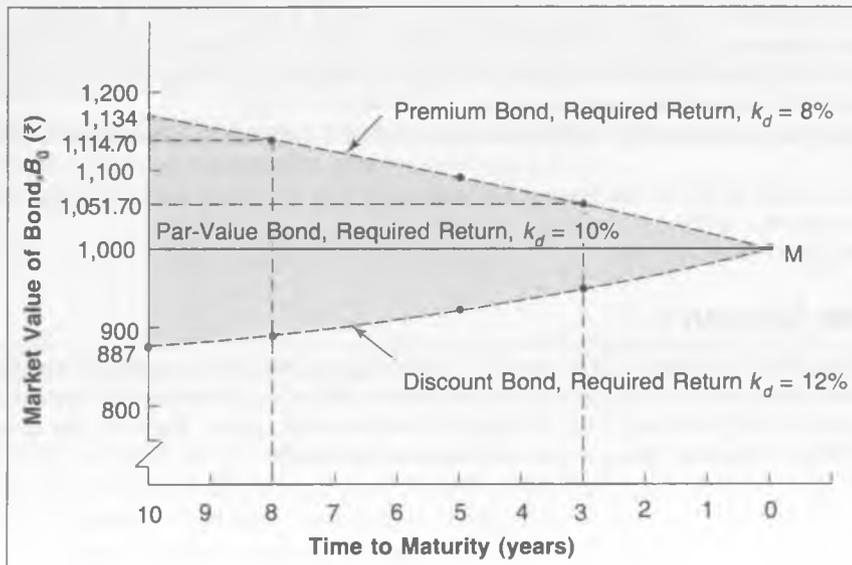

FIGURE 4.2 Time to Maturity and Bonds

Yield to Maturity (YTM)

Yield to maturity (YTM) is the rate of return an investor earns on a bond held till maturity.

The **YTM** is the rate of return that investors earn if they buy a bond at a specific price and hold it until maturity. It assumes that the issuer of the bond makes all due interest payments and repayments of principal as contracted/promised. The YTM on a bond whose current price equals its par/face value (i.e. purchase price = maturity value) would always be equal to its coupon interest rate. In case the bond value differs from the par value, the YTM would differ from the CR. Assuming annual interest payments, the YTM can be computed using Equation 4.3-A. Consider Example 4.4.

Example 4.4

The bonds of the Premier Company Ltd (PCL) are currently selling for ₹10,800. Assuming (i) coupon rate of interest, 10 per cent, (ii) par value, ₹10,000, (iii) years to maturity, 10 years and (iv) annual interest payment, compute the YTM.

Solution

Substituting the values in Equation 4.3-A.

$$₹10,800 = [₹1,000 \times (PVIFA_{k_d,10}) + ₹10,000 \times (PVIF_{k_d,10})]$$

If $k_d = 10$ per cent, that is, equal to the coupon rate, the value of the bond would be ₹10,000. Since the value of the bond is ₹10,800, the k_d must be less than 10 per cent. Using 9 per cent discount rate (k_d), we get

$$\begin{aligned} & ₹1,000 \times (PVIFA_{9,10}) + ₹10,000 (PVIF_{9,10}) \\ &= (₹1,000 \times 6.418) + (₹10,000 \times 0.422) \\ &= ₹6,418 + ₹4,220 = ₹10,638 \end{aligned}$$

Since the value of the bond (₹10,638) at $k_d = 9$ per cent is less than ₹10,800 (current market price), we try a lower rate of discount (k_d). Using 8 per cent, we get

$$\begin{aligned} & (₹1,000 \times 6.710) + (₹10,000 \times 0.463) \\ &= ₹6,710 + ₹4,630 = ₹11,340 \end{aligned}$$

Since the bond value (₹11,340) is higher than the current price of ₹10,800, the k_d (YTM) must be between 8 and 9 per cent. The exact value can be found by interpolation, as discussed below.

- (i) Difference between the bond values at 8 and 9 per cent = ₹702 (₹11,340 – ₹10,638)
 - (ii) Difference between desired value (₹10,800) and the value with the lower, $k_d = ₹540$ (₹11,340 – ₹10,800)
 - (iii) Percent of the difference/distance across the discount rate range, 8-9 per cent, that is, divide the value from step (i) by the value found in step (ii) = 0.77 (₹540 ÷ ₹702)
 - (iv) Multiplying the per cent in (iii) by the interval width of 1 per cent (9-8) per cent = 0.77 per cent (0.77 × 1%)
 - (v) Adding the value in (iv) to the interest rate associated with the lower end of the interval/interest rate = 8.77 per cent (8 + 0.77).
- Thus, the YTM = 8.77 per cent

Spreadsheet Solution 4.1

Alternatively, the Yield-to-Maturity (YTM) can be calculated using the yield function of the MS-Excel. To use the yield function, you need to click on the function tab in MS Excel, a window will appear; select Financial from the category of the functions, a list of financial functions will appear; scroll the list down and click on the function YIELD, a window listing the inputs required will appear.

	A	B	C	D	E	F	G	H
1	Settlement Date	Maturity Date	Rate	Pr	Redemption	Frequency	YTM	
2	1-Jan-00	31-Dec-09	10%	108	100	1	0.0877	
3								
4								

Else, you can directly enter the formula in the formula bar as =YIELD (settlement, maturity, rate, pr, redemption, frequency, [basis]). To solve the above example, relevant data has been entered in the spreadsheet. Since the excel function requires settlement and maturity dates instead of time period to maturity. We have chosen two dates representing the period of 10 years, i.e., bonds time left to maturity. The settlement and maturity dates have been entered in cells A2 and B2 respectively. Interest rate has been entered in cell C2. Notably, the other two inputs (Pr and redemption) need to be written per 100 rupees. Therefore, the current price has been written as 108 instead of 10800 and the redemption value has been written as 100 instead of 10000. The last input frequency denotes the frequency of coupon payment in the year, e.g., annual, semiannually etc. The input needed is 1 for annual payment, 2 for semiannual payments and so on. Finally, we have calculated the YTM by using the excel function in cell G2. The answer we get is the same as determined by the manual calculations, i.e., 0.0877 or 8.77%.

Semiannual Interest and Bond Values

The procedure to value bonds paying interest semiannually (half-yearly) is similar to that illustrated in Chapter 2 for compounding interest more frequently than annually. However, here we have to find out the present value. The following steps are involved in computing the value of a bond when interest is paid semiannually:

- Convert annual interest, I , to semiannual interest by dividing it by 2.
- Convert the number of years to maturity, n , to the number of 6-month periods to maturity by multiplying n by 2.
- Convert the required stated return for similar-risk bonds that also pay half-yearly interest from an annual rate, K_d to a semiannual rate by dividing it by 2.

Symbolically,

$$B = \frac{I}{2} \times [PVIFA_{d/2, 2n}] + M \times [PVIF_{d/2, 2n}] \quad (4.4)$$

Example 4.5

For facts in Example 4.4, assume (i) the bonds of the firm pay interest semiannually, (ii) the required stated return is 14 per cent for similar-risk bonds that also pays half-yearly interest. Compute the value of the bond.

Solution

Substituting the values in Equation 4.4, we get

$$\begin{aligned} B &= (\text{₹}1,000 + 2) \times [PVIFA_{14/2 \times 2, 10}] + \text{₹}10,000 \times [PVIF_{14/2, 2 \times 10}] \\ &= (\text{₹}1,000/2) \times (PVIFA_{7, 20}) + \text{₹}1,000 \times (PVIF_{7, 20}) \\ &= (\text{₹}500 \times 10.594) + (\text{₹}1,000 \times 0.258) \\ &= \text{₹}5,297 + \text{₹}2,580 = \text{₹}7,877 \end{aligned}$$

The value of a bond selling at a discount is lower when semiannual interest is used compared to annual interest. For bonds selling at a premium, the value with semiannual interest is greater than with annual interest.

Spreadsheet Solution 4.2

The value of bond can be calculated by using PRICE function of the MS Excel.

	A	B	C	D	E	F	G
1	Settlement Date	Maturity Date	Rate	Yield	Redemption	Frequency	Price
2	1-Jan-00	31-Dec-09	10%	14%	100	2	7881.38
3							

The function PRICE is similar to the function YIELD as the inputs needed are nearly the same. This function requires YTM (Yld) instead of current price of the bond. The required return on the other bond in the same risk class can be treated as YTM. It is important to note that the function requires redemption value per 100 rupees, the price generated is also per 100 rupees of face value. The price of the bond has been determined in cell G2 using the formula =PRICE (settlement, maturity, rate, yld, redemption, frequency, [basis]). The price per 10,000 rupees of face value can be determined by multiplying the price with 100. The difference in the prices is because of approximations in the manual calculations.

LO 4.3 VALUATION OF PREFERENCE SHARES

Preference shares, like debentures, are usually subject to fixed rate of return/dividend. In the case of no stated maturity, their valuation is similar to perpetual bonds. Symbolically,

$$V = \sum_{t=1}^n \frac{D_p}{(1 + (k_p)^t)} \text{ or } \frac{D_p}{k_p} \quad (4.5)$$

The valuation of redeemable preference shares is given by Equations 4.6 and 4.7.

$$V = \sum_{t=1}^n \frac{D_p}{(1 + (k_p)^t)} + \frac{MV}{(1 + k_p)^n} \quad (4.6)$$

$$= D_p(PVIFA_{k_p n}) + MV(PVIF_{pv n}) \quad (4.7)$$

Expected return is the return that is expected to be earned on a given security over an infinite time horizon.

LO 4.4 VALUATION OF ORDINARY SHARES

The ordinary/equity shareholders buy/hold shares in expectation of periodic cash dividends and an increasing share value. They would buy a share when it is undervalued (i.e. its true value is more than its market price) and sell it when its market price is more than its true value (i.e. it is overvalued). The value of a share is equal to the present value of all future dividends it is expected to provide over an infinite time horizon. symbolically,

$$P = \frac{D_1}{(1 + K_e)^1} + \frac{D_2}{(1 + K_e)^2} + \dots + \frac{D_\infty}{(1 + K_e)^\infty} \quad (4.8)$$

where P = value of shares
 D_t = per share dividend expected at the end of year, t
 K_e = required return on share

The equation is designed to compute the value of shares with reference to the expected growth pattern of future dividends and the appropriate discount rate. We illustrate below the computation of value of shares with reference to (i) zero growth, (ii) constant growth and (iii) variable growth.

Zero Growth Model

This approach to dividend valuation assumes a constant non-growing dividend stream. With zero growth in dividends, the value of share would equal the present value of a perpetuity of dividends (D_1) discounted at K_e . Symbolically,

$$P = D_1 \times \sum_{t=1}^{\infty} \frac{1}{(1 + K_e)^t} = D_1 (PVIFA_{K_e \infty}) = D_1 \times \frac{1}{K_e} = \frac{D_1}{K_e} \quad (4.9)$$

where D_1 = constant dividend per share
 K_e = required return of investors

Example 4.6

The per share dividend of Premier Instruments Ltd (PIL) remains constant indefinitely at ₹10. Assuming a required rate of return of 16 per cent, compute the value of the PIL's shares.

Solution

$$P = \frac{D_1}{K_e} = \frac{₹10}{0.16} = ₹62.5$$

Constant Growth Model/Gordon Model

According to this approach, dividends are assumed to grow at a constant rate which is less than the required rate. This model is primarily known as the Gordon Model. The value of a share is given by Equation (4.10).

$$P = \frac{D_0 \times (1 + g)^1}{(1 + K_e)^1} + \frac{D_0 \times (1 + g)^2}{(1 + K_e)^2} + \dots + \frac{D_0 \times (1 + g)^\infty}{(1 + K_e)^\infty} \quad (4.10)$$

$$\text{or } P = \frac{D_1}{K_e - g} \quad (4.11)$$

Where P = value of share K_e = required rate g = growth rate in dividend
 This is illustrated in Example 4.7

Example 4.7

The Premier Instruments Ltd (PIL) had paid the following dividends per share.

- **Zero growth model**
- is an approach to dividend valuation that assumes a constant, non-growing dividend stream.

- **Constant growth model**
- assumes that dividend will grow at a constant rate that is less than the required rate.

- **Gordon model**
- is the common name for the constant growth model widely cited in dividend valuation.

- **Required rate/return**
- is a specified return required by investors for a given level of risk.

Year	Dividend per share	Year	Dividend per share
6	₹2.80	3	2.24
5	2.58	2	2.10
4	2.40	1	2.00

Assuming a 16 per cent required return, and ₹3 per share dividend in year 7 (D_7) compute the value of the shares of PIL.

Solution

$$P = \frac{D_1}{K_e - g}$$

The expected constant rate of dividend growth, g , would be equal to the annual growth rate of dividends.

$$g = \frac{D_6 - D_1}{D_1} = \frac{2.80 - 2.00}{2.00} = 0.40$$

$$\frac{D_1}{D_6} = \frac{1}{(1 + g)^5} = PVIF_{g,5}$$

$$PVIF = \frac{2.00}{2.80} = 0.714$$

Number of years of growth: year 6 – year 1 = 5

The $PVIF$ closest to 0.714 (Table A-3) = 0.713 (at 7 per cent). Therefore, $g = 7$ per cent

$$P = \frac{₹3}{(0.16 - 0.07)} = \frac{₹3}{0.09} = ₹33.3 \text{ per share}$$

Variable Growth Model

Variable growth model is a dividend valuation approach that allows for a change in the dividend growth rate.

As a dividend valuation approach, this model incorporates a change in the dividend growth rate. Assuming g_1 = initial growth rate and g_2 = the subsequent growth rate occurs at the end of year N , the value of the shares can be determined as follows:³

Step 1: Compute the value of cash dividends at the end of each year (D_t) during the initial growth period (years 1 – N). Symbolically,

$$D_t = D_0 \times (1 + g_1)^t = D_0 \times PVIF_{g_1, t}$$

Step 2: Compute the present value of the dividends expected during the initial growth period. Symbolically,

$$\sum_{t=1}^N \frac{D_0 \times (1 + g_1)^t}{(1 + K_e)^t} = \sum_{t=1}^N \frac{D_t}{(1 + K_e)^t} = \sum_{t=1}^N (D_t \times PVIF_{K_e, t})$$

Step 3: Find the value of the share at the end of the initial growth year, $P_N = (D_N + 1) / (K_e - g_2)$. This is the present value of all dividends expected from year $N + 1$ onwards assuming a constant dividend growth rate, g_2 . The present value of P_N would represent the value today of all dividends expected to be received from year $N + 1$ to infinity. Symbolically,

$$\frac{1}{(1 + K_e)^N} \times \frac{D_N + 1}{K_e - g_2} = PVIF_{K_e, N} \times P_N$$

Step 4: Add the present value components found in Step 2 and 3 to find the value of share, P given in Equation 4.9.

$$P = \underbrace{\sum_{t=1}^N \frac{D_0 \times (1+g_1)^t}{(1+K_e)^t}}_{\text{(Present value of dividends during initial growth period)}} + \underbrace{\left[\frac{1}{(1+K_e)^N} \times \frac{D_N + 1}{K_e - g_2} \right]}_{\text{(Present value of price of share at the end of initial growth period)}} \quad (4.12)$$

We illustrate (Example 4.8) the computation of the value of shares with only one growth rate change.

Example 4.8

The most recent (year zero, Y_0) annual dividend paid by the Premier Instruments Ltd (PIL) is ₹3 per share. An annual increase of 10 per cent (g_1) is expected over the next three years ($Y_1 - 3$). At the end of 3 years (Y_3), the dividend growth rate would slow down to 5 per cent for ever (g_2). Assuming 15 per cent required rate of return, compute the current value of the shares of the PIL.

Solution

Step 1: Present value of cash dividends, $Y_1 - 3$

Year-end (t)	$D_0 = D_{Y_0}$	$PVIF_{10,t}$	$D_t [(1) \times (2)]$	$PVIF_{15,t}$	Present value of dividends [(3) \times (4)]
	(1)	(2)	(3)	(4)	(5)
Y_1	₹3	1.100	₹3.30	0.870	₹2.87
Y_2	3	1.210	3.63	0.756	2.75
Y_3	3	1.331	4.00	0.658	2.63
					8.25

Step 2: Sum of present value of dividends = $\sum_{t=1}^3 \frac{D_0 \times (1+g_1)^t}{(1+K_e)^t} = ₹8.25$

Step 3: Value of shares at the end of the initial growth period ($N = Y_3$)

$$D_{N+1} = D_{Y_4}$$

$$D_{Y_4} = D_{Y_3} \times (1 + 0.05) = ₹4 \times 1.05 = ₹4.2$$

By using $D_{Y_4} = ₹4.2$, $K_e = 0.15$ and $g_2 = 0.05$, the value of shares at end - Y_3 , P_{Y_3}

$$= \frac{D_{Y_4}}{K_e - g_2} = \frac{₹4.2}{0.15 - 0.05} = \frac{₹4.2}{0.10} = ₹42$$

Conversion of present value of ₹42 at the end of Y_3 to current value (Y_0) = $PVIF_{K_e, N} \times P_{Y_3}$

$$= PVIF_{15,3} \times P_{Y_3} = 0.658 \times ₹42$$

$$= ₹27.64$$

Step 4: Current (end- Y_0) value of shares of PIL:

$$= ₹8.25 + ₹27.64 = ₹35.89$$

Thus, the share is currently worth ₹35.89 per share.

Spreadsheet Solution 4.3

The value of a share can be calculated by using MS Excel as well.

	A	B	C	D	E	F	G	H	I
1	Dividend at the beginning of the year (D_0)			3					
2	Growth Rate for first three years (g_1)			10%					
3	Growth Rate after third year (g_2)			5%					
4	Required Rate Return (k_e)			15%					
5	Year	D_t							
6	1	3.3							
7	2	3.63							
8	3	3.99							
9	4	4.19		35.81					
10									
11									

The data related to the initial dividend, initial growth rate, continuing growth rate and required rate of return has been entered in cells D1 to D4 respectively. The dividend at the end of year 1 has been calculated in cell B6 by using formula $=D\$1*(1+D\$2)^{A6}$. This formula has been copied to cells D7 and D8 for the dividends at the end of years 2 and 3 respectively. Since the growth rate for the year 4 and subsequent years has changed, the dividend for year 4 has been calculated by using the formula $=B8*(1+D3)$. Finally, the value of a share has been determined using the formula $=NPV(D4,B6:B8)+((B9/(D4-D3))/(1+D4)^3)$. The formula can be decomposed into two components. The first component represents the value of share based on the dividends for the first three years growing at 10%. This has been determined using NPV formula. The other component of the share value represents the continuing value based on the dividends fourth year onwards growing at 5%. This has been determined by using valuation formula and has been discounted to the time zero period or beginning of the year 1.

LO 4.5 OTHER APPROACHES TO VALUATION OF SHARES

In addition to the dividend valuation approach discussed in the preceding section, there are other approaches to valuation of shares. We discuss below three of these: (i) book value, (ii) liquidation value and (iii) price-earning multiples.

Book Value Approach

Book value per share is the amount per share on the sale of assets of the company at their exact book (accounting) value minus all liabilities including preference shares.

This approach uses the **book value per share (BVPS)** as the basis of valuation of shares. The **BVPS** is the *networth (i.e. equity capital plus reserves and surplus) divided by the number of outstanding equity shares*. Alternatively, the BVPS is the *amount per share on the sale of the assets of the company at their exact book (accounting) value minus all liabilities including preference shares*. Assuming total assets of Alert Ltd ₹60 crore, total liabilities including preference shares of ₹45 crore and 10,00,000 shares, its $BVPS = (\text{₹}60 \text{ crore} - \text{₹}45 \text{ crore}) / 10,00,000 = \text{₹}150$. Alternatively, assuming a networth of ₹15 crore (i.e. capital ₹10 crore and reserves ₹5 crore), the BVPS of Alert Ltd

$$= \frac{\text{₹15 crore}}{10,00,000} = \text{₹150}$$

However, the BVPS is not a good proxy for true investment value. For one thing, this approach relies on historical balance sheet data. Moreover, it ignores the expected earning potential. Similarly, the BVPS has no true relationship to the market value of the firm.

Liquidation Value

This approach to valuation of shares is based on the **liquidation value per share (LVPS)**.

$$\text{LVPS} = \frac{\left[\text{Value realised from liquidating all assets} \right] - \left[\text{Amount to be paid to all creditors and preference shareholders} \right]}{\text{Number of outstanding shares}}$$

- **Liquidation value per share** is the actual amount per share if all assets are sold, liabilities including preference shares paid and any remaining money is divided among the ordinary shareholders.

If the total assets of Alert Ltd can be liquidated for ₹52.5 crore, its LVPS = (₹52.5 crore – ₹45 crore) ÷ 10,00,000 = ₹75. The minimum value of the firm would be ₹75 per share. The LVPS is a more realistic measure than book value. But it ignores the earnings power of the assets of the firm. Moreover, it is difficult to estimate the liquidation value of a going concern. For these reasons, the LVPS is also not a true proxy of the true investment value.

Price/Earnings (P/E) Multiples/Ratio

The **P/E ratio/multiple** reflects the amount investors are willing to pay for each rupee of earnings. Based on the P/E multiple, market price of a share (MPS) can be determined as per equation 4.13

$$\text{MPS} = \text{EPS} \times \text{P/E ratio} \quad (4.13)$$

- **Price/earnings multiple approach** is a technique to compute value of shares multiplying expected earnings per share by the average price/earnings ratio for the industry.

The earnings per share (EPS) of the firm are multiplied by the average P/E ratio for the industry to estimate the value of the firm on the assumption that the investors value the earnings of a given firm in the same manner as they do the “average” firm in the industry. Assuming on the basis of an analysis of historical earnings trends and expected economic and industry conditions, the Alert Ltd would earn ₹15 per share next year, and average P/E ratio for the firms in the industry is 10, value of its share = ₹15 × 10 = ₹150.

LO 4.6 RELATIONSHIP AMONG FINANCIAL DECISIONS, RETURN, RISK AND SHARE VALUES

Any action of the financial manger that (i) increases the level of expected return ($D_{1,g}$) without changing risk (k_e) should increase share value, (ii) reduces the level of expected return without changing risk should reduce share values. Likewise, any action that increases/reduces risk (required return) will reduce/increase share value. Since financial decisions affect both return and risk, an assessment of their effect on value must form part of the decision making process. We illustrate below their impact on share values.

Changes in Expected Return

Any management action that would increase the level of expected return without changing risk (required return) would have a positive effect on share values/owners wealth and should, accordingly, be undertaken. Consider Example 4.9.

Example 4.9

For the facts in Example 4.7, assuming that the expected rate of growth would increase from 7 to 9 per cent due to proposal to upgrade technology, compute the value of the share.

Solution

$$\begin{aligned} P_0 &= \frac{D_1}{K_e - g} \\ &= \frac{₹3}{(0.16 - 0.09)} = \frac{₹3}{0.07} = ₹42.9 \end{aligned}$$

Thus, value of shares has increased from ₹33.3 to ₹42.9. The increase is caused by the higher expected future return/dividends as reflected in the increase in the growth rate.

Changes in Risk

Any action by the financial manager that increases risk will also increase the required return. It will result in reduction in value. Any action that decreases risk would contribute to an increase in value. Consider Example 4.10.

Example 4.10

Assume for the facts in Example 4.7 that reflecting an increase in risk, the required rate increases to 17 per cent. Compute the value of the shares.

Solution

$$\begin{aligned} P_0 &= \frac{D_1}{K_e - g} \\ &= \frac{₹3}{(0.17 - 0.07)} = \frac{₹3}{(0.10)} = ₹30 \end{aligned}$$

Thus, the value of shares has declined from ₹33.3 to ₹30 due to increase in the required return (K_e) without any corresponding increase in the expected return.

Combined Effect

A financial decision typically affects both return and risk. Depending on the magnitude of change in these variables, the net effect on value can be assessed. This is shown in Example 4.11.

Example 4.11

To illustrate the combined effect of the changes in the expected return and the required return in Examples 4.9 and 4.10, compute the value of the shares.

Solution

$$P_0 = \frac{D_1}{K_e - g}$$

$$= \frac{₹3}{(0.17 - 0.09)} = \frac{₹3}{0.08} = ₹37.5$$

The net effect of the management decision which increased return (i.e. g from 7 to 9 per cent) as well as risk (i.e. K_e from 16 to 17 per cent) is positive resulting in increase value of shares from ₹33.3 to ₹37.5. As it increases the owners value, the decision seems to be in the interest of the shareholders.

LO 4.7**EQUITY RETURNS IN INDIA**

Equity returns in India (from NSE 500 index companies) earned during 1994-2014 are summarized below:

- The Indian equity markets provide adequate returns to the technical (short-term) investors and also allow returns over the long-run to the fundamental (long-term) investors. However, in view of volatility in the short-run which increases the risk, it would be wiser to invest in the long-run in the Indian stock market. Such a strategy should result in relatively less risky and stable returns vis-à-vis the short-run returns.
- The average return on equity funds (ROEF) has been 19.10 per cent. Even though there was a drop in the ROEF, post-recession, the sample companies were still able to record the return of 16.86 per cent. The adequate returns can be construed as good news/signal for further growth of equity markets in years to come. The companies are in a comfortable position to meet cost of equity.
- The average cost of equity has been nearly 14 per cent, assuming the average risk free rate to be 7.75 per cent.
- Market returns on equity substantially surpass the other relatively less risky investment avenues (debt) available in India. The average returns for the equity portfolios of 15-years, 10-years and 5-years durations were 18.41 per cent, 19.62 per cent and 17.33 per cent respectively. Further, the after-tax computation of equity returns would be greater than the after-tax computation of interest income (assuming the highest tax slab rate of 30 per cent). The other advantage that accrues to equity investment is the liquidity (in terms of transaction and the entry/exit into/from the market).
- There appears to be a negative correlation between age and returns. The 'young' companies with mean returns of 43.33 per cent fare far better than their 'middle-aged' and 'old' counterparts with mean returns of 33.72 and 31.09 per cent respectively.
- In terms of size, the 'small' and 'medium' size companies fare better (40 per cent return) than their 'large' counterparts by 10 percentage points. Volatility remains evident in these segments as well.

Source: Singh, Shveta, Jain, P. K. and Yadav, Surendra S. (2016), "Equity Market in India: Returns, Risk and Price Multiples" India Studies in Business and Economics Series, Springer.

SUMMARY

Valuation is the process that links risk and return to determine the worth of an asset/security. The key inputs in the valuation process are expected returns (cash flows), their timing/pattern and the risk (required return).

The value of a security is the present/discounted value of all future cashflows associated with it over the relevant/specified period. Symbolically,

$$V = \frac{A_1}{(1+k)^1} + \frac{A_2}{(1+k)^2} + \dots + \frac{A_n}{(1+k)^n}$$

$$= [(A_1 \times PVIF_{k,1}) + (A_2 \times PVIF_{k,2}) + \dots + (A_n \times PVIF_{k,n})] \text{ or } = A \times PVIFA_{(k,n)}$$

LO 4.2	<p>The value of a bond is the present value of the contractual payments by its issuer from the beginning till maturity. Symbolically,</p> $B = I \left[\sum_{t=1}^n \frac{1}{(1+k_d)^t} \right] + M \times \left[\frac{1}{(1+k_d)^n} \right]$ $= I \times (PVIFA_{k_d, n}) + M \times (PVIF_{k_d, n})$
LO 4.3	<p>The valuation of redeemable preference shares is equal to the sum of present value of all future dividends till maturity and redeemed value at maturity. Symbolically,</p> $V = \sum_{t=1}^n \frac{D_p}{(1+k_p)^t} + \frac{MV}{(1+k_p)^n}$
LO 4.4	<p>The value of a share is equal to the present value of all future dividends over an indefinite period of time. Symbolically,</p> $P = \frac{D_1}{(1+K_e)^1} + \frac{D_2}{(1+K_e)^2} + \dots + \frac{D_\infty}{(1+K_e)^\infty}$ <p>With zero growth in dividends, $P = \frac{D_1}{K_e}$</p> <p>With constant growth in dividends, $P = \frac{D_1}{K_e - g}$</p> <p>With variable growth in dividends</p> $P = \sum_{t=1}^n \frac{D_0 \times (1+g)^t}{(1+K_e)^t} + \left[\frac{1}{(1+K_e)^n} \times \frac{D_{n+1}}{K_e - g_2} \right]$
LO 4.5	<p>In addition to the dividend approach, there are other approaches to value ordinary shares, namely, book value, liquidation value and P/E multiples/ratio. The P/E multiple approach is the most popular in practice because, unlike the book value and liquidation value, this approach views the firm as a going concern whose value lies in its earning power rather than its asset values.</p>
LO 4.6	<p>Any action of a financial manager that increases the level of expected return without changing risk would increase share value and any action that reduces the level of expected returns without changing risk would reduce share values. Similarly, an action that increases risk will reduce value of shares and any action that reduces risk will increase share values. As most financial decisions affect both return and risk, an assessment of their combined effect on value must be part of the financial decision process.</p>

SOLVED PROBLEMS

P.4.1 The face value of a 10-year, 10 per cent bond (with 10 per cent coupon rate) is ₹1,000. The interest is payable semi-annually. Assuming 12 per cent required rate of return of investors, compute the value of the bond. What price would an investor be willing to pay, if the interest is payable annually.

LO 4.2 **LO 4.2** **E**

Solution Interest paid semi-annually:

$$V = I(PVIFA_{r,n}) + M(PVIF_{r,n})$$

$$= ₹50(PVIFA_{6,20}) + ₹1,000(PVIF_{6,20}) = (₹50 \times 11.4699) + (₹1,000 \times 0.3118) = ₹885.3$$

Note: $I = ₹100/2 = ₹50$; $n = 10 \text{ years} \times 2 = 20$; $r = 12 \text{ per cent}/2 = 6 \text{ per cent}$.

Interest paid annually:

$$V = ₹100(PVIFA_{12,10}) + ₹1,000(PVIF_{12,10}) = (₹100 \times 5.6502) + (₹1,000 \times 0.3220) = ₹887.02$$

The investor would be willing to pay ₹887.02 for the bond.

P.4.2 ABC Ltd paid a dividend of ₹4 per share at the end of the year. It is expected to grow by 8 per cent each year for the next 4 years. The market price of the shares is expected to be ₹60 at the end of 4 years. Assuming 12 per cent required rate of return of investors, at what price should the shares of ABC Ltd sell?

LO 4.4 LOD M

Solution Expected price (P_0) = $\sum_{t=1}^4 \frac{D_t}{(1+r)^t} + \frac{P_4}{(1+r)^4}$

$$= D_1/(1.12) + D_2/(1.12)^2 + D_3/(1.12)^3 + D_4/(1.12)^4 + ₹60/(1.12)^4$$

$$= ₹4.32(0.893) + ₹4.67(0.797) + ₹5.04(0.712) + ₹5.44(0.567)$$

$$= ₹3.86 + ₹3.72 + ₹3.59 + ₹3.09 + ₹3.02 = ₹48.28.$$

The shares of ABC Ltd should sell for ₹48.28.

Working Notes Dividends: Present (D_0) = ₹4

$$D_1 = ₹4(1.08) = ₹4.32$$

$$D_3 = ₹4(1.08)^3 = ₹5.04$$

$$D_2 = ₹4(1.08)^2 = ₹4.67$$

$$D_4 = ₹4(1.08)^4 = ₹5.44$$

P.4.3 The required rate of return of investors is 14 per cent. Assume the D_1 (next expected dividend) is ₹2.50. Compute the price at which the shares will sell if the investors expect the earnings/dividends to grow, (i) at 12 per cent, (ii) 14 per cent and (iii) at 16 per cent.

LO 4.4 LOD M

Solution $P_0 = D_1/(r-g)$

(i) Growth in dividends, 12 per cent: $P_0 = ₹2.5/(0.14 - 0.12) = ₹125$.

(ii) Growth in dividends, 14 per cent: $P_0 = ₹2.5/(0.14 - 0.14) =$ (the formula is invalid since a necessary condition is $r > g$).

(iii) Growth in dividends, 16 per cent: $P_0 = ₹2.5/(0.14 - 0.16) =$ undefined.

P.4.4 The following facts are available:

- Risk-free rate, 9 per cent
- Required rate of return, 18 per cent
- Beta coefficient of the shares of ABC Ltd, 1.5
- Expected dividend during the next year, ₹3
- Growth rate in dividends/earnings, 8 per cent

LO 4.4 LOD M

Compute the price at which the shares of ABC Ltd should sell?

Solution $P_0 = D_1/(r-g) = ₹3/(0.225 - 0.08) = ₹3/0.145 = ₹20.7$

Working Notes $r = r_f + b(r_m - r_f) = 0.09 + 1.5(0.18 - 0.09) = 0.225$

P.4.5 The required rate of return of investors is 15 per cent. ABC Ltd declared and paid annual dividend of ₹4 per share. It is expected to grow @20 per cent for the next 2 years and at 10 per cent thereafter. Compute the price at which the shares should sell?

LO 4.4 LOD M

Solution $P_0 = [D_1(1+r) + D_2/(1+r)^2] + [D_3/(r-g)]/(1+r)^2$

(a) Present value of dividends for the first 2 years: $(₹4.8 \times PVIF_{15,1}) + (₹5.76 \times PVIF_{15,2})$
 $= (₹4.8 \times 0.8696) + ₹5.76 \times 0.7561 = ₹4.17 + ₹4.355 = ₹8.53.$

$$\begin{aligned} \text{(b) Present value of price after 2 years } (P_2) &= (D_3/r - g) \times (PVIF_{15,2}) = ₹6.34/(0.15) = 0.10) \\ &= ₹106.8 \times 0.7561 = ₹80.75 \\ P_0 &= ₹8.53 + ₹80.75 = ₹89.28. \end{aligned}$$

Working Notes Dividends: D_0 (present) = ₹4

$$D_1 = ₹4(1.2)^1 = ₹4.8$$

$$D_2 = ₹4(1.2)^2 = ₹5.76$$

$$D_3 = ₹5.76(1.10) = ₹6.34$$

P.4.6 A bond has 3 years remaining until maturity. It has a par value of ₹1,000. The coupon interest rate on the bond is 10 per cent. Compute the yield to maturity at current market price of (i) ₹1,100 (ii) ₹1,000 and (iii) ₹900, assuming interest is paid annually.

LO 4.2 LOD M

Solution

(i) Market price (above par or at premium) ₹1,100:

$$\text{Yield to maturity} = [(I + (M - V)/n)/(M + V)]/2 = [₹100 + (₹1,000 - ₹1,100)/3]/(₹1,000 + ₹1,100)/2 = ₹66.67/₹1,050 = 0.063 = 6.3 \text{ per cent}$$

(ii) Market price (at par), ₹1,000:

$$\text{Yield to maturity} = [₹100 + (₹1,000 - ₹1,000)/3]/(₹1,000 + ₹1,000)/2 = ₹100/₹1,000 = 0.10 = 10 \text{ per cent.}$$

(iii) Market price (below par or at discount), ₹900:

$$\text{Yield to maturity} = [₹100 + (₹1,000 - ₹900)/3]/(₹1,000 + ₹900)/2 = ₹133.33/₹950 = 0.1403 = 14.03 \text{ per cent.}$$

P.4.7 A note (secured premium note) is available for ₹1,400. It offers, including one immediate payment, 10 annual payments of ₹210. Compute the rate of return (yield) on the note.

LO 4.2 LOD M

Solution

$$V = \sum_{t=1}^n \frac{C_t}{(1+r)^t}$$

$$= ₹1,400 = ₹210(1 + PVIFA_{r,9})$$

$$(1 + PVIFA_{r,9}) = ₹1,400/₹210 = 6.67$$

$$PVIFA_{r,9} = 6.67 - 1 = 5.67$$

From Table A-4 (Appendix), the closest values are 5.7590 (0.10) and 5.3282 (0.11). By interpolation, $r = 10.2$ per cent.

P.4.8 A share is selling for ₹50 on which a dividend of ₹3 per share is expected at the end of the year. The expected market price after the dividend declaration is to be ₹60. Compute (i) the return on investment (r) in shares, (ii) dividend yield and (iii) capital gain yield.

LO 4.3, 4 LOD D

Solution

(i) $r = [D_1 + (P_1 - P_0)]/P_0 = [₹3 + (₹60 - ₹50)]/₹50 = 0.26 = 26 \text{ per cent.}$

$$\text{Alternatively, } ₹50 = ₹3/(1+r) + ₹60/(1+r)$$

$$r = 50(1+r) = ₹3 + ₹60$$

$$1+r = (₹3 + ₹60)/₹50$$

$$r = [(₹3 + ₹60)/₹50] - 1 = 1.26 - 1 = 0.26 = 26 \text{ per cent.}$$

(ii) Dividend yield = $D_1/P_0 = ₹3/₹50 = 0.06 = 6 \text{ per cent}$

(iii) Capital gain yield = $(P_1 - P_0)/P_0 = ₹10/₹50 = 0.20 = 20 \text{ per cent.}$

P.4.9 Assume (i) ₹100 par value, (ii) 8 per cent coupon rate of interest and (iii) 10 years remaining to maturity date

LO 4.2 LOD D

- If interest is paid annually, find the value of the bond when the required rate of return is (a) 7 per cent, (b) 8 per cent and (c) 10 per cent. Indicate for each case whether the bond is selling at a discount, at a premium or at its par value.

- Using 10 per cent required return, what would be the value of the bond if interest is paid semiannually?

Solution Value of bond, when interest is paid annually:

$$B = I \times (PVIFA_{K_d n}) + M \times (PVIF_{K_d n})$$

(a) $K_d = 7$ per cent

$$B = (\text{₹}8 \times 7.024) + (\text{₹}100 \times 0.508) \\ = \text{₹}56.19 + \text{₹}50.8 = \text{₹}106.99 \text{ (sells at a premium)}$$

(b) $K_d = 8$ per cent

$$B = (\text{₹}8 \times 6.710) + (\text{₹}100 \times 0.463) \\ = \text{₹}53.6 + \text{₹}46.3 = \text{₹}99.9 \text{ (sells at par value)}$$

(c) $K_d = 10$ per cent

$$B = (\text{₹}8 \times 6.145) + (\text{₹}100 \times 0.386) \\ = \text{₹}49.16 + \text{₹}38.6 = \text{₹}87.76 \text{ (sells at a discount)}$$

Value of bond when interest is paid semiannually:

$$B = 1/2 \times (PVIFA_{k_{d/2, 2n}}) + M \times (PVIF_{k_{d/2, n}}) \\ = \text{₹}8/2 \times (PVIFA_{10/2, 2 \times 10}) + \text{₹}100 (PVIF_{10/2, 2 \times 10}) \\ = \text{₹}4 \times (PVIFA_{5, 20}) + \text{₹}100(PVIF_{5, 20}) \\ = (\text{₹}4 \times 12.462) + (\text{₹}100 \times 0.377) \text{ or } = \text{₹}49.85 + \text{₹}37.7 = \text{₹}87.55$$

P.4.10 The bonds of Alert Ltd currently sell at ₹115. They have a 11 per cent coupon rate of interest and ₹100 par value. The interest is paid annually and the bonds have 18 years to maturity. Compute the yield to maturity (YTM) of the bond. Compare the computed YTM with the coupon interest rate. How do you explain the difference between the current price and the par value of the bond.

LO 4.2	LOD M
--------	----------

Solution

$$B = \text{₹}115$$

$$I = \text{₹}100 \times 0.11 = \text{₹}11$$

$$M = \text{₹}100$$

$$n = 18$$

$$\text{₹}115 = 11 \times (PVIFA_{K_d 18}) + \text{₹}100 \times (PVIF_{K_d 18})$$

If $K_d = 11$ per cent, $B = \text{₹}100 = M$. So let us try a lower rate (say, 10 per cent)

$$B = \text{₹}11 \times (PVIFA_{10, 18}) + \text{₹}100 (PVIF_{10, 18})$$

$$= (\text{₹}11 \times 8.201) + (\text{₹}100 \times 0.180)$$

$$= \text{₹}90.21 + \text{₹}18 = \text{₹}108.21$$

As $\text{₹}108.21 < \text{₹}115$, let us try a lower rate (say, 9 per cent)

$$B = \text{₹}11 (PVIFA_{9, 18}) + \text{₹}100 (PVIF_{9, 18})$$

$$= (\text{₹}11 \times 8.756) + (\text{₹}100 \times 0.212)$$

$$= \text{₹}96.32 + \text{₹}21.2 = \text{₹}117.52$$

Therefore, the YTM of the bond is between 9-10 per cent. By interpolation, YTM = 9.27 per cent).

The YTM (9.27%) is below the coupon interest rate (11%) of the bond as its market value (₹115) is above its par value (₹100). When the market value of a bond is above its par value (i.e. it sells at a premium), its YTM would be below its coupon rate of interest; when a bond sells at par, the YTM = its coupon rate of interest; when the bond sells at a discount (i.e. market value < par value), the YTM would be greater than its coupon rate of interest.

P.4.11 The Alert Ltd currently pays ₹3 per share as annual dividend. Assuming 10 per cent required rate of return on shares (K_s), compute the value of shares under each of the following dividend growth rate assumptions:

LO 4.4	LOD D
--------	----------

- Annual rate of growth, zero (0) per cent indefinitely.
- Annual constant rate of growth, 5 per cent to infinity.
- Annual rate of growth, 5 per cent for each of the next 3 years, followed by a constant annual rate of growth of 4 per cent in years 4 to infinity.

Solution Value of shares, zero growth:

$$P = \frac{D_1}{K_e} = \frac{D_1 = D_0 = ₹3}{0.10} = ₹30$$

Value of shares, constant growth, $g = 5$ per cent:

$$D_1 = D_0 \times (1 + g) = ₹3 \times (1 + 0.05) = ₹3.15$$

$$P = \frac{D_1}{K_e - g} = \frac{₹3.15}{(0.10 - 0.05)} = \frac{₹3.15}{0.05} = ₹63$$

Value of shares, with variable growth in dividends, $N = 3$,

$g_1 = 5$ per cent and $g_2 = 4$ per cent:

$$D_1 = D_0 \times (1 + g_1)^1 = ₹3 \times (1 + 0.05)^1 = ₹3.15$$

$$D_2 = D_0 \times (1 + g_1)^2 = ₹3 \times (1 + 0.05)^2 = ₹3.31$$

$$D_3 = D_0 \times (1 + g_1)^3 = ₹3 \times (1 + 0.05)^3 = ₹3.47$$

$$D_4 = D_3 \times (1 + g_2) = ₹3.47 \times (1 + 0.04) = ₹3.61$$

$$P = \sum_{t=1}^N \frac{D_0 \times (1 + g)^t}{(1 + K_e)^t} + \left[\frac{1}{(1 + K_e)^N} \times \frac{D_N + 1}{K_e - g_2} \right]$$

$$= \sum_{t=1}^3 \frac{D_0 \times (1 + g)^t}{(1 + K_e)^t} + \frac{₹3.15}{(1 + 0.10)^1} + \frac{₹3.31}{(1 + 0.10)^2} + \frac{₹3.47}{(1 + 0.10)^3}$$

$$= [₹3.15 \times (PVIF_{10,1})] + [₹3.31 \times (PVIF_{10,2})] + [₹3.47 \times (PVIF_{10,3})]$$

$$= [(₹3.15 \times 0.909) + (₹3.31 \times 0.826) + (₹3.47 \times 0.751)]$$

$$= ₹2.86 + ₹2.73 + ₹2.61 = ₹8.2$$

$$\left[\frac{1}{(1 + K_e)^N} \times \frac{D_N + 1}{K_e - g_2} \right] = \left[\frac{1}{(1 + 0.10)^3} \times \frac{D_4 = ₹3.61}{(0.10 - 0.04)} \right]$$

$$= (PVIF_{10,3}) \times \frac{₹3.61}{0.06}$$

$$= 0.751 \times ₹160.17 = ₹45.19$$

$$P = \sum_{t=1}^N \frac{D_0 \times (1 + g)^t}{(1 + K_e)^t} + \left[\frac{1}{(1 + K_e)^N} \times \frac{D_N + 1}{K_e - g_2} \right] = ₹8.2 + ₹45.19$$

$$= ₹53.39 \text{ per share}$$

MINI CASES

4.C.1 (Gordon Growth Model) The BSES Rajdhani Ltd supplies power to homes and businesses in the New Delhi and the South Delhi areas. Its pricing is regulated by the Delhi Electricity Regulatory Commission (DERC). The BSES's average annual free cash flows available to the equity holders (FCFE) during the 5-year period 2006-10 were ₹551 crore and the average annual dividends during the same period amounted to ₹506 crore. The earnings per share (EPS) and the dividends per share (DPS) in 2009 were ₹3.13 and ₹2.19 respectively, the dividend pay-out ratio being 70 per cent. The return on equity averaged 11.63 per cent.

The management of the BSES has appointed Richa Singh as a financial consultant to compute the value of its shares. Richa Singh estimates that the beta for power distributors like BSES is 0.90. Similarly, the risk free rate and the market risk premium rate are 5.4 per cent and 4 per cent respectively. What is the per share value of the BSES Ltd?

Solution

Given that the BSES, based on size and area, has stable growth and that its pricing is regulated by the DERC, Richa Singh uses the Gordon Growth Model to value its shares:

The value of shares = $DPS / (K_e - g)$

Where DPS = Expected dividend next year

K_e = Required rate of return on equity

g = Growth in dividends

1. Cost of equity capital = 0.54 (risk free return) + $[0.90$ (beta) \times 0.40 (risk premium)] = 0.09 (9 per cent).
2. Expected growth in dividends = $(1 - \text{dividend pay-out ratio}) \times \text{return on equity} = (1 - 0.70) \times (0.1163) = 0.0349$ (3.49 per cent)
3. Value of shares = $(\text{₹}2.19 \times 1.0349) \div (0.09 - 0.0349) = \text{₹}41.15$.

4.C.2 (Valuation of Shares) Financial Technologies Ltd (FTL) creates leading-edge technologies for fast-growing markets. Its reported earnings and dividends per share were ₹11.50 and ₹2.40 respectively in 2009. For the next five years, the projected earnings growth is 30.1 per cent. It is expected to decline linearly to 8 per cent after five years. The (dividend) pay-out ratio is likely to remain stable during 2009-14. It would rise linearly after that and reach 21 per cent in 2019-20. The shares of FTL are expected to have a beta of 1.18 in the next five years but it is likely to decline linearly over the following five years to reach 1 by the time the FTL reaches its steady level of growth (8 per cent) in 2019-20. The risk free rate is currently 8 per cent and may be assumed to remain constant in the foreseeable future. The market risk premium may be assumed to be 4 per cent.

Required As a financial consultant, compute the value of the FTL's shares.

Solution

Using dividend valuation (discount) model, the value of the shares is shown in Table 1.

TABLE 1 Valuation of Shares (Dividend Growth Model)

Year		2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	Total
1	Earnings growth (%)	-	30.10	30.10	30.10	30.10	30.10	25.68	21.26	16.84	12.42	8.00	8.00

10	Share price at end-2019 (Dividend) _{t+1} ÷ (Required return - Growth rate) = ₹21.02/(12% - 8%)											525.50		
11	Present value of share price at end - 2009 (₹525.50 × 0.31)													162.91(b)
12	Share value at end-2009 (a + b)													210.75

[⊙] Tax free return ÷ (Beta × risk premium)

^{⊙⊙} Tax free return + (Beta × risk premium)

REVIEW QUESTIONS

LOD: Easy

- RQ 4.1** (a) Indicate whether the following statements are True or False. [LO 4.2, 3, 4]
- (i) Value of a bond is dependent solely on the interest payments it provides.
 - (ii) If coupon rate = Required rate, the value of the bond would be equal to its par value.
 - (iii) Bond value will differ from its par value, even though yield to maturity = coupon rate.
 - (iv) For a bond, yield to maturity (YTM) is always equal to coupon rate.
 - (v) Value of a bond with semi-annual interest rate, is greater than the value of bond providing interest on annual basis.
 - (vi) Constant/variable growth model, for the valuation of equity share, is applicable for the growth rate $g \geq k_e$.
 - (vii) In a variable growth model, the dividend is assumed to grow at a constant rate forever after a initial growth period.
 - (viii) Any action by finance manager that increase the risk will reduce the value.
- [Answers: (i) False (ii) True (iii) False (iv) False (v) True (vi) False (vii) True (viii) True]**
- (b) In the following multiple choice questions select the correct answers.
- (i) The value of a bond/debenture is
 - (a) present value of contractual payments it receives till maturity
 - (b) present value of interest payments it receives
 - (c) present value of its redemption amount/value
 - (d) none of these.
 - (ii) When the required rate of return is greater than coupon rate, the bond will be valued at
 - (a) discount
 - (b) premium
 - (c) par value
 - (d) none of these.
 - (iii) Given the coupon rate to be constant, the value of bond, as it approaches to maturity, will converge to
 - (a) its par value
 - (b) redemption value
 - (c) issued value
 - (d) none.
 - (iv) A bond can be issued at premium if
 - (a) Coupon rate > Required returns
 - (b) Coupon rate < Required returns
 - (c) Coupon rate = Required returns
 - (d) none.

[Answers: (i) a (ii) a (iii) b (iv) a]

RQ 4.2 Define and specify the general equation for the value of any asset/security. [LO 4.1]

RQ 4.3 Describe the basic procedure used to value a bond that pays interest (i) annually, (ii) semiannually. [LO 4.2]

RQ.4.4 An investor is considering the purchase of a share of ABC Ltd at the beginning of the year. If his required rate of return is 10 per cent, the year-end expected dividend is ₹4 and year-end price is expected to be ₹26, compute the value of the share. [LO 4.4]

RQ.4.5 An investor has invested in the shares of ABC Ltd which expects no (zero) growth in dividends. ABC Ltd has paid a dividend of ₹3 per share. If the required rate of return is 14 per cent, what would be the value of the share? [LO 4.4]

LOD: Medium

RQ 4.6 Explain the relationship between the required return and coupon interest rate that would cause a bond to sell at (i) a discount, (ii) premium, (iii) par. [LO 4.2]

RQ 4.7 Explain and illustrate the yield to maturity (YTM) on a bond. [LO 4.2]

RQ 4.8 Describe, illustrate, compare and contrast each of the following share valuation models: [LO 4.4]

- Zero growth
- Constant growth
- Variable growth

RQ 4.9 Explain the following other approaches to the valuation of shares:

[LO 4.5]

- Book value
- Liquidation value
- P/E multiples

RQ.4.10 The Premier Instruments Ltd's (PIL's) bonds have the following attributes: (i) par value, ₹100; (ii) coupon interest rate, 10 per cent; (iii) interest payment, annually; (iv) years remaining to its maturity date, 12.

[LO 4.2]

- Find the current sale value of the PIL's bonds if bonds of similar risk are currently earning 8 per cent rate of return.
- Why is a similar risk bond earning a return (8%) below the coupon interest rate (10%)?
- What would be the current value of PIL's bonds if the required return was 10 per cent and not 8 per cent?

RQ.4.11 The shares of ABC Ltd are currently selling for ₹100 on which the expected dividend is ₹4. Compute the total return on the shares if the earnings or dividends are likely to grow at (a) 5 per cent (b) 10 per cent and (c) 0 (zero) per cent (no growth).

[LO 4.4]

RQ.4.12 ABC Ltd paid a dividend of ₹2 per share last year (D_0), which is expected to grow at 10 per cent. If the current market price is ₹40 and the required rate of return is 18 per cent, compute the expected dividend yield and capital gains yield next year.

[LO 4.4]

LOD: Difficult

RQ 4.13 If the required return on a bond differs from its coupon interest rate and is assumed to be constant until maturity, describe the behaviour of the bond value over a period of time as the bond moves towards maturity.

[LO 4.2]

RQ.4.14 The closing price of the shares of ABC Ltd on December 31, previous year, was ₹25. It paid a year-end dividend as detailed below:

[LO 4.4]

Year 1 ₹2	Year 4 ₹2.50
2 ₹2	5 ₹2.50
3 ₹2.20	

At what price should an investor sell his shares at the end of year 5 to earn a compound rate of return of 15 per cent on the initial investment (of ₹25)? Ignore commission and taxes.

ANSWERS

RQ.4.4 ₹27.28

RQ.4.5 ₹21.43

RQ.4.10 ₹115.06 (current sale value); ₹100 (current value of PIL bond)

RQ.4.11 (a) 9 per cent, (b) 14 per cent, (c) 4 per cent.

RQ.4.12 Dividend yield 5.5 per cent; capital gain yield 12.5 per cent

RQ.4.14 ₹35.46

FINANCIAL ANALYSIS, PROFIT PLANNING AND CONTROL

Chapter 5
**STATEMENT OF CASH
FLOWS**

Chapter 6
**FINANCIAL STATEMENTS
ANALYSIS**

Chapter 7
**VOLUME-COST-PROFIT
ANALYSIS**

Chapter 8
**BUDGETING AND PROFIT
PLANNING**

Part Two of the book is devoted to the discussion of the use of financial statements and profit planning and control. The preparation and use of cash flow statement is covered in Chapter 5. Chapter 6 discusses the techniques to analyse the balance sheet and statement of profit and loss.

Cost data are an important input in internal managerial planning. The most widely- used profit planning techniques are also illustrated in this part. The volume-cost-profit analysis, as a tool of profit planning, is covered in Chapter 7. Budgeting, as a systematic approach to profit planning and control is elaborated in Chapter 8.

CHAPTER

5

Statement of Cash Flows

LEARNING OBJECTIVES

LO 5.1	Explain the concept of statement of cash flows
LO 5.2	Determine cash inflows and cash outflows transactions
LO 5.3	Understand the usefulness of statement of cash flows
LO 5.4	Illustrate preparation of statement of cash flows
LO 5.5	Discuss cash flow statement as per AS-7

The balance sheet and statement of profit and loss are the two major financial statements of a business/corporate firm. A balance sheet shows the financial position of the a firm as at the last day of the accounting period. An income statement focuses on financial performance (profit or loss) due to the operating activities of a firm during the period. Revenues recorded in income statement do not reflect cash inflows as the debtors may pay later. Likewise, some of the expenses shown in income statement may be non-cash expenses (depreciation, amortisation etc.) and some may not be paid in full (goods purchased on credit, salaries payable etc). Thus, the period's profit or loss does not bear direct relationship to the cash flows associated with the period's operations. It does not evidently provide information about the investing and financing activities of the firm during the accounting period.

This chapter describes the third financial statement a company is required to prepare, namely, the statement of cash flows. The objective of the cash-flow statement is to provide information about the cash flows associated with operating, investing and financing activities of the firm during the accounting period. The information is significant to the stakeholders of a company. Dividends payable to the shareholders obviously are dependent on cash flows; interest payment and debt repayment to the lenders require the availability of cash; payment to the employees, suppliers and taxes in time is contingent upon the company's ability to generate adequate cash flows to meet these financial obligations.¹ For these reasons, statement of cash flows/cash flow statement (CFS) is the third major financial statement of a company. The meaning, sources and uses of cash, and usefulness of the CFS are outlined first. The preparation of CFS is also covered. Its preparation

in conformity with Ind AS-7 is illustrated subsequently. Annexure I contains the actual cash flow statement of the Reliance Industries Ltd. The main points are summarised by way of recapitulation.

LO 5.1 MEANING

Cash flow statement is a statement which indicates sources of cash inflows and transactions of cash outflows of a firm during an accounting period. The activities/transactions which generate cash inflows are known as sources of cash and activities which cause cash outflows are known as uses of cash. It is appropriately termed as **"Where Got Where Gone Statement"**.

It may be emphasised that the information contained in the CFS are objective and, hence, more credible and reliable *vis-à-vis* the other financial statements. The reason is that **cash is cash** and the amounts of cash flows are not affected by the subjective judgments and estimates that are normally made in revenues, expenses and other accruals.² The CFS is a financial document as it leaves no scope for any maneuvering on the amounts of cash inflows and cash outflows.

LO 5.2 SOURCES AND USES OF CASH

Exhibit 5.1 shows major items of cash inflows and cash outflows.

EXHIBIT 5.1 Statement of Cash Flows of Hypothetical Limited

Particulars	Amounts
(I) Sources of Cash Inflows:	
(1) Business operations/operating activities	
(2) Non-business/operating activities (interest/dividend received)	
(3) Sale of long-term assets (plant, building and equipment)	
(4) Issue of additional long-term securities (equity, preference shares and debentures)	
(5) Additional long-term borrowings (banks and financial institutions)	
(6) Others sources (specify them)	
(II) Sources of Cash Outflows:	
(1) Purchase of long-term assets (plant and machinery, land and building, office equipments and furniture)	
(2) Redemption of preference shares and debentures	
(3) Repurchase of equity shares	
(4) Repayment of long-term borrowings	
(5) Cash dividends paid to shareholders (preference and equity)	
(6) Others items (specify)	
Net Increase (Decrease) in Cash [I – II]	

LO 5.3 USEFULNESS OF STATEMENT OF CASH FLOWS

The cash flow statement helps to provide answers to users to some of the important questions related to the company such as the following:

- How much cash has been generated from normal business operating activities/operations of a company?
- What have been the other premier financing activities of the firm through which cash has been raised? What has happened to cash so obtained?
- How much cash has been spent on investment activities, say, on purchase of new plant and

equipments?

- How was the redemption of preference shares and debentures accomplished?
- Have long-term sources of cash (internally generated plus raised externally) adequate to finance purchase of new long-term/fixed assets?
- What has been the proportion of debt and equity for cash raised from outside?
- Why are dividends not larger?
- Is the company borrowing to pay cash dividends?
- Has the liquidity position of the company improved?

Thus, the CFS enables the management to see whether the long-term funds are adequate to finance major fixed assets expansion. A situation in which short-term sources (bank overdraft, temporary loans, etc.) constitute the bulk of sources for long-term purposes may not be desirable. Such a pattern of financing is likely to cause problems for the firm to meet its current liabilities in future. Besides, the CFS also indicates the extent of reliance on external resources *vis-a-vis* the internal sources. Thus, the CFS clearly highlights the firm's financing and investment activities.

The CFS, when prepared on a projected basis, has immense potential/utility as a tool of financial planning. It shows the effect of various financing and investment decisions on future cashflows. If the implementation of the decision results in excessive or inadequate cash, steps may be taken to improve the situation or review the decisions. For instance, if the cash position is expected to deteriorate, funds may be raised by borrowing or issuing new equity shares. If the required amount is not feasible to be raised, plans for acquisition of assets may be postponed or alternative operative plans can be developed to ensure that the desired future level of business operations, expansion, and so on, are achieved. Thus, the CFS enables the management to revise/review its investments, operations and financing activities so as to conform to the desired financial inflow and outflow of resources. Above all, the long-term lenders can use the statement as a means of estimating the firm's ability to service their debts.

LO 5.4 PREPARATION OF STATEMENT OF CASH FLOWS

You will remember that the balance sheet and income statement are prepared from the ledger account balances of a company. In contrast, the cash flow statement is derived from these two financial statements. The CFS explains factors which have caused changes in assets, liabilities and shareholders' funds between the opening and closing dates of the accounting period. Therefore, the CFS can be prepared by (i) finding the difference in amounts among the various items (say, changes in long-term liabilities, long-term assets) between the comparative balance sheets and then (ii) analysing the causes of difference. The analysis, in some cases, is facilitated by the use of 'T' accounts. The preparation of CFS is illustrated in Example 5.1.

Example 5.1

Given below are the balance sheets as on March 31, previous year and current year, and a statement of income and reconciliation of earnings for the current year of Electronics Ltd (EL). The only item in the plant and machinery account sold during the year was a specialised machine that originally cost ₹15,00,000. The accumulated depreciation on this machine at the time of sale was ₹8,00,000. The machine was sold for ₹6,00,000 and full payment was received in cash. Electronics Ltd. purchased patents for ₹16,00,000 during the year. Besides cash purchases of plant and equipment, the assets of another company were also purchased for ₹1,00,00,000 payable in fully paid-up shares, issued at par; the assets purchased being goodwill, ₹30,00,000 and plant, ₹70,00,000.

Comparative Balance Sheets

Particulars	March 31 Previous Year (₹ lakh)	March 31 Current Year (₹ lakh)
Cash	74	37
Sundry debtors	54	47
Inventories	312	277
Prepaid expenses	6	4
Land	60	60
Patents	55	65
Plant and machinery	420	550
Less: Accumulated depreciation	(105)	(120)
Goodwill	—	30
Total Assets	876	950
Sundry creditors	86	102
Provision for income tax	89	17
Debentures	220	60
Equity capital	250	560
Retained earnings	231	211
Total Liabilities	876	950

Statement of Income and Reconciliation of Earnings for Current Year

Particulars	Amount (₹ lakh)
Net sales	1,977
Less: Cost of goods sold	1,480
Gross profit	497
Less: Operating expenses (includes depreciation on plant and machinery and amortisation of patents)	486
Less: Interest on debentures	14
Net loss from operations	(3)
Add: Retained earnings (previous year)	231
	228
Less: Dividend paid	16
Less: Loss on sale of assets	1
Retained earnings (March 31, current year)	211

From the foregoing information, prepare a statement of cash-flows for Electronics Ltd.

Solution

Statement of Cash Flows of Electronics Limited the current year

Particulars	Amount (in ₹ lakh)
(A) Sources of cash inflows	
Business operations	
Cash from customers/debtors (1)*	₹1,984
Less payment to creditors (2)*	(1,429)
Less operating expenses (5)*	(455)
Less interest on debentures	14
Less taxes paid (₹89-₹17)	72
Sale of machine	14
Issue of equity share capital (8)*	6
	210
	230

(Contd.)

(Contd.)

(B) Cash outflows	
Purchase of long-term assets	
Plant and machinery (6)*	75
Patents	16
Redemption of debentures (7)*	160
Dividends paid to equity shareholders	16
	<u>267</u>
(C) Net decrease in cash (B-A)	37
Cash at beginning of year	37
Cash at year-end	<u>74</u>

Note: Figures in brackets refer to working note number.

Working Notes

(A) Determination of cash from business operation requires recasting of income statement from accrual basis to cash basis. Exclusion of non-cash items, namely, depreciation and amortisation is obvious. The less obvious is the computation of cash inflows from debtors/customers and cash payments to creditors for goods purchased and expenses. The following working notes provide these required inputs.

(1) Cash Receipts from Debtors:

Sundry Debtors Account		(Amount in ₹ lakh)	
Particulars	Amount	Particulars	Amount
To Balance b/f (opening balance)	54	By Cash (receipts from debtors,	
To Net sales (assumed credit sales)	1,977	balancing figure)	1,984
	<u>2,031</u>	By Balance c/d	47
			<u>2,031</u>

Alternatively		(in ₹ lakh)
Net sales		1,977
Add debtors due at the beginning of current year		54
Total amount receivable from debtors		<u>2,031</u>
Less debtors due at the end of current year		(47)
Cash receipts from debtors during current year		<u>1,984</u>

(2) Cash Payment to Creditors

Sundry Creditors Account		(Amount in ₹ lakh)	
Particulars	Amount	Particulars	Amount
To Cash (payments to creditors,		By Balance b/f (opening balance)	86
balancing figure)	1,429	By purchases' (assumed credit)	1,445
To Balance c/d	102		
	<u>1,531</u>		<u>1,531</u>

*Cost of goods sold = Opening stock + Purchases - Closing stock
 = ₹1,480 = ₹312 + Purchases - ₹277
 = ₹1,480 - ₹312 + ₹277 = ₹1,445 (Purchases)

Alternatively		(in ₹ lakh)
Credit purchases		1,445
Add sundry creditors at the beginning of year		86
Total amount due/payable to creditors		1,531
Less sundry creditors at the year-end		(102)
Cash payment to creditors during the year		1,429

(3) Determination of Depreciation Charges**(a) T-Account Approach**

Accumulated Depreciation Account

(Amount in ₹ lakh)

Particulars	Amount	Particulars	Amount
To Machine (accumulated depreciation written off on machine sold)	8	By Balance b/f	105
To Balance c/d	120	By P&L A/c (depreciation amount charged during the year, balancing figure)	23
	128		128

(b) Statement Approach

(Amount in ₹ lakh)

Opening balance at the beginning of year	105
Less depreciation written off on plant sold during current year	(8)
	97
Closing balance	120
Difference represents current year depreciation	23

(4) Determination of Amortisation Charges

Patent Account

(Amount in ₹ lakh)

Particulars	Amount	Particulars	Amount
To Balance b/f	55	By Amortisation (balancing figures)	6
To Cash (purchases)	16	By Balance c/d	65
	71		71

(5) Determination Cash Operating Expenses

(Amount in ₹ lakh)

Total operating expenses	486
Less depreciation (as it does not cause current cash outflow)	(23)
Less amortisation (non-cash expense)	(6)
Operating expenses (other than depreciation and amortisation)	457
Less prepaid expenses (already paid in previous year)	(6)
Add expenses paid in advance in current year	4
Operating expenses paid in cash	455

(B) Likewise, changes in *long term assets*, in particular, plant and machinery require a more careful analysis to ascertain cash obtained from their sales and cash used in their acquisition because the straight difference of the two years values do not indicate either purchase or sale. Such assets are subject to depreciation. Therefore, depreciation amount should be adjusted to ascertain the amount of such assets purchased/sold.

(6) Purchase of Plant and Machinery

(a) T-Account Approach

Plant and Machinery Account (Gross Basis)

(Amount in ₹ lakh)

Particulars	Amount	Particulars	Amount
To Balance b/f	420	By Cash (sale value)	6
To Equity share capital	70	By Loss (P&L A/c)	1
To Cash (purchases, balancing figure)	75	By Accumulated depreciation (on plant sold)	8
		By Balance c/d	550
	565		565

(b) Statement Approach

(Amount in ₹ lakh)

Opening balance of plant and machinery	420
Less original purchase price of plant sold (₹6 + 1 + 8)	15
	405
Closing balance	550
Difference represents purchases	145
Less purchases against issue of share capital	70
Cash purchases of plant	75

(c) Equation Approach

Opening balance of plant and machinery (PM) + Purchases of PM during the year –
Initial acquisition cost of PM sold during the year = Closing balance of PM (5.1)

$$₹420 + \text{Purchases} - ₹15 = ₹550$$

$$\text{Purchases} = ₹550 - ₹420 + ₹15 = ₹145$$

Cash purchases = Total purchases ₹145 – Purchases through issue of equity share capital ₹75 = ₹70

OR

(a) T-Account Approach

Plant and Machinery (Net Basis)

(Amount in ₹ lakh)

Particulars	Amount	Particulars	Amount
To Balance b/f (₹420 – ₹105)	315	By Depreciation(charged during current year)	23
To Equity share capital	70	By Cash	6
To Cash (purchases, balancing figure)	75	By P&L A/c (loss on sale of machine)	1
		By Balance c/d (₹550 – ₹120)	430
	460		460

(b) Statement Approach

(Amount in ₹ lakh)

Opening balance of plant and machinery	₹315
Less book value of plant sold	7
Less depreciation charged during the year	23
	285

(Contd.)

(Contd.)

Closing balance	430
Difference represents purchases	145
Less purchases against issue of share capital	70
Cash purchase of plant	75

(c) Equation Approach

Opening balance of PM + Purchases of PM during the year – Book value of PM sold during the year – Depreciation charges during the year = Closing balance of PM (5.2)

$$₹315 + \text{Purchases} - ₹7 - ₹23 = ₹430$$

$$\text{Purchases} = ₹430 - ₹315 + ₹7 + ₹23 = ₹145$$

Cash purchases = Total purchases ₹145 = Purchases through issue of equity share capital ₹75 = ₹70

- (C) Treatment of changes in long-term liabilities are the easiest to deal. They relate to (i) fresh issue of shares and debentures or their redemption and (ii) additional long-term borrowings or their repayment. The increase is indicative of additional issue of securities or additional borrowings and, hence, is a source of cash.

The decrease represents repayment and, therefore, is use of cash, that is, cash outflow. However, if the increase in securities, say, in equity capital is caused due to issue of bonus shares, it is not a source of cash. Likewise, if increase in shares is an outcome of (i) payment for purchase of plant and machinery, land and building or any other asset and (ii) conversion of debentures into shares, such transactions do not affect cash inflow and are excluded.

(7) Redemption of Debentures

(Amount in ₹ lakh)

Opening balance (at the year beginning)	220
Closing balance (at year-end)	60
Decrease in balance represents redemption of debentures	160

(8) Issue of Equity Share Capital for Cash

(Amount in ₹ lakh)

Closing balance at current year-end	560
Less opening balance	250
Increase in balance represents additional issue	310
Less payment for goodwill (₹30) and for plant (₹70) by equity capital	100
Difference indicates additional cash raised through equity capital	210

It is emphasised that the amount of cash from business operations (in preparation of the CFS of Electronics Limited) has been determined using 'T' accounts extensively. Alternatively, cash from business operation can be computed by another approach. This approach uses less of 'T' account and involves two steps: (i) to determine working capital from business operations by excluding depreciation, amortisation, loss/gain on sale of long-term assets, non-operating incomes and (ii) to adjust the working capital from business operations by changes in current liabilities and current assets (except cash).

The rules for relating the changes in current assets and current liabilities to the profit and loss account in the computation of a flow of cash from operations are summarised below.

- 1. All the increases in current assets excluding cash and decreases in current liabilities which increase working capital decrease cash.** The decrease in current liabilities takes place when they are paid in cash. For instance, decrease in creditors, bank overdrafts, bills payable and dividends payable will occur due to their payment. A word of explanation is necessary to show the negative impact of increase in current assets on cash. For instance, an

increase in sundry debtors takes place when credit sales are greater than cash collections from them; inventories increase when the cost of goods purchased is more than the cost of goods sold. Increase in prepaid expenses involves payment of more cash than is required for their current services. Evidently, increase in current assets decreases cash.

2. **From the first follows the second rule—all decreases in current assets other than cash and increases in current liabilities which cause a decrease in working capital increase cash.** Debtors would decrease when cash collections are more than current credit sales. Inventories would decrease because cost of goods sold is more than cost of goods purchased; decrease in prepaid expenses reflects that the firm has paid less for services than are currently used. Exhibits 5.2 and 5.3 show the procedure for determining cash from business operations.

EXHIBIT 5.2 Cash from Business Operations (Direct Method)

- (A) Sales revenues
- (B) *Less:* Expenses using working capital
 Cost of raw materials used (or cost of goods sold)
 Wages and salary expenses
 Others manufacturing expenses (excluding depreciation)
 Office expenses
 Selling and distribution expenses
 Interest
 Income tax
- (C) Working capital from business operations
- (D) Adjustment to convert to cash basis
- (i) *Add:* Decrease in WC (–CA or +CL)
 Decrease in current assets other than cash (item-wise)
 Increase in current liabilities (item-wise)
- (ii) *Less:* Increase in WC (+CA or –CL)
 Increase in current assets other than cash (item-wise)
 Decrease in current liabilities (item-wise)
- (E) Cash flow from business operations
-

EXHIBIT 5.3 Cash from Business Operation (Indirect Method)

- (A) Net income (or loss) as shown by profit and loss account
- (B) *Add:* Depreciation expenses;
 Amortisation of goodwill, patents and other intangible assets;
 Amortisation of discount on debentures or share issue expenses;
 Amortisation of extraordinary losses occurred in previous years;
 Loss on sale of non-current assets;
- (C) *Less:* Amortisation of premium received on debentures;
 Profit on sale of equipment (already included under sources)
 Profit on revaluation of non-current assets (does not contribute to working capital)
 Dividends and interest received on investments (reported separately).
 (A + B – C) = Working capital from business operations.
- (D) Adjustment to convert to cash basis:
- (i) *Add:* Decrease in WC (–CA or +CL)
 Decrease in current assets other than cash (item wise)
 Increase in current liabilities (item-wise)
- (ii) *Less:* Increase in WC (+CA or –CL)
 Increase in current assets other than cash (item-wise)
 Decrease in current liabilities (item-wise)
- (E) Cash flow from business operations
-

Cash from business operations has been computed in Exhibits 5.4 and 5.5 for Electronics Limited using Exhibits 5.2 and 5.3 respectively.

EXHIBIT 5.4 Cash from Business Operation [Based on Exhibit 5.2] (Amount in ₹ lakh)

Net sales		1,977
Less cost of goods sold	1,480	
Less operating expenses (other than depreciation and amortisation)	457	
Less interest on debentures	14	1,951
Working capital from business operations		26
Add (Decrease in WC i.e. - CA or + CL):		
Debtors	7	
Inventories	35	
Prepaid expenses	2	
Creditors	16	60
Less (increase in WC i.e. - CA or - CL)		
Provision for income-taxes		(72)
Cash from business operation		14

EXHIBIT 5.5 Cash from Business Operations [Based on Exhibit 5.3]

Net loss as per income statement		(3)
Add depreciation on plant and machinery		23
Add amortisation on patents		6
Working capital from business operations		26
Add (Decrease in WC i.e. - CA or + CL)		
Debtors	7	
Inventories	35	
Prepaid expenses	2	
Creditors	16	60
Less (increase in WC i.e. - CA or - CL)		
Provision for income-taxes		(72)
Cash from business operations		14

Example 5.2

From the following information furnished to you relating to plant and equipment account of Hypothetical Ltd., determine cash obtained from sale of old plant and equipment.

Particulars	Previous year (₹ thousand)	Current year (₹ thousand)
Plant and equipment (gross)	100	125
Accumulated depreciation	20	30
Additional information:		
(i) Loss on sale of plant and equipment		1
(ii) Depreciation charged during the year on plant and equipment		14
(iii) Purchase of new plant during the year		35

Solution

Equations 5.1 and 5.3 can be used to determine the required information to ascertain the sale proceeds from old plant and equipment (PE).

$$(i) \text{ Opening balance of PE (+) Purchases of PE during the year (-) Initial acquisition cost of PE sold during the year} = \text{Closing balance of PE} \quad (5.1)$$

$$= ₹1,00,000 + ₹35,000 - x = ₹1,25,000$$

$$= x = ₹1,35,000 - ₹1,25,000 = ₹10,000 \text{ (Purchase price of PE sold)}$$

- (ii) Opening balance of accumulated depreciation, *AD* + Depreciation charged during the year - *AD* written off on the *PE* sold during the year = Closing balance of *AD* (5.3)

$$= ₹20,000 + ₹14,000 - x = ₹30,000$$

$$= x = ₹34,000 - ₹30,000 = ₹4,000 \text{ (AD on PE sold)}$$

The following information relating to the plant and equipment that has been sold is, thus, available:

Gross book value (purchase cost) ₹10,000

Accumulated depreciation 4,000

Net book value (₹10,000 - ₹4,000) 6,000

Therefore, sale proceeds of plant (₹6,000 - ₹1,000 loss) 5,000

The preceding information can also be obtained by preparing ledger accounts.

Plant and Equipment Account

Particulars	Amount (₹ thousand)	Particulars	Amount (₹ thousand)
Opening balance	100	Acquisition cost of sold plant (balancing figure)	10
Cash purchase of new plant	35	Closing balance	125
	135		135

Accumulated Depreciation Account

Total depreciation on sold plant (balancing figure)	4	Opening balance	20
Closing balance	30	Depreciation expenses charged during the year	14
	34		34

LO 5.5 AS-7: STATEMENT OF CASH FLOWS

The preparation and presentation of cash flow statement was prescribed by Accounting Standard-3 (AS3) issued by the Institute of Chartered Accountants of India (ICAI). As a part of the process of convergence of Indian Accounting Standards with International Financial Reporting Standards (IFRS), ICAI has issued a new accounting standard Ind AS-7 that deals with the statement of cash flows.

All listed and unlisted companies having net worth above ₹500 crore are to follow the new accounting standard from April 1, 2016. The deadline is also applicable for other entities having net worth of ₹500 crore or more. It would also apply to holding, subsidiary, joint venture or associate companies of these two classes of entities.

From April 1, 2017, Ind AS-7 has become mandatory for (i) Companies—whose equity and/or debt securities are listed or are in the process of being listed within India or outside — having a net worth of less than ₹500 crore. (ii) Other companies, that are unlisted having a net worth of ₹250 crore or more but less than ₹500 crore. Holding, subsidiary, joint venture or associate companies of these entities would have to comply with this deadline.

Companies whose securities are listed or in the process of listing on SME exchanges would not be required to apply Ind AS. Such companies would continue to comply with the existing accounting standard unless they choose otherwise.

We explain and illustrate below the CFS mandated by the Ind AS-7. **Annexure-5.1 illustrates the CFS of the Reliance Industries Limited.**

Objectives

Information about the cash flows of an enterprise is useful in providing users of financial statements with a basis to assess the ability of the enterprise to generate cash and cash-equivalents and the needs of the enterprise to utilise those cash flows. The economic decisions that are taken by users require an evaluation of the ability of an enterprise to generate cash and cash-equivalents and the timing and certainty of their generation.

The CFS deals with the provision of information about the historical changes in cash and cash-equivalents of an enterprise by means of a cash flow statement which classifies cash flows during the period among **(i)** operating, **(ii)** investing and **(iii)** financing activities.

Statement of Cash flows provides a summary of operating, investment and financing cashflows and reconciles them with changes in its cash and cash-equivalents (marketable securities) during the period.

Benefits of Cash Flow Operation

A cash flow statement, when used in conjunction with the other financial statements, provides information that enables users to evaluate the changes in net assets of an enterprise, its financial structure (including its liquidity and solvency), and its ability to affect the amounts and timing of cash flows in order to adapt to changing circumstances and opportunities. Cash flow information is useful in assessing the ability of the enterprise to generate cash and cash-equivalents and enables users to develop models to assess and compare the present value of the future cash flows of different enterprises. It also enhances the comparability of the reporting of operating performance by different enterprises because it eliminates the effects of using different accounting treatments for the same transactions and events.

Definitions Associated with Cash Flow

Cash It consists of cash in hand and demand deposits with banks.

Cash Equivalents These are short-term highly liquid investments that are readily convertible into known amounts of changes in value. They have short maturity, say, of three months or less from the date of acquisition, for example, treasury bills.

Cash management includes the investment of excess cash in cash equivalents. Bank overdrafts (which are repayable on demand) are to be included as a component of cash and cash equivalents; the reason is that the bank balance often fluctuates from being positive to overdrawn.

Cash Flows These are inflows and outflows of cash and cash-equivalents.

Operating Activities Cash inflows from operating activities primarily accrue from the major revenue producing activities (i.e., sale of goods and rendering of services) of the enterprise. Therefore, they generally result from the transactions and other events that enter into the determination of net profit or loss. Examples of cash flows from

operating activities are as follows:

- Cash receipts from the sale of goods and the rendering of services
- Cash receipts from royalties, fees, commissions, and other revenues
- Cash payments to suppliers for goods and services
- Cash payments to and on behalf of employees
- Cash receipts and cash payments of an insurance enterprise for premiums and claims, annuities and other policy benefits
- Cash payments or refunds of income taxes unless they can be specifically identified with financing and investing activities
- Cash receipts and payments from contracts held for dealing or trading purposes.

Since the focus is on determining cash flows due to business/operating activities, non-operating expenses as well as non-operating incomes are excluded. In other words, both interest/dividend receipts and interest/dividend payments are excluded.

Investing Activities The investing activities relate to the acquisition and disposal of long-term assets and other investments not included in cash-equivalents. Their separate disclosure is important as they represent the extent to which expenditures have been made for resources intended to generate future income and cash flows. The principal items covered under this category of activities are as follows:

- **Investment flows**
- are cashflows
- associated with
- purchase/sale of
- both fixed assets
- and business
- interests.

- Cash payments to acquire property, plant and equipment, intangible and other long-term assets: fixed assets (including intangibles). These payments include those relating to capitalised research and development costs and self-constructed property, plant and equipment.
- Cash receipts from disposal of property, plant and equipment, intangible and other long-term assets.
- Cash payments to acquire shares, warrants or debt instruments of other enterprises and interests in joint ventures
- Cash receipts from disposal of shares, warrants, or debt instruments of other enterprises and interests in joint ventures
- Cash advances and loans made to third parties
- Cash receipts from the repayment of advances and loans made to third parties
- Cash payments for futures contracts, forward contracts, option contracts and swap contracts.
- Cash receipts from futures contracts forward contracts, option contracts and swap contracts.

Financing Activities The financing activities report the changes in the size and composition of the share/owner's capital and debt of the enterprise. Their separate disclosure is useful in predicting claims on future cash flows by providers of funds (both capital and borrowings) to the enterprise. Examples of cash flows arising from financing activities are as follows:

- **Financing flows**
- are cash flows that
- result from debt/
- equity financing
- transactions and
- include incurrence
- and repayment of
- debt cashflows
- from the sale
- of shares and
- cash outflows to
- purchase shares or
- pay dividend.

- Cash proceeds from issue of shares or other equity instruments
- Cash proceeds from issue of debentures, loans, notes, bonds, mortgages and other short-term or long-term borrowings
- Cash repayments of amounts borrowed
- Dividend/interest paid
- Cash payments to owners to acquire or redeem the entity's shares i.e., buy back of shares and redemption of preference shares.
- Cash payments by a lessee for the reduction of the outstanding liability relating to a finance lease.

Reporting Cash Flows

From Operating Activities An enterprise is required to report cash flows from operating activities using either direct method or indirect method.

Direct Method Under this method, gross cash receipts and gross cash payments for the major items are disclosed, such as cash receipts from customers and cash paid to suppliers.

Indirect Method Under the indirect method, profit and loss account is adjusted for **(i)** the effects of transactions of non-cash nature such as depreciation, amortisation, deferred taxes, loss on sale of fixed assets and unrealised foreign exchange gains and losses, **(ii)** changes during the period in inventories and operating receivables and payables, and **(iii)** for all other items for which the cash effects are shown either in financing or investing activities.

From Investing and Financing Activities An enterprise is required to report separately major classes of gross cash receipts and gross cash payments arising from investing and financing activities. The cash flows from operating, financing and investing activities are to be reported on a *net* basis.

Treatment of Some Major Items

While most of the items (to be included in the CFS) are self-explanatory in nature, some transactions/items merit more explanation. These relate to **(i)** foreign currency, **(ii)** interest, **(iii)** dividends, **(iv)** taxes on income, **(v)** deferred taxes, **(vi)** investments in subsidiaries, associates and joint ventures, **(vii)** Changes in ownership interests in subsidiaries and other business units, **(viii)** non-cash transactions and **(ix)** other disclosures.

Foreign Currency Cash Flows Cash flows arising from transactions in a foreign currency should be recorded in an enterprise's functional currency by applying to the foreign currency amount the exchange rate between the functional currency and the foreign currency at the date of the cash flow. A rate that approximates the actual rate may be used if the result is substantially the same as would arise if the rates at the dates of the cash flows were used.

The effect of changes in exchange rates on cash and cash-equivalents held in a foreign currency are to be reported as a separate part of the reconciliation of the changes in cash and cash-equivalents during the period.

Evidently, unrealised gains and losses arising from changes in foreign exchange rates are not cash flows.

Interest In general, cash flows arising from interest paid should be classified as cash flows from financing activities, say interest on loans/debts; interest paid on working capital loan and any other loan taken to finance operating activities are to be shown as a part of operating activities. Unless stated otherwise, interest paid is to be reported with financing activities. The reason is that they are cost of obtaining financial resources.

Interest received from short-term investments (classified as cash equivalents) are to be reckoned as cash inflows from operating activities.

Cash flows arising from interest paid and interest received in the case of a financial enterprises should be classified as cash flows from operating activities. The reason that is borrowing and lending are the normal business activities for such enterprises.

Dividends While dividends paid are classified as financing activities as they are cost of obtaining financial resources, dividends received on investments constitute a part of investment activities. The reason is that they are the returns on investments.

For the financial enterprises, dividends received form a part of operating activities and dividends paid as a part of financing activities.

Taxes on Income Taxes paid on income as well as tax refunds are usually classified as cash flows from operating activities. In the event of their specific identification with investment or financing activities, the tax cash flow is classified as an investing or financing activity as appropriate.

Deferred Taxes There can be differences in the amount of taxes payable, determined on the basis of financial accounting *vis-a-vis* tax accounting. One such item which can cause this distortion relates to the treatment of depreciation. For instance, for income-tax reporting, the machine may be subject to higher rate of depreciation compared to financial accounting. This lowers the taxes payable in the early years of machine purchased and increases the taxes payable in the latter years. **Deferred taxes are to be treated just like other expenses on accrual basis.** Deferring tax liabilities to the future years is referred to as deferred taxes. As a result, increase in deferred tax liabilities are considered as cash inflows and decrease as cash outflows.

Investments in Subsidiaries, Associates and Joint Ventures Enterprises having investments in subsidiaries, associates and joint ventures are required to report in the CFS the cash flows between themselves and the investee/joint venture, for example, cash flows relating to dividends and advances.

Changes in Ownership Interests in Subsidiaries and Other Business Units The aggregate cash flows arising from obtaining or losing control of subsidiaries or other business units should be presented separately and classified as investing activities.

An enterprise should disclose, in aggregate, in respect of both obtaining and losing control of subsidiaries or other business units during the period, each of the following: **(i)** the total purchase or disposal consideration paid or received; and **(ii)** the portion of the purchase consideration discharged by means of cash and cash-equivalents.

Non-Cash Transactions Investing and financing transactions that do not require the use of cash or cash-equivalents should be excluded from a cash flow statement. Such transactions should be disclosed elsewhere in the financial statements in a way that provides all the relevant information about these investing and financing activities. Examples of non-cash transactions are: **(i)** the acquisition of assets/an enterprise by means of issue of shares and/or debentures, **(ii)** conversion of debt into equity and **(iii)** issue of bonus shares.

Other Disclosures An enterprise should disclose, together with a commentary by management, the amount of significant cash and cash-equivalent balances held by the enterprise that are not available for use by it. Examples include cash and cash-equivalent balances held by a branch of the enterprise that operates in a country where exchange controls or other legal restrictions apply as a result of which the balances are not available for use by the enterprise.

Exhibits 5.6 to 5.8 show the procedure of the preparation of the cash flow statement as per AS-3 (revised).

EXHIBIT 5.6 Direct Method Statement of Cash Flows

Cashflow From Operating Activities
Cash receipts from customers
Cash paid to suppliers and employees
Cash generated from operations
Income tax
Net cash from operating activities
Cashflow From Investing Activities
Purchase of fixed assets
Proceeds from sale of equipments
Interest received
Dividends received
Net cash from investing activities
Cashflow From Financing Activities
Proceeds from issuance of share capital
Proceeds from long-term borrowings
Repayments of long-term borrowings
Interest paid
Dividends paid
Net cash used in financing activities
Net Increase in Cash and Cash-equivalents*
Cash and cash-equivalents at the beginning of a period
Cash and cash-equivalents at the end of a period

*Consists of cash on hand and balance with banks, investment in money market (short-term) investments and effect of exchange rate changes.

EXHIBIT 5.7 Indirect Method Statement of Cash Flows**Cashflow From Operating Activities**

Net profit before taxation, and extraordinary items

Adjustment for

- Depreciation
- Foreign exchange loss
- Interest income
- Dividend income
- Interest expense

Operating profit before working capital changes

Decrease/(increase) in sundry debtors

Decrease/(increase) in inventories

Increase/(decrease) in sundry creditors

Cash generated from operations

Income tax paid

Net cash from operating activities

Cashflow From Investing Activities

Purchase of fixed assets

Proceeds from sale of equipment

Interest received

Dividends received

Net cash from investing activities

Cashflow From Financing Activities

Proceeds from issuance of share capital

Proceeds from long-term borrowings

Repayment of long-term borrowings

Interest paid

Dividends paid

Net cash used in financing activities

Net Increases in Cash and Cash-equivalents

Cash and cash-equivalents at the beginning of a period

Cash and cash-equivalents at the end of a period

EXHIBIT 5.8 Statement of Cash Flows of a Financial Enterprise**Cashflows From Operating Activities**

Interest and commission receipts

Interest payment

Recoveries on loans previously written off

Cash payments to employees and suppliers

Operating profit before changes in operating assets

Decrease (or increase) in operating assets:

- Short-term funds
- Deposit held for regulatory or monetary control purposes
- Funds advanced to customers
- Net increase in credit card receivables
- Other short-term securities

Decrease (or increase) in operating liabilities

- Deposits from customers
- Certificates of deposit
- Net cash from operating activities before income tax
- Income taxes paid

(Contd.)

(Contd.)

Net cash from operating activities
Cashflows From Investing Activities
Dividends received
Interest received
Proceeds from sale of permanent investments
Purchase of permanent investments
Purchase of fixed assets
Net cash from investing activities
Cashflows From Financing Activities
Issue of shares
Repayment of long-term borrowings
Net decrease in other borrowings
Dividends paid
Net cash used in financing activities

For the Electronics Ltd. in Example 5.1, the cash flow statement as per AS-3 is shown in Exhibits 5.9 and 5.10.

EXHIBIT 5.9 Statement of Cash Flows of Electronics Limited for the Current Year (Direct Method)
(Amount in ₹ lakh)

Particulars	Amount
Cash Flows From Operating Activities	
Cash receipts from customers	1,984 ¹
Cash paid to suppliers and employees	1,884 ²
Cash generated from operations	100
Income taxes paid	(72)
Net cash from operating activities	28*
Cash Flows From Investing Activities	
Purchase of plant and machinery	(75)
Purchase of patents	(16)
Proceeds from sale of plant	6
Net cash used in investing activities	(85)
Cash Flows From Financing Activities	
Proceeds from issuance of equity share capital	210
Repayment of debentures (₹220 – 60)	(160)
Interest paid to debenture-holders	(14)
Dividends paid	(16)
Net decrease in cash balance (₹85 – 48)	(37)
Less	
Cash and cash equivalents at beginning of the year	74
Cash and cash equivalents at end of the year	37

* It may be recalled that cash from operating activities (shown in Section II) was ₹14; the difference of ₹14 (₹28 as per AS3 and ₹14 as per CFS) is due to exclusion of interest payment on debentures (₹14); this interest payment is shown under financing activities.

Working Notes

(Amount in ₹ lakh)

(1) Cash receipts from debtors and customers:	
Debtors at the beginning of the year	54

(Contd.)

(Contd.)

Add: Net sales during the year	1,977
Total sum receivable	2,031
Less: Debtors at the end of the year	47
Total	1,984
(2) Cash paid to suppliers and employees:	
Cost of goods sold	1,480
Add: Operating expenses excluding depreciation and amortisation (₹486 – 23 – 6)	457
Add: Current year prepaid expenses	4
Less Previous year prepaid expenses	(6)
	455
Add: Creditors at the beginning of the year	86
Add: Inventories at the end of the year	277
Less: Creditors at the end of the year	(102)
Less: Inventories at the beginning of the year	(312)
Total	1,884

EXHIBIT 5.10 Statement of Cash Flows of Electronics Limited for the Current Year (Indirect Method)
(Amount in ₹ lakh)

Particulars	Amount
Cash flows From Operating Activities	
Net loss before taxation and extra-ordinary items	(4)
Adjustments for:	
Depreciation	23
Amortisation of patent	6
Interest expenses	14
Loss on sale of assets	1
Operating profit before working capital changes	40
Add: Decrease in debtors	7
Add: Decrease in inventories	35
Add: Prepaid expenses	2
Add: Increase in creditors	16
Cash generated from operations	100
Less: Income-tax paid	72
Net cash from operating activities	28
Cash flows From Investing Activities	
Purchase of plant and machinery	(75)
Purchase of patents	(16)
Proceeds from sale of plant	6
Net cash used in investing activities	(85)
Cash flows From Financing Activities	
Proceeds from issuance of equity share capital	210
Repayment of debentures (220 – 60)	(160)
Interest paid to debentureholders	(14)
Dividends paid	(16)
Net decrease in cash balance (78 – 41)	(37)
Cash and cash equivalents at beginning of the year	74
Cash and cash equivalents at end of the year	37

The statement highlights that the firm does not have enough funds from its operating activities (₹28 lakh) and financing activities (₹20 lakh) to cater to investment requirement of ₹85 lakh, causing decline in cash (₹37 lakh).

ANNEXURE 5.1

Cash Flow Statement of Reliance Industries Limited for the Year 2015-16

Particulars	(₹ in crore)	
	2015-16	2014-15
A: CASH FLOW FROM OPERATING ACTIVITIES		
Net Profit Before Tax as per Profit and Loss Statement	35,701	29,468
Adjusted for:		
Write off of Investment [₹ Nil (Previous Year ₹26,96,800)]	—	—
Loss on Sale/Discard of Assets (Net)	20	31

C: CASH FLOW FROM FINANCING ACTIVITIES		
Proceeds from Issue of Share Capital	283	226
Share Application Money	8	17
Proceeds from Long Term Borrowings	7,552	20,310
Repayment of Long Term Borrowings	(4,591)	(4,555)
Short Term Borrowings (net)	1,843	(10,302)
Dividends Paid (Including Dividend Distribution Tax)	(7,259)	(3,268)
Interest Paid	(4,268)	(3,368)
Net Cash (used in)/From Financing Activities	(6,432)	(940)
Net (Decrease) in Cash and Cash Equivalents	(4,679)	(21,653)
Opening Balance of Cash and Cash Equivalents	11,571	33,224
Closing Balance of Cash and Cash Equivalents	6,892	11,571

SUMMARY

LO 5.1	Cash flow statement indicates sources of cash inflows and transactions of cash outflows of a firm during a period. It is also called "Where-Got Where-Gone" statement. The statement provides answers to many important questions related to financial position of an enterprise.
LO 5.2	The major sources of cash inflows are cash from: (i) business operations, (ii) non-business operations (like interest, dividend etc), (iii) sale proceeds of long-term assets, (iv) raising additional share capital and (v) long-term borrowings. The principal uses of cash are: (i) purchase of long-term assets, (ii) redemption of preference shares/debentures, (iii) repayment of long-term borrowings and (iv) payment of dividends.
LO 5.3	Cash flow statement (CFS) is an important tool of financial analysis. It clearly highlights the firm's operating, financing and investment activities. It enables the management to assess whether the firm has adequate long-term funds to finance major fixed assets expansion.
LO 5.4	Preparation of cash flow statement is mandatory for all the listed companies as well as for all enterprises which have net worth of ₹500 crore or more.
	The CFS shows the sources and uses of cash and cash equivalents in terms of three components: (i) operating, (ii) financing and (iii) investing activities. The cash flows from each of these categories are to be reported on net basis.
	Cash flows from operating activities result from the major revenue producing activities of a firm. Accordingly, the income statement constitutes the main source of data. The major operating items are (i) cash receipts from customers, (ii) cash paid to suppliers and employees and (iii) income-tax.
	The items included in financing activities are: (i) proceeds from issue of share capital, (ii) proceeds from long-term borrowings, (iii) redemption of preference shares/debentures, (iv) repayment of long-term borrowings and (v) payment of interest and dividend to debenture-holders/lenders and shareholders respectively.
	Cash flows representing investment activities relate to capital expenditures incurred with intent to generate future earnings as cash flows and includes: (i) purchase of new fixed assets, (ii) proceeds from sale of existing fixed assets and (iii) interest and dividend received on investments made.

SOLVED PROBLEMS

P.5.1 Answer the following:

- (a) A company sold building for cash at ₹100 lakh. The profit and loss account has shown ₹40 lakh profit on sale of building. How will you report it in cash flow statement (based on Ind AS-7)?
- (b) From the following information, determine cash received from debtors during current year:

LO 5.4 LO
E

Debtors in the beginning of current year	₹100 lakh
Total sales	2,000
Cash sales	500
Debtors at the end of current year	300

(c) Determine cash paid to suppliers/creditors from the following data during current year:

Cost of goods sold	₹480 lakh
Opening stock	30
Closing stock	50
Creditors at the beginning of year	60
Creditors at the end of the year	90
Cash purchases	40

(d) From the following (i) determine the gross amount of plant and machinery purchased and (ii) depreciation charged during the current year.

- Plant assets (net of depreciation) at year-end ₹285 lakh and at the year-beginning ₹127 lakh.
- Gross plant assets increased by ₹186 lakh even through machine costing initially ₹58 lakh with book value of ₹38 lakh was sold at loss of ₹25 lakh.

(e) Account balances relating to equipment during 2015–16 are as follows:

Particulars	April 1, 2015	March 31, 2016
Equipment	₹2,00,000	₹4,00,000
Less: Accumulated depreciation	50,000	70,000

Equipment with an original cost of ₹40,000, having an accumulated depreciation of ₹20,000, were sold at a gain of ₹5,000. Determine: (i) Cash provided by the sale of equipment; (ii) Cash used to acquire equipment; (iii) Depreciation expense on equipment during 2015–16.

(f) Would your answer for (e) (i), (ii) and (iii) be different if the equipment were sold at a loss of ₹5,000?

Solution

(a) Cashflows from Investing Activities:

Proceeds from sale of building ₹100 lakh.

(b) Cash Receipts from Debtors:

Debtors at the beginning of current year	₹100 lakh
Plus credit sales (₹2,000 lakh – ₹500 lakh)	1,500
Total sum receivable from debtors	1,600
Less debtors at the end of current year	300
Cash received from debtors	1,300

(c) (i) Determination of Credit Purchases:

- Cost of goods sold = Opening stock + Purchases (x) – Closing stock

$$₹480 \text{ lakh} = ₹30 \text{ lakh} + x - ₹50 \text{ lakh}$$

$$x = ₹480 \text{ lakh} - ₹30 \text{ lakh} + ₹50 \text{ lakh} = ₹500 \text{ lakh}$$

- Credit purchases = ₹500 lakh – ₹40 lakh = ₹460 lakh

(ii) Determination of Payment to Creditors:

Creditors at the beginning of year	₹60 lakh
Plus credit purchases	460
Total sum payable	520
Less creditors at the year-end	90
Payment to creditors	430

(d) (i) Plant and Machinery Purchased:

Net increase in gross value	₹186 lakh
Add initial cost of plant sold	58
	<u>244</u>

(ii) Depreciation Charges:

Plant assets (net) at year beginning	₹127 lakh
Plus purchase cost of new plant	244
Less book value of plant sold	<u>(38)</u>
	333
Closing balance	<u>285</u>
Difference represents depreciation	48

(e) (i) Cash From the Sale of Equipment

Original cost of the sold equipment	₹40,000
Less: Accumulated depreciation on the sold equipment	<u>(20,000)</u>
Net book value	20,000
Plus: Gain on the sold equipment	<u>5,000</u>
Cash proceeds from sale of equipment	<u>25,000</u>

(ii) Cash Spent on Purchase of Equipment

Balance of equipment on April 1, 2015 (gross)	₹2,00,000
Less: Gross book value of the sold equipment	<u>(40,000)</u>
Balance of equipment on March 31, 2016 (without purchases)	1,60,000
Actual balance as on March 31, 2016 of equipment	<u>4,00,000</u>
Difference representing purchases made during 2015–16	<u>2,40,000</u>

(iii) Determination of Depreciation Amount Charged to the P&L A/c During 2015–16:

Balance of accumulated depreciation (1.4.2015)	₹50,000
Less: Depreciation written-off on sold equipment during 2015–16	<u>(20,000)</u>
Balance of accumulated depreciation without additional depreciation during 2015–16	30,000
Actual balance as on March 31, 2016 of accumulated depreciation	<u>70,000</u>
Difference representing depreciation amount charged during 2015–16	<u>40,000</u>

(f) Answers for parts **(e)(ii)** and **(e)(iii)** would remain unchanged. However, cash provided by the sale of equipment would be reduced by ₹10,000. The relevant calculations would be as follows:

Net book value	₹20,000
Less loss on sale of equipment	<u>(5,000)</u>
	<u>15,000</u>

P.5.2 Compute cash generated from operations during the year 2015-16, from the following data:

Particulars	April 1, 2015	March 31, 2016
Sundry debtors	₹30,000	₹40,000
Sundry creditors	48,000	30,000
Outstanding expenses	3,000	6,000
Outstanding income	1,000	1,000
Stock in trade	55,000	60,000
Prepaid expenses	3,000	2,000
Accumulated depreciation (no retirements during the year)	50,000	60,000
Provision for doubtful accounts	1,500	2,000
Dividends payable	—	3,000
Bills receivable	10,000	12,000
Bills payable	8,000	6,000
Net income before taxes (as per profit and loss account)	—	80,000

Solution

Determination of Cash From Operations:

Net income as per P&L A/c		₹80,000
Add Depreciation		10,000
Working capital from business operations		90,000
Less: Transactions other than cash, increasing working capital:		
(i) Increase in current assets:		
Sundry debtors	₹10,000	
Outstanding income	500	
Stock-in-trade	5,000	
Bills receivable	2,000	(17,500)
(ii) Decrease in current liabilities:		
Sundry creditors	18,000	
Bills payable	2,000	(20,000)
Add: Transactions other than cash, decreasing working capital:		
(i) Decrease in current assets:		
Prepaid expenses	1,000	1,000
(ii) Increase in current liabilities:		
Outstanding expenses	3,000	
Provision for doubtful accounts	500	
Dividends payable	3,000	6,500
Cash from operations		60,000

P.5.3 From the following summary cash account of Y Ltd., prepare statement of cash flows for the current year ended March 31 in accordance with AS-7 using the direct method. The company does not have any cash equivalents.

LO 5.5

LOP
M

Summary Cash Account
for the Current Year Ended March 31

Cash inflows	₹ ('000)	Cash outflows	₹ ('000)
Opening balance	50	Payment to suppliers	2,000
Issue of equity shares	300	Purchase of fixed assets	200
Receipts from customers	2800	Overhead expenses	200
Sale of fixed assets	100	Wages and salaries	100
		Taxation	250
		Dividend	50
		Repayment of bank loan	300
		Closing balance	150
	3,250		3,250

Solution

Statement of Cash Flows Y Ltd.
as per AS-3 for the Current Year ended March 31

Cash flows from operating activities:	Amount
Cash receipts from customers	₹28,00,000
Cash paid to suppliers	(20,00,000)
Wages and salaries	(1,00,000)
Overhead expenses	(2,00,000)
Cash generated from operations	5,00,000
Income tax paid	2,50,000
Net cash from operating activities	₹2,50,000
Cash flows from investing activities:	
Purchase of fixed assets	(2,00,000)
Sale of fixed assets	1,00,000
Net cash used in investing activities	(1,00,000)
Cash flows from financing activities:	
Issue of equity shares	3,00,000
Repayment of bank loan	(3,00,000)
Dividend	(50,000)
Net cash used in financing activities	(50,000)
Net increase in cash and cash-equivalent	1,00,000
Cash and cash equivalent at beginning of year	50,000
Cash and cash equivalent at the end of year	1,50,000

P.5.4 Charatlal, the president and majority shareholder, was a superb operating executive. He was an imaginative, aggressive marketing man and an ingenious, creative production man. But he had little patience with financial matters. After examining the most recent balance sheet and income statement, he muttered, "We have enjoyed ten years of steady growth, this year was our most profitable year. Despite this, we are in the worst cash position in our history. Just look those current liabilities in relation to our available cash! This whole picture of the more you make, the poorer you get, just does not make sense. These statements must be cockeyed."

Statement of Cash Flows

5.27

The balance sheets (in lakh of rupees) of Charat Engineering Ltd. are given below:

Assets	March 31		Liabilities	March 31	
	Current Year	Previous year		Current year	Previous year
Cash	2	10	Current liabilities	105	30
Receivables (net)	60	30	Long-term debt	150	—
Inventories	100	50	Stockholder's equity	207	160
Plan assets (net of accumulated depreciation)	300	100			
Total assets	462	190	Total equities	462	190

Net income before taxes, ₹81 lakh. Taxes paid are ₹27 lakh. Net income was ₹54 lakh. Cash dividend paid were ₹7 lakh. Depreciation was ₹20 lakh. Fixed assets were purchase for ₹220 lakh, ₹150 lakh of which was financed via the issuance of long-term debt outright for cash.

Using cash flow statement (based on AS-7), write a short memorandum to Mr Charatlal, explaining why there is such squeeze for cash, Show working.

Solution

Statement of Cash Flows of Charat Engineering Ltd. (Indirect Method)

Particulars	Amount in ₹ lakh	
Cashflow from operating activities:		
Net profit before taxation	₹81	
Adjustment for		
Depreciation	20	
Operating profit before working capital changes	101	
Increase in receivables (net)	(30)	
Increase in inventories	(50)	
Increase in current liabilities	75	
Cash generated from operations	96	
Income tax paid	27	
Net cash from operating activities		69
Cashflow from investing activities:		
Purchase of fixed assets	(220)	(220)
Net cash used for investing activities		
Cashflow from financing activities:		
Issuance of long-term debt	150	
Dividends paid	(7)	
Net cash from financing activities		143
Net decrease in cash		(8)
Cash at the beginning of current year		10
Cash at the end of the year		2

Memorandum: The squeeze for cash has resulted from major fixed assets expansion programme. The cash flow statement highlights that the company does not have enough funds from operating activities (₹69 lakh) and financing activities (₹143 lakh) to cater to investment requirements of ₹220 lakh, causing decline in cash of ₹8 lakh.

P.5.5 Prepare a statement from the following financial information of ABC company, to explain the causes of increase in cash despite the firm incurring losses.

Interest	(6)	
Taxes	(189)	(200)
Net income after taxes		200

Notes: (a) The depreciation charged for the year was ₹60 lakh.

(b) The book value of the building and equipment disposed off was ₹10 lakh.

Prepare a cash flow statement (based on AS-7).

Solution

Statement of Cash Flows of Nandini Limited (Indirect Method)

Particulars	Amount in ₹ lakh	
Cashflow from operating activities:		
Net profit before taxation	₹389	
Adjustment for		
Depreciation	60	
Gain on sale of building and equipment	(5)	
Interest expense	6	
Loss on sale of investments	10	
Operating profit before working capital changes	460	
Increase in working capital	(90)	
Cash generated from operations	370	
Income tax paid	189	
Net cash from operating activities		181
Cashflow from investing activities:		
Proceeds from sale of long-term investments (1)	40	
Proceeds from sale of land	10	
Proceeds from sale of building and equipment (₹10 lakh + ₹5 lakh gain)	15	
Purchase of building and equipment (2)	(130)	
Net cash used in investing activities		(65)
Cashflow from financing activities:		
Proceeds from issuance of bonds (₹100 – ₹50)	50	
Proceeds from issuance of equity shares (₹200 – ₹150)	50	
Interest on debentures	(6)	
Dividend to equity shareholders (3)	(200)	
Net cash used in financing activities		(106)
Net increase in cash		10
Cash at the beginning of year 2		5
Cash at the end of year 2		15

Working Notes**(1) Proceeds from sale of long-term investments:**

Investments at beginning of year -2	₹150 lakh
Less investment of year-end 2	100
Book value of investments sold	50
Less loss on sale of investments	(10)
Sale proceeds	40

(2) Purchase of building and equipment

Original cost of buildings and equipment at the beginning of year 2	₹400 lakh
Less original cost of building and equipment sold during year-2 (book value ₹10 lakh Plus accumulated depreciation ₹20 lakh)	(30)
	370
Original cost of building and equipment at year-end 2	500
Difference represents purchases of building and equipment	130

*Accumulated Depreciation Account (in ₹ lakh)

Particular	Amount	Particular	Amount
To Building and equipment (accumulated depreciation on sale, balancing figure)	20	By Balance b/f	160
To Balance c/d	200	By P&L A/c (depreciation of current year)	60
	220		220

(3) Since there is no increase in reserves (₹340 lakh), the entire net income after taxes of ₹200 lakh represents payment of dividend to equity shareholders.

P.5.7 The manager of a small plastic manufacturing company has reviewed the annual financial statements for the current year and is unable to determine from a reading of the balance sheet the reasons for the changes in cash during the year. He asks you for assistance and presents the following balance sheets of the Hypothetical Ltd.

LO 5.5	LO D
---------------	-------------

Particulars	Previous year March 31	Current year March 31	Increase (Decreases)
Assets:			
Goodwill	₹1,00,000	(Nil)	₹(1,00,000)
Buildings	2,80,000	₹4,05,000	1,25,000
Land	75,000	70,000	(5,000)
Machinery	1,00,000	1,65,000	65,000
Tools	35,000	20,000	(15,000)
Trade investments	7,500	9,000	1,500
Inventories	1,09,000	1,05,000	(4,000)
Sundry debtors	46,000	90,000	44,000
Bills receivable	13,500	10,500	(3,000)
Cash in hand	4,500	1,000	(3,500)
Unexpired insurance	700	600	(100)
Unamortised discount on debentures	1,250	1,050	(200)
	7,72,450	8,77,150	1,04,700
Liabilities:			
Equity share capital	2,00,000	3,50,000	1,50,000
Debentures	50,000	75,000	25,000
Sundry creditors	26,000	29,000	3,000
Bank overdraft	—	4,000	4,000
Bills payable	5,000	4,500	(500)
Bank loans (short-term)	3,400	750	(2,650)
Accrued taxes	1,500	2,500	1,000
Accrued interest	3,000	5,000	2,000
Allowance for doubtful accounts	1,150	2,250	1,100
Accumulated depreciation	90,500	1,35,600	45,100
Retained earnings	3,91,900	2,68,550	(1,23,350)
	7,72,450	8,77,150	1,04,700

Additional Information:

- (i) There were no purchases or sales of tools.
- (ii) Equity shares were issued at a discount of 10 per cent.
- (iii) Old machinery that cost ₹2,250 was scrapped and written off the books. Accumulated depreciation on such equipment was ₹1,650.
- (iv) The income statement for the current year is:

Statement of Cash Flows

Sales (net)	₹6,25,000
Less: Expenses:	
Operating charges:	
Materials and supplies	1,25,000
Direct labour	1,05,000
Manufacturing overhead	90,750
Depreciation	61,750
Selling expenses	1,22,500
General expenses	1,15,000
Interest expenses	3,750
Unusual items:	
Writing off of goodwill	1,00,000
Writing off of land	5,000
Loss on machinery	600
Discount on issue of equity shares 15,000	7,44,350
Net loss	<u>(1,19,350)</u>

You are required to prepare cash flow statement based on Ind AS-7.

Solution

Statement of Cash Flows of Plastic Manufacturing Company
for the Current Year (Indirect method)

Particulars	Amount
Cash flow from operating activities:	
Net loss	₹(1,19,350)
Adjusted for	
Depreciation	61,750
Interest expenses	3,750
Writing off of goodwill	1,00,000
Writing off of land	5,000
Loss on machinery	600
Discount on issue of shares	15,000
Amortisation of discount on debentures	200
Operating profit before working capital changes	<u>66,950</u>
Adjusted for changes in working capital:	
Decrease in inventories	4,000
Increase in sundry debtors	(44,000)
Decrease in bills receivable	3,000
Decrease in unexpired insurance	100
Increase in creditors	3,000
Increase in bank overdraft	4,000
Decrease in bills payable	(500)
Decrease in bank loans (short-term)	(2,650)
Increase in accrued taxes	1,000
Allowance for doubtful debts	1,100
Net cash from operating activities	<u>₹36,000</u>
Cash flow from investing activities:	
Purchase of machine (1)	(67,250)
Purchase of building	(1,25,000)
Purchase of trade investments	1,500
Net cash used in investing activities	<u>1,93,750</u>
Cash flow from financing activities:	
Proceeds from issue of equity shares	1,35,000
Proceeds from issue of debentures	25,000
Interest paid (2)	(1,750)
Dividend paid (3)	(4,000)
Net cash from financing activities	<u>1,54,250</u>
Net decrease in cash and cash-equivalents	<u>(3,500)</u>
Cash and cash equivalents at the beginning of current year	4,500
Cash and cash equivalents at the end of current year	<u>1,000</u>

Working Notes**1. Purchase of Machine**

Machinery at beginning of the year	₹1,00,000
Less scrap value of machine	2,250
	<u>97,750</u>
Closing balance of machine	1,65,000
Difference represents purchase of machine*	<u>67,250</u>

2. Interest paid

Accrued interest at the beginning of year	3,000
Interest due during the year	3,750*
	<u>6,750</u>
Less accrued interest at the end of the year	5,000
Interest paid	1,750

*Interest expenses are (₹1,750 paid + Payable, ₹2,000). In operating activities, ₹3,750 has been adjusted in determining figure of operating profit before working capital changes. Increase in accrued interest of ₹2,000 (₹5,000 – ₹3,000) is not adjusted subsequently as it would have added more to cash flow by ₹2,000. (to avoid double counting).

3. Determination of dividend amount:

Balance of retained earnings 31st March, previous year	₹3,91,900
Less: Net loss of current year	<u>1,19,350</u>
	<u>2,72,550</u>

However, the balance of retained earnings as on December 31, current year is ₹2,68,550, that is, ₹4,000 less. In the absence of any other information, this amount is assumed to have been paid as dividends to equityholders.

P.5.8 The following are the summarised balance sheets of Sound Ltd. as on March 31 for the two consecutive years 1 and 2:

LO 5.5	LO D
---------------	-------------

(₹ in thousand)

Particulars	Year 2	Year 1
Assets:		
Plant and machinery	1,980	1,010
Land and buildings	1,000	1,000
Long-term investments	550	550
Short-term investments	470	85
Sundry debtors	2,195	2,500
Inventories	1,400	1,300
Interest receivable	100	65
Cash in hand	300	500
Cash in bank	405	300
	<u>8,400</u>	<u>7,310</u>
Liabilities:		
Share capital	2,600	2,150
Reserve and surplus	1,460	900
15% debentures	2,000	1,800
Sundry creditors	440	650
Wages outstanding	40	20
Income-tax payable	400	450
Accumulated depreciation:		
Plant and machinery	910	840
Land and buildings	550	500
	<u>8,400</u>	<u>7,310</u>

Income Statement
for the period ending March 31, year 2 (₹ in thousand)

Sales revenue	45,300
Less: Cost of sales	39,000
Gross profit	6,300
Less: Depreciation	(540)
Selling and administration expenses	(2,960)
Interest paid	(300)
Add: Interest income	65
Dividend income (gross)	95
Net profit before extraordinary items	2,660
Add: Insurance settlement received	10
	2,670
Less: Provision for income-taxes	550
Net profit after taxes	2,120

Additional information (₹ in thousand):

- (1) 15% Debentures of ₹300 was redeemed during year 2.
- (2) Tax deducted at source on dividends received (included in provision for taxes) amounts to ₹15.
- (3) A plant costing ₹500, having accumulated depreciation of ₹420 was sold for ₹80.
- (4) During year 2, interim dividend of ₹760 was paid; final dividend paid was ₹800.
- (5) All sales and purchases are made on credit basis.

You are required to prepare a statement of cash flows as per Ind AS-7 (revised).

Solution

Direct Method Cash Flow Statement

(₹ in thousand)

Cash flows from operating activities:		
Cash receipts from customers	45,605	
Cash paid to suppliers and employees	(42,250)	
Cash generated from operations	3,355	
Income tax paid	(585)	
Cash flow before extraordinary item	2,770	
Proceeds from insurance settlement	10	
Net cash from operating activities		2,780
Cash flows from investing activities:		
Purchases of plant and machinery	(1,470)	
Proceeds from sale of plant and machinery	80	
Interest received	30	
Dividends received (₹95 - 15)	80	
Net cash used in investing activities		(1,280)
Cash flows from financing activities:		
Proceeds from issuance of share capital	450	
Proceeds from issue of 15% debentures	500	
Redemption of 15% debentures	(300)	
Interest paid	(300)	
Dividends paid (interim + final)	(1,560)	
Net cash used in financing activities		(1,210)
Net increase in cash and cash-equivalent		290
Cash and cash-equivalent at beginning of year 2		885
Cash and cash-equivalents at the end of year 2		1,175

(Contd.)

Shareholders' Funds		
Share capital	1,500	1,250
Reserves	3,410	1,380
Total shareholders' funds	<u>4,910</u>	<u>2,630</u>
Total liabilities and shareholders' funds	<u>6,800</u>	<u>6,660</u>

Statement of Profit and Loss
for the year 2 ended March 31

	(₹ '000)
Sales	30,650
Cost of sales	(26,000)
Gross profit	4,650
Depreciation	(450)
Administrative and selling expenses	(910)
Interest expense	(400)
Interest income	300
Dividend income	200
Foreign exchange loss	(40)
Net profit before taxation and extraordinary item	3,350
Extraordinary item-Insurance proceeds from earthquake disaster settlement	180
Net profit after extraordinary item	3,530
Income-tax	(300)
Net profit	<u>3,230</u>

Additional information (₹ in thousand)

- (i) An amount of 250 was raised from the issue of share capital and a further 250 was raised from long-term borrowings.
- (ii) Interest expense was 400 of which 170 was paid during the period. 100 relating to interest expense of the prior period was also paid during the period.
- (iii) Dividends paid were 1,200.
- (iv) Tax deducted at source on dividends received (included in the tax expense of 300 for the year) amounted to 40.
- (v) During the period, the enterprise acquired fixed assets for 350. The payment was made in cash.
- (vi) Plant with original cost of 80 and accumulated depreciation of 60 was sold for 20.
- (vii) Foreign exchange loss of 40 represents the reduction in the carrying amount of a short-term investment in foreign-currency designated bonds arising out of a change in exchange rate between the date of acquisition of the investment and the balance sheet date.
- (viii) Sundry debtors and sundry creditors include amounts relating to credit sales and credit purchases only.

Solution

Notes to the cash flow statement (direct method and indirect method)**1. Cash and cash-equivalents**

Cash and cash equivalents consist of cash on hand and balances with banks, and investments in money-market instruments. Cash and cash-equivalents included in the cash flow statement comprise the following balance sheet amounts.

	Year 2	Year 1
Cash on hand and balances with banks	₹200	₹25
Short-term investments	670	135
Cash and cash-equivalents	870	160
Effect of exchange rate changes	40	—
Cash and cash equivalents as restated	910	160

Cash and cash-equivalents at the end of the period include deposits with banks of 100 held by a branch which are not freely remissible to the company because of currency exchange restrictions.

The company has undrawn borrowing facilities of 2,000 of which 700 may be used only for future expansion.

2. Total tax paid during the year (including tax deducted at source on dividends received) amounted to 900.

Alternative Presentation (indirect method):

As an alternative, in an indirect method cash flow statement, operating profit before working capital changes is sometimes presented as follows:

Revenues excluding investment income	₹30,650	
Operating expense excluding depreciation	(26,910)	
Operating profit before working capital changes		₹3,740

Working Notes

(Figures in ₹ '000)

1. Cash receipts from customers

Sales	30,650
Add: Sundry debtors at the end of the year	1,200
	<u>31,850</u>
Less: Sundry debtors at the end of the year	1,700
	<u>30,150</u>

2. Cash paid to suppliers and employees

Cost of sales	26,000
Administrative and selling expenses	910
	<u>26,910</u>
Add: Sundry creditors at the beginning of the year	1,890
Inventories at the end of the year	900
Less: Sundry creditors at the end of the year	150
Inventories at the beginning of the year	1,950
	<u>2,100</u>
	<u>27,600</u>

3. Income taxes paid (including tax deducted at source from dividends received)

Income tax expense for the year (including tax deducted at source from dividends received)	300
Add: Income tax liability at the beginning of the year	1,000
	<u>1,300</u>
Less: Income tax liability at the end of the year	400
	<u>900</u>

Out of 900, tax deducted at source on dividends received (amounting to 40) is included in cash flows from investing activities and the balance of 860 is included in cash flows from operating activities.

4. Repayment of long-term borrowings	
Long-term debt at the beginning of the year	1,040
Add: Long-term borrowing made during the year	250
	<hr/> 1,290
Less: Long-term borrowings at the end of the year	1,110
	<hr/> 180
5. Interest paid	
Interest expense for the year	400
Add: Interest payable at the beginning of the year	100
	<hr/> 500
Less: Interest payable at the end of the year	230
	<hr/> 270

REVIEW QUESTIONS

LOD: Easy

RQ.5.1 Indicate whether the following statements are True or False.

[LO 5.4.5]

- (i) Cash from business operations can be determined from income statement.
- (ii) Working capital from business operations can be determined from profit and loss account.
- (iii) Sources of cash should always be more than uses of cash, in the context of cash flows statement.
- (iv) Interest paid on debentures is a part of operating activities.
- (v) Interest received on two-months deposits in bank is shown under investing activities.
- (vi) Sources of cash and uses of cash are to be equal.
- (vii) Cash flows are inflows and outflows of cash and cash-equivalents.
- (viii) Revaluation of building affects cashflows.
- (ix) Sale proceeds from machinery, being a source of finance, form part of financing activities.
- (x) Cash flow statement is mandatory for all business firms.
- (xi) In normal circumstances a firm has positive cash from operations and negative cash flow from investing activities.

[Answers: (i) False, (ii) True, (iii) False, (iv) False, (v) False, (vi) False, (vii) True, (viii) False, (ix) False, (x) False, and (xi) True]

RQ.5.2 Fill in the following blanks with right answer:

[LO 5.4.5]

- (i) Cash flow statement (based on AS-7) indicates change in _____ (cash/bank/cash and cash-equivalents).
- (ii) Decrease in creditors _____ (Decreases/Increases) cash.
- (iii) Interest received on long-term investments is shown under _____ (Operating/Financing/Investing activities).
- (iv) Decrease in inventory _____ (Decreases/Increases) cash.
- (v) Increase in pre-paid expenses _____ (Decreases/Increases) cash.
- (vi) Cash payments to suppliers for goods and services are shown under _____ (Operating/Financing/Investing activities).
- (vii) Cash-flow statement (based on AS-7) of listed companies should be presented as per the _____ (Indirect/Direct) method.
- (viii) Cash payments to acquire long-term assets form part of _____ (Financing/Investing activities).
- (ix) Buy back of shares is shown under (Financing/Investing activities).
- (x) Dividends paid to shareholders are classified as _____ (Financing/Investing activities).

[Answers: (i) cash and cash-equivalents, (ii) decreases, (iii) investing activities, (iv) increases, (v) decreases, (vi) operating, (vii) indirect, (viii) investing, (ix) financing and (x) financing]

- RQ.5.3** "The analysis of cash flow statement in any organisation can be very useful to the management." Elucidate the statement. [LO 5.3]
- RQ.5.4** The cash flow statement is as useful to shareholders and lenders as to management. Explain. [LO 5.3]
- RQ.5.5** Name three activities in which cash flows are classified as per Accounting Standard 7. Also give three examples of transactions covered in these activities. [LO 5.5]
- RQ.5.6** Describe in brief the procedure of determining cash flow from operating activities as per indirect method of AS-7. Take an appropriate example to illustrate your answer. [LO 5.5]
- RQ.5.7** The directors of Precision Tools Ltd. are worried at the deteriorating financial position of the company. The company has utilised full overdraft facility from the bank and is still not able to pay its creditors on due dates, although the profits earned are satisfactory. [LO 5.5]
The following are the balance sheets as on March 31 for the recent 2 years.

	Previous year		Current year	
Share capital: shares of ₹10 each fully paid		₹10,00,000		₹10,00,000
P & L appropriation A/c		60,000		80,000
Overdraft from bank		1,60,000		6,00,000
Sundry creditors		2,00,000		6,00,000
		<u>14,20,000</u>		<u>22,80,000</u>
Land and buildings		3,00,000		5,00,000
Plant and machinery	₹5,00,000		₹6,00,000	
Less depreciation	<u>1,20,000</u>	3,80,000	<u>1,80,000</u>	4,20,000
Vehicles	1,16,000		1,24,000	
Less depreciation	<u>56,000</u>	60,000	<u>84,000</u>	40,000
Stock		2,20,000		7,20,000
Debtors		<u>4,60,000</u>		<u>6,00,000</u>
		14,20,000		22,80,000

During the year, a dividend of 10 per cent was distributed to the shareholders. On April 1 of the current year, a motor car, which originally costed ₹20,000, and showed a book value of ₹10,000, was sold for ₹16,000.

You are required to prepare a statement of cash flows based on Ind AS-7.

LOD: Medium

- RQ.5.8** From the following financial information, select non-cash investing, financing and operating activities: [LO 5.4, 5]
- Redemption of debentures by converting into equity shares
 - Buy back of equity shares
 - Purchase of fixed assets in exchange of preference shares
 - Depreciation on fixed assets
 - Increase in debtors
 - Loss on sale of plant
 - Decrease in inventories
 - Amortisation of patents
 - Issuance of equity share for cash
 - Bonus shares

[Answer: (Non-cash activities)

Investing: Purchase of fixed assets in exchange of preference shares.

Financing: (i) Redemption of debentures by converting into equity shares,

(ii) Issue of preference shares for purchase of fixed assets,

(iii) Bonus shares **Operating:** (i) Depreciation on fixed assets, (ii) Amortisation of patents, (iii) Loss on sale of plant]

RQ.5.9 Explain with example the two methods of determining cash provided by operating activities.

[LO 5.5]

RQ.5.10 Explain why decrease in current liabilities decrease cash and decrease in current assets increase cash.

[LO 5.4]

RQ.5.11 "Depreciation is a non-cash expense. Still it is an integral part of cash flows". Explain.

[LO 5.4]

RQ.5.12 Write short notes on the following

[LO 5.5]

(i) Cash-equivalents

(ii) Treatment of interest and dividends received in cash flow statement (based on AS-7).

(iii) Major non-cash items.

RQ.5.13 Given the following data (₹ thousands), prepare a statement of cash flows based on Ind AS-7.

[LO 5.5]

	Year 2	Year 1
Liabilities		
Equity share capital	₹3,600	₹3,600
Reserves	2,545	2,100
Total shareholder's equity	<u>6,145</u>	<u>5,700</u>

Financial Statements Analysis

LEARNING OBJECTIVES

LO 6.1	Know the meaning and rationale of ratio analysis
LO 6.2	Understand liquidity ratios
LO 6.3	Explain capital structure ratios
LO 6.4	Describe profitability ratios
LO 6.5	Interpret activity/efficiency ratios
LO 6.6	Discuss integrated analysis of ratios/Du Pont chart
LO 6.7	Review the common size statements
LO 6.8	Illustrate the importance of ratio analysis
LO 6.9	Outline the limitations of ratio analysis

INTRODUCTION

A basic limitation of the traditional financial statements comprising the balance sheet and the statement of profit and loss is that they do not give all the information related to the financial operations of a firm. Nevertheless, they provide some extremely useful information to the extent that the balance sheet mirrors the financial position on a particular date in terms of the structure of assets, liabilities and owners' equity, and so on and the statement of profit and loss shows the results of operations during a certain period of time in terms of the revenues obtained and the cost incurred during the year. Thus, the financial statements provide a summarised view of the financial position and operations of a firm. Therefore, much can be learnt about a firm from a careful examination of its financial statements as invaluable documents/performance reports. The analysis of financial statements is, thus, an important aid to financial analysis.

The focus of financial analysis is on key figures in the financial statements and the significant relationship that exists between them. The analysis of financial statements is a process of evaluating the relationship between component parts of financial statements to obtain a better understanding

of the firm's position and performance.¹ The first task of the financial analyst is to select the information relevant to the decision under consideration from the total information contained in the financial statements. The second step is to arrange the information in a way to highlight significant relationships. The final step is interpretation and drawing of inferences and conclusions. *In brief, financial analysis is the process of selection, relation and evaluation.*²

The present chapter is devoted to an in-depth analysis of financial statements and its use for decision making by various external and internal parties interested in them. The focus of the Chapter is on ratio analysis as the most widely used technique of financial statement analysis. The Chapter also discusses common-size statements as method of analysis of financial statements. The importance of ratio analysis and its limitations are similarly briefly outlined. The major points are summarised by way of recapitulation.

LO 6.1 RATIO ANALYSIS—MEANING AND RATIONALE

Ratio Analysis is a widely-used tool of financial analysis. It can be used to compare the risk and return relationships of firms of different sizes. It is defined as the systematic use of ratio to interpret the financial statements so that the strengths and weaknesses of a firm as well as its historical performance and current financial condition can be determined. The term ratio refers to the numerical or quantitative relationship between two items/variables. This relationship can be expressed as **(i)** percentages, say, net profits are 25 per cent of sales (assuming net profits of ₹25 lakh and sales of ₹100 lakh, **(ii)** fraction (net profit is one-fourth of sales) and **(iii)** proportion of numbers (the relationship between net profits and sales is 1:4). These alternative methods of expressing items which are related to each other are, for purposes of financial analysis, referred to as ratio analysis. It should be noted that computing the ratios does not add any information not already inherent in the above figures of profits and sales. What the ratios do is that they reveal the relationship in a more meaningful way so as to enable equity investors, management and lenders make better investment and credit decisions.

Rationale

The rationale of ratio analysis lies in the fact that it makes related information comparable. A single figure by itself has no meaning but when expressed in terms of a related figure, it yields significant inferences. For instance, the fact that the net profits of a firm amount to, say, ₹10 lakh throws no light on its adequacy or otherwise. The figure of net profit has to be considered in relation to other variables. How does it stand in relation to sales? What does it represent by way of return on total assets used or total capital employed? If, therefore, net profits are shown in terms of their relationship with items such as sales, assets, capital employed, equity capital and so on, meaningful conclusions can be drawn regarding their adequacy. To carry the above example further, assuming the capital employed to be ₹50 lakh and ₹100 lakh, the net profits are 20 per cent and 10 per cent respectively. Ratio analysis, thus, as a quantitative tool, enables analysts to draw quantitative answers to questions such as: Are the net profits adequate? Are the assets being used efficiently? Is the firm solvent? Can the firm meet its current obligations and so on?

Basis of Comparison

Ratios, as shown above, are relative figures reflecting the relationship between variables. They enable analysts to draw conclusions regarding financial operations. The use of ratios, as a tool of financial analysis, involves their comparison, for a single ratio, like absolute figures, fails to reveal the true position. For example, if in the case of a firm, the return on capital employed is 15 per cent in

a particular year, what does it indicate? Only if the figure is related to the fact that in the preceding year the relevant return was 12 per cent or 18 per cent, it can be inferred whether the profitability of the firm has declined or improved. Alternatively, if we know that the return for the industry as a whole is 10 per cent or 20 per cent, the profitability of the firm in question can be evaluated. Comparison with related facts is, therefore, the basis of ratio analysis. Four types of comparisons are involved: **(i)** trend ratios, **(ii)** interfirm comparison, **(iii)** comparison of items within a single year's financial statement of a firm, and **(iv)** comparison with standards or plans.

Trend ratios involve a comparison of the ratios of a firm over time, that is, present ratios are compared with past ratios for the same firm. The comparison of the profitability of a firm, say, year 1 through 5 is an illustration of a trend ratio. Trend ratios indicate the direction of change in the performance—improvement, deterioration or constancy—over the years.

The **inter-firm comparison** involving comparison of the ratios of a firm with those of others in the same line of business or for the industry as a whole reflects its performance in relation to its competitors.

Other types of comparison may relate to comparison of items within a single year's financial statement of a firm and comparison with standards or plans.

Types of Ratios

Ratios can be classified into 5 broad groups: (i) Liquidity ratios, (ii) Capital structure/leverage ratios, (iii) Profitability ratios, (iv) Activity/Efficiency ratios and (v) Integrated analysis of ratios. **A checklist of financial ratios of Reliance Industries Limited (based on data for 2012 is provided in Annexure 6.1.**

LO 6.2 LIQUIDITY RATIOS

The importance of adequate liquidity in the sense of the ability of a firm to meet current/short-term obligations when they become due for payment can hardly be overstressed. In fact, liquidity is a prerequisite for the very survival of a firm. The short-term creditors of the firm are interested in the short-term solvency or liquidity of a firm. But liquidity implies, from the viewpoint of utilisation of the funds of the firm, that funds are idle or they earn very little. A proper balance between the two contradictory requirements, that is, liquidity and profitability, is required for efficient financial management. The liquidity ratios measure the ability of a firm to meet its short-term obligations and reflect the short-term financial strength/solvency of a firm. The ratios which indicate the liquidity of a firm are: **(i)** net working capital, **(ii)** current ratios, **(iii)** acid test/quick ratios, **(iv)** super quick ratios, **(v)** turnover ratios, **(vi)** defensive-interval ratios and **(vii)** cash flow from operations ratio.

Net Working Capital

Net working capital (NWC) represents the excess of current assets over current liabilities. The term current assets refers to assets which in the normal course of business get converted into cash without diminution in value over a short period, usually not exceeding one year or length of operating/cash cycle whichever is more. Current liabilities are those liabilities which at the inception are required to be paid in short period, normally a year. Although NWC is really not a ratio, it is frequently employed as a measure of a company's liquidity position. An enterprise should have sufficient NWC in order to be able to meet the claims of the creditors and the

- **Trend ratios**
- involve evaluation of financial performance over a period of time using financial ratio analysis.

- **Inter-firm comparison**
- involves comparison of different firms' financial ratios at the same point of time; involves comparison of a firm's ratios to those of others in its industry or to industry average.

- **Net working capital**
- is a measure of liquidity calculate by subtracting current liabilities from current assets.

The first part of the report is a general introduction to the subject of the study. It discusses the importance of the study and the objectives of the research. The second part of the report is a detailed description of the methodology used in the study. This includes a description of the data sources, the sampling method, and the statistical methods used to analyze the data. The third part of the report is a discussion of the results of the study. This includes a description of the findings and an interpretation of the results. The final part of the report is a conclusion and a list of references.

1.1. Introduction

The purpose of this study is to investigate the relationship between the variables X and Y. The study is based on a sample of 100 observations. The results of the study are presented in the following table. The first column shows the value of X, and the second column shows the value of Y. The third column shows the frequency of each combination of X and Y. The fourth column shows the relative frequency of each combination of X and Y. The fifth column shows the marginal frequency of X, and the sixth column shows the marginal frequency of Y.

The results of the study show that there is a positive correlation between X and Y. This means that as the value of X increases, the value of Y also tends to increase. The strength of the correlation is indicated by the coefficient of determination, which is 0.64. This means that 64% of the variation in Y can be explained by the variation in X. The remaining 36% of the variation in Y is due to other factors that are not included in the study.

1.2. Methodology

The data for this study were collected from a random sample of 100 observations. The sample was selected using simple random sampling. The data were then analyzed using the following statistical methods: descriptive statistics, correlation analysis, and regression analysis.

The second part of the report is a detailed description of the methodology used in the study. This includes a description of the data sources, the sampling method, and the statistical methods used to analyze the data. The third part of the report is a discussion of the results of the study. This includes a description of the findings and an interpretation of the results. The final part of the report is a conclusion and a list of references.

The results of the study show that there is a positive correlation between X and Y. This means that as the value of X increases, the value of Y also tends to increase. The strength of the correlation is indicated by the coefficient of determination, which is 0.64. This means that 64% of the variation in Y can be explained by the variation in X. The remaining 36% of the variation in Y is due to other factors that are not included in the study.

1.3. Results

The results of the study are presented in the following table. The first column shows the value of X, and the second column shows the value of Y. The third column shows the frequency of each combination of X and Y. The fourth column shows the relative frequency of each combination of X and Y. The fifth column shows the marginal frequency of X, and the sixth column shows the marginal frequency of Y.

1.4. Discussion

The results of the study show that there is a positive correlation between X and Y. This means that as the value of X increases, the value of Y also tends to increase. The strength of the correlation is indicated by the coefficient of determination, which is 0.64. This means that 64% of the variation in Y can be explained by the variation in X. The remaining 36% of the variation in Y is due to other factors that are not included in the study.

1.5. Conclusion

The study has shown that there is a positive correlation between X and Y. This means that as the value of X increases, the value of Y also tends to increase. The strength of the correlation is indicated by the coefficient of determination, which is 0.64. This means that 64% of the variation in Y can be explained by the variation in X. The remaining 36% of the variation in Y is due to other factors that are not included in the study.

day-to-day needs of business. The greater is the amount of NWC, the greater is the liquidity of the firm. Accordingly, NWC is a measure of liquidity. Inadequate working capital is the first sign of financial problems for a firm.

There is, however, no predetermined criterion as to what constitutes adequate NWC. Moreover, the size of the NWC is not an appropriate measure of the liquidity position of a firm as shown in Table 6.1:

TABLE 6.1 Net Working Capital

Particulars	Company A (₹ lakh)	Company B (₹ lakh)
Total current assets	180	30
Total current liabilities	120	10
NWC	60	20

If the size of NWC is a measure of liquidity, Company A must be three times as liquid as Company B. However, a deeper probe would show that this is not so. A comparison of current liabilities and current assets of both the firms shows that for each rupee of current liability, B has ₹3 of current assets, while A has only ₹1.50. Thus, while A has three times the NWC of B, the current assets of the former are only 1.5 times its current liabilities as compared to 3 times in case of the latter. Obviously, from the viewpoint of the ability to meet its current obligations, firm B is in a better position than firm A. Another limitation of NWC, as a measure of liquidity, is that a change in NWC does not necessarily reflect a change in the liquidity position of a firm. Witness Table 6.2.

TABLE 6.2 Change in Net Working Capital

Particulars	End-year 1 (₹ lakh)	End-year 2 (₹ lakh)
Current assets	150	300
Current liabilities	75	200
NWC	75	100

Although the NWC has gone up for the firm in Table 6.2 from ₹75 lakh to ₹100 lakh, that is, by ₹25 lakh or 33.3 per cent between two points of time, there is, in reality, a deterioration in the liquidity position. In the first year, the firm had ₹2 of current assets for each rupee of current liabilities; but by the end of the second year the amount of current assets for each rupee of current liabilities declined to ₹1.5 only, that is, by 25 per cent. For these reasons, NWC is not a satisfactory measure of the liquidity of a firm for inter-firm comparison or for trend analysis.³ A better indicator is the current ratio.

Current Ratio

The **current ratio** is the ratio of total current assets to total current liabilities. It is calculated by dividing current assets by current liabilities:

$$\text{Current ratio} = \frac{\text{Current assets}}{\text{Current liabilities}} \quad (6.1)$$

Current ratio is a measure of liquidity calculated by dividing the current assets by the current liabilities.

The current assets of a firm, as already stated, represent those assets which can be, in the ordinary course of business, converted into cash within a short period of time, normally not exceeding one year and include cash and bank balances, marketable securities, inventory of raw materials, semi-finished (work-in-progress) and finished goods, debtors net of provision for bad and doubtful debts, bills receivable and prepaid expenses. The current liabilities defined as liabilities which are short-term maturing obligations to be met, as originally contemplated, within a year, consist of trade creditors, bills payable, bank credit, provision for taxation, dividends payable and outstanding expenses. The current ratio for firms A and B of Table 6.1 are shown in Table 6.3.

TABLE 6.3 Current Ratio

Particulars	Firm A (₹ lakh)	Firm B (₹ lakh)
Current assets	= 180	= 30
Current liabilities	120	10
	= 3 : 2 (1.5 : 1)	3 : 1

Rationale The current ratio of a firm measures its short-term solvency, that is, its ability to meet short-term obligations. As a measure of short-term/current financial liquidity, it indicates the rupees of current assets (cash balance and its potential source of cash) available for each rupee of current liability/obligation payable. *The higher the current ratio, the larger is the amount of rupees available per rupee of current liability, the more is the firm's ability to meet current obligations and the greater is the safety of funds of short-term creditors.* Thus, current ratio, in a way, is a measure of margin of safety to the creditors.

The need for safety margin arises from the inevitable unevenness in the flow of funds through the current assets and liabilities account. If the flows were absolutely smooth and uniform each day so that inflows exactly equalled absolutely maturing obligations, the requirement of a safety margin would be small. The fact that a firm can rarely count on such an even flow requires that the size of the current assets should be sufficiently larger than current liabilities so that the firm would be assured of being able to pay its current maturing debt as and when it becomes due. Moreover, the current liabilities can be settled only by making payment whereas the current assets available to liquidate them are subject to shrinkage for various reasons, such as bad debts, inventories becoming obsolete or unsaleable and occurrence of unexpected losses in marketable securities and so on. The current ratio measures the size of the short-term liquidity 'buffer'. A satisfactory current ratio would enable a firm to meet its obligations even when the value of the current assets declines.

Interpretation In the case of company A in the above example, the current ratio is 1.5 : 1. It implies that for every one rupee of current liabilities, current assets of one-and-half rupees are available to meet them. In other words, the current assets are one-and-half times the current liabilities. The current ratio of 3 : 1 for company B signifies that current assets are three-fold its short-term obligations. The liquidity position, as measured by the current ratio, is better in the case of B as compared to A. This is because the safety margin in the former (200 per cent) is substantially higher than in the latter (50 per cent). A slight decline in the value of current assets will adversely affect the ability of firm A to meet its obligations and, therefore, from the viewpoint of creditors, it is a more risky venture. In contrast, there is a sufficient cushion in firm B and even with two-thirds shrinkage in the value of its assets, it will be able to meet its obligations in full. For the creditors the firm is less risky. The interpretation is: *in interfirm comparison, the firm with the higher current ratio has better liquidity/short-term solvency.*

It is important to note that a very high ratio of current assets to current liabilities may be indicative of slack management practices, as it might signal excessive inventories for the current requirements and poor credit management in terms of overextended accounts receivable. At the same time, the firm may not be making full use of its current borrowing capacity.⁵ Therefore, a firm should have a reasonable current ratio.

Although there is no hard and fast rule, conventionally, a current ratio of 2 : 1 (current assets twice current liabilities) is considered satisfactory. The logic underlying the conventional rule is that even with a drop-out of 50 per cent (half) in the value of current assets, a firm can meet its obligations, that is, a 50 per cent margin of safety is assumed to be sufficient to ward off the worst of situations.

Section 35: Specific Provisions

The firm A of our example, having a current ratio of 1.5 : 1, can be interpreted, on the basis of the conventional rule, to be inadequately liquid from the point of view of its ability to always satisfy the claims of short-term creditors. The firm B, of course, is sufficiently liquid as its current ratio is 3 : 1. The rule of thumb (a current ratio of 2 : 1) cannot, however, be applied mechanically. What is a satisfactory ratio will differ depending on the development of the capital market and the availability of long-term funds to finance current assets, the nature of industry and so on.

In capital-rich countries, where long-term funds from the capital market are available in abundance, firms depend on current liabilities for financing a relatively small part of their current asset requirements and it is not unusual for a firm to finance two-thirds to three-quarters of its current assets by long-term sources.⁶ This policy of relying to a limited extent on short-term credit (current liabilities) is probably to avoid the difficulty in which the firms may be put by the creditors in times of temporary adversity. In underdeveloped countries, there is no alternative to relying heavily on short-term financing. Yet, in view of the risk which such a practice entails, the firms would be well advised to keep the current liabilities within reasonable limits and finance a certain minimum part of the current assets by long-term sources.

Another factor which has a bearing on the current ratio is the nature of the industry. For instance, public utility companies generally have a very low current ratio, as normally such companies have very little need for current assets. The wholesale dealers, on the other hand, purchasing goods on cash basis or on credit basis for a very short period but selling to retailers on credit basis, require a higher current ratio. If, in our above example, firm A is a public utility, its liquidity position can be interpreted to be satisfactory even though its current ratio is less than the conventional norm. Thus, the standard norm of current ratio (2 : 1) may vary from industry to industry. However, a ratio of less than 1 : 1 would certainly be undesirable in any industry as at least some safety margin is required to protect the interest of the creditors and to provide cushion to the firm in adverse circumstances.

The current ratio, though superior to NWC in measuring short-term financial solvency, is a rather crude measure of the liquidity of a firm. The limitation of current ratio arises from the fact that it is a *quantitative* rather than a *qualitative* index of liquidity. The term quantitative refers to the fact that it takes into account the total current assets without making any distinction between various types of current assets such as cash, inventories and so on. A qualitative measure takes into account the proportion of various types of current assets to the total current assets. A satisfactory measure of liquidity should consider the liquidity of the various current assets *per se*. As already mentioned, while current liabilities are fixed in the sense that they have to be paid in full in all circumstances, the current assets are subject to shrinkage in value, for example, possibility of bad debts, unsaleability of inventory and so on. Moreover, some of the current assets are more liquid than others: cash is the most liquid of all; receivables are more liquid than inventories, the last being the least liquid as they have to be sold before they are converted into receivables and, then, into cash. A firm with a higher percentage of its current assets in the form of cash would be more liquid, in the sense of being able to meet obligations as and when they become due, than one with a higher percentage of slow moving and unsaleable inventory and/or slow paying receivables even though both have the same current ratio. In fact, the latter type of firm may encounter serious difficulties in paying its bills even though it may have a current ratio of 2 : 1, whereas the former may do well with a ratio lower than the conventional norm. Thus, the current ratio is not a conclusive index of the real liquidity of a firm. It fails to answer questions, such as, how liquid are the receivables and the inventory? What effect does the omission of inventory and prepaid expenses have on the liquidity of a firm? To answer these and related questions, an additional analysis of the quality of current assets is required. This is done in acid-test or quick ratio.

Acid-Test/Quick Ratio

As observed above, one weakness of the current ratio is that it fails to convey any information on the composition of the current assets of a firm. A rupee of cash is considered equivalent to a rupee of inventory or receivables. But it is not so. A rupee of cash is more readily available (i.e. more liquid) to meet current obligations than a rupee of, say, inventory. This impairs the usefulness of the current ratio. The acid-test ratio is a measure of liquidity designed to overcome this shortcoming of the current ratio. It is often referred to as quick ratio because it is a measurement of a firm's ability to convert its current assets quickly into cash in order to meet its current liabilities. Thus, it is a measure of quick or acid liquidity.

The **acid-test ratio** is the ratio between quick current assets and current liabilities and is calculated by dividing the quick assets by the current liabilities:

$$\text{Acid-test ratio} = \frac{\text{Quick assets}}{\text{Current liabilities}} \quad (6.2)$$

- Acid-test ratio
- (quick ratio)
- is a measure of
- liquidity calculated
- dividing current
- assets minus
- inventory and
- prepaid expenses
- by current
- liabilities.

The term **quick assets** refers to current assets which can be converted into cash immediately or at a short notice without diminution of value. Included in this category of current assets are (i) cash and bank balances; (ii) short-term marketable securities and (iii) debtors/receivables. Thus, the current assets which are excluded are: prepaid expenses and inventory. The exclusion of inventory is based on the reasoning that it is not easily and readily convertible into cash. Prepaid expenses by their very nature are not available to pay off current debts. They merely reduce the amount of cash required in one period because of payment in a prior period.⁸ The acid-test ratio is calculated in Table 6.4.

TABLE 6.4 Acid-Test Ratio

Cash	₹20 lakh
Debtors	20
Inventory	120
Total current assets	160
Total current liabilities	80
(i) Current ratio	2 : 1
(ii) Acid-test ratio	0.5 : 1

Interpretation The acid-test ratio is a rigorous measure of a firm's ability to service short-term liabilities. The usefulness of the ratio lies in the fact that it is widely accepted as the best available test of the liquidity position of a firm. That the acid-test ratio is superior to the current ratio is evident from Table 6.4. The current ratio of the hypothetical firm is 2 : 1 and can certainly be considered satisfactory. This interpretation of the liquidity position of the firm needs modification in the light of the quick ratio. Generally, an acid-test ratio of 1:1 is considered satisfactory as a firm can easily meet all current claims. In the case of the hypothetical firm the quick ratio (0.5 : 1) is less than the standard/norm, the satisfactory current ratio notwithstanding. The interpretation that can be placed on the current ratio (2 : 1) and acid-test (0.5 : 1) is that a large part of the current assets of the firm is tied up in slow moving and unsaleable inventories and slow paying debts. The firm would find it difficult to pay its current liabilities. The acid-test ratio provides, in a sense, a check on the liquidity position of a firm as shown by its current ratio. The quick ratio is a more rigorous and penetrating test of the liquidity position of a firm. Yet, it is not a conclusive test. Both the current and quick ratios should be considered in relation to the industry average to infer whether the firm's short-term financial position is satisfactory or not.

A variation of this ratio,⁹ may be super-quick/cash ratio. This ratio is calculated by dividing the super-quick assets by the current liabilities of a firm. The super-quick current assets are cash and marketable securities. This ratio is the most rigorous and conservative test of a firm's liquidity position. Further, it is suggested that it would be useful, for the management, if the liquidity measure also takes into account 'reserve borrowing power' as the firm's real debt paying ability depends not only on cash resources available with it but also on its capacity to borrow from the market at short notice.

Turnover Ratio The liquidity ratios discussed so far relate to the liquidity of a firm as a whole. Another way of examining the liquidity is to determine how quickly certain current assets are converted into cash. The ratios to measure these are referred to as **turnover ratios**. These are, as activity ratios, covered in detail later in this chapter. In fact, liquidity ratios are not independent of activity ratios. Poor debtor or inventory turnover ratios limit the usefulness of the current and acid-test ratios. Both obsolete/unsaleable inventory and uncollectible debtors are unlikely to be sources of cash. Therefore, the liquidity ratios should be examined in conjunction with relevant turnover ratios affecting liquidity. The three relevant turnover ratios are (i) inventory turnover ratio; (ii) debtors turnover ratio; and (iii) creditors turnover ratio.

Inventory Turnover Ratio It is computed by dividing the cost of goods sold by the average inventory. Thus,

$$\text{Inventory turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Average inventory}} \quad (6.3)$$

The cost of goods sold means sales minus gross profit. The average inventory refers to the simple average of the opening and closing inventory. The ratio indicates how fast inventory is sold. A high ratio is good from the viewpoint of liquidity and *vice versa*. A low ratio would signify that inventory does not sell fast and stays on the shelf or in the warehouse for a long time. This is illustrated in Example 6.1.

Example 6.1

A firm has sold goods worth ₹300 lakh with a gross profit margin of 20 per cent. The stock at the beginning and the end of the year was ₹35 lakh and ₹45 lakh respectively. What is the inventory turnover ratio?

Solution

$$\text{Inventory turnover ratio} = \frac{(\text{₹}300 \text{ lakh} - \text{₹}60 \text{ lakh})}{(\text{₹}35 \text{ lakh} + \text{₹}45 \text{ lakh}) \div 2} = 6 \text{ (times per year)}$$

$$\text{Inventory holding period} = \frac{12 \text{ months}}{\text{Inventory turnover ratio, (6)}} = 2 \text{ months}$$

Debtors Turnover Ratio It is determined by dividing the net credit sales by average debtors outstanding during the year. Thus,

$$\text{Debtors turnover ratio} = \frac{\text{Net credit sales}}{\text{Average debtors}} \quad (6.4)$$

Net credit sales consist of gross credit sales minus returns, if any, from customers. Average debtors is the simple average of debtors (including bills receivable) at the beginning and at the end of year.

The analysis of the debtors turnover ratio supplements the information regarding the liquidity of one item of current assets of the firm. The ratio measures how rapidly receivables are collected. A high ratio is indicative of shorter time-lag between credit sales and cash collection. A low ratio shows that debts are not being collected rapidly. This is shown in Example 6.2.

Example 6.2

A firm has made credit sales of ₹240 lakh during the year. The outstanding amount of debtors at the beginning and at the end of the year respectively was ₹27.5 lakh and ₹32.5 lakh. Determine the debtors turnover ratio.

Solution

$$\text{Debtors turnover ratio} = \frac{\text{₹240 lakh}}{(\text{₹27.5 lakh} + \text{₹32.5 lakh}) \div 2} = 8 \text{ (times per year)}$$

$$\text{Debtors collection period} = \frac{12 \text{ months}}{\text{Debtors turnover ratio (8)}} = 1.5 \text{ month}$$

Creditors Turnover Ratio It is a ratio between net credit purchases and the average amount of creditors outstanding during the year. It is calculated as follows:

$$\text{Creditors turnover ratio} = \frac{\text{Net credit purchases}}{\text{Average creditors}} \quad (6.5)$$

Net credit purchases = Gross credit purchases less returns to suppliers

Average creditors = Average of creditors (including bills payable) outstanding at the beginning and at the end of the year

A low turnover ratio reflects liberal credit terms granted by suppliers, while a high ratio shows that accounts are to be settled rapidly. The creditors turnover ratio is an important tool of analysis as a firm can reduce its requirement of current assets by relying on supplier's credit. The extent to which trade creditors are willing to wait for payment can be approximated by the creditors turnover ratio. Consider Example 6.3.

Example 6.3

The firm of Examples 6.1 and 6.2 has made credit purchases of ₹180 lakh. The amount payable to the creditors at the beginning and at the end of the year is ₹42.5 lakh and ₹47.5 lakh respectively. Find out the creditors turnover ratio.

Solution

$$\text{Creditors turnover ratio} = \frac{(\text{₹180 lakh})}{(\text{₹42.5 lakh} + \text{₹47.5 lakh}) \div 2} = 4 \text{ (times per year)}$$

$$\text{Creditor's payment period} = \frac{12 \text{ months}}{\text{Creditors turnover ratio (4)}} = 3 \text{ months}$$

The summing up of the three turnover ratios (known as a cash cycle) has a bearing on the liquidity of a firm. The cash cycle captures the interrelationship of sales, collections from debtors and payment to creditors. The combined effect of the three turnover ratios is summarised below:

Inventory holding period	2 months
Add: Debtor's collection period	+ 1.5 months
Less: Creditor's payment period	- 3 months
	0.5 months

As a rule, the shorter is the cash cycle, the better are the liquidity ratios as measured above and *vice versa*.

Defensive-Interval Ratio

Defensive interval ratio is the ratio between quick assets and projected daily cash requirement.

- The liquidity ratios of a firm outlined in the preceding discussions throw light on the ability of a firm to pay its current liabilities. Apart from paying current liabilities, the liquidity position of a firm should also be examined in relation to its ability to meet projected daily expenditure from operations. The **defensive-interval ratio** provides such a measure of liquidity. It is a ratio between the quick/liquid assets and the projected daily cash requirements and is calculated according to Equation 6.6.

$$\text{Defensive-interval ratio} = \frac{\text{Liquid assets}}{\text{Projected daily cash requirement}} \quad (6.6)$$

where

$$\text{Projected daily cash requirement} = \frac{\text{Projected cash operating expenditure}}{\text{Number of days in a year (365)}}$$

The projected cash operating expenditure is based on past expenditures and future plans. It is equivalent to the cost of goods sold excluding depreciation, plus selling and administrative expenditure and other ordinary cash expenses. Alternatively, a very rough estimate of cash operating expenses can be obtained by subtracting the non-cash expenses like depreciation and amortisation from total expenses. Liquid assets, as already stated, include current assets excluding inventory and prepaid expenses.

The defensive-interval ratio measures the timespan a firm can operate on present liquid assets (comprising cash, marketable securities and debtors) without resorting to next year's income. Consider Example 6.4.

Example 6.4

The projected cash operating expenditure of a firm from the next year is ₹182.5 lakh. It has liquid current assets amounting to ₹40 lakh. Determine the defensive-interval ratio.

Solution

$$\text{Projected daily cash requirement} = \frac{\text{₹182.5 lakh}}{365} = \text{₹50,000}$$

$$\text{Defensive-interval ratio} = \frac{\text{₹40 lakh}}{\text{₹50,000}} = 80 \text{ days}$$

The figure of 80 days indicates that the firm has liquid assets which can meet the operating cash requirements of business for 80 days without resorting to future revenues. A higher ratio would be favourable as it would reflect the ability of a firm to meet cash requirements for a longer period of time. It provides a safety margin to the firm in determining its ability to meet basic operational costs. A higher ratio would provide the firm with a relatively higher degree of protection and tends to offset the weakness indicated by low current and acid-test ratios.⁹ Sorter and Benston¹⁰ have also suggested a ratio of liquid assets to daily cash operating expenditure as a measure of short-term solvency.

Cash-Flow From Operations Ratio

This ratio measures liquidity of a firm by comparing actual cash flows from operations (in lieu of current and potential cash inflows from CAs such as inventory and debtors) with current liability. It is calculated as per Equation 6.7

$$\text{Cash-flow from operations ratio} = \frac{\text{Cash flow from operations}}{\text{Current liabilities}} \quad (6.7)$$

Being a cash measure, the ratio does not encounter the problems of actual convertibility of current assets (such as debtors and inventory) and the need for maintaining minimum levels of these assets. In general, the higher the ratio, the better is a firm from the point of view of liquidity.

To conclude the discussion of liquidity ratios, the short-term solvency of a firm can be judged not merely in terms of the traditional liquidity ratios such as current and acid-tests, but the analysis should also be extended towards examining the quality of turnover of the items of current assets on which such ratios are based. These qualitative considerations (turnover ratios) coupled with the defensive-interval and cash flow from operation ratios would reveal the true liquidity position of the firm.

The liquidity ratios are, no doubt, primarily relevant from the viewpoint of the creditors of the firm. In theory, therefore, the higher the liquidity ratios, the better is the firm. But high ratios have serious implications from the firm's point of view. High current and acid-test ratios would imply that funds have unnecessarily accumulated and are not being profitably utilised. Similarly, an unusually high rate of inventory turnover may indicate that a firm is losing business by failing to maintain an adequate level of inventory to serve the customer's needs. A rapid turnover of debtors may reflect strict credit policies that hold revenue below levels that could be obtained by granting more liberal credit terms.

Finally, while interpreting the short-term position of the firm by the creditors, it should be recognised that the management may be tempted to indulge in 'window-dressing' just before the financial statements are prepared so as to make the current financial position appear better than what it actually is. For instance, by postponing purchases, allowing inventories to fall below the normal levels, using all available cash to pay off current liabilities and pressing collection on debtors, the current and acid-test ratios, and debtors turnover ratios may be artificially improved. Even when no deliberate attempt has been made to present a good picture, the current financial position shown by the year-end financial statements is probably more favourable than at any other time of the year. This is particularly true when a firm adopts a natural business year that ends during an ebb in the seasonal swing of business activity. At the time of peak activity, debtors, inventories and current liabilities tend to be at higher levels. In such cases, an analysis of current financial position based solely on year-end data will tend to over-state a firm's average liquidity position.¹²

LO 6.3 LEVERAGE/CAPITAL STRUCTURE RATIOS

The second category of financial ratios is leverage or capital structure ratios. The long-term lenders/creditors would judge the soundness of a firm on the basis of the long-term financial strength measured in terms of its ability to pay the interest regularly as well as repay the instalment of the principal on due dates or in one lump sum at the time of maturity. The long-term solvency of a firm can be examined by using leverage or capital structure ratios. The leverage or capital structure ratios may be defined as financial ratios which throw light on the long-term solvency of a firm as reflected in its ability to assure the long-term lenders with regard to (i) periodic payment of interest

during the period of the loan and **(ii)** repayment of principal on maturity or in predetermined instalments at due dates.

There are, thus, two aspects of the long-term solvency of a firm: **(i)** ability to repay the principal when due, and **(ii)** regular payment of the interest. Accordingly, there are two different, but mutually dependent and interrelated, types of leverage ratios. First, ratios which are based on the relationship between borrowed funds and owner's capital. These ratios are computed from the balance sheet and have many variations such as **(a)** debt-equity ratio, **(b)** debt-assets ratio, **(c)** equity-assets ratio, and so on. The second type of capital structure ratios, popularly called coverage ratios, are calculated from the profit and loss account. Included in this category are **(a)** interest coverage ratio, **(b)** dividend coverage ratio, **(c)** total fixed charges coverage ratio, **(d)** cash flow coverage ratio, and **(e)** debt services coverage ratio.

Debt-Equity Ratios

Debt-equity ratio measures the ratio of long-term or total debt to shareholders' equity.

- The relationship between borrowed funds and owner's capital is a popular measure of the long-term financial solvency of a firm. This relationship is shown by the debt-equity ratios. This ratio reflects the relative claims of creditors and shareholders against the assets of the firm. Alternatively, this ratio indicates the relative proportions of debt and equity in financing the assets of a firm. The relationship between outsiders' claims and owner's capital can be shown in different ways and, accordingly, there are many variants of the debt-equity (D/E) ratio.

One approach is to express the D/E ratios in terms of the relative proportion of long-term debt and shareholders' equity. Thus,

$$\text{D/E ratio} = \frac{\text{Long-term debt}}{\text{Shareholders' equity}} \quad (6.8)$$

The debt considered here is exclusive of current liabilities. The shareholders' equity includes **(i)** equity and preference share capital, **(ii)** past accumulated profits but excludes fictitious assets like past accumulated losses, **(iii)** discount on issue of shares and so on.

Another approach to the calculation of the debt-equity ratio is to relate the total debt (not merely long-term debt) to the shareholders' equity. That is,

$$\text{D/E ratio} = \frac{\text{Total debt}}{\text{Shareholders' equity}} \quad (6.9)$$

The D/E ratio is, thus, the ratio of total outside liabilities to owners' total funds. In other words, it is the ratio of the amount invested by outsiders to the amount invested by the owners of business.

The difference between this and the first approach is essentially in respect of the treatment of current liabilities. While the former excludes them, the latter includes them in the numerator (debt). Should current liabilities be included in the amount of debt to calculate the D/E ratio? While there is no doubt that current liabilities are short-term and the ability of a firm to meet such obligations is reflected in the liquidity ratios, their amount fluctuates widely during a year and interest payments on them are not large, they should form part of the total outside liabilities to determine the ability of a firm to meet its long-term obligations for a number of reasons. For one thing, individual items of current liabilities are certainly short-term and may fluctuate widely, but, as a whole, a fixed amount of them is always in use so that they are available more or less on a long-term footing. Moreover, some current liabilities like bank credit, which are ostensibly short-term, are renewed year after year and remain by and large permanently in the business. Also, current liabilities have, like the

long-term creditors, a prior right on the assets of the business and are paid along with long-term lenders at the time of liquidation of the firm. Finally, the short-term creditors exercise as much, if not more, pressure on management. The omission of current liabilities in calculating the D/E ratio would lead to misleading results.

How should preference share capital be treated? Should it be included in the debt or equity? The exact treatment will depend upon the purpose for which the D/E ratio is being computed. If the object is to examine the financial solvency of a firm in terms of its ability to avoid financial risk, preference capital should be clubbed with equity capital. If, however, the D/E ratio is calculated to show the effect of the use of fixed-interest/dividend sources of funds on the earnings available to the ordinary shareholders, preference capital should be clubbed with debt.

Interpretation The D/E ratio is an important tool of financial analysis to appraise the financial structure of a firm. It has important implications from the view-point of the creditors, owners and the firm itself. The ratio reflects the relative contribution of creditors and owners of business in its financing. A high ratio shows a large share of financing by the creditors of the firm; a low ratio implies a smaller claim of creditors. The D/E ratio indicates the margin of safety to the creditors. If, for instance, the D/E ratio is 1 : 2, it implies that for every rupee of outside liability, the firm has two rupees of owner's capital or the stake of the creditors is one-half of the owners. There is, therefore, a safety margin of 66.67 per cent available to the creditors of the firm. The firm would be able to meet the creditors claims even if the value of the assets declines by 66.67 per cent. Conversely, if the D/E ratio is 2 : 1, it implies low safety margin (one-third) for the creditors.

If the D/E ratio is high, the owners are putting up relatively less money of their own. It is danger signal for the creditors. If the project should fail financially, the creditors would lose heavily. Moreover, with a small financial stake in the firm, the owners may behave irresponsibly and indulge in speculative activity. If they are heavily involved financially, they will strain every nerve to make the enterprise a success. In brief, the greater the D/E ratio, the greater is the risk to the creditors.

A high debt-equity ratio has equally serious implications from the firm's point of view also. A high proportion of debt in the capital structure would lead to inflexibility in the operations of the firm as creditors would exercise pressure and interfere in management. Secondly, such a firm would be able to borrow only under very restrictive terms and conditions. Further, it would have to face a heavy burden of interest payments, particularly in adverse circumstances when profits decline. Finally, the firm will have to encounter serious difficulties in raising funds in future.

The shareholders of the firm would, however, stand to gain in two ways: **(i)** with a limited stake, they would be able to retain control of the firm and **(ii)** the return to them would be magnified. With a larger proportion of debt in the financial structure, the earnings available to the owners would increase more than proportionately with an increase in the operating profits of the firm. This is because the debt carries a fixed rate of return and if the firm is able to earn on the borrowed funds a rate higher than the fixed-charge on loans, the benefit will go to the shareholders. This is illustrated in Table 6.5. Technically, this is referred to as **leverage** or **trading on equity**. The expression 'trading on equity' describes the practice of using borrowed funds carrying a fixed-charge in the expectation of obtaining a higher return to the equity-holders. The leverage can, of course, work in the opposite direction also, if the return on borrowed funds is less than the fixed charge.¹³

- **Trading**
- **on equity**
- **(leverage)**
- is the use of
- borrowed funds
- in expectation of
- higher return to
- equity-holders.

A low D/E ratio has just the opposite implications. To the creditors, a relatively high stake of the owners implies sufficient safety margin and substantial protection against shrinkage in

assets. For the company also, the servicing of debt is less burdensome and consequently its credit standing is not adversely affected, its operational flexibility is not jeopardised and it will be able to raise additional funds. The shareholders of the firm are deprived of the benefits of trading on equity or leverage.

TABLE 6.5 Trading on Equity

(Amount in ₹ thousand)

Particular	A	B	C	D
(a) Total assets	1,000	1,000	1,000	1,000
Financing pattern:				
Equity capital	1,000	800	600	200
15% Debt	—	200	400	800
(b) Operating profit (EBIT)	300	300	300	300
Less: Interest	—	30	60	120
Earnings before taxes	300	270	240	180
Less: Taxes (0.35)	105	94.5	84	63
Earnings after taxes	195	175.5	156	117
Return on equity (per cent)	19.5	21.9	26	58.5

The preceding discussion should leave no doubt that both high and low D/E ratios are not desirable. What is needed is a ratio which strikes a proper balance between debt and equity. What is the reasonable relationship between debt and equity? There cannot be a rigid rule. It will depend upon the circumstances, prevailing practices and so on. The general proposition is: *other's money should be in reasonable proportion to the owner's capital and the owners should have sufficient stake in the fortunes of the enterprise.* For instance, in a capital-rich country, the practice is to use as little debt as possible. A D/E ratio of 1 : 3 is regarded as indicative of a fairly heavy debt; a ratio of 1 : 1 would indicate an extremely heavy and unsatisfactory debt situation.¹⁴ In underdeveloped countries such standards cannot be expected. It was not unusual to find firms having a D/E ratio of 2 : 1 or even 3 : 1 in the case of joint stock enterprises in India. One reason for such heavy dose of debt was to be found in the fact that enterprises had to depend, by and large, on public financial institutions (PFIs) which provided most of the funds in the form of loans. This had made the financial structure of companies lopsided and, on canons of sound financing practices, highly imprudent. The borrowers were finding it extremely difficult to service the debt burden and the overdues of the financial institutions rose unabated.¹⁵ With the shift in the post-1991 period of dependence of the corporates on the capital market, their dependence on loans/debt has significantly declined.

Secondly, the D/E ratio cannot be applied mechanically without regard to the circumstances of each case, such as type and size of business, the nature of the industry and the degree of risk involved. For example, firms having a stable income such as an electricity company, can afford to have a higher D/E ratio. Similarly, capital intensive industries and firms producing a basic product, like cement, tend to use a larger proportion of debt. The tolerable D/E ratio of a new company would be much lower than for an established one.

Finally, there is an important issue whether to use book or market values to compute leverage ratio. Valuation models in finance are generally based on the market value of debt and equity. Therefore, the use of market values can make the D/E ratio a more useful analytical tool. For instance, if the market value of equity is higher than its book value, the market value based D/E ratio will be lower than the one using book value. This would imply that the firm can raise funds at attractive financial costs. The financial costs would be higher if the market value of equity is lower than its book value as equity capital can be issued at a discount to book value.

Debt to Total Capital Ratio

The relationship between creditors' funds and owner's capital can also be expressed in terms of another leverage ratio. This is the debt to total capital ratio. Here, the outside liabilities are related to the total capitalisation of the firm and not merely to the shareholder's equity. Essentially, this type of capital structure ratio is a variant of the D/E ratio described above. It can be calculated in different ways.

One approach is to relate the long-term debt to the permanent capital of the firm. Included in the permanent capital are shareholders' equity as well as long-term debt. Thus,

$$\text{Debt to total capital ratio} = \frac{\text{Long-term debt}}{\text{Permanent capital}} \quad (6.10)$$

Another approach to calculating the debt to capital ratio is to relate the total debt to the total assets of the firm. The total debt of the firm comprises long-term debt plus current liabilities. The total assets consist of permanent capital plus current liabilities. Thus,

$$\text{Debt to total assets/capital ratio} = \frac{\text{Total debt}}{\text{Total assets}} \quad (6.11)$$

Still another variant of the D/E ratio is to relate the owner's/proprietor's funds with total assets. This is called the **proprietary ratio**. The ratio indicates the proportion of total assets financed by owners. Symbolically, it is equal to:

$$\frac{\text{Proprietor's funds}}{\text{Total assets}} \times 100 \quad (6.12)$$

- **Proprietary ratio**
- indicates the extent to which assets are financed by owners funds.

Finally, it may also be of some interest to know the relationship between equity funds (also referred to as net worth) and fixed-income bearing funds (preference shares, debentures and other borrowed funds). This ratio, called the **capital gearing ratio**, is useful when the objective is to show the effect of the use of fixed-interest/dividend source of funds on the earnings available to the equity shareholders.

Interpretation

As the ratio is like the D/E ratio, it gives results similar to the D/E ratio in respect of capital structure of a firm. The first of these (Equation 6.10), indicates what proportion of the permanent capital of a firm consists of long-term debt. If the ratio for a firm is 1 : 2, it implies that one-third of the total permanent capital of the firm is in the form of long-term debts. Although no hard and fast rules exist, conventionally a ratio of 1 : 2 is considered to be satisfactory.

The second ratio (Equation 6.11) measures the share of the total assets financed by outside funds. The third variant (Equation 6.12) shows what portion of the total assets are financed by the owner's capital. A low ratio of debt to total assets is desirable from the point of the creditors/ lenders as there is sufficient margin of safety available to them. But its implications for the shareholders are that debt is not being exploited to make available to them the benefit of trading on equity. A firm with a very high ratio would expose the creditors to higher risk. The implications of the ratio of equity capital of total assets are exactly opposite to that of the debt to total assets. A firm should have neither a very high ratio nor a very low ratio.

Coverage Ratios

The second category of leverage ratios are **coverage ratios**. These ratios are computed from information available in the profit and loss account. For a normal firm, in the

- **Coverage ratios**
- measure the firm's ability to pay certain fixed charges.

ordinary course of business, the claims of creditors are not met out of the sale proceeds of the permanent assets of the firm. The obligations of a firm are normally met out of the earnings or operating profits. These claims consist of **(i)** interest on loans, **(ii)** preference dividend, and **(iii)** amortisation of principal or repayment of the instalment of loans or redemption of preference capital on maturity. The soundness of a firm, from the view-point of long-term creditors, lies in its ability to service their claims. This ability is indicated by the coverage ratios. The coverage ratios measure the relationship between what is normally available from operations of the firms and the claims of the outsiders. The important coverage ratios are: **(i)** interest coverage, **(ii)** dividend coverage, **(iii)** total coverage, **(iv)** total cashflow coverage, and **(v)** debt service coverage ratio.

Interest coverage (time-interest-earned) ratio measures the firm's ability to make contractual interest payments.

Interest Coverage Ratio It is also known as 'time-interest-earned ratio'. This ratio measures the debt servicing capacity of a firm insofar as fixed interest on long-term loan is concerned. It is determined by dividing the operating profits or earnings before interest and taxes (EBIT) by the fixed interest charges on loans. Thus,

$$\text{Interest coverage} = \frac{\text{EBIT}}{\text{Interest}} \quad (6.13)$$

It should be noted that this ratio uses the concept of net profits before taxes because interest is tax-deductible so that tax is calculated after paying interest on long-term loan.

This ratio, as the name suggests, indicates the extent to which a fall in EBIT is tolerable in that the ability of the firm to service its interest payments would not be adversely affected. For instance, an interest coverage of 10 times would imply that even if the firm's EBIT were to decline to one-tenth of the present level, the operating profits available for servicing the interest on loan would still be equivalent to the claims of the lenders. On the other hand, a coverage of five times would indicate that a fall in operating earnings only to upto one-fifth level can be tolerated. From the point of view of the lenders, the larger the coverage, the greater is the ability of the firm to handle fixed-charge liabilities and the more assured is the payment of interest to them. However, too high a ratio may imply unused debt capacity. In contrast, a low ratio is a danger signal that the firm is using excessive debt and does not have the ability to offer assured payment of interest to the lenders.

Dividend Coverage Ratio It measures the ability of a firm to pay dividend on preference shares which carry a stated rate of return. This ratio is the ratio (expressed as x number of times) of net earnings after taxes (EAT) and the amount of preference dividend. Thus,

$$\text{Dividend coverage} = \frac{\text{EAT}}{\text{Preference dividend}} \quad (6.14)$$

It can be seen that although preference dividend is a fixed obligation, the earnings taken into account are after taxes. This is because, unlike debt on which interest is a charge on the profits of the firm, the preference dividend is treated as an appropriation of profit. The ratio, like the interest coverage ratio, reveals the safety margin available to the preference shareholders. As a rule, the higher the coverage, the better it is from their point of view.

Total fixed charge coverage ratios measure the firm's ability to meet all fixed payment obligations.

Total Fixed Charge Coverage Ratio While the interest coverage and preference dividend coverage ratios consider the fixed obligations of a firm to the respective suppliers of funds, that is, creditors and preference shareholders, the total coverage ratio has a wider scope and takes into account all the committed fixed obligations of a firm, that is, **(i)** interest on loan, **(ii)** preference dividend, **(iii)** lease payments, and **(iv)** repayment of principal. Symbolically,

$$\text{Total fixed charge coverage} = \frac{\text{EBIT} + \text{Lease payment}}{\text{Interest} + \text{Lease payments} + (\text{Preference dividend} + \text{Instalment of principal}) / (1 - t)} \quad (6.15)$$

Total Cashflow Coverage Ratio However, coverage ratios mentioned above, suffer from one major limitation, that is, they relate the firm's ability to meet its various financial obligations to its earnings. In fact, these payments are met out of cash available with the firm. Accordingly, it would be more appropriate to relate cash resources of a firm to its various fixed financial obligations. The ratio, so determined, is referred to as **total cash flow coverage ratio**. Symbolically,

$$\text{Total cash flow coverage} = \frac{\text{EBIT} + \text{Lease Payments} + \text{Depreciation} + \text{Non-cash expenses}}{\text{Lease payment} + \text{Interest} + \frac{(\text{Principal repayment})}{(1 - t)} + \frac{(\text{Preference dividend})}{(1 - t)}} \quad (6.16)$$

The overall ability of a firm to service outside liabilities is truly reflected in the total cash flow coverage ratio: the higher the coverage, the better is the ability.

Internally generated cash from operating activities (CFO) are required for investment as well as debt servicing. A typical firm requires funds both for growth, apart from replacement of existing fixed assets (in particular, plant and machinery) and servicing of debt. Accordingly, a firm's long-term solvency is a function of its ability (i) to finance the expansion and replacements needs of the business and (ii) to generate cash for servicing of debt.

Capital Expenditure Ratio measures the relationship between the firm's ability to generate CFO and its capital expenditure requirements. It is determined dividing CFO by capital expenditure. The higher the ratio, the better it is. The ratio greater than one indicates that the firm has cash to service debt as well as to make payment of dividends.

Debt-Service Coverage Ratio (DSCR) is considered a more comprehensive and apt measure to compute **debt service capacity** of a business firm. It provides the value in terms of the number of times the total debt service obligations consisting of interest and repayment of principal in instalments are covered by the total operating funds available after the payment of taxes: Earnings after taxes, EAT + Interest + Depreciation + Other non-cash expenditures like amortisation (OA). Symbolically,

$$\text{DSCR} = \frac{\sum_{t=1}^n \text{EAT}_t + \text{Interest}_t + \text{Depreciation}_t + \text{OA}_t}{\sum_{t=1}^n \text{Instalment}_t} \quad (6.17)$$

- **Debt service capacity**
- is the ability of a firm to make the contractual payments required on a scheduled basis over the life of the debt.

The higher the ratio, the better it is. A ratio of less than one may be taken as a sign of long-term solvency problem as it indicates that the firm does not generate enough cash internally to service debt. In general, lending financial institutions consider 2:1 as satisfactory ratio. Consider Example 6.5.

Example 6.5

Agro Industries Ltd has submitted the following projections. You are required to work out yearly debt service coverage ratio (DSCR) and the average DSCR: (Figures in ₹ lakh)

Year	Net profit for the year	Interest on term loan during the year	Repayment of term loan in the year
1	21.67	19.14	10.70
2	34.77	17.64	18.00
3	36.01	15.12	18.00
4	19.20	12.60	18.00
5	18.61	10.08	18.00
6	18.40	7.56	18.00
7	18.33	5.04	18.00
8	16.41	Nil	18.00

The net profit has been arrived after charging depreciation of ₹17.68 lakh every year.

Solution

TABLE 6.6 Determination of Debt Service Coverage Ratio (Amount in lakh of rupees)

Year	Net profit	Depre- ciation	Interest	Cash available (col. 2+3+4)	Principal instalment	Debt obligation (col. 4+col. 6)	DSCR [col. 5 + col. 7 (No. of times)]
1	2	3	4	5	6	7	8

Average DSCR (DSCR ÷ 8)							1.83

LO 6.4 PROFITABILITY RATIOS

Apart from the creditors, both short-term and long-term, also interested in the financial soundness of a firm are the owners and management or the company itself. The management of the firm is naturally eager to measure its operating efficiency. Similarly, the owners invest their funds in the expectation of reasonable returns. The operating efficiency of a firm and its ability to ensure adequate returns to its shareholders/owners depends ultimately on the profits earned by it. The profitability of a firm can be measured by its profitability ratios. In other words, the profitability ratios are designed to provide answers to questions such as (i) is the profit earned by the firm adequate? (ii) what rate of return does it represent? (iii) what is the rate of profit for various divisions and segments of the firm? (iv) what are the earnings per share? (v) what was the amount paid in dividends? (vi) what is the rate of return to equity-holders? and so on.

Profitability ratios can be determined on the basis of either sales or investments. The profitability ratios in relation to sales are (a) profit margin (gross and net) and (b) expenses ratio. Profitability in relation to investments is measured by (a) return on assets, (b) return on capital employed, and (c) return on shareholders' equity.

Profitability Ratios Related to Sales

These ratios are based on the premise that a firm should earn sufficient profit on each rupee of sales. If adequate profits are not earned on sales, there will be difficulty in meeting the operating

expenses and no returns will be available to the owners. These ratios consist of (i) profit margin, and (ii) expenses ratios.

Profit Margin The profit margin measures the relationship between profit and sales. As the profits may be gross or net, there are two types of profit margins: Gross profit margin and Net profit margin.

Gross Profit Margin is also known as gross margin. It is calculated by dividing gross profit by sales. Thus,

$$\text{Gross profit margin} = \frac{\text{Gross profit}}{\text{Sales}} \times 100 \quad (6.18)$$

If the sales of a firm amount to ₹40,00,000 and its gross profit is ₹10,00,000, the gross margin would be 25 per cent ($\text{₹}10,00,000 \div \text{₹}40,00,000$). If the gross margin (25 per cent) is deducted from 100, the result (75 per cent) is the ratio of cost of goods sold to sales. The former measures profits in relation to sales, while the latter reveals the relationship between cost of production and sale price.

Gross profit is the result of the relationship between prices, sales volume and costs. A change in the gross margin can be brought about by changes in any of these factors. The gross margin represents the limit beyond which fall in sales prices are outside the tolerance limit. Further, the gross profit ratio/margin can also be used in determining the extent of loss caused by theft, spoilage, damage, and so on in the case of those firms which follow the policy of fixed gross profit margin in pricing their products.

A high ratio of gross profit to sales is a sign of good management as it implies that the cost of production of the firm is relatively low. It may also be indicative of a higher sales price without a corresponding increase in the cost of goods sold. It is also likely that cost of sales might have declined without a corresponding decline in sales price. Nevertheless, a very high and rising gross margin may also be the result of unsatisfactory basis of valuation of stock, that is, overvaluation of closing stock and/or undervaluation of opening stock.

A relatively low gross margin is definitely a danger signal, warranting a careful and detailed analysis of the factors responsible for it. The important contributory factors may be (i) a high cost of production reflecting acquisition of raw materials and other inputs on unfavourable terms, inefficient utilisation of current as well as fixed assets, and so on; and (ii) a low selling price resulting from severe competition, inferior quality of the product, lack of demand, and so on. A thorough investigation of the factors having a bearing on the low gross margin is called for.

A firm should have a reasonable gross margin to ensure adequate coverage for operating expenses of the firm and sufficient return to the owners of the business, which is reflected in the net profit margin.

Net Profit Margin is also known as net margin. This measures the relationship between net profits and sales of a firm. Depending on the concept of net profit employed, this ratio can be computed in three ways:

$$1. \text{ Operating profit ratio} = \frac{\text{Earnings before interest and taxes (EBIT)}}{\text{Net sales}} \quad (6.19)$$

$$2. \text{ Pre-tax profit ratio} = \frac{\text{Earnings before taxes (EBT)}}{\text{Net sales}} \quad (6.20)$$

- **Gross profit margin**
- measures the percentage of each sales rupee remaining after the firm has paid for its goods.

- **Net profit margin**
- measures the percentage of each sales rupee remaining after all costs and expenses including interest and taxes have been deducted.

Table 1: Summary of data for the first section.

Year	Value 1	Value 2	Value 3
1950	100	100	100
1951	105	105	105
1952	110	110	110
1953	115	115	115
1954	120	120	120
1955	125	125	125
1956	130	130	130
1957	135	135	135
1958	140	140	140
1959	145	145	145
1960	150	150	150

Table 2: Summary of data for the second section.

Year	Value 1	Value 2	Value 3	Value 4	Value 5	Value 6
1950	100	100	100	100	100	100
1951	105	105	105	105	105	105
1952	110	110	110	110	110	110
1953	115	115	115	115	115	115

1955	125	125	125	125	125	125
1956	130	130	130	130	130	130
1957	135	135	135	135	135	135
1958	140	140	140	140	140	140
1959	145	145	145	145	145	145
1960	150	150	150	150	150	150

SECTION 1

The first section of the report discusses the initial findings and the methodology used for data collection. It highlights the importance of accurate record-keeping and the challenges faced during the process. The data presented in Table 1 shows a steady increase in values over the period from 1950 to 1960, indicating a positive trend in the measured variable.

SECTION 2

The second section provides a more detailed analysis of the data, including a comparison of the two sets of values shown in Table 2. It notes that the trends in both sets are consistent, with values increasing linearly over time. This suggests that the underlying factors being measured are stable and predictable.

CONCLUSION

In conclusion, the data from both sections of the report shows a clear and consistent upward trend from 1950 to 1960. The methodology employed was rigorous, and the results are reliable. Further research is recommended to explore the causes of these trends and to predict future values.

SECTION 3

The third section of the report discusses the final findings and the implications of the data. It emphasizes the need for continued monitoring and the potential for future growth. The data presented in Table 3 shows a continuation of the upward trend, with values reaching their highest point in 1960.

SECTION 4

The fourth section provides a summary of the entire report and offers recommendations for future work. It suggests that the current findings are promising and that further data collection would be beneficial. The report concludes with a statement of confidence in the results and a commitment to ongoing research.

SECTION 5

The fifth section of the report discusses the final findings and the implications of the data. It emphasizes the need for continued monitoring and the potential for future growth. The data presented in Table 4 shows a continuation of the upward trend, with values reaching their highest point in 1960.

SECTION 6

The sixth section provides a summary of the entire report and offers recommendations for future work. It suggests that the current findings are promising and that further data collection would be beneficial. The report concludes with a statement of confidence in the results and a commitment to ongoing research.

SECTION 7

The seventh section of the report discusses the final findings and the implications of the data. It emphasizes the need for continued monitoring and the potential for future growth. The data presented in Table 5 shows a continuation of the upward trend, with values reaching their highest point in 1960.

SECTION 8

The eighth section provides a summary of the entire report and offers recommendations for future work. It suggests that the current findings are promising and that further data collection would be beneficial. The report concludes with a statement of confidence in the results and a commitment to ongoing research.

$$3. \text{ Net profit ratio} = \frac{\text{Earnings after interest and taxes (EAT)}}{\text{Net sales}} \quad (6.21)$$

The net profit margin is indicative of *management's ability to operate the business with sufficient success not only to recover from revenues of the period, the cost of merchandise or services, the expenses of operating the business (including depreciation) and the cost of the borrowed funds, but also to leave a margin of reasonable compensation to the owners for providing their capital at risk. The ratio of net profit (after interest and taxes) to sales essentially expresses the cost price effectiveness of the operation.*¹⁶

A high net profit margin would ensure adequate return to the owners as well as enable a firm to withstand adverse economic conditions when selling price is declining, cost of production is rising and demand for the product is falling.

A low net profit margin has the opposite implications. However, a firm with a low profit margin, can earn a high rate of return on investments if it has a higher inventory turnover. This aspect is covered in detail in the subsequent discussion. The profit margin should, therefore, be evaluated in relation to the turnover ratio. In other words, the overall rate of return is the product of the net profit margin and the investment turnover ratio. Similarly, the gross profit margin and the net profit margin should be jointly evaluated. The need for joint analysis arises because the two ratios may show different trends. For example, the gross margin may show a substantial increase over a period of time but the net profit margin may (i) have remained constant, or (ii) may not have increased as fast as the gross margin, or (iii) may actually have declined. It may be due to the fact that the increase in the operating expenses individually may behave abnormally. On the other hand, if either as a whole or individual items of operating expenses decline substantially, a decrease in gross margin may be associated with an improvement in the net profit margin.

Expenses Ratio Another profitability ratio related to sales is the **expenses ratio**. It is computed by dividing expenses by sales. The term 'expenses' includes (i) cost of goods sold, (ii) administrative expenses, (iii) selling and distribution expenses, (iv) financial expenses but excludes taxes, dividends and extraordinary losses due to theft of goods, good destroyed by fire and so on.

There are different variants of expenses ratios. That is,

$$1. \text{ Cost of goods sold ratio} = \frac{\text{Cost of goods sold}}{\text{Net sales}} \times 100 \quad (6.22)$$

$$2. \text{ Operating expenses ratio} = \frac{\text{Administrative expenses} + \text{Selling expenses}}{\text{Net sales}} \times 100 \quad (6.23)$$

$$3. \text{ Administrative expenses ratio} = \frac{\text{Administrative expenses}}{\text{Net sales}} \times 100 \quad (6.24)$$

$$4. \text{ Selling expenses ratio} = \frac{\text{Selling expenses}}{\text{Net sales}} \times 100 \quad (6.25)$$

$$5. \text{ Operating ratio} = \frac{\text{Cost of goods sold} + \text{Operating expenses}}{\text{Net sales}} \times 100 \quad (6.26)$$

$$6. \text{ Financial expenses ratio} = \frac{\text{Financial expenses}}{\text{Net sales}} \times 100 \quad (6.27)$$

Interpretation

The expenses ratio is closely related to the profit margin, gross as well as net. For instance, if the operating profit margin is deducted from 100 per cent, the resultant is the operating ratio. Alternatively, when the operating ratio is subtracted from 100 per cent, we get the operating profit margin. If the sales and total non-financial expenses of a firm are ₹40,00,000 and ₹32,00,000 respectively, the *operating ratio* would be 80 per cent. It implies that total operating expenses including cost of goods sold consume 80 per cent of the sales revenues of the firm and 20 per cent is left for meeting interest, tax and dividends obligations as also retaining profits for future expansion. *The cost of goods sold ratio* shows what percentage share of sales is consumed by cost of goods sold and, conversely, what proportion is available for meeting expenses such as selling and general distribution expenses as well as financial expenses consisting of taxes, interest and dividends, and so on.

The expenses ratio is, therefore, very important for analysing the profitability of a firm. It should be compared over a period of time with the industry average as well as firms of similar type. As a working proposition, a low ratio is favourable, while a high one is unfavourable. The implication of a high expenses ratio is that only a relatively small percentage share of sales is available for meeting financial liabilities like interest, tax and dividends, and so on. An analysis of the factors responsible for a low ratio may reveal changes in the selling price or the operating expenses. It is likely that individual items may behave differently. While some operating expenses may show a rising trend, others may record a fall. The specific expenses ratio for each of the items of operating cost may be calculated. These ratios would identify the specific cause. To illustrate, an increase in selling expenses, may be due to a number of reasons: **(i)** general rise in selling expenses, **(ii)** inefficiency of the marketing department leading to uncontrolled promotional and other expenses, **(iii)** growing competition, **(iv)** ineffective advertising, **(v)** inefficient utilisation of resources, and the like.

A low operating ratio is by and large a test of operational efficiency. In case of firms whose major source of income and expenses are non-operating, the operating ratio, however, cannot be used as a yardstick of profitability.

To conclude, the profitability ratios based on sales are an important indicator of the operational efficiency of a manufacturing enterprise. However, they suffer from a serious limitation in that they are not useful from the viewpoint of the owners of the firm. Consider Example 6.6.

Example 6.6

From the following information of a firm, determine **(i)** gross profit margin and **(ii)** net profit margin.

- | | |
|-----------------------------|-----------|
| 1. Sales | ₹200 lakh |
| 2. Cost of goods sold | 100 lakh |
| 3. Other operating expenses | 50 lakh |

Solution

$$\text{(i) Gross profit margin} = \frac{(\text{₹}200 \text{ lakh} - \text{₹}100 \text{ lakh} = \text{₹}100 \text{ lakh})}{\text{₹}200 \text{ lakh}} = 50 \text{ per cent}$$

$$\text{(ii) Net profit margin (before taxes)} = \frac{(\text{₹}100 \text{ lakh} - \text{₹}50 \text{ lakh} = \text{₹}50 \text{ lakh})}{\text{₹}200 \text{ lakh}} = 25 \text{ per cent}$$

The operating efficiency of the firm is fairly good. Assume, however, that the investments are ₹1,000 lakh. The return on investments works out to be 5 per cent only. From the owner's point of view, rate of return on investments is a better measure of testing the profitability of a firm.

Profitability Ratios Related to Investments

Return on investments (ROI) measures the overall effectiveness of management in generating profits with its available assets.

As already observed, the profitability ratios can also be computed by relating the profits of a firm to its investments. Such ratios are popularly termed as return on investments (ROI). There are three different concepts of investments in vogue in financial literature: assets, capital employed and shareholders' equity. Based on each of them, there are three broad categories of ROIs. They are **(i)** return on assets, **(ii)** return on capital employed and **(iii)** return on shareholders' equity.

Return on Assets (ROA) Here, the profitability ratio is measured in terms of the relationship between net profits and assets. The ROA may also be called profit-to-asset ratio. There are various possible approaches to define net profits and assets, according to the purpose and intent of the calculation of the ratio. Depending upon how these two terms are defined, many variations of ROA are possible.

The concept of net profit may be **(i)** net profits after taxes, **(ii)** net profits after taxes plus interest, and **(iii)** net profits after taxes plus interest minus tax savings.¹⁷ Assets may be defined as **(i)** total assets, **(ii)** fixed assets, and **(iii)** tangible assets. Accordingly, the different variants of the RAO are:

$$1. \text{ Return on assets (ROA)} = \frac{\text{Net profit after taxes}}{\text{Average total assets}} \times 100 \quad (6.28)$$

The ROA based on this ratio would be an underestimate as the interest paid to the lenders is excluded from the net profits. In point of fact, the real return on the total assets is the net earnings available to owners (EAT) and interest to lenders as assets are financed by owners as well as creditors. A more reliable indicator of the true return on assets, therefore, is the net profits inclusive of interest. It reports the total return accruing to all providers of capital (debt and equity).

$$2. \text{ ROA} = \frac{\text{Net profit after taxes} + \text{Interest}}{\text{Average total assets}} \times 100 \quad (6.29)$$

$$3. \text{ ROA} = \frac{\text{Net profit after taxes} + \text{Interest}}{\text{Average tangible assets}} \times 100 \quad (6.30)$$

$$4. \text{ ROA} = \frac{\text{Net profit after taxes} + \text{Interest}}{\text{Average fixed assets}} \times 100 \quad (6.31)$$

These measures, however, may not provide correct results for inter-firm comparisons particularly when these firms have markedly varying *capital structures* as interest payment on debt qualifies for tax deduction in determining net taxable income. Therefore the effective cash outflows is less than the actual payment of interest by the amount of tax shield on interest payment. As a measure of *operating performance*, therefore, Equations 6.29 to 6.31 should be substituted by the following.

$$\text{ROA} = \frac{\text{EAT} + (\text{Interest} - \text{Tax advantage on interest}) \text{ or After tax interest cost}}{\text{Average total assets/Tangible assets/Fixed assets}} \quad (6.32)$$

This equation correctly reports the operating efficiency of firms as if they are all equity-financed. The ROA measures the profitability of the total funds/ investments of a firm. It, however, throws no light on the profitability of the different sources of funds which finance the total assets. These aspects are covered by other ROIs.

Return on Capital Employed (ROCE) The ROCE is the second type of ROI. It is similar to the ROA except in one respect. Here the profits are related to the total capital employed. The term capital employed refers to long-term funds supplied by the lenders and owners of the firm. It can be computed in two ways. First, it is equal to non-current liabilities (long-term liabilities) plus owners' equity. Alternatively, it is equivalent to net working capital plus long-term assets. Second, it is equal to long-term funds minus investments made outside the firm. Thus, the capital employed basis provides a test of profitability related to the sources of long-term funds. A comparison of this ratio with similar firms, with the industry average and over time would provide sufficient insight into how efficiently the long-term funds of owners and lenders are being used. The higher the ratio, the more efficient is the use of capital employed.

The ROCE can be computed in different ways, using different concepts of profits and capital employed. Thus,

$$1. \text{ ROCE} = \frac{\text{EBIT}}{\text{Average total capital employed}} \times 100 \quad (6.33)$$

$$2. \text{ ROCE} = \frac{\text{Net profit after taxes} + \text{Interest} - \text{Tax advantage on interest}}{\text{Average total capital employed}} \times 100 \quad (6.34)$$

$$3. \text{ ROCE} = \frac{\text{Net profit after taxes} + \text{Interest} - \text{Tax advantage on interest} - (\text{Interest and/or Dividends received} - \text{Taxes paid})}{\text{Average total capital employed} - \text{Investments (long-term) made}} \times 100 \quad (6.35)$$

Return on Shareholders' Equity This profitability ratio carries the relationship of return to the sources of funds yet another step further. While the ROCE expresses the profitability of a firm in relation to the funds supplied by the lenders and owners taken together, the return on shareholders' equity measures exclusively the return on the owners' funds.

- **Return on shareholders equity**
- measures the return on the owners (both preference and equity shareholders) investment in the firm.

The shareholders of a firm fall into two broad groups: preference shareholders and equity shareholders. The holders of preference shares enjoy a preference over equity shareholders in respect of receiving dividends. In other words, from the net profits available to the shareholders, the preference dividend is paid first and whatever remains belongs to the ordinary shareholders. The profitability ratios based on shareholders' equity are termed as *return on shareholders' equity*. There are several measures to calculate the return on shareholders equity: (i) Rate of return on (a) total shareholders' equity and (b) equity of ordinary shareholders; (ii) earnings per share; (iii) dividends per share; (iv) dividend-pay-out ratio; (v) dividend and earnings yield; and (vi) price-earnings ratio.

Return on Total Shareholders' Equity According to this ratio, profitability is measured by dividing the net profits after taxes (but before preference dividend) by the average total shareholders' equity. The term shareholders' equity includes (i) preference share capital; (ii) ordinary shareholders' equity consisting of (a) equity share capital, (b) share premium, and (c) reserves and surplus less accumulated losses. The ordinary shareholders' equity is also referred to as net worth. Thus,

$$\text{Return on total shareholders' equity} = \frac{\text{Net profit after taxes}}{\text{Average total shareholders' equity}} \times 100 \quad (6.36)$$

The ratio reveals how profitably the owners' funds have been utilised by the firm. A comparison of this ratio with that of similar firms as also with the industry average will throw light on the relative performance and strength of the firm.

Return on Ordinary Shareholders' Equity (Net Worth) While there is no doubt that the preference shareholders are also owners of a firm, the real owners are the ordinary shareholders who bear all the risk, participate in management and are entitled to all the profits remaining after all outside claims including preference dividends are met in full. The profitability of a firm from the owners' point of view should, therefore, in the fitness of things be assessed in terms of the return to the ordinary shareholders. The ratio under reference serves this purpose.

Return on ordinary shareholders' equity measures the return on the total equity funds of ordinary shareholders.

It is calculated by dividing the profits after taxes and preference dividend by the average equity of the ordinary shareholders.

Thus,

$$\text{Return on equity funds} = \frac{\text{Net profit after taxes} - \text{Preference dividend}}{\text{Average ordinary shareholders' equity or net worth}} \times 100 \quad (6.37)$$

This is probably the single most important ratio to judge whether the firm has earned a satisfactory return for its equity-holders or not. Its adequacy can be judged by (i) comparing it with the past record of the same firm, (ii) inter-firm comparison, and (iii) comparisons with the overall industry average. The rate of return on ordinary shareholders' equity is of crucial significance in ratio analysis vis-a-vis from the point of the owners of the firm.

Earnings Per Share (EPS) measures the profit available to the equity shareholders on a per share basis, that is, the amount that they can get on every share held. It is calculated by dividing the profits available to the equity shareholders by the number of the outstanding shares. The profits available to the ordinary shareholders are represented by net profits after taxes and preference dividend. Thus,

$$\text{EPS} = \frac{\text{Net profit available to equity-holders}}{\text{Number of ordinary shares outstanding}} \quad (6.38)$$

Earnings Per Share (EPS) is a widely used ratio. Yet, EPS as a measure of profitability of a firm from the owner's point of view, should be used cautiously as it does not recognise the effect of increase in equity capital as a result of retention of earnings. In other words, if EPS has increased over the years, it does not necessarily follow that the firm's profitability has improved because the increased profits to the owners may be the effect of an enlarged equity capital as a result of profit retentions, though the number of ordinary shares outstanding still remains constant. Another limitation of EPS is that it does not reveal how much is paid to the owners as dividend, nor how much of the earnings are retained in the business. It only shows how much earnings *theoretically* belong to the ordinary shareholders (per share basis).

As a profitability ratio, the EPS can be used to draw inferences on the basis of (i) its trends over a period of time, (ii) comparison with the EPS of other firms, and (iii) comparison with the industry average.

Cash Earnings Per Share is computed using cash flows from business operations as the numerator. This value is determined by adding non-cash expenses, such as depreciation and amortisation to net profits available to equity owners. Thus,

$$\text{Cash EPS} = \frac{\text{Net profit available to equity-owners} + \text{Depreciation} + \text{Amortisation} + \text{Non-cash expenses}}{\text{Number of equity shares outstanding}} \quad (6.39)$$

The ratio indicates the cash generating ability (per equity share) of the firm. Like EPS, cash EPS should be used with caution. It is beset with all the limitations associated with EPS measure.

Book Value Per Share represents the equity/claim of the equity shareholder on a per share basis. It is computed dividing net worth (equity share capital + reserves and surplus – accumulated losses) by the number of equity shares outstanding (at balance sheet date), as shown in Equation 6.40)

$$\text{Book value per share} = \frac{\text{Net worth}}{\text{Number of equity shares outstanding}} \quad (6.40)$$

This ratio is sometimes used as a benchmark for comparisons with the market price per share. However, the book value per share has a serious limitation as a valuation tool as it is based on the historical costs of the assets of a firm. There may be a significant difference between the market value of assets from the book value of assets (as per balance sheet). Besides, there may be hidden assets or other intangible assets of uncertain value.

Price-to-Book Value Ratio Also known as price to book (P/B) ratio, measures the relationship between the market price of an equity share (MPS) with book value (net worth) per share (BPS). Thus,

$$\text{P/B ratio} = \frac{\text{MPS}}{\text{BPS}} \quad (6.41)$$

The P/B ratio is significant in predicting future stock returns. For instance, Fama and French observed that the P/B ratio (along with size) was the best predictor of future stock returns¹⁸. Firms with low P/B ratios had consistently higher returns compared to the firms with high P/B ratios.

Dividend Per Share (DPS) is the dividends paid to the equity shareholders on a per share basis. In other words, DPS is the net distributed profit belonging to the ordinary shareholders divided by the number of ordinary shares outstanding. That is,

$$\text{DPS} = \frac{\text{Dividend paid to ordinary shareholders}}{\text{Number of ordinary shares outstanding}} \quad (6.42)$$

The DPS would be a better indicator than EPS as the former shows what exactly is received by the owners. Like the EPS, the DPS also should not be taken at its face value as the increased DPS may not be a reliable measure of profitability as the equity base may have increased due to increased retention without any change in the number of outstanding shares.

Dividend Pay-out (D/P) Ratio is also known as pay-out ratio. It measures the relationship between the earnings belonging to the ordinary shareholders and the dividend paid to them. In other words, the D/P ratio shows what percentage share of the net profits after taxes and preference dividend is paid out as dividend to the equity-holders. It can be calculated by dividing the total dividend paid to the owners by the total profits/earnings available to them. Alternatively, it can be found out by dividing the DPS by the EPS. Thus,

• **Dividend payout (D/P) ratio** measures the proportion of dividends paid to earning available to shareholders.

$$1. \text{ D/P ratio} = \frac{\text{Total dividend (cash dividend) to equityholders}}{\text{Total net profit belonging to equityholders}} \times 100 \quad (6.43)$$

$$2. \text{ D/P} = \frac{\text{Dividend per ordinary share (DPS)}}{\text{Earnings per share (EPS)}} \times 100 \quad (6.44)$$

If the D/P ratio is subtracted from 100, retention ratio is obtained. The ratio indicates what percentage share of the net profits are retained in the business. To illustrate, if the net earnings after taxes and preference dividends are ₹50 lakh and the dividend paid to the ordinary shareholders

amount to ₹30 lakh, the D/P = 60 per cent. This implies that 40 per cent of the profits of the firm are retained (retention ratio) and 60 per cent distributed as dividends. Similarly, if the DPS is ₹2 and EPS ₹5, the D/P is 60 per cent. While 60 per cent profits are used to pay dividends, 40 per cent are ploughed back.

The D/P ratio is an important and widely-used ratio. The pay-out ratio can be compared with the trend over the years or an inter-firm and intra-industry comparison would throw light on its adequacy.

Earnings and Dividend Yield is closely related to the EPS and DPS. While the EPS and DPS are based on the book value per share, the yield is expressed in terms of the market value per share. The earnings yield may be defined as the ratio of earnings per share to the market value per ordinary share. Similarly, the dividend yield is computed by dividing the cash dividends per share by the market value per share. That is,

$$1. \text{ Earnings yield} = \frac{\text{EPS}}{\text{Market value per share}} \times 100 \quad (6.45)$$

$$2. \text{ Dividend yield} = \frac{\text{DPS}}{\text{Market value per share}} \times 100 \quad (6.46)$$

The earnings yield is also called the earning-price ratio.

Price/Earnings (P/E) ratio measures the amount investors are willing to pay for each rupee of earnings; the higher the ratio, the larger the investors' confidence in the firm's future.

Price Earnings (P/E) Ratio is closely related to the earnings yield/earnings price ratio. It is actually the reciprocal of the latter. This ratio is computed dividing the market price of the shares by the EPS. Thus,

$$P/E \text{ ratio} = \frac{\text{Market price of share}}{\text{EPS}} \quad (6.47)$$

The *P/E* ratio reflects the price currently being paid by the market for each rupee of currently reported EPS. In other words, the *P/E* ratio measures investors' expectations and the market appraisal of the performance of a firm. In estimating the earnings, therefore, only normally sustainable earnings associated with the assets are taken into account. That is, the earnings are adjusted for income from, say, discontinued operations and extraordinary items as well as many other items not expected to occur. This ratio is popularly used by security analysts to assess a firm's performance as expected by the investors.

LO 6.5 ACTIVITY/EFFICIENCY RATIOS

Activity ratios are concerned with measuring the efficiency in asset management. These ratios are also called **efficiency ratios** or **assets utilisation ratios**. The efficiency with which the assets are used would be reflected in the speed and rapidity with which assets are converted into sales. The greater is the rate of turnover or conversion, the more efficient is the utilisation of assets, other things being equal. For this reason, such ratios are also designated as turnover ratios. Turnover is the primary mode for measuring the extent of efficient employment of assets by relating the assets to sales.

An activity ratio may, therefore, be defined as a test of the relationship between sales (more appropriately with cost of sales) and the various assets of a firm. Depending upon the various types of assets, there are various types of activity ratios.

Inventory (or Stock) Turnover Ratio

This ratio indicates the number of times inventory is replaced during the year. It measures the relationship between the cost of goods sold and the inventory level. The ratio can be computed in two ways.

First, it is calculated dividing the cost of goods sold by the average inventory. Symbolically,

$$\text{Inventory turnover} = \frac{\text{Cost of goods sold}}{\text{Average inventory}} \quad (6.48)$$

• **Inventory**
 • **(stock) turnover**
 • measures the
 • activity/liquidity
 • of inventory of a
 • firm; the speed with
 • which inventory is
 • sold.

The average inventory figure may be of two types. In the first place, it may be the monthly inventory (stock) average. The monthly average can be found by adding the opening inventory of each month from, in case of the accounting year being a calendar year, January through January and dividing the total by thirteen. If the firm's accounting year is other than a calendar year, say a financial year, (April to March), the average level of inventory can be computed by adding the opening inventory of each month from April through April and dividing the total by thirteen.¹⁹ This approach has the advantage of being free from bias as it smoothens out the fluctuations in inventory level at different periods. This is particularly true of firms in seasonal industries. However, a serious limitation of this approach is that detailed month-wise information may present practical problems of collection for the analyst. Therefore, average inventory may be obtained by using another basis, namely, the average of the opening inventory and the closing inventory.

Not only are there difficulties in getting detailed information regarding inventory level, but data may also not be readily available to an analyst in respect of the cost of goods sold. To solve the problem arising out of non-availability of the required data, the second approach to the computation of inventory turnover ratio is based on the relationship between sales and closing inventory. Thus, alternatively,

$$\text{Inventory turnover} = \frac{\text{Sales}}{\text{Closing inventory}} \quad (6.49)$$

In theory, this approach is not a satisfactory basis as it is not logical. For one thing, the numerator (sales) and the denominator (inventory) are not strictly comparable as the former is expressed in terms of market price, the latter is based on cost. Secondly, the closing inventory figures are likely to be underestimates as firms traditionally have lower inventory at the end of the year. The net effect will be that the ratio given by this approach will be higher than the one given by the first approach. Thus the ratio has built-in bias to show better utilisation of inventory.

In brief, of the two approaches to calculating the inventory turnover ratio, the first which relates the cost of goods sold to the average inventory is theoretically superior as it is logically consistent. The merit of the second approach is that it is free from practical problems of computation.

Interpretation The inventory/stock turnover ratio measures how quickly inventory is sold. It is a test of efficient inventory management. To judge whether the ratio of a firm is satisfactory or not, it should be compared over a period of time on the basis of trend analysis. It can also be compared with the level of other firms in that line of business as well as with industry average.

In general, a high inventory turnover ratio is better than a low ratio. A high ratio implies good inventory management. Yet, a very high ratio calls for a careful analysis. It may be indicative of underinvestment in, or very low level of, inventory. A very low level of inventory has serious implications. It will adversely affect the ability to meet customer demand as it may not cope with its requirements. That is, there is a danger of the firm being out of stock and incurring high 'stock out cost'. It is also likely that the firm may be following a policy of replenishing its stock in too many small sizes. Apart from being costly, this policy may retard the production process as sufficient stock of materials may not be available.

...the ... of ...

THE ...

...the ... of ...

THE ...

...the ... of ...

Similarly, a very low inventory turnover ratio is dangerous. It signifies excessive inventory or overinvestment in inventory. Carrying excessive inventory involves cost in terms of interest on funds locked up, rental of space, possible deterioration and so on. A low ratio may be the result of inferior quality goods, overvaluation of closing inventory, stock of unsaleable/obsolete goods and deliberate excessive purchases in anticipation of future increase in their prices and so on.

Thus, a firm should have neither too high nor too low inventory turnover. To avoid both 'stock out costs' associated with a high ratio and the costs of carrying excessive inventory with a low ratio, what is suggested is a reasonable level of this ratio. The firm would be well advised to maintain a close watch on the trend of the ratio and significant deviations on either side should be thoroughly investigated to locate the factors responsible for it. The computation of the turnover for the individual components of the inventory may be useful in this context. Such ratios can be computed in respect of raw materials and work-in-progress. Thus,

$$\text{Raw materials turnover} = \frac{\text{Cost of raw materials used}}{\text{Average raw material inventory}} \quad (6.50)$$

$$\text{Work-in-progress turnover} = \frac{\text{Cost of goods manufactured}}{\text{Average work-in-progress inventory}} \quad (6.51)$$

Receivables (Debtors) Turnover Ratio and Average Collection Period

Average collection period is the average amount of time needed to collect accounts receivable.

The second major activity ratio is the **receivables or debtors turnover ratio**. Allied and closely related to this is the average collection period. It shows how quickly receivables or debtors are converted into cash. In other words, the debtors turnover ratio is a test of the liquidity of the debtors of a firm.

The liquidity of a firm's receivables can be examined in two ways: **(i)** debtors/receivables turnover; **(ii)** average collection period.

The debtors turnover shows the relationship between credit sales and debtors of a firm. It can be calculated in two ways:

$$1. \text{ Debtor turnover} = \frac{\text{Credit sales}}{\text{Average debtors} + \text{Average bills receivable (B/R)}} \quad (6.52)$$

This approach requires two types of data. First, credit sales, which may not be readily available to the analyst. Similarly, the computation of the figure of average debtors and bills receivable involves practical difficulties. In theory, these figures should be measured, as in the case of average inventory, on the basis of the monthly average. Since this type of information is not likely to be available to the analyst, the alternative is to use the average of the opening and closing balances of debtors and bills receivable.

To avoid the difficulty arising out of the non-availability of information in respect of credit sales and average debtors and bills receivable, the alternative method is to calculate the debtors turnover in terms of the relationship between total sales and closing balance of debtors. Thus,

$$2. \text{ Debtors turnover}^{20} = \frac{\text{Total sales}}{\text{Debtors} + \text{Bills receivable}} \quad (6.53)$$

The first approach to the computation of the debtors turnover is superior in that the question of the speed of conversion of sales into cash arises only in the case of credit sales. The effect of adopting the second approach would be to inflate the receivables turnover ratio and deflate the collection period.

The second type of ratio for measuring the liquidity of a firm's debtors is the average collection period. This is, in fact, interrelated with, and dependent upon, the receivables turnover ratio. It is calculated dividing the days in a year by the debtors turnover. Thus,

$$\text{Average collection period} = \frac{\text{Months (days) in a year}}{\text{Debtors turnover}} \quad (6.54)$$

$$\text{Alternatively} = \frac{\text{Months (days) in a year} (\times) (\text{Average Debtors} + \text{Average B/R})}{\text{Total credit sales}} \quad (6.55)$$

Example 6.7

The credit sales of a firm in a year amount to ₹120 lakh. The outstanding amount of debtors at the beginning and end of the year were ₹14 lakh and ₹16 lakh respectively. Determine the debtor turnover ratio and the average collection period.

Solution

$$1. \text{ Debtor turnover ratio} = \frac{\text{₹120 lakh}}{(\text{₹14 lakh} + \text{₹16 lakh})/2} = 8 \text{ (times per year)}$$

$$2. \text{ (i) Average debt collection period} = \frac{12 \text{ months}}{8} = 1.5 \text{ months}$$

$$\text{(ii) } (12 \text{ months} \times \text{₹15 lakh})/\text{₹120 lakh} = 1.5 \text{ months.}$$

We can get the debtor turnover dividing the months (days) in the year by the average collection period (i.e. $12 \div 1.5 = 8$). Likewise, if we divide the months (days) in the year by the debtor turnover ratio, we get the average collection period ($12 \div 8 = 1.5$).

Interpretation This ratio indicates the speed with which debtors/accounts receivable are being collected. A turnover ratio of 8 signifies that debtors get converted into cash 8 times in a year. The collection period of 1.5 months or 45 days implies that debtors on an average are collected in 45 days. Thus, it is indicative of the efficiency of trade credit management. The higher the turnover ratio and the shorter the average collection period, the better is the trade credit management and the better is the liquidity of debtors, as short collection period and high turnover ratio imply prompt payment on the part of debtors. On the other hand, low turnover ratio and long collection period reflect delayed payments by debtors. In general, therefore, short collection period (high turnover ratio) is preferable.

It is not, however, very prudent for a firm to have either a very short collection period or a very long one. A very long collection period would imply either poor credit selection or an inadequate collection effort. The delay in the collection of receivables would mean that, apart from the interest cost involved in maintaining a higher level of debtors, the liquidity position of the firm would be adversely affected. Moreover, there is the likelihood of a large number of accounts receivable becoming bad debts. Similarly, too short a period of average collection or too high a turnover ratio is not necessarily good. While it is true that it avoids the risk of receivables being bad debt as well as the burden of high interest on outstanding debtors, it may have an adverse effect on the volume of sales of the firm. Sales may be confined to only such customers as make prompt payments. The credit and collection policy of the firm may be very restrictive. Without reasonable credit, sales will be severely curtailed. Thus, a firm should have neither a very low nor a very high receivables turnover ratio; it should maintain it at a reasonable level. The reasonableness of the collection period can be judged in either of the following two ways.

...the ... of ...

First, the collection period of a firm can be compared with the industry practices of trade credit. Any notable deviation may result from (i) a more or less liberal policy of extending trade credit, or (ii) better/poor quality of receivables. A liberal trade credit policy may be aimed at augmenting sales.

Second, it may be more appropriately examined in relation to the credit terms and policy of the firm itself. In our example, the average collection period is 45 days or 1.5 months. This should be compared with the credit terms/period normally allowed by the firm. If the normal credit period, let us assume, as extended by the firm is 40-45 days, it means the firm is able to collect its receivables well within the due dates. If, however, the credit period normally allowed is 1 month or 30 days, it means that the debtors are outstanding for a period longer than warranted by the firm's credit policy. This may be a reflection on the efficiency of the credit collection department: it has made either poor credit selection or inadequate collection effort. The management should investigate the reasons for the difficulties in the collection of receivables.

Ageing schedule enables analysts to identify slow paying debtors. A related aspect of the average collection period is the **ageing schedule**. While the former is concerned with the liquidity of debtors/receivables as a whole, the latter analyses them in a disaggregative manner by dividing the outstanding debtors on the basis of the duration during which they have been outstanding. The usefulness of the ageing schedule lies in the fact that it enables the analyst to identify the slow paying debtors in respect of whom the firm may have to encounter a serious collection problem. A hypothetical ageing schedule for the firm of our example, with an average collection period of 1.5 months is given in Table 6.7.

TABLE 6.7 Ageing Schedule

<i>Outstanding period of debtors</i> (1)	<i>Amount outstanding</i> (2)	<i>Percentage of total</i> (3)
Up to 30 days (1 month)	₹2,00,000	12.5
31-45 days (1.5 months)	4,00,000	25.0
46-60 days (2 months)	8,00,000	50.0
Above 60 days (more than two months)	2,00,000	12.5
	<u>16,00,000</u>	<u>100</u>

It can be seen from Table 6.7 that more than 60 per cent of the receivables are overdue as they remain outstanding beyond the average collection period of 45 days. Moreover, more than one-tenth of the outstanding debtors remain uncollected for more than 60 days. The ageing schedule, thus, supplements the collection period by showing how long the debtors are outstanding.

Assets turnover indicates the efficiency with which firm uses all its assets to generate sales.

Assets Turnover Ratio

This ratio is also known as the investment turnover ratio. It is based on the relationship between the cost of goods sold²¹ and assets/investments of a firm. A reference to this was made while working out the overall profitability of a firm as reflected in its earning power. Depending upon the different concepts of assets employed, there are many variants of this ratio.

Thus,

$$1. \text{ Total assets turnover} = \frac{\text{Cost of goods sold}}{\text{Average total assets}} \quad (6.56)$$

$$2. \text{ Fixed assets turnover} = \frac{\text{Cost of goods sold}}{\text{Average fixed assets}} \quad (6.57)$$

$$3. \text{ Capital turnover} = \frac{\text{Cost of goods sold}}{\text{Average capital employed}} \quad (6.58)$$

$$4. \text{ Current assets turnover} = \frac{\text{Cost of goods sold}}{\text{Average current assets}} \quad (6.59)$$

$$5. \text{ Working capital turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Net working capital}} \quad (6.60)$$

Here, the total assets and fixed assets are net of depreciation and the assets are exclusive of fictitious assets like debit balance of profit and loss account and deferred expenditures and so on.

The assets turnover ratio, howsoever defined, measures the efficiency of a firm in managing and utilising its assets. The higher the turnover ratio, the more efficient is the management and utilisation of the assets while low turnover ratios are indicative of underutilisation of available resources and presence of idle capacity. In operational terms, it implies that the firm can expand its activity level (in terms of production and sales) without requiring additional capital investments. In the case of high ratios, the firm would normally be required, other things being equal, to make additional capital investments to operate at higher level of activity. To determine the efficiency of the ratio, it should be compared across time as well as with the industry average. In using the assets turnover ratios one point must be carefully kept in mind. The concept of assets/fixed assets is net of depreciation. As a result, the ratio is likely to be higher in the case of an old and established company as compared to a new one, other things being equal. The turnover ratio is in such cases likely to give a misleading impression regarding the relative efficiency with which assets are being used. It should, therefore, be cautiously used.

LO 6.6 INTEGRATED ANALYSIS OF RATIOS

The ratios discussed so far measure a firm's liquidity, solvency, efficiency of operations and profitability independent of one another. However, there exists interrelationship among these ratios. This aspect is brought out by integrated analysis of ratios. The disaggregation of ratios can reveal certain major economic and financial aspects, which otherwise would have been ignored. For instance, significant changes in profitability measured in terms of return on assets (ROA) and return on equity (ROE) are understood better through an analysis of its components.

The various profitability ratios discussed earlier throw light on the profitability of a firm from the viewpoint of (i) the owners of the firm, and (ii) the operating efficiency of the firm. The ratios covered under the rate of return to the equity-holders fall under the first category. The operating efficiency of a firm in terms of the efficient utilisation of the resources is reflected in net profit margin. It has been observed that although a high profit margin is a test of better performance, a low margin does not necessarily imply a lower rate of return on investments if a firm has higher investments/assets turnover. Therefore, the overall operating efficiency of a firm can be assessed on the basis of a combination of the two. The combined profitability is referred to as earning power/return on assets (ROA) ratio. The **earning power** of a firm may be defined as the overall profitability of an enterprise. This ratio has two elements: (i) profitability on sales as reflected in the net profit margin, and (ii) profitability of assets which is revealed by the assets/investment turnover. The earning power (ROA ratio) of a firm can be computed by multiplying the net profit margin and the assets turnover. Thus,

Earning power is the overall profitability of a firm; is computed by multiplying net profit margin and assets turnover.

$$\text{Earning power} = \text{Net profit margin} \times \text{Assets turnover} \quad (6.61)$$

where, Net profit margin = Earning after taxes/Sales

Asset turnover = Sales/Total assets

$$\text{Earning power} = \frac{\text{Earnings after taxes}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Total assets}} = \frac{\text{EAT}}{\text{Total assets}} \quad (6.62)$$

The basic elements of the earning power of a firm are portrayed in Figure 6.1. This chart is known as the Du Pont Chart.

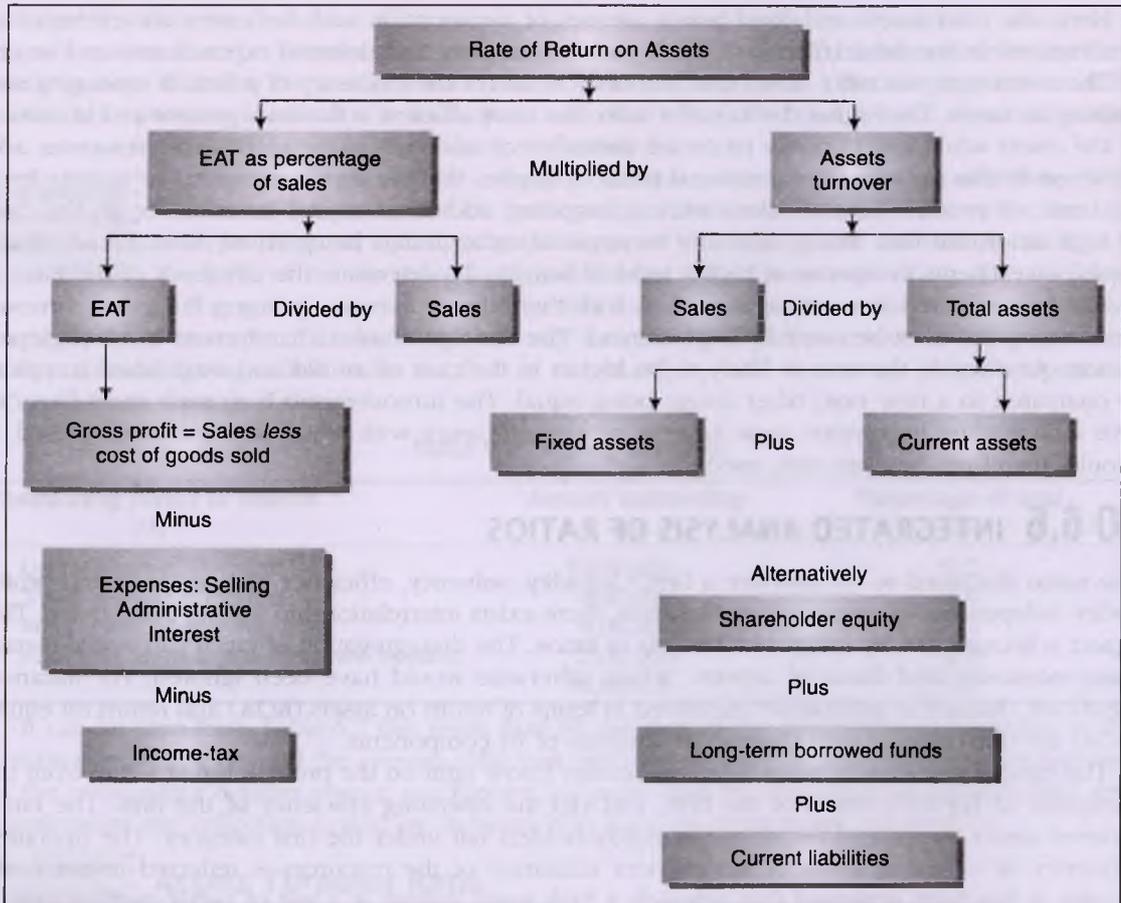

FIGURE 6.1 Du Pont Chart

The ROA ratio is a central measure of the overall profitability and operational efficiency of a firm. It shows the interaction of profitability and activity ratios. It implies that the performance of a firm can be improved either by generating more sales volume per rupee of investment or by increasing the profit margin per rupee of sales. Consider Example 6.8.

Example 6.8

Assume that there are two firms, A and B, each having total assets amounting to ₹4,00,000, and average net profits after taxes of 10 per cent, that is, ₹40,000, each. Firm A has sales of ₹4,00,000, whereas the sales of firm B aggregate ₹40,00,000. Determine the ROA of firms A and B.

Table 6.8 shows the ROA based on two components.

Solution

TABLE 6.8 Return on Assets (ROA) of Firms A and B

Particulars	Firm A	Firm B
1. Net sales	₹4,00,000	₹40,00,000
2. Net profit	40,000	40,000
3. Total assets	4,00,000	4,00,000
4. Profit margin (2 ÷ 1) (per cent)	10	1
5. Assets turnover (1 ÷ 3) (times)	1	10
6. ROA ratio (4 × 5) (per cent)	10	10

Thus, the ROA of firms A and B is identical. While firm A has higher profit margin, B firm has higher assets turnover. Thus, the earning power is affected by two variables, namely, profit margin and assets turnover. Assets turnover ratio can further be segregated into inventory turnover, debtors turnover and fixed assets turnover ratios. Likewise, profit margin can be decomposed into gross profit, operating profit, profit before taxes and so on.

The usefulness of the integrated analysis lies in the fact that it presents the overall picture of the performance of a firm as also enables the management to identify the factors which have a bearing on profitability. In Example 6.8, if firm B could improve its profit margin even marginally, say, from 1 per cent to 2 per cent, its earning power (ROA) will be doubled, assuming sales are not affected. Similarly, firm A can double its earning power simply by a marginal increase in its investment turnover, as it indicates that the assets are used more efficiently, that is, more sales per rupee of investments. The two components of this ratio, namely, the profit margin and the investment turnover ratio, individually do not give an overall view as the former ignores the profitability of investments, while the latter fails to consider the profitability on sales.

The profitability analysis based on ROA can be extended further for a detailed examination of the return on equity (ROE). It is the most important measure of financial performance from the point of view of equityholders. The ROE can be decomposed into three following principal components:

$$\frac{\text{Earnings after taxes, EAT}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}} \quad (6.63)$$

The three components in the ROE are indicative of net profit margin (profitability), assets turnover (efficiency in operations) and financial leverage (indicating the extent to which assets are financed by owners funds). Thus, the ROE is the product of the following three ratios:

$$\text{Net profit ratio} (\times) \text{ Assets turnover} (\times) \text{ Financial leverage/Equity multiplier} \quad (6.64)$$

The equation indicates that the management of the firm has three levers through which it can control ROE: (i) the net profit margin per rupee of sales, (ii) the sales generated per rupee of assets employed and (iii) the amount of equity used to finance the assets. While profit margin summarises profit performance as reflected in the income statement of a firm, assets turnover and financial leverage measure its performance with respect to assets and liabilities side of its balance sheet respectively. Thus, these three levers capture the major elements of financial performance of a firm.²²

Suppose in Example 6.7, Firm A uses equity capital of ₹2 lakh and B of ₹2.5 lakh in financing total assets of ₹4 lakh. The financial leverage of A is 2 (₹4 lakh assets/₹2 lakh equity) and of B is 1.6 (₹4 lakh/₹2.5 lakh). The ROE for A and B can be computed using Equation 6.65.

$$\text{Net profit ratio} \times \text{Assets turnover} \times \text{Financial leverage} \quad (6.65)$$

$$10\% \times 1 \times 2 = 20\% \text{ (A)}$$

$$1\% \times 10 \times 1.6 = 16\% \text{ (B)}$$

...

...

...

...

...

...

...

...

Though the ROA for both firms is the same (10%), A has higher ROE (20%) than B (16%). The higher ROE of A primarily can be attributed to its higher financial leverage. The management of B can explore the possibility of increasing its financial leverage and thereby enhance the ROE of its equity owners. It will be profitable for B to employ more debt if the ROA is higher than the cost of debt. The relationship between ROA and ROE may be expressed as per Equation 6.66.

$$\text{ROE} = (\text{ROA} - \text{Interest cost} \div \text{Assets}) \times \text{Assets} \div \text{equity} \quad (6.66)$$

The three-component model of ROE (Equation 6.65) can be broadened further to consider the effect of interest and tax payments. The net profit ratio is to be disaggregated in the following three elements (the assets turnover and financial leverage ratios remaining unchanged).

$$\frac{\text{EAT}}{\text{Earnings before taxes (EBT)}} \times \frac{\text{EBT}}{\text{EBIT}} \times \frac{\text{EBIT}}{\text{Sales}} = \frac{\text{Net profit}}{\text{Sales}} \quad (6.67)$$

As a result of three sub-parts of net profit ratio, the ROE is composed of the following 5 components.

$$\frac{\text{EAT}}{\text{EBT}} \times \frac{\text{EBT}}{\text{EBIT}} \times \frac{\text{EBIT}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}} \quad (6.68)$$

A 5-way break-up of ROE enables the management of a firm to analyse the effect of interest payments and tax payments separately from operating profitability.²³ To illustrate further assume 8 per cent interest rate, 35 per cent tax rate and other operating expense of ₹3,22,462 (Firm A) and ₹39,26,462 (Firm B) for the facts contained in Example 6.8. Table 6.9 shows the ROE (based on the 5 components) of Firms A and B.

TABLE 6.9 ROE (Five-way Basis) of Firms A and B

Particulars	Firm A	Firm B
Net sales	₹4,00,000	₹40,00,000
Less: Operating expenses	3,22,462	39,26,462
Earnings before interest and taxes (EBIT)	77,538	73,538
Less: Interest (8%)	16,000	12,000
Earnings before taxes (EBT)	61,538	61,538
Less: Taxes (35%)	21,538	21,538
Earnings after taxes (EAT)	40,000	40,000
Total assets	4,00,000	4,00,000
Debt	2,00,000	2,50,000
Equity	2,00,000	1,50,000
EAT/EBT (times)	0.65	0.65
EBT/EBIT (times)	0.79	0.84
EBIT/Sales (per cent)	19.4	1.84
Sales/Assets (times)	1	10
Assets/Equity (times)	2	1.6
ROE (per cent)	20	16

Table 6.9 shows that there is little impact of taxes and interest payment on the difference in the ROE of the two firms (as reflected in the EAT/EBT as well as EBT/EBIT ratios). The financial leverage ratio, as pointed out earlier, is a major explanatory factor for higher ROE of Firm A *vis-à-vis* Firm B.

ANNEXURE 6.1

**Checklist of Financial Ratios of Reliance Industries Limited
(For the Year 2012) (Amount is in ₹ Crore)**

1. Liquidity Ratios

$$\text{Current Ratio} = \frac{\text{Current assets}}{\text{Current liabilities}} = \frac{₹1,28,175}{₹68,888} = 1.86 : 1$$

$$\begin{aligned} \text{Total current assets} &= \text{Cash and bank} + \text{Inventories} + \text{Trade receivables} + \text{Other current} \\ &\quad \text{assets} + \text{Loans and advances (Note 16)} + \text{Current investments} \\ &= ₹39,598 + ₹35,955 + ₹18,424 + ₹249 + (11,089 - 4,169^*) \\ &\quad ₹6920 + ₹27,029 \\ &= ₹1,28,175 \end{aligned}$$

@ Not usually available to pay current liabilities.

$$\begin{aligned} \text{Total current liabilities} &= \text{Short-term borrowings} + \text{Trade payables} + \text{Short-term provisions} \\ &\quad + \text{Other current liabilities} \\ &= ₹10,593 + ₹40,324 + ₹13,713 + ₹4,258 = ₹68,888 \end{aligned}$$

$$2. \text{ Acid-test ratio} = \frac{\text{Liquid assets}}{\text{Current liabilities}} = \frac{₹85,300}{₹68,888} = 1.24 : 1$$

$$\begin{aligned} \text{Liquid assets} &= \text{Total current assets} - \text{Inventories} - \text{Advances} \\ &= ₹1,28,175 - ₹35,955 - ₹6,920 = ₹85,300 \end{aligned}$$

$$\begin{aligned} 3. \text{ (a) Inventory turnover ratio (Finished goods)} &= \frac{\text{Cost of goods sold}}{\text{Average finished goods inventory}} \\ &= \frac{₹2,97,023}{₹7,660} = 38.78 \text{ times} \end{aligned}$$

$$\text{Average finished goods inventory} = (\₹7,944 + \₹7,376)/2 = ₹7,660$$

$$\text{(b) Inventory holding period} = 365 \text{ Days}/38.78 = 9.41 \text{ days}$$

$$\begin{aligned} \text{Cost of goods sold}^* &= \text{Opening stock of finished goods} + \text{Production cost} - \text{Closing stock} \\ &\quad \text{of finished goods} \\ &= ₹7,376 + ₹2,97,591 - ₹7,944 = ₹2,97,023 \end{aligned}$$

$$\begin{aligned} \text{Production cost} &= \text{Opening stock in process} + \text{Raw materials consumed} + \text{Cash} \\ &\quad \text{manufacturing expenses} + \text{Depreciation and amortisation (on net basis)} + \text{Other purchases} \\ &\quad \text{(as per P/L Account)} - \text{Closing stock-in-process} \\ &= ₹4,909 + ₹2,74,814 + ₹10,307 + ₹11,394 + ₹1,441 - ₹5,274 \\ &= ₹2,97,591 \end{aligned}$$

*Source: Notes 13 and 25.

4. (a) Debtors turnover ratio (assuming all sales on credit basis)

$$= \frac{\text{Net credit sales}}{\text{Average debtors}} = \frac{₹3,39,792}{₹17,933} = 18.95 \text{ times}$$

$$\text{(b) Debtors collection period} = 365 \text{ Days}/18.95 = 19.26 \text{ Days}$$

$$\text{Average debtors} = (\₹17,442 + \₹18,424)/2 = ₹17,933$$

(Ratio is based on gross turnover as the amount of taxes is also to be received)

5. (a) Creditors turnover ratio (assuming all purchases on credit basis)

$$= \frac{\text{Total credit purchases}^{\text{a)}}}{\text{Average creditors}} = \frac{\text{₹ } 2,81,029}{\text{₹ } 37,584} = 7.47 \text{ times}$$

(b) Creditors payment period = $365 \text{ Days} / 7.47 = 48.86 \text{ Days}$

$$\begin{aligned} \text{*Total credit purchases} &= \text{Purchase of raw materials} + \text{Other purchases} \\ &= \text{₹ } 2,79,588 + \text{₹ } 1,441 = \text{₹ } 2,81,029 \end{aligned}$$

Purchases of raw materials = Raw materials consumed + Closing stock of raw materials – Opening stock of raw materials

$$= \text{₹ } 2,74,814 + \text{₹ } 19,350 - \text{₹ } 14,576 = \text{₹ } 2,79,588$$

$$\text{Average creditors} = (\text{₹ } 34,844 + \text{₹ } 40,324) / 2 = 37,584$$

$$6. \text{ Cash flow from operations ratio}^* = \frac{\text{Cash flow from operations}}{\text{Current liabilities}} = \frac{\text{₹ } 26,974}{\text{₹ } 68,888} = 0.39 : 1$$

*(Source: Cash flow statement of Reliance Industries Ltd.)

II. Solvency Ratios

$$7. \text{ (a) Long-term debt to equity ratio} = \frac{\text{Long-term debt}}{\text{Shareholders' equity}} = \frac{\text{₹ } 60,156}{\text{₹ } 1,66,096} = 0.36 : 1$$

$$\begin{aligned} \text{Long-term debt} &= \text{Long-term borrowings} + \text{Deferred tax liability (net)} \\ &= \text{₹ } 48,034 + \text{₹ } 12,122 = \text{₹ } 60,156 \end{aligned}$$

$$(b) \text{ Total external obligations to equity ratio} = \frac{\text{Total external obligations}}{\text{Shareholders' equity}} = \frac{\text{₹ } 1,29,044}{\text{₹ } 1,66,096} = 0.78 : 1$$

$$\begin{aligned} \text{Total external obligations} &= \text{Long-term borrowings} + \text{Short-term borrowings} + \text{Trade payables} \\ &\quad + \text{Other current liabilities} + \text{Short-term provisions} + \text{Deferred tax liability (net)} \\ &= \text{₹ } 48,034 + \text{₹ } 10,593 + \text{₹ } 40,324 + \text{₹ } 13,713 + \text{₹ } 4,258 \\ &\quad + \text{₹ } 12,122 = \text{₹ } 1,29,044 \end{aligned}$$

$$(c) \text{ Total debt to equity Ratio} = \frac{\text{Total debt}}{\text{Shareholders' equity}} = \frac{\text{₹ } 70,749}{\text{₹ } 1,66,096} = 0.43 : 1$$

(Gross D/E ratio)

$$\begin{aligned} \text{Total debt} &= \text{Long-term borrowings} + \text{Short-term borrowings} + \text{Deferred tax liability (net)} \\ &= \text{₹ } 70,749 \end{aligned}$$

$$8. \text{ Total debt to assets ratio} = \frac{\text{Total debt}}{\text{Total assets}} = \frac{\text{₹ } 70,749}{\text{₹ } 2,95,140} = 0.24 : 1$$

$$9. \text{ Long-term debt to assets ratio} = \frac{\text{Long-term debt}}{\text{Total assets}} = \frac{\text{₹ } 60,156}{\text{₹ } 2,95,140} = 0.20 : 1$$

$$10. \text{ Total external obligations to assets ratio} = \frac{\text{Total external obligations}}{\text{Total assets}} = \frac{\text{₹ } 1,29,044}{\text{₹ } 2,95,140} = 0.44 : 1$$

$$11. \text{ Proprietary ratio} = \frac{\text{Proprietor's funds/Shareholder's funds}}{\text{Total assets}} = \frac{\text{₹ } 1,66,096}{\text{₹ } 2,95,140} = 0.56 : 1$$

$$12. \text{ Interest coverage ratio} = \frac{\text{EBIT}}{\text{Interest}} = \frac{\text{₹ } 27,716}{\text{₹ } 1,966} = 14.09 \text{ times}$$

$$\text{EBIT} = \text{EBT} + \text{Interest} = \text{₹ } 25,750 + \text{₹ } 1,966 \text{ (see note 23)} = \text{₹ } 27,716$$

$$13. \text{ Total fixed charge coverage ratio} = \frac{\text{EBIT}}{\text{Finance Costs}} = \frac{\text{₹ } 27,716}{\text{₹ } 2,667} = 10.39 \text{ times}$$

$$14. \text{ Total cash flow coverage ratio} = \frac{\text{EBIT} + \text{Depreciation and amortisation}}{\text{Interest}}$$

$$= \frac{\text{₹ } 27,716 + \text{₹ } 11,394}{\text{₹ } 1,966} = 19.89 \text{ times}$$

III. Profitability Ratios

$$15. \text{ Gross profit margin} = \frac{\text{Gross profit} \times 100}{\text{Net sales}} = \frac{\text{₹ } 32,881}{\text{₹ } 3,29,904} \times 100 = 9.97\%$$

$$\text{Gross profit} = \text{Revenue from operations} - \text{Cost of goods sold}$$

$$= \text{₹ } 3,29,904 - \text{₹ } 2,97,023 = \text{₹ } 32,881$$

$$16. \text{ Operating profit ratio} = \frac{\text{EBIT} - \text{Other incomes}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 27,716 - \text{₹ } 6,192}{\text{₹ } 3,29,904} \times 100 = 6.52\%$$

$$17. \text{ Pre-tax profit ratio} = \frac{\text{EBT}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 25,750}{\text{₹ } 3,29,904} \times 100 = 7.8\%$$

$$18. \text{ Net profit ratio} = \frac{\text{EAT}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 20,040}{\text{₹ } 3,29,904} \times 100 = 6.07\%$$

$$19. \text{ Cost of goods sold ratio} = \frac{\text{Cost of goods sold}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 2,97,023}{\text{₹ } 3,29,904} \times 100 = 90.03\%$$

$$20. \text{ Operating expenses ratio} = \frac{\text{Operating expenses}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 10,595}{\text{₹ } 3,29,904} \times 100 = 3.21\%$$

$$\text{Operating expenses} = \text{Employee benefit expenses} + \text{Selling and distribution expenses} + \text{Establishment expenses}$$

$$= \text{₹ } 2,862 + \text{₹ } 5,393 + \text{₹ } 2,340 = \text{₹ } 10,595$$

$$21. \text{ Administrative expenses ratio} = \frac{\text{Administrative expenses}}{\text{Net sales}} \times 100$$

$$= \frac{\text{₹ } 5,202}{\text{₹ } 3,29,904} \times 100 = 1.58\%$$

$$\text{Administrative expenses} = \text{Employees benefits expenses} + \text{Establishment expenses}$$

$$= \text{₹ } 2,862 + \text{₹ } 2,340 = \text{₹ } 5,202$$

$$22. \text{ Selling expenses ratio} = \frac{\text{Selling expenses}}{\text{Net sales}} \times 100 = \frac{\text{₹ } 5,393}{\text{₹ } 3,29,904} \times 100 = 1.63\%$$

$$23. \text{ Operating ratio} = \frac{\text{Cost of goods sold} + \text{Operating expenses}}{\text{Net sales}} \times 100$$

$$= \frac{\text{₹ } 2,97,023 + \text{₹ } 10,595}{\text{₹ } 3,29,904} = 93.24\%$$

$$24. (a) \text{ Return on assets (ROA)} = \frac{\text{Net profit after taxes}}{\text{Average total assets}} \times 100 = \frac{\text{₹ } 20,040}{\text{₹ } 2,89,930} \times 100 = 6.9\%$$

$$\text{Average total assets} = (2,95,140 + \text{₹ } 2,84,719) / 2 = \text{₹ } 2,89,930$$

$$(b) \text{ ROA} = \frac{\text{Net profit after taxes} + \text{Interest}}{\text{Average total assets}} \times 100 = \frac{₹ 20,040 + ₹ 1,966}{₹ 2,89,930} \times 100 = 7.6\%$$

$$(c) \text{ ROA} = \frac{\text{EAT} + \text{Interest} - \text{Tax advantage on interest}}{\text{Average total assets}} \times 100$$

$$= \frac{₹ 20,040 + ₹ 1,966 - (₹ 1,966 \times 0.339)}{₹ 2,89,930} \times 100$$

$$= \frac{₹ 21,353.29}{₹ 2,89,930} \times 100 = 7.36\%$$

$$\text{Corporate Tax Rate} = 30\% + 7.5\% (\text{Surcharge}) + 3\% (\text{Education cess on taxes payable})$$

$$= 33.2\%$$

$$25. (a) \text{ ROCE} = \frac{\text{EBIT} - \text{Other income}}{\text{Average long-term (fixed) assets used} + \text{Net working capital}}$$

(Excluding capital work-in-progress as it does not contribute to operating income)

$$= \frac{₹ 27,716 - ₹ 6,192}{₹ 1,28,219 + ₹ 59,287} \times 100 = 11.48\%$$

$$\text{Average long-term asset used} = (₹ 1,13,723 + ₹ 1,42,707) / 2 = ₹ 1,28,219$$

$$\text{Net working capital} = \text{Current assets} - \text{Current liabilities}$$

$$= ₹ 1,28,175 - ₹ 68,888 = ₹ 59,287$$

Net profit after tax + Interest - Tax advantage on interest -
(other income attributed primarily from interest/dividends
received from investments made outside-taxes paid)

$$(b) \text{ ROCE} = \frac{\text{Net profit after tax} + \text{Interest} - \text{Tax advantage on interest} - \text{Other income}}{\text{Average long-term assets used} + \text{Net working capital}} \times 100$$

$$= \frac{₹ 20,040 + ₹ 1,966 - ₹ 652.71 - (₹ 6,192 - ₹ 6,192 \times 0.332)}{₹ 1,87,506} \times 100 = 9.18\%$$

$$26. \text{ Return on total shareholders' equity} = \frac{\text{Net profit after taxes}}{\text{Average shareholders' equity}} \times 100$$

$$= \frac{₹ 20,040}{₹ 1,58,818} \times 100 = 12.62\%$$

$$\text{Average shareholders' equity} (₹ 1,66,096 + ₹ 1,51,540) / 2 = ₹ 1,58,818$$

$$27. \text{ Return on equity funds} = \frac{\text{Net profit after taxes} - \text{Preference dividend}^*}{\text{Average ordinary shareholders' equity}}$$

* (Preference dividend is zero in this case)

$$= \frac{₹ 20,040}{₹ 1,58,818} \times 100 = 12.62\%$$

$$28. \text{ Earnings Per Share (EPS)} = \frac{\text{Net profit available to equity holders}}{\text{Number of ordinary shares outstanding}} = \frac{₹ 20,040}{327.10} = 61.27 \text{ per share}$$

$$29. \text{ Cash EPS} = \frac{₹ 20,040 + ₹ 11,394}{327.10} = ₹ 96.10 \text{ per share}$$

$$30. \text{ Book value per share} = \frac{\text{Net worth/Equity funds}}{\text{Number of equity shares outstanding}} = \frac{₹1,66,096}{327.10} = ₹507.78 \text{ per share}$$

$$31. (a). \text{ Dividend per share} = \frac{\text{Dividend paid to ordinary shareholders}^*}{\text{No. of ordinary shares outstanding}} \\ = \frac{₹2,531}{327.10} = ₹7.74 \text{ per share}$$

*Excluding tax on dividend

$$(b) \text{ Dividend payout ratio} = \frac{\text{Total dividend paid to equity holders}}{\text{Total net profit}} \\ = \frac{₹2,941}{₹20,040} \times 100 = 14.68\%$$

*Including tax on dividend

$$(c) \text{ Earnings yield} = \frac{\text{EPS}}{\text{Market price per share}^*} \times 100 = \frac{₹61.27}{₹810.38} \times 100 = 7.56\%$$

*Market price per share = ₹810.35 (as on March 31, 2012 at NSE)

$$(d) \text{ Dividend yield} = \frac{\text{DPS}}{\text{MPS}} = \frac{₹7.74}{₹810.35} \times 100 = 0.96\%$$

$$(e) \text{ P/E ratio} = \frac{\text{MPS}}{\text{EPS}} = \frac{₹810.35}{₹61.27} = 13.22 \text{ times}$$

IV. Efficiency Ratios

$$32. (a) \text{ Raw materials turnover} = \frac{\text{Cost of raw materials used}}{\text{Average raw materials inventory}} = \frac{₹2,74,814}{₹16,963} = 16.20 \text{ times}$$

$$\text{Average raw materials inventory} = (\₹14,576 + 19,350)/2 = ₹16,963$$

$$(b) \text{ Raw material holding period} = 365 \text{ Days}/16.20 = 22.53 \text{ Days}$$

$$33. \text{ Stock-in-process turnover ratio} = \frac{\text{Cost of goods manufactured}}{\text{Average stock in process inventory}} = \frac{₹2,97,591}{₹5,089} = 58.48 \text{ times}$$

$$\text{Cost of goods manufactured} = \text{Cost of goods sold} + \text{Closing stock of finished goods} \\ - \text{Opening stock of finished goods} \\ = ₹2,97,023 + ₹7,944 - ₹7,376 = ₹2,97,591$$

$$\text{Average stock-in-process} = (\₹4,904 + ₹5,274)/2 = ₹5,089$$

$$34. (a) \text{ Total assets turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Average total assets}} = \frac{₹2,97,023}{₹2,89,930} = 1.02 \text{ times}$$

$$(b) \text{ Total assets turnover ratio} = \frac{\text{Net sales}}{\text{Average total assets}} = \frac{₹3,29,904}{₹2,89,930} = 1.14 \text{ times}$$

(Based on sales)

$$35. (a) \text{ Fixed assets turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Average fixed assets}} = \frac{₹2,97,023}{₹1,28,219} = 2.32 \text{ times}$$

$$(b) \text{ Total assets turnover ratio} = \frac{\text{Net sales}}{\text{Average fixed assets}} = \frac{₹3,29,904}{₹1,28,219} = 2.57 \text{ times}$$

(Based on sales)

$$36. \text{ Capital turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Average capital employed}} = \frac{₹ 2,97,023}{₹ 1,87,506} = 1.58 \text{ times}$$

$$37. \text{ Current assets turnover Ratio} = \frac{\text{Cost of goods sold}}{\text{Average current assets}} = \frac{₹ 2,97,023}{₹ 1,14,111} = 2.60 \text{ times}$$

$$(b) \text{ Total assets turnover ratio} = \frac{\text{Net sales}}{\text{Average current assets}} = \frac{₹ 3,29,904}{₹ 1,14,111} = 2.89 \text{ times}$$

$$\text{Average current assets} = (\text{₹}1,32,344 + \text{₹}95,877)/2 = \text{₹}1,14,111$$

$$38. \text{ Working capital turnover ratio} = \frac{\text{Net sales}}{\text{Net working capital}} = \frac{₹ 3,29,904}{₹ 59,287} = 5.56 \text{ times}$$

$$\text{Net working capital} = (\text{₹}1,28,175 - \text{₹}68,888)$$

V. Integrated Ratios

$$39. (a) \text{ Earning power} = \text{Net profit margin} \times \text{Assets turnover}$$

$$\text{Net profit margin} = \frac{\text{EAT}}{\text{Sales}} \times 100 = \frac{₹ 20,040}{₹ 3,29,904} \times 100 = 6.07\%$$

$$\text{Assets turnover} = \frac{\text{Sales}}{\text{Total assets}} = \frac{₹ 3,29,904}{₹ 2,95,140} = 1.12 \text{ times}$$

$$\text{Earning power} = 6.07\% \times 1.12 = 6.80\%$$

$$(b) \text{ Return on Equity} = \frac{\text{EAT}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}}$$

$$= \frac{₹ 20,040}{₹ 3,29,904} \times \frac{₹ 3,29,904}{₹ 2,95,140} \times \frac{₹ 2,95,140}{₹ 1,66,096} = 11.96\%$$

$$\text{or (c) ROE} = \frac{\text{EAT}}{\text{EBT}} \times \frac{\text{EBT}}{\text{EBIT}} \times \frac{\text{EBIT}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}}$$

$$= \left(\frac{₹ 20,040}{₹ 25,750} \times \frac{₹ 25,750}{₹ 27,716} \times \frac{₹ 27,716}{₹ 3,29,904} \times \frac{₹ 3,29,904}{₹ 2,95,140} \times \frac{₹ 2,95,140}{₹ 1,66,096} \right) \times 100 = 11.96\%$$

LO 6.7 COMMON SIZE STATEMENTS

Ratio analysis apart, another useful way of analysing financial statements is to convert them into common size statements by expressing absolute rupee amounts into percentages. When this method is pursued, the income statement exhibits each expense item or group of expense items as a percentage of net sales, and net sales are taken at 100 per cent. Similarly, each individual asset and liability classification is shown as a percentage of total assets and liabilities respectively. Statements prepared in this way are referred to as **common-size statements**.

Common-size comparative statements prepared for one firm over the years would highlight the relative changes in each group of expenses, assets and liabilities. These statements can be equally useful for inter-firm comparisons, given the fact that absolute figures of two firms of the same industry are not comparable. Financial statements and common-size statements of the Hypothetical Ltd are presented in Example 6.9.

Example 6.9

The accompanying balance sheet and profit and loss account relate to Hypothetical Ltd. Convert these into common-size statements.

Balance Sheet as at March 31		(Amount in lakh of rupees)	
Particulars	Previous Year	Current Year	
Liabilities			
Equity share capital (of ₹10 each)	240	240.0	
General reserves	96	182.0	
Long-term loans	182	169.5	
Creditors	67	52.0	
Outstanding expenses	6	—	
Other current liabilities	9	6.5	
	600	650.0	
Assets			
Plant [net of accumulated depreciation]	402	390	
Cash	54	78	
Debtors	60	65	
Inventories	84	117	
	600	650	

Income Statement for the Year Ended March 31		(Amount in lakh of rupees)	
Particulars	Previous year	Current year	
Gross sales	370	480	
Less: Returns	20	30	
Net sales	350	450	
Less: Cost of goods sold	190	215	
Gross profit	160	235	
Less: Selling, general and administrative cost	50	72	
Operating profit	110	163	
Less: Interest expenses	20	17	
Earning before taxes	90	146	
Less: Taxes	31.5	51.5	
Earning after taxes	58.5	94.9	

Solution

Income Statement (Common-size) for the Years Ended March 31		(Percentages)	
Particulars	Previous year	Current year	
Net sales	100.0	100.0	
Cost of goods sold	54.3	47.8	
Gross profit	45.7	52.2	
Selling, general and administrative expenses	14.3	16.0	
Operating profit	31.4	36.2	
Interest	5.7	3.8	
Earnings before taxes	25.7	32.4	
Taxes	9.0	11.4	
Earnings after taxes (EAT)	16.7	21.0	

Particulars	Balance Sheets (Common-size as at March 31)	
	Previous year	Current year
Owners' equity:		
Equity share capital	40.0	36.9
General reserves	16.0	28.0
	<u>56.0</u>	<u>64.9</u>
Long-term borrowings:		
Loan	30.3	26.1
Current liabilities:		
Creditors	11.2	8.0
Outstanding expenses	1.0	
Other liabilities	1.5	1.0
	<u>13.7</u>	<u>9.0</u>
Total liabilities	<u>100.0</u>	<u>100.0</u>
Fixed assets:		
Plant (net of accumulated depreciation)	67.0	60.0
Current assets:		
Cash	9.0	12.0
Debtors	10.0	10.0
Inventories	14.0	18.0
	<u>33.0</u>	<u>40.0</u>
Total assets	<u>100.0</u>	<u>100.0</u>

These percentage figures bring out clearly the relative significance of each group of items in the aggregative position of the firm. For instance, in the current year the EAT of Hypothetical Ltd has increased to 21 per cent from 16.7 per cent in the previous year. This improvement in profitability can mainly be traced to the decrease of 6.5 per cent in the cost of goods sold, reflecting improvement in efficiency of manufacturing operations. The decrease in financial overheads (interest) by 1.9 per cent during the current year can be traced to the repayment of a part of long-term loans. Further analysis indicates that profitability would have been more but for an increase in operating expenses ratio by 1.7 per cent.

The common-size balance sheets show that current assets as a percentage of total assets have increased by 7 per cent over previous year. This increase was shared by inventories (4 per cent) and cash (3 per cent); the share of debtors remained unchanged at 10 per cent. The proportion of current liabilities (mainly due to creditors) was also lower at 9 per cent in the current year compared to 13.7 per cent in the previous year. These facts signal overall increase in the liquidity position of the firm. Further, the share of long-term debt has also declined and owners' equity has gone up from 56 per cent in the previous year to 64.9 per cent in the current year.

LO 6.8 IMPORTANCE OF RATIO ANALYSIS

As a tool of financial management, ratios are of crucial significance. The importance of ratio analysis lies in the fact that it presents facts on a comparative basis and enables the drawing of inferences regarding the performance of a firm. Ratio analysis is relevant in assessing the performance of a firm in respect of the following aspects: (i) liquidity position, (ii) long-term solvency, (iii) operating efficiency, (iv) overall profitability, (v) inter-firm comparison, and (vi) trend analysis.

Liquidity Position

With the help of ratio analysis conclusions can be drawn regarding the liquidity position of a firm. The liquidity position of a firm would be satisfactory if it is able to meet its current obligations

when they become due. A firm can be said to have the ability to meet its short-term liabilities if it has sufficient liquid funds to pay the interest on its short-maturing debt usually within a year as well as to repay the principal. This ability is reflected in the liquidity ratios of a firm. The liquidity ratios are particularly useful in credit analysis by banks and other suppliers of short-term loans.

Long-term Solvency

Ratio analysis is equally useful for assessing the long-term financial viability of a firm. This aspect of the financial position of a borrower is of concern to the long-term creditors, security analysts and the present and potential owners of a business. The long-term solvency is measured by the leverage/capital structure and profitability ratios which focus on earning power and operating efficiency. Ratio analysis reveals the strengths and weaknesses of a firm in this respect. The leverage ratios, for instance, will indicate whether a firm has a reasonable proportion of various sources of finance or if it is heavily loaded with debt in which case its solvency is exposed to serious strain. Similarly, the various profitability ratios would reveal whether or not the firm is able to offer adequate return to its owners consistent with the risk involved.

Operating Efficiency

Yet another dimension of the usefulness of the ratio analysis, relevant from the viewpoint of management, is that it throws light on the degree of efficiency in the management and utilisation of its assets. The various activity ratios measure this kind of operational efficiency. In fact, the solvency of a firm is, in the ultimate analysis, dependent upon the sales revenues generated by the use of its assets—total as well as its components.

Overall Profitability

Unlike the outside parties which are interested in one aspect of the financial position of a firm, the management is constantly concerned about the overall profitability of the enterprise. That is, they are concerned about the ability of the firm to meet its short-term as well as long-term obligations to its creditors, to ensure a reasonable return to its owners and secure optimum utilisation of the assets of the firm. This is possible if an integrated view is taken and all the ratios are considered together.

Inter-firm Comparison

Ratio analysis not only throws light on the financial position of a firm but also serves as a stepping stone to remedial measures. This is made possible due to interfirm comparison and comparison with industry averages. A single figure of a particular ratio is meaningless unless it is related to some standard or norm. One of the popular techniques is to compare the ratios of a firm with the industry average. It should be reasonably expected that the performance of a firm should be in broad conformity with that of the industry to which it belongs. An interfirm comparison would demonstrate the firm's position *vis-a-vis* its competitors. If the results are at variance either with the industry average or with those of the competitors, the firm can seek to identify the probable reasons and, in that light, take remedial measures.

Trend Analysis

Finally, ratio analysis enables a firm to take the time dimension into account. In other words, whether the financial position of a firm is improving or deteriorating over the years. This is made possible by the use of trend analysis. The significance of a trend analysis of ratios lies in the fact that the analysts can know the direction of movement, that is, whether the movement is favourable

or unfavourable. For example, the ratio may be low as compared to the norm but the trend may be upward. On the other hand, though the present level may be satisfactory but the trend may be a declining one.

LO 6.9 LIMITATIONS OF RATIO ANALYSIS

Ratio analysis is a widely used tool of financial analysis. Yet, it suffers from various limitations. The operational implication of this is that while using ratios, the conclusions should not be taken on their face value. Some of the limitations which characterise ratio analysis are **(i)** difficulty in comparison, **(ii)** impact of inflation, and **(iii)** conceptual diversity.

Difficulty in Comparison

One serious limitation of ratio analysis arises out of the difficulty associated with their comparability. One technique that is employed is interfirm comparison. But such comparisons are vitiated by different procedures adopted by various firms. The differences may relate to:

- Differences in the basis of inventory valuation (e.g. last in first out, first in first out, average cost and cost);
- Different depreciation methods (i.e. straight line vs written down basis);
- Estimated working life of assets, particularly of plant and equipment;
- Amortisation of intangible assets like goodwill, patents and so on;
- Amortisation of deferred revenue expenditure such as preliminary expenditure and discount on issue of shares;
- Capitalisation of lease;
- Treatment of extraordinary items of income and expenditure; and so on.

Secondly, apart from different accounting procedures, companies may have different accounting periods, implying differences in the composition of the assets, particularly current assets. For these reasons, the ratios of two firms may not be strictly comparable.

Another basis of comparison is the industry average. This presupposes the availability, on a comprehensive scale, of various ratios for each industry group over a period of time. If, however, as is likely, such information is not compiled and available, the utility of ratio analysis would be limited.

Impact of Inflation

The second major limitation of the ratio analysis as a tool of financial analysis is associated with price level changes. This, in fact, is a weakness of the traditional financial statements which are based on historical costs. An implication of this feature of the financial statements as regards ratio analysis is that assets acquired at different periods are, in effect, shown at different prices in the balance sheet, as they are not adjusted for changes in the price level. As a result, ratio analysis will not yield strictly comparable and, therefore, dependable results. To illustrate, there are two firms which have identical rates of returns on investments, say 15 per cent. But one of these had acquired its fixed assets when prices were relatively low, while the other one had purchased them when prices were high. As a result, the book value of the fixed assets of the former type of firm would be lower, while that of the latter higher. From the point of view of profitability, the return on the investment of the firm with a lower book value would be overstated. Obviously, identical rates of returns on investment are not indicative of equal profitability of the two firms. This is a limitation of ratios.

Conceptual Diversity

Yet another factor which influences the usefulness of ratios is that there is difference of opinion regarding the various concepts used to compute the ratios. There is always room for diversity of opinion as to what constitutes shareholders' equity, debt, assets, profit and so on. Different firms may use these terms in different senses or the same firm may use them to mean different things at different times.

Reliance on a single ratio for a particular purpose may not be a conclusive indicator. For instance, the current ratio alone is not an adequate measure of short-term financial strength; it should be supplemented by the acid-test ratio, debtors turnover ratio and inventory turnover ratio to have a real insight into the liquidity aspect.

Finally, ratios are only a post-mortem analysis of what has happened between two balance sheet dates. For one thing, the position in the interim period is not revealed by ratio analysis. Moreover, they give no clue about the future.

In brief, ratio analysis suffers from some serious limitations. The analyst should not be carried away by its oversimplified nature, easy computation with a high degree of precision. The reliability and significance attached to ratios will largely depend upon the quality of data on which they are based. They are as good as the data itself. Nevertheless, they are an important tool of financial analysis.

SUMMARY

Ratio analysis is a widely used tool of financial analysis. It is defined as the systematic use of ratio to interpret the financial statements so that the strengths and weaknesses of a firm, as well as its historical performance and current financial condition, can be determined.

Ratios make the related information comparable. A single figure by itself has no meaning, but when expressed in terms of a related figure, it yields significant inferences. Thus, ratios are *relative figures* reflecting the relationship between related variables. Their use as tools of financial analysis involves their comparison as single ratios, like absolute figures, are not of much use. Three types of comparisons are generally involved: namely, (i) trend analysis, (ii) inter firm comparison, and (iii) comparison with standards or industry average.

LO 6.1

Trend analysis involves comparison of a firm over a period of time, that is, present ratios are compared with past ratios for the same firm. The comparison of the profitability ratios of a firm, say, year 1 to year 5, is an illustration of a trend analysis. It indicates the direction of change in the performance – improvement, deterioration or constancy – over the years.

Interfirm comparison involves comparing the ratios of a firm with those of others in the same lines of business or for the industry as a whole. It reflects the firm's performance in relation to its competitors. Other types of comparisons may relate to the comparison of items within a single year's financial statement of firm and comparison with standards or plans.

Ratios can broadly be classified into five groups: (i) liquidity, (ii) capital structure or leverage, (iii) profitability, (iv) activity/efficiency and (v) integrated.

LO 6.2

Liquidity ratios measure the ability of a firm to meet its short-term obligations and reflect its short-term financial strength or solvency. The important liquidity ratios are (a) current ratio, and (b) quick or acid test ratio.

Current ratio is the ratio of total current assets (CAs) to total current liabilities (CLs). A satisfactory current ratio would enable a firm to meet its obligations, even if the value of its CAs decline. It is, however, a quantitative index of liquidity as it does not differentiate among the components of CAs, such as cash and inventory which are not equally liquid.

LO 6.2

The quick or acid test ratio takes into consideration the differences in the liquidity of the components of CAs. It represents the ratio between quick CAs and the total CLs. It is a rigorous measure and superior to the current ratio. However, both these ratios should be used as complementary to each other to analyse the liquidity position of a firm.

The main liquidity ratios are computed as follows: **(i)** Current ratio = Current assets/Current liabilities. **(ii)** Acid test ratio = (Current assets – Stock – Pre-paid expenses)/Current liabilities. **(iii)** Super-quick ratio = (Cash + Marketable securities)/Current liabilities.

The capital structure or leverage ratios throw light on the long-term solvency of a firm. This is reflected in its ability to assure the long-term creditors with regard to periodic payment of interest and the repayment of loan on maturity, or in pre-determined instalments at due dates. There are two types of such ratios: **(a)** debt-equity or debt-assets, and **(b)** coverage.

The first type is computed from the balance sheet and reflects the relative contribution or stake of owners and creditors in financing the assets of the firm. In other words, such ratios reflect the safety margin to the long-term creditors.

The second category of such ratios is based on the income statement, which shows the number of times the fixed obligations are covered by earnings before interest and taxes or cash inflows. In other words, they indicate the extent to which a fall in operating profit or cash inflows is tolerable, in that the ability to repay would not be adversely affected.

The important leverage ratios are: **(i)** Debt/equity ratios = Total debt (long-term debt + current liabilities)/Shareholders' funds. **(ii)** Debt to total capital ratio = Total debt/Permanent capital (shareholder's funds + long-term debt). **(iii)** Debt to total assets ratio = Total debt/Total assets. **(iv)** Proprietary ratio = Owner's funds/Total assets. **(v)** Capital gearing ratio = (Preference share capital + Debentures + Other borrowed funds)/Equity funds (net worth). **(vi)** Interest coverage ratio (times-interest earned) = Earnings before interest and taxes (EBIT/Interest. **(vii)** Dividend coverage ratio = Earnings after taxes (EAT)/Preference dividend (D_p).

LO 6.3

$$\text{(viii) Total coverage ratio} = \frac{\text{EBIT} + \text{Lease payment}}{\text{Interest lease payment} + \left(\frac{D_p}{1-t}\right) + \frac{\text{Instalment of principal}}{(1-t)}}$$

$$\text{(ix) Cash flow coverage ratio} = \frac{\text{EBIT} + \text{Lease payment} + \text{Depreciation}}{\text{Interest Lease payment} + \left(\frac{D_p}{1-t}\right) + \frac{\text{Instalment of principal}}{(1-t)}}$$

$$\text{(x) Debt service coverage ratio} = \frac{\sum_{t=1}^n \text{EAT}_t + \text{Depreciation}_t + \text{Interest}_t + \text{Other non-cash expenses}_t}{\sum_{t=1}^n \text{Principal}_t + \text{Interest}_t}$$

LO 6.4

The profitability of a firm can be measured by the profitability ratios. Such ratios can be computed either from sales or investment.

The profitability ratios based on sales are **(a)** profit margin (gross and net), and **(b)** expenses or operating ratios. They indicate the proportion of sales consumed by operating costs and the proportion available to other expenses.

The profitability ratios related to investments include **(i)** return on assets, **(ii)** return on capital employed, and **(iii)** return on shareholders' equity, including earnings per share, dividend per share, dividend-payout ratio, earning and dividend yield.

LO 6.4	<p>The procedure of calculating profitability ratios based on sales are: (i) Gross profit ratio/margin = Gross profit (sales – cost of goods sold)/Net sales. (ii) Operating profit ratio/margin = EBIT/Net sales. (iii) Net profit ratio/margin = Earnings after taxes (EAT)/Net sales. (iv) Cost of goods sold ratio = Cost of goods sold/Net sales. (v) Operating expenses ratio = (Administrative expenses + Selling expenses)/Net sales. (vi) Administrative expenses ratio = Administrative expenses/Net sales. (vii) Selling expenses ratio = Selling expenses/Net sales. (viii) Operating ratio = (Cost of goods sold + Operating expenses)/Net sales.</p> <p>Ratios related to total investment are calculated as follows: (i) Return on total assets = (EAT + Interest – Tax advantage on interest)/Average total assets. (ii) Return on capital employed = (EAT + Interest – Tax advantage on interest)/Average total capital employed. (iii) Return on shareholders' equity = EAT/Average total shareholders' equity. (iv) Return on equity funds = (EAT – Preference dividend)/Average ordinary shareholders' equity (net worth). (v) Earnings per share (EPS) = Net profit available to equity shareholders' (EAT – D_p)/Number of equity shares outstanding (N) (vi) Dividends per share (DPS) = Dividend paid to ordinary shareholders/Number of ordinary shares outstanding (N). (vii) Earnings yield = EPS/Market price per share. (viii) DPS/Market price per share. (ix) Dividend payment/payout (D/P) ratio = DPS/EPS. (x) Price-earnings (P/E) ratio = Market price of a share/EPS. (xi) Book value per share = Ordinary shareholders' equity/Number of equity shares outstanding.</p>
LO 6.5	<p>The activity ratios (also known as efficiency or turnover ratios) are concerned with measuring the efficiency in asset management. The efficiency with which assets are managed/used is reflected in the speed and rapidity with which they are converted into sales. Thus, the activity ratios are a test of relationship between sales/cost of goods sold and assets. Depending upon the type of assets, activity ratios may be (a) inventory/stock turnover, (b) receivables/debtors turnover, and (c) total assets turnover.</p> <p>The first of these indicates the number of times inventory is replaced during the year or how quickly the goods are sold. It is a test of efficient inventory management.</p> <p>The second category of turnover ratios indicates the efficiency of receivables management and shows how quickly trade credit is collected.</p> <p>The total assets turnover represents the ratio of total assets to sales/cost of goods sold. It reveals the efficiency in managing and utilizing the total assets.</p> <p>The computation procedure of these ratios is as follows: (i) Raw material turnover = Cost of raw materials used/Average raw materials inventory. (ii) Work-in-process turnover = Cost of goods manufactured/Average work-in-process inventory. (iii) Finished goods inventory turnover = Cost of goods sold/Average finished goods inventory. (iv) Debtors turnover ratio = Total credit sales/(Average debtors + Averages bills receivable). (v) Average collection period = Months (days) in year/Debtors turnover ratio. (vi) Total assets turnover = Cost of goods sold/Average total assets. (vii) Fixed assets turnover = Cost of goods sold/Average fixed assets. (viii) Current assets turnover = Cost of goods sold/Average current assets. (ix) Working capital turnover ratio = Cost of goods sold/Average net working capital. If data about cost of goods sold are not available, sales figures are used in the numerator.</p>
LO 6.6	<p>Integrated ratios provide better insight about financial and economic analysis of a firm. For instance of the rate of return on assets (ROA) can be decomposed in to net profit margin (EAT/Sales) and assets turnover (Sales/Total assets). Likewise, the ROE can be decomposed in the following two ways: (i) (EAT/Sales) × (Sales/Assets) × (Assets/Equity) and (ii) (EAT/EBT) × (EBT/EBIT) × (EBIT/Sales) × (Sales/Assets) × (Assets/Equity).</p>
LO 6.7	<p>Preparation of common-size financial statements is an extension of ratio analysis. These statements convert absolute sums into more easily understood percentages of some base amount. It is sales in the case of income statement and totals of assets and liabilities in the case of the balance sheet.</p>
LO 6.8	<p>As a tool of financial analysis, ratios are of crucial significance. The importance of ratio analysis lies in the fact that it enables to assess the performance of a firm in respect of: (i) liquidity position, (ii) long-term solvency, (iii) operating efficiency and (iv) overall profitability. Apart from facilitating inter-firm comparison, it also enables the firm to assess its performance over the years.</p>

The first part of the history of the world is the history of the human race. It is a story of struggle and progress, of triumph and defeat, of hope and despair. It is a story that has shaped the course of human civilization and that continues to shape it today.

The second part of the history of the world is the history of the individual nations. It is a story of the rise and fall of empires, of the growth and decline of civilizations, of the triumph and defeat of kings and emperors. It is a story that has shaped the course of human history and that continues to shape it today.

The third part of the history of the world is the history of the human mind. It is a story of the discovery of truth, of the pursuit of knowledge, of the quest for wisdom. It is a story that has shaped the course of human thought and that continues to shape it today.

The fourth part of the history of the world is the history of the human spirit. It is a story of the triumph of the human will, of the power of the human imagination, of the strength of the human heart. It is a story that has shaped the course of human life and that continues to shape it today.

The fifth part of the history of the world is the history of the human future. It is a story of the hopes and dreams of the human race, of the aspirations and ambitions of the human mind. It is a story that has shaped the course of human destiny and that continues to shape it today.

The sixth part of the history of the world is the history of the human present. It is a story of the challenges and opportunities of the human race, of the triumphs and setbacks of the human mind. It is a story that has shaped the course of human life and that continues to shape it today.

The seventh part of the history of the world is the history of the human past. It is a story of the triumphs and setbacks of the human race, of the hopes and dreams of the human mind. It is a story that has shaped the course of human life and that continues to shape it today.

Ratio analysis in view of its several limitations should be considered only as a tool for analysis rather than as an end in itself. The reliability and significance attached to ratios will largely hinge upon the quality of data on which they are based. They are as good or as bad as the data itself. Nevertheless, they are an important tool of financial analysis.

24. There are varying practices regarding its treatment. Assuming going concern concept and RIL to be profitable in future, it is treated as liability.

SOLVED PROBLEMS

P.6.1 B Raj Ltd sells goods on cash as well as credit. The following particulars are extracted from their books of accounts for the current year-end.

LO 6.2 LOD E

Particulars	Amount (in lakh of rupees)
Total gross sales	100
Cash sales (included in above)	20
Sales returns	7
Total debtors at the end	9
Bills receivable	2
Provision for doubtful debts at the end of the year	1
Total creditors at the end	10

Calculate the average collection period.

Solution

Total net credit sales = Gross sales – Cash sales – Sales returns = ₹100 lakh – ₹20 lakh – ₹7 lakh = ₹73 lakh

$$\text{Debtors turnover} = \frac{\text{Credit sales}}{\text{Debtors + Bills receivable}} = \frac{\text{₹73 lakh}}{\text{₹11 lakh}} = \frac{73}{11}$$

$$\text{Average collection period} = \frac{365 \text{ days}}{\text{Debtors turnover (73/11)}} = 55 \text{ days}$$

P.6.2 The following are the ratios relating to the activities of National Traders Ltd:

LO 6.3	LO D
---------------	-------------

Debtors velocity (months)	3
Stock velocity (months)	8
Creditors velocity (months)	2
Gross profit ratio (%)	25

Gross profit for the current year ended December 31 amounts to ₹4,00,000. Closing stock of the year is ₹10,000 above the opening stock. Bills receivable amount to ₹25,000 and bills payable to ₹10,000. Find out: (a) Sales, (b) Sundry debtors, (c) Closing stock, and (d) Sundry creditors.

Solution

(a) Determination of sales: $\text{Sales} = \frac{\text{₹4,00,000}}{25} \times 100 = \text{₹16,00,000}$

(b) Determination of sundry debtors: Debtors velocity is 3 months. In other words, debtors' collection period is 3 months, or debtors' turnover ratio is 4. Assuming all sales to be credit sales and debtors turnover ratio being calculated on the basis of year-end figures,

$$\text{Debtors turnover ratio} = \frac{\text{Credit sales}}{\text{Closing debtors + Bills receivable}}$$

$$\text{Closing debtors + Bills receivable} = \frac{\text{Credit sales}}{\text{Debtors turnover ratio}} = \frac{\text{₹16,00,000}}{4} = \text{₹4,00,000}$$

$$\text{Closing debtors} = \text{₹4,00,000} - \text{₹25,000} = \text{₹3,75,000}$$

(c) Determination of closing stock: Stock velocity of 8 months signifies that the inventory holding period is 8 months, stock turnover ratio is 1.5 = (12 months ÷ 8).

$$\text{Stock turnover} = \frac{\text{Cost of goods sold (Sales – Gross profit)}}{\text{Average stock}}$$

$$1.5 = \frac{\text{₹12,00,000}}{\text{Average stock}}$$

$$\text{Average stock} = \frac{\text{₹12,00,000}}{1.5} = \text{₹8,00,000}$$

$$\text{Closing stock} - \text{Opening stock} = \text{₹10,000} \quad (1)$$

$$\frac{\text{Closing stock} + \text{Opening stock}}{2} = \text{₹8,00,000} \quad (2)$$

$$\text{Closing stock} + \text{Opening stock} = \text{₹16,00,000} \quad (3)$$

or

Subtracting (1) from (3) we have,

$$2 \text{ Opening stock} = \text{₹15,90,000}$$

$$\text{Opening stock} = \text{₹7,95,000}$$

Therefore,

$$\text{Closing stock} = \text{₹8,05,000}$$

- (d) Determination of sundry creditors: Creditors velocity of 2 months signifies that the credit payment period is 2 months. In other words, creditors' turnover ratio is 6 (12 months ÷ 2). Assuming all purchases to be credit purchases and creditors turnover is based on year-end figures,

$$\text{Creditors turnover ratio} = \frac{\text{Credit purchases}}{\text{Creditors} + \text{Bills payable}}$$

$$6 = \frac{\text{₹12,10,000}}{\text{Creditors} + \text{₹10,000}}$$

$$\text{Creditors} + \text{₹10,000} = \frac{\text{₹12,10,000}}{6} = \text{₹2,01,667}$$

$$\text{Creditors} = \text{₹2,01,667} - \text{₹10,000} = \text{₹1,91,667}$$

Credit purchases are calculated as follows:

Cost of goods sold = Opening stock + Purchases – Closing stock

$$\text{₹12,00,000} = \text{₹7,95,000} + \text{Purchases} - \text{₹8,05,000}$$

$$\text{₹12,00,000} + \text{₹10,000} = \text{Purchases}$$

$$\text{₹12,10,000} = \text{Purchases (credit)}.$$

- P.6.3** The Avon Ltd has a capital of ₹10,00,000; its turnover is 3 times the capital and the net profit margin on sales is 6 per cent. What is the return on investment?

LO 6.4 LOD E

Solution

Rate of return on investment = Margin of profit × Capital/Investment turnover

$$= \frac{\text{Net profit}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Capital}} = 0.06 \times 3 = 18 \text{ per cent}$$

- P.6.4** The capital of E. Ltd. is as follows:

LO 6.4 LOD M

9% Preference shares, ₹10 each	₹3,00,000
Equity shares of ₹10 each	8,00,000
	11,00,000

Additional information: Profit (after tax at 35 per cent), ₹2,70,000; Depreciation, ₹60,000; Equity dividend paid, 20 per cent; Market price of equity shares, ₹40.

You are required to compute the following, showing the necessary workings:

- (a) Dividend yield on the equity shares.
- (b) Cover for the preference and equity dividends.
- (c) Earnings per shares.
- (d) Price-earnings ratio.

Solution

$$\begin{aligned} \text{(a) Dividend yield on the equity shares:} &= \frac{\text{Dividend per share}}{\text{Market price per share}} \times 100 \\ &= \frac{\text{₹2 (0.20} \times \text{₹10)}}{\text{₹40}} \times 100 = 5 \text{ per cent} \end{aligned}$$

- (b) Dividend coverage ratio:

- (i) Preference

$$= \frac{\text{Profit after taxes}}{\text{Dividend payable to preference shareholders}} = \frac{\text{₹2,70,000}}{\text{₹27,000 (0.09} \times \text{₹3,00,000)}} = 10 \text{ times}$$

(ii) Equity =
$$\frac{\text{Profit after taxes} - \text{Preference share dividend}}{\text{Dividend payable to equity shareholders at current rate of ₹2 per share}}$$

$$= \frac{₹2,70,000 - ₹27,000}{₹1,60,000 (80,000 \text{ shares} \times ₹2)} = 1.52 \text{ times}$$

$$(c) \text{ Earnings per equity share} = \frac{\text{Earnings available to equity shareholders}}{\text{Number of equity shares outstanding}} = \frac{₹2,43,000}{80,000} = ₹3.04 \text{ per share}$$

$$(d) \text{ Price-earning (P/E) ratio} = \frac{\text{Market price per share}}{\text{Earnings pe share}} = \frac{₹40}{₹3.04} = 13.2 \text{ time}$$

P.6.5 Z Ltd purchased a retail store and commenced business on April 1. From the following information, you are required to prepare in as much details as possible, a trading and profit and loss account for the current year ended March 31 and a balance sheet as at the date. **LO 6.1,4,5**

Capital introduced on April 1	₹47,000
Drawings during the year	5,000
Working capital (current assets less current liabilities) at March 31	23,000
Depreciation of fixed assets during the year, based on a rate of 20 per cent per annum on cost	3,000
Ratio of annual sales to year-end values of fixed assets plus working capital	2:1
Ratio of current assets to current liabilities at the year-end	2:1
Ratio of liquid assets (cash plus debtors) to current liabilities on March 31	5:4
Debtors at the year-end as per cent of annual sales	12
General expenses (excluding depreciation) as per cent of annual sales	20

The current assets consist of stocks (which are unchanged throughout the year), debtors and cash. Stocks are turned over four times during the year. The current liabilities consist only of creditors.

Solution

Trading A/c of Z Ltd for the Current Year ended March 31

To Cost of sales	₹69,000	By Sales	₹1,00,000
To Gross profit c/f to P&L A/c	31,000		
	1,00,000		1,00,000

Profit and Loss A/c for the Current Year ended March 31

To General Expenses	₹20,000	By Gross profit b/f from trading	₹31,000
To Depreciation	3,000	A/c	
To Net profit c/f to capital A/c	8,000		
	31,000		31,000

Balance Sheet as at March 31, Current Year

Liabilities		Amount	Assets		Amount
Capital	₹47,000		Fixed assets	₹30,000	
Add: Net profit	8,000		Less: Depreciation	3,000	₹27,000
	55,000		Current assets		
Less: Drawings	5,000	₹50,000	Cash	16,750	
Creditors	23,000		Debtors	12,000	
			Stock	17,250	46,000
		73,000		73,000	

Working Notes

1. Determination of current assets and current liabilities:

$$CA - CL = ₹23,000 \quad (1)$$

$$0.5 CA - CL = 0 \quad (2)$$

Subtracting equation (2) from equation (1)

$$0.5 CA = ₹23,000$$

$$CA = ₹46,000$$

CL = ₹23,000 = Creditors as there are no other current liabilities.

2. Determination of fixed assets: Depreciation rate, 10 per cent = ₹3,000

$$\text{Cost of fixed assets} = ₹3,000 \times \frac{100}{10} = ₹30,000$$

3. Determination of sales =
- $\frac{\text{Sales}}{\text{Fixed assets} + \text{Working capital}} = 2$

$$\frac{\text{Sales}}{₹27,000 + ₹23,000} = 2$$

$$\text{Sales} = ₹1,00,000$$

4. Determination of liquid assets: liquid ratio =
- $\frac{\text{Liquid assets}}{\text{Current liabilities}}, 1.25 = \frac{\text{Liquid assets}}{₹23,000}$

$$₹28,750 = \text{Liquid assets (cash + debtors)}$$

(a) Debtors are 12 per cent of annual sales = ₹12,000 (0.12 × ₹1,00,000)

(b) Cash = ₹28,750 - ₹12,000 = ₹16,750

5. Determination of stock: Current assets - Liquid assets

$$₹46,000 - ₹28,750 = ₹17,250$$

6. Determination of cost of sales: Stock turnover ratio =
- $\frac{\text{Cost of sales}}{\text{Average stock}}$

$$4 = \frac{\text{Cost of sales}}{₹17,250}$$

$$₹69,000 = \text{Cost of sales.}$$

P.6.6 Using the following information, complete the balance sheet given below:**LO 6.2,3,4,5** **LO D**

Total debt to net worth: 0.5 to 1.

Turnover of total assets (based on year-end sales figures): 2.

Gross profit: 30 per cent

Average collection period (based on 360-day-year): 40 days

Inventory turnover (based on cost of goods sold and year-end inventory): 3 times.

Acid test ratio: 0.75:1.

Balance sheet

Cash		Notes and accounts payable	
Accounts receivable		Common stock	₹2,00,000
Inventory		Retained earnings	3,00,000
Plant and equipment			
Total	_____	Total	_____

Solution**Balance sheet**

Cash	₹20,833	Notes and accounts payable	₹2,50,000
Accounts receivable	1,66,667	Common stock	2,00,000
Inventory	3,50,000	Retained earnings	3,00,000
Plant and equipment	2,12,500		
Total	7,50,000	Total	7,50,000

Working notes

$$1. \text{ Debt to net worth ratio} = \frac{\text{Total debt}}{\text{Net worth (Common stock + Retained earnings)}}$$

$$0.5 = \frac{\text{Total debt}}{₹5,00,000}$$

$$₹2,50,000 = \text{Total debt (notes and accounts payable)}$$

2. Substituting the value of 'notes and accounts payable' on the liabilities side, we have ₹7,50,000 as the total sum of liabilities and so the total assets will be ₹7,50,000.

$$\text{Total assets turnover} = \frac{\text{Sales}}{\text{Total assets}}$$

$$2 = \frac{\text{Sales}}{₹7,50,000}$$

or $₹15,00,000 = \text{Sales}$

$$3. \text{ Gross profit ratio} = \frac{\text{Gross profit}}{\text{Sales}} \times 100$$

$$30 = \frac{\text{Gross profit}}{₹15,00,000} \times 100$$

$$₹4,50,000 = \text{Gross profit}$$

$$\text{Cost of goods sold} = \text{Sales} - \text{Gross profit} = ₹15,00,000 - ₹4,50,000 = ₹10,50,000$$

4. Assuming all sales to be credit sales, the figure of accounts receivable would be determined as follows:

$$\text{Accounts receivable turnover ratio} = \frac{360 \text{ days}}{\text{Average collection period}} = \frac{360 \text{ days}}{40 \text{ days}} = 9$$

$$\text{Accounts receivable turnover ratio} = \frac{\text{Credit sales}}{\text{Average debtors}}$$

$$9 = \frac{₹15,00,000}{\text{Average debtors}}$$

$$\text{Average debtors} = \frac{₹15,00,000}{9} = ₹1,66,667$$

In the absence of any figure of the opening debtors and closing debtors, it is assumed that accounts receivable ratio is calculated on the basis of year-end figures. Accordingly, the amount of ₹1,66,667 represents the balance of accounts receivable at the end of the year.

$$5. \text{ Inventory turnover ratio} = \frac{\text{Cost of goods sold}}{\text{Closing inventory}}$$

$$3 = \frac{\text{₹10,50,000}}{\text{Closing inventory}}$$

$$\text{or } \text{₹3,50,000} = \text{Closing inventory}$$

$$6. \text{ Acid test ratio} = \frac{\text{Liquid assets}}{\text{Current liabilities}}$$

$$0.75 = \frac{\text{Liquid assets}}{\text{₹2,50,000}}$$

$$\text{₹1,87,500} = \text{Liquid assets}$$

$$\text{₹1,87,500} = \text{Cash} + \text{Accounts receivable}$$

$$\text{₹1,87,500} - \text{₹1,66,667} = \text{₹20,833} = \text{Cash}$$

P.6.7 As the manager of a financial services company, you have received a proposal seeking a term loan of ₹300 lakh, from a firm planning an investment in fixed assets of ₹500 lakh in a new project. The loan is indicated to be repayable in three annual instalments commencing from the end of the second year. The following information concerning the project is available: (₹ in lakhs)

LO 6.3 LOD M

Particulars	Year			
	1	2	3	4
Gross profit (before depreciation)	75	100	150	150
Depreciation	50	45	40	35
Interest on term loan	25	45	30	15
Working capital borrowing (interest)	10	15	20	20
Provision for tax	—	—	10	30

Assuming other *techno-economic* criteria to be satisfactory, you are required to:

- compute appropriate financial ratio which, in your opinion, would guide the financing decision, and
- interpret briefly the ratio so computed and give your views on the proposal.

Solution

- Debt service coverage ratio is the most appropriate ratio for the lending company as it indicates relationship between the total cash funds available with the borrowing firm to service debt/instalment (consisting of principal repayment and interest).

Debt-Service Coverage Ratio (DSCR): (Amount in lakhs of rupees)

Particulars	Year			
	1	2	3	4
Gross profit (before depreciation)	75	100	150	150
Less interest on working capital borrowing	10	15	20	20
Less provision for tax	—	—	10	30
(i) Cash available to service term loan	65	85	120	100
Debt service obligations:				
Interest on term loan	25	45	30	15
Instalment payment	—	100	100	100
(ii) Total debt service obligations	25	145	130	115
(iii) DSCR (i ÷ ii) (Number of times)	2.6	0.59	0.92	0.87

(b) COMMENT: The DSCR is very unsatisfactory as it is less than one for all the three years in which instalments are to be paid. The firm will not have enough cash to service instalment and is likely to commit default. The proposal is not financially viable and term loan should not be sanctioned by the financial services company.

P.6.8 The information below is taken from the records of two companies in the same industry. The companies are X Ltd and Y Ltd; and the data is as follows:

LO 6.2,3,4 LOP M

Particulars	X Ltd	Y Ltd
Cash	₹2,10,000	₹3,20,000
Debtors (net)	3,30,000	6,30,000
Stock	12,30,000	9,50,000
Plant and equipment	16,95,000	24,00,000
Total assets	34,65,000	43,00,000
Sundry creditors	9,00,000	10,50,000
8% Debentures	5,00,000	10,00,000
Equity share capital	11,00,000	17,50,000
Retained earnings	9,65,000	5,00,000
Total liabilities	34,65,000	43,00,000
Sales	56,00,000	82,00,000
Cost of goods sold	40,00,000	64,80,000
Other operating expenses	8,00,000	8,60,000
Interest expenses	40,000	80,000
Income taxes	2,66,000	2,73,000
Dividends	1,00,000	1,80,000

Answer each of the following questions by making a comparison of one, or more, relevant ratios.

- (i) Which company is using the equity shareholders' money more profitably?
- (ii) Which company is better able to meet its current debts?
- (iii) If you were to purchase the debentures of one company, which company's debentures would you buy?
- (iv) Which company collects its receivables faster, assuming all sales to be credit sales?
- (v) Which company is extended credit for a longer period by the creditors, assuming all purchases (equivalent to cost of goods sold) to be credit purchases?
- (vi) How long does it take each company to convert an investment in stock to cash?
- (vii) Which company retains the larger proportion of income in the business?

Solution

- (i) *Rate of return (ROR) on shareholders' funds*
 $= (\frac{₹4,94,000}{₹20,65,000}) \times 100 = 23.9 \text{ per cent (X Ltd)}$
 $= (\frac{₹5,07,000}{₹22,50,000}) \times 100 = 22.5 \text{ per cent (Y Ltd)}$
 X Ltd is using the shareholders' money more profitably.
- (ii) (a) *Current ratio* = $\frac{₹17,70,000}{₹9,00,000} = 1.97$ (X), $\frac{₹19,00,000}{₹10,50,000} = 1.81$ (Y)
 (b) *Acid test ratio* = $\frac{₹5,40,000}{₹9,00,000} = 0.6$ (X), $\frac{₹9,50,000}{₹10,50,000} = 0.9$ (Y)
 Y Ltd is better able to meet its current debts.
- (iii) (a) *Debt-equity ratio* = $\frac{₹14,00,000}{₹20,65,000} = 0.68$ (X), $\frac{₹20,50,000}{₹22,50,000} = 0.91$ (Y)
 (b) *Interest coverage ratio* = $\frac{₹8,00,000}{₹40,000} = 20$ times (X), $\frac{₹8,60,000}{₹80,000} = 10.75$ times (Y)
 The debentures of X Ltd should be bought.
- (iv) *Debtors collection period* = $(360 \times \frac{₹3,30,000}{₹56,00,000}) = 21$ days (X Ltd), $(360 \times \frac{₹6,30,000}{₹82,00,000}) = 28$ days (Y Ltd)
 X Ltd collects its receivables faster.

(v) *Creditors payment period* = $(360 \times ₹9,00,000)/₹40,00,000 = 81$ days (X Ltd), $(360 \times ₹10,50,000)/₹64,80,000 = 58$ days (Y Ltd)

X Ltd is extended credit for a longer period by the creditors.

(vi) *Stock turnover ratio* = $₹40,00,000/₹12,30,000 = 3.25$ times (X), $₹64,80,000/₹9,50,000 = 6.82$ times (Y)
= $360 \text{ days}/3.25 = 111$ days (X), $360 \text{ days}/6.82 = 53$ days (Y)

Length of time required for conversion of investment in stock to cash:

111 days + 21 days (debtors collection period) = 132 days (X)

53 days + 28 days (debtors collection period) = 81 days (Y)

(vii) *Dividend payout ratio* = $₹1,00,000/₹4,94,000 = 20.2$ per cent (X), $₹1,80,000/₹5,07,000 = 35.5$ per cent (Y)

Retention ratio = $100 - 20.2 = 79.8$ per cent (X), $100 - 35.5 = 64.5$ per cent (Y)

X Ltd retains the larger proportion of its income in the business

* ₹56,00,000 – ₹51,06,000

– ₹82,00,000 – ₹76,93,000

P.6.9 The following information was taken from the financial statements of XYZ Ltd
(amount in thousand of rupees)

LO 6.5 **LOD**
M

Particulars	Year 1	Year 2	Year 3
Total assets	750	850	860
Credit sales	420	520	550
Cost of goods sold	450	595	645
Cash	50	60	55
Debtors	150	165	180
Inventory	130	160	170
Net fixed assets	120	260	250
Creditors	75	85	100
Short-term debt	125	175	170
Long-term debt	125	185	175
Equity	125	200	210

Calculate those ratios which indicate the efficient use of assets and discuss potential sources of trouble.

Solution

The efficient use of assets is indicated by the following key ratios: (a) Current assets turnover, (b) Debtors' turnover, (c) Inventory turnover, (d) Fixed assets turnover, and (e) Total assets turnover.

Computation of ratios

Particulars	Year 1	Year 2	Year 3
(a) Current assets turnover ratio (cost of goods sold ÷ total current assets)	1.36	1.55	1.59
(b) Debtors' turnover (credit sales ÷ average debtors)	2.8*	3.30	3.19
(c) Inventory turnover (cost of goods sold ÷ average inventory)	3.46*	4.10	3.91
(d) Fixed assets turnover (cost of goods sold ÷ fixed assets)	3.75	2.29	2.58
(e) Total assets turnover (cost of goods sold ÷ total assets)	1.00	0.92	0.98

*Based on debtors and inventory at the end, as their opening balances are not available.

COMMENTS: The first three ratios indicate the efficiency of current assets usage, and the latter two, namely, fixed assets turnover and total assets turnover ratio, show the efficacy of utilisation of these. Current assets utilisation appears to be very satisfactory as reflected in the first three types of ratios. No major change is noticeable in their values over a period of time, which is presumably indicative of consistency in debtors collection period and inventory turnover. There does not seem to be any significant problem regarding utilisation of current assets.

However, it appears that fixed assets are not being fully utilised. Investments in fixed assets have more than doubled during years 2 and 3. The fixed assets turnover ratio has sharply fallen to 2.58 in year 3 from 3.75 in year 1. Thus, investments in fixed assets are either excessive, or the capacity of the additional plant is under-utilised. This is corroborated by the fact that sales in the latter 2 years have increased by around 15 per cent. Therefore, the remedy lies in utilising the plant capacity by increasing production and sales.

P.6.10 From the ratios and other data set forth below for the Auto Accessories Ltd, indicate your interpretation of the company's financial condition:

LO 6.2,4,5 **LOD M**

Particulars	Year 3	Year 2	Year 1
Current ratio (per cent)	302	278	265
Acid-test ratio	99	110	155
Working capital turnover (times)	3.25	3.00	2.75
Receivable turnover (times)	7.2	8.41	9.83
Collection period (days)	50	43	37
Inventory to working capital (per cent)	110	100	95
Inventory turnover (times)	5.41	6.01	6.11
Income per equity share (₹)	2.5	4.05	5.10
Net income to net worth (per cent)	7	8.5	11.07
Operating expenses to net sales (per cent)	25	23	22
Sales increase during the year (per cent)	23	16	10
Cost of goods sold to net sales (per cent)	73	71	70
Dividend per share (₹)	3	3	3
Fixed assets to net worth (per cent)	22.7	18.0	16.4
Net profit on net sales (per cent)	2.0	5.09	7.03

Solution

The interpretation of the financial condition of Auto Accessories Ltd, as revealed by the ratios and other data, yields the following inferences:

(i) Declining profitability is evident from the following:

(a) Decrease in gross profit ratio from 30 in year 1 to 27 per cent in year 3, (b) decrease in net profit ratio from 7 in year 1 to 2 in year 3 and (c) decrease in rate of return on net worth from 11.1 per cent in year 1 to 7 per cent in year 3. This is in spite of increase in sales from 10 per cent in year 1 to 23 per cent in year 3.

In interpreting the profitability of the company, another relevant factor is the expenses ratios. The ratio of cost of goods sold to net sales has gone up from 70 to 73 per cent during the period. Likewise, there has been an increase in operating expenses ratio from 22 to 25 per cent. The high inventories as reflected in lower inventory turnover ratio of 5.41 in year 3 as compared to 6.11 in year 1 have also adversely affected the profit margin.

As a consequence, the EPS has declined by more than 50 per cent during year 1-3 from ₹5.1 in year 1 to ₹2.5 in year 3.

(ii) The emerging liquidity position of the company appears to be highly satisfactory. The current ratio has increased from 2.65 in year 1 to 3.02 in year 3. Though, the acid-test ratio has declined from 1.55 to 0.99, it meets the standard. The company is unlikely to encounter any serious difficulty in paying the short-term obligations as and when they become due for payment.

However, the management should realise that the policy relating to collection of debt is not sound as reflected in the declining trend of receivables turnover from 9.83 in year 1 to 7.2 in year 3. In other words, the average debt collection period has increased from 37 days to 50 days. There is carelessness either (i) in collecting the payments from debtors, or (ii) in extending credit sales to customers leading to an increase in bad debts and thereby an increase in the expenses ratio. Further, the inventory holding period requires investigation as the consistent increase in the current ratio and the consistent decrease in the acid-test ratio result from large accumulation of inventories. The excessive investment in current assets seem to be affecting the rate of return.

The investment in fixed assets appears excessive as shown by a consistent increase in the ratio of fixed assets to net worth. However, the overinvestment in fixed assets is not as clear as the overinvestment in working capital.

The stable dividend policy of the company is commendable and is likely to have a salutary effect on the market price of its shares.

In conclusion, the firm's financial position has not become so bad that it cannot be cured. What is required is a thorough probe into overinvestment in working capital, particularly inventories and fixed assets.

P.6.11 Below is given the balance sheet of Best Ltd, as on March 31, of the current year:

LO 6.2,3,4,5 LO M

<i>Equity and Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Equity share capital	₹20,00,000	Fixed assets (cost)	₹50,00,000
7.5% Preference share capital	10,00,000	Depreciation written-off	16,00,000
General reserve	4,00,000		<u>34,00,000</u>
6% Debentures	6,00,000	Stock	6,00,000
Sundry creditors	<u>10,00,000</u>	Sundry debtors	8,00,000
		Cash	<u>2,00,000</u>
	50,00,000		50,00,000

The following additional information is available:

- (1) Fixed assets costing ₹10,00,000 to be installed on April 1, and would become operative on that date, payment to be made on March 31 of next year.
- (2) The fixed assets turnover ratio (on the cost of the fixed assets) would be 1.5.
- (3) The stock turnover ratio would be 14.4 (calculated on the basis of the average of the opening and closing stocks).
- (4) The break-up of cost and profit would be as follows (percentages):

Materials	40
Labour	25
Manufacturing expenses	10
Office and selling expenses	10
Depreciation	5
Profit	<u>10</u>
Sales	100

The profit is subject to debenture interest and taxation @ 35 per cent.

- (5) Debtors would be 1/9 of turnover.
- (6) Creditors would be 1/5 of materials consumed.
- (7) In March next year a dividend of 10 per cent on equity capital would be paid.
- (8) ₹5,00,000, 6% debentures would be issued on April 1, next year.

You are required to prepare the forecast balance sheet as on March 31, next year and calculate the resultant:

- (a) Current ratio;
 (b) Fixed Assets/Net worth ratio; and
 (c) Debt-equity ratio
 (The turnover above refers to the value of sales).

Solution

Forecast Balance Sheet of Best Ltd as on March 31, Next Year

<i>Equity and Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Equity share capital	₹20,00,000	Fixed assets:	
13.5% Preference share capital	10,00,000	Cost	₹60,00,000
General reserves	6,67,100	Less: Depreciation	20,50,000
15% Debentures	11,00,000	Sundry debtors	10,00,000
Sundry creditors	7,20,000	Stock	6,50,000
Provision for taxation	2,91,900	Cash	1,79,000
	57,79,000		57,79,000

Resultant ratio:

<i>Ratio</i>	<i>Formula</i>	<i>Computation</i>
(i) Current ratio	$\frac{\text{Current assets}}{\text{Current liabilities}}$	$\frac{₹18,29,000}{₹11,37,000} = 1.61$
(ii) Fixed assets to net worth	$\frac{\text{Fixed assets}}{\text{Net worth}}$	$\frac{₹39,50,000}{₹35,42,000} = 1.12$
(iii) Debt-equity ratio	(a) $\frac{\text{External dept}}{\text{Internal equity}}$	$\frac{₹22,37,000}{₹35,42,000} = 0.63$
	(b) $\frac{\text{Long term debt}}{\text{Internal equity}}$	$\frac{₹11,00,000}{₹35,42,000} = 0.31$

Working notes**1. Determination of sales:**

$$\text{Fixed assets turnover ratio} = \frac{\text{Sales}}{\text{Fixed assets}}$$

$$\text{Or } 1.5 = \frac{\text{Sales}}{₹60,00,000}$$

$$\text{Or } ₹90,00,000 = \text{Sales}$$

2. Determination of actual expenses

<i>Particulars</i>	<i>Percentage of sales</i>	<i>Amount</i>
Materials	40	₹36,00,000
Manufacturing expenses	10	9,00,000
Labour	25	22,50,000
Office & selling expenses	10	9,00,000
Depreciation	5	4,50,000
Profit	10	9,00,000
	100	90,00,000

3. Determination of net fixed assets:

Opening balance		₹50,00,000
Add: Purchases		10,00,000
		<u>60,00,000</u>
Less: Depreciation:		
Accumulated	₹16,00,000	
Additional	4,50,000	20,50,000
Closing balance		<u>39,50,000</u>

4. Determination of closing stock:

$$\text{Average stock} = \frac{\text{Sales}}{\text{Stock turnover ratio}}$$

$$= \frac{₹90,00,000}{14.4} = ₹6,25,000$$

$$\text{Average stock} = \frac{\text{Opening stock} + \text{closing stock}}{2}$$

$$₹12,50,000 = ₹6,00,000 + \text{Closing stock}$$

$$₹6,50,000 = \text{Closing stock}$$

5. Determination of debtors:

$$\text{Debtors} = \frac{\text{Sales}}{9} = \frac{₹90,00,000}{9} = ₹10,00,000$$

6. Determination of creditors:

$$\text{Creditors} = \frac{\text{Materials consumed}}{5} = \frac{₹36,00,000}{5} = ₹7,20,000$$

7. Determination of interest and provision for taxation:

Net profit	₹9,00,000
Less: Interest (0.06 × ₹11,00,000)	66,000
	<u>8,34,000</u>
Less: Taxes (0.35 × ₹8,34,000)	2,91,900
Net-profit after taxes	<u>5,42,100</u>

8. Determination of amount to be transferred to general reserves:

Opening balance of general reserve		₹4,00,000
Transfer from the current year:		
Net profit	₹5,42,100	
Less: Preference dividend	(75,000)	
Less: Equity dividend	(2,00,000)	2,67,100
Closing balance		<u>6,67,100</u>

9. Determination of cash:

Cash flow statement

Sources of cash:	
Cash from operations:	
Profit after tax	₹5,42,100
Add: Depreciation	4,50,000
	<u>9,52,100</u>
Add: Increase in current liabilities (provision for taxation):	2,91,900
Less: Increase in current assets and decrease in current liabilities:	

(Contd.)

(Contd.)

Stock	₹50,000		
Debtors	2,00,000		
Creditors	<u>2,80,000</u>	(5,30,000)	₹ 7,54,000
Issue of debentures			<u>5,00,000</u>
Total cash (sources) (A)			12,54,000
Uses of cash:			
Purchase of fixed assets			10,00,000
Payment of dividend:			
Preference		75,000	
Equity		<u>2,00,000</u>	<u>2,75,000</u>
Total cash (uses) (B)			<u>12,75,000</u>
Net decrease in cash (B – A)		(21,000)	
Opening balance of cash		2,00,000	
Less: Decrease in cash		<u>21,000</u>	<u>1,79,000</u>
Closing balance of cash			

P.6.12 You have been supplied data for the Supreme Plastic Company Ltd, and its industry averages:

LO 6.2,3,4,5	LOD M
--------------	----------

1. Determine the indicated ratios for the Supreme Plastic Company.
2. Indicate the company's strengths and weaknesses as shown by your analysis.

Balance sheet as at March 31

<i>Equity and Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>
Equity share capital	₹12,00,000	Net fixed assets	₹6,05,000

Net profit	75,075		
Equity share capital	12,00,000	6.3	12.7
Total debt	7,25,000		
Total assets	19,25,000	37.7	63.5

2. The level of stock maintained by Supreme Plastics is alarmingly high in that it is almost three times the industry average. The other turnover ratios are in conformity with that of the industry. In fact, current ratios and debtors turnover reflecting debt collection period of the company are better than those of the industry.

The greatest weakness of the company is the high level of inventories. It has caused a steep decline in the total assets turnover. The cost of carrying stocks is likely to adversely affect the profit margin. As a result of its low turnover and profit margin, the company's rate of return on net worth is less than one-half of the industry. The rate of return on equity capital of the company is also low because the company is using relatively less debt, i.e. 37.7 per cent as against the industry average of 63.5 per cent.

P.6.13 From the following particulars, prepare the balance sheet of Shri Mohan Ram and Co.

Ltd as at March 31, current year.

Current ratio, 2
Working capital, ₹4,00,000
Capital block to current asset, 3:2

(Contd.)

LO 6.2,3,4,5 LOP D

(Contd.)

Stock velocity, 2 months
Creditors velocity, 2 months
Debtors velocity, 2 months
Gross profit ratio, 25 per cent (to sales)
Capital block:
Net profit, 10 per cent of turnover
Reserve, 2.5 per cent of turnover

Solution

Balance Sheet as at March 31

Liabilities	Amount	Assets	Amount
Share capital	₹6,00,000	Fixed assets (net)	₹8,00,000
Reserves	60,000	Current assets:	
Profit and loss A/c	2,40,000	Stock	3,00,000
Debentures	3,00,000	Debtors	2,66,667
Creditors	3,50,000	Other current assets	2,33,333
Other current liabilities	50,000		
	<u>16,00,000</u>		<u>16,00,000</u>

Working Notes

- Current ratio of 2 implies that $CA_s = \text{twice } CL$, i.e., $CA - 2CL = 0$
Further, $CA - CL = ₹4,00,000$ or, $CL = ₹4,00,000$ and $CA = ₹8,00,000$.
- Capital block to current assets ratio of 3:2 implies that long-term capital funds (equity funds + debentures) are 1.5 times current assets, i.e., $₹8,00,000 \times 1.5 = ₹12,00,000$.
- Total assets = Total liabilities = ₹16,00,000 (₹12,00,000 long-term funds + ₹4,00,000 CL).
- Fixed assets = ₹16,00,000, Total assets – ₹8,00,000, $CA = ₹8,00,000$.
- $FA/\text{Turnover (sales)} = 1/3$ or $\text{Sales} = ₹8,00,000 \times 3 = ₹24,00,000$.
- Proportion of cash sales to credit sales is 1:2 or cash sales are one-third of total sales, i.e. $1/3 \times ₹24,00,000 = ₹8,00,000$; credit sales = ₹16,00,000.
- Gross profit = $0.25 \times ₹24,00,000 = ₹6,00,000$; cost of goods sold = ₹18,00,000.
- Debtors = $₹16,00,000/6$ (Debtors turnover ratio, $12 \div 2$) = ₹2,66,667.
- Stock = $₹18,00,000/6$ (Stock turnover ratio, $12 \div 2$) = ₹3,00,000.
- Other CAs = $₹8,00,000 - (₹2,66,667 + ₹3,00,000) = ₹2,33,333$.
- Reserves = $0.025 \times ₹24,00,000 = ₹60,000$.
- Credit purchases = Cost of goods sold + Closing stock = $₹18,00,000 + ₹3,00,000 = ₹21,00,000$.
- Creditors = $₹21,00,000 \div 6$ (creditors turnover ratio, $12 \div 2$) = ₹3,50,000.
- Other CLs = Total CL – Creditors, i.e. $₹4,00,000 - ₹3,50,000 = ₹50,000$.
- Debentures to share capital ratio of 1:2 implies that debentures in value are equal to one-half of share capital (2 Debentures = Share capital). Further, capital block (as per working note 3) is ₹12,00,000.
₹12,00,000 = Debentures + Share capital + Net profit + Reserves
₹12,00,000 = 3 Debentures + ₹2,40,000 (10 per cent of sales) + ₹60,000
₹3,00,000 = Debentures; Share capital = ₹6,00,000

P.6.14 The following items appear in the accounts of XYZ Ltd as at March 31, current year:

LO 6.4	LOD M
--------	----------

Cash	₹4,860	Bank overdraft	₹5,200
Land and building	80,000	Equity shares (₹10 each)	1,00,000

Plant and machinery	54,400		
			<u>1,36,400</u>
Working capital (net)			
Current assets:			
Cash	₹4,860		
Deposit and payments in advance	6,200		
Stock	37,280		
Debtors	52,300		
Bills receivable	2,260	1,02,900	
Less: Current liabilities:			
Trade creditors	40,575		
Bank overdraft	5,200		
Provision for taxation	12,400		
Bills payable	1,800		
Proposed equity dividends	8,625	(68,600)	
			<u>34,300</u>
			<u>1,70,700</u>

Rate of return on capital employed (ROCE)

$$(i) \frac{\text{EBIT}}{\text{Capital employed}} \times 100 = \frac{\text{₹}32,783 + \text{₹}3,000^{\circ}}{\text{₹}1,70,700} \times 100 = 21\% \text{ per cent}$$

^oInterest on 12% Debentures is ₹25,000 × 0.12 = ₹3,000

$$(ii) \frac{\text{EAT} + \text{Interest}}{\text{Capital employed}} \times 100 = \frac{\text{₹}32,783 - \text{₹}12,400 + \text{₹}3,000}{\text{₹}1,70,700} \times 100 = 13.7\% \text{ per cent}$$

$$(iii) \frac{\text{EAT} + \text{Interest} - \text{tax advantage on interest}^{**}}{\text{Capital employed}} \times 100 = \frac{\text{₹}20,383 + \text{Rs } 3,000 - \text{₹}1,134}{\text{₹}1,70,700} \times 100 = 13\% \text{ per cent}$$

^{**}(Effective tax rate = ₹12,400/₹32,783 = 37.8 per cent)

P.6.15 Towards the end of previous year, the directors of A Ltd decided to expand the business. The annual accounts of the company for the previous year and current year are summarised as given:

LO 6.4,5 LOD
M

Particulars	Previous year		Current year	
Sales: Cash	₹30,000		₹32,000	
Credit	<u>2,70,000</u>	₹3,00,000	<u>3,42,000</u>	₹3,74,000
Cost of goods sold		<u>2,36,000</u>		<u>2,98,000</u>
Gross margin		<u>64,000</u>		<u>76,000</u>
Expenses:				
Warehousing		13,000		14,000
Transport		6,000		10,000
Administration		19,000		19,000
Selling		11,000		14,000
Debenture interest		<u>—</u>		<u>2,000</u>
		<u>49,000</u>		<u>59,000</u>
Net profit		<u>15,000</u>		<u>17,000</u>
Fixed assets (<i>less</i> depreciation)		30,000		40,000
Current assets:				
Stock	60,000		94,000	
Debtors	50,000		82,000	
Cash	<u>10,000</u>	1,20,000	<u>7,000</u>	1,83,000
Less: Current liabilities (trade creditors)		<u>50,000</u>		76,000
Net current assets		<u>70,000</u>		1,07,000
		<u>1,00,000</u>		1,47,000
Share capital		75,000		75,000
Reserves and undistributed profit		25,000		42,000
Debentures		<u>—</u>		<u>30,000</u>
		1,00,000		1,47,000

You are informed that, **(a)** all sales were from stocks in the company's warehouse, **(b)** the range of merchandise was not changed and buying prices remained steady throughout the 2 years, **(c)** the stocks as on April 1 previous year was ₹40,000 and **(d)** the debenture loan was received on April 1 current year and fixed assets were purchased on that date.

You are required to work out the following accounting ratios for both the years.

(i) Gross profit ratio

- (ii) Operating expenses to sales
- (iii) Operating profit ratio
- (iv) Capital turnover ratio
- (v) Stock turnover ratio
- (vi) Net profit to capital employed ratio and
- (vii) Debtors collection period (in days).

Your answer should give the figures calculated to one decimal place, together with possible reasons for changes in the ratios for 2 years. Ratios relating to capital employed should be based on the capital at the end of the year. Ignore taxation.

Solution

- (i) Gross profit ratio (gross profit/sales) \times 100

$$\text{Previous year } (\text{₹}64,000/\text{₹}3,00,000) \times 100 = 21.3 \text{ per cent}$$

$$\text{Current year } (\text{₹}76,000/\text{₹}3,74,000) \times 100 = 20.3 \text{ per cent}$$

The gross profit ratio has declined by 1 per cent. The possible reasons may be (i) decrease in unit selling price, (ii) increase in direct expenses other than purchases and value of stock and/or (iii) any combination of (i) and (ii).

- (ii) Operating expenses to sales (OES) ratio

$$\text{Previous year } (\text{₹}49,000/\text{₹}3,00,000) \times 100 = 16.3 \text{ per cent}$$

$$\text{Current year } (\text{₹}57,000/\text{₹}3,74,000) \times 100 = 15.2 \text{ per cent}$$

Operating expenses may not change *pari passu* with sales as such expenses are partly fixed in nature. As a result, the OES ratio has fallen in current year in spite of increase in sales. For instance, administration expenses remained unchanged (at ₹19,000) resulting in a decline in administration expenses ratio from 6.3 to 5.1 per cent. The warehousing expenses have similarly fallen from 4.3 to 3.7 per cent. These cost savings have been partly offset by increase in transport expenses ratio (from 2 per cent to 2.7 per cent and selling expenses ratio from 3.7 to 3.8 per cent) presumably caused by additional transport expenses and selling expenses due to market expansion and tapping of more distant customers.

- (iii) Operating profit ratio (EBIT/sales) \times 100

$$\text{Previous year } (\text{₹}15,000/\text{₹}3,00,000) \times 100 = 5 \text{ per cent}$$

$$\text{Current year } (\text{₹}19,000/\text{₹}3,74,000) \times 100 = 5.1 \text{ per cent}$$

The increase in operating profit ratio by 0.1 per cent is the result of (i) decrease in operating expenses ratio by 1.1 per cent (increase in profits) and (ii) decrease in gross profit ratio by 1 per cent. It implies that there is virtually no gain to the company from increased sales.

- (iv) Capital turnover ratio (sales/capital employed)

$$\text{Previous year } (\text{₹}3,00,000/\text{₹}1,00,000) = 3 \text{ times}$$

$$\text{Current year } (\text{₹}3,74,000/\text{₹}1,47,000) = 2.5 \text{ times}$$

The reduction in capital turnover ratio signifies that the company is unable to employ the additional funds as profitably as the existing funds. The expected increase in sales does not seem to have materialised.

- (v) Stock turnover ratio (cost of goods sold/average stock)

$$\text{Previous year } (\text{₹}2,36,000/\text{₹}50,000) = 4.7 \text{ times}$$

$$\text{Current year } (\text{₹}2,98,000/\text{₹}77,000) = 3.9 \text{ times}$$

The increase in sales was less than proportionate increase in stock.

(vi) Net profit to capital employed ratio [(net profit + interest)/capital employed] × 100

Previous year (₹15,000/₹1,00,000) × 100 = 15 per cent

Current year (₹19,000/₹1,47,000) × 100 = 12.9 per cent

The company seems to have failed to maintain the earning rate on the funds employed.

(vii) Debtors' collection period (debtors/average credit sales per day)

Previous year (₹50,000/₹739.7) = 68 days

Current year (₹82,000/₹937) = 88 days

The increase in debtors' collection period implies relaxation in credit terms to promote sales, in particular, to penetrate new market/customers.

To sum up, the expansion of the business does not seem to have yielded the anticipated benefits.

P.6.16 Hypothetical Industries Ltd (HIL) has submitted the following projections. (₹lakh) You are required to determine yearly debt service coverage ratio (DSCR) and the average DSCR and comment.

LO 6.3 LOD M

Year	EAT	Interest on loan	Repayment of term loan
1	20	19	11
2	35	17	18
3	40	15	18
4	20	12	18
5	18	10	18
6	18	7	8
7	16	5	8
8	16	2	8

The net profit (EAT) has been arrived at after charging depreciation of ₹20 lakh every year.

Solution

Determination of Debt Service Coverage Ratio (amount in lakh of rupees)

Year	EAT	Depreciation	Interest	Cash available (Col. 2 + 3 + 4)	Principal instalment	Debt obligations	DSCR (Col. 5 ÷ Col. 7)
1	2	3	4	5	6	7	8
1	20	20	19	59	11	30	1.97
2	35	20	17	72	18	35	2.06
3	40	20	15	75	18	33	2.27
4	20	20	12	52	18	30	1.73
5	18	20	10	48	18	28	1.71
6	18	20	7	45	8	15	3.00
7	16	20	5	41	8	13	3.15
8	16	20	2	38	8	10	3.80
Average DSCR (ODSCR/8) =							2.46

COMMENT: The DSCR of HIL is very satisfactory.

P.6.17 The financial statement of Excel AMP Graphics Limited are as under:

LO 6.6 LOD D

Provision for tax:			
Current tax		450	371
Deferred tax		(6)	—
Profit after tax		1,468	1,215

Required:

- (i) Compute and analyse the return on capital employed (ROCE) in a Du-Pont control chart framework.
(ii) Compute and analyse the average inventory holding period and average collection period.
(iii) Compute and analyse the return on equity (ROE) by bringing out clearly the impact of financial leverage.

Solution**(i) Determination of Return on Capital Employed (ROCE) as per Du-Pont chart** (Amount in ₹ crore)

Particulars	2013	2012
(a) Determination of EBIT:		
Profit before tax	₹1,912	₹1,586
Add back interest	164	88
Less other incomes	(320)	(306)
Earnings before interest and taxes (EBIT)	<u>1,756</u>	<u>1,368</u>
(b) Determination of capital employed		
Shareholders funds	10,071	8,930
Add loan funds	245	374
Less capital work-in-progress	(27)	(28)
Less investments	(288)	(222)
Less loans and advances	<u>(2,043)</u>	<u>(1,712)</u>
Capital employed in business	<u>7,958</u>	<u>7,342</u>
(c) Sales and services (operating revenues)	<u>23,436</u>	<u>17,849</u>
(d) EBIT/sales (%)	7.49	7.66
(e) Sales/capital employed (times)	2.945	2.431
(f) ROC/= (d × e) (%)	22.06	18.62

(ii) Computation of average inventory holding period and average collection period

(Amount in ₹ crore)

Particulars	2013	2012
Cost of materials used during the year	₹15,179	₹10,996
Inventories at year-end	2,709	2,540
Average inventory holding period (365 days × Closing inventory)/		
Cost of materials used (days)	65	84
Sales and services (assumed to be on credit)	23,436	17,849
Debtors at year-end	9,468	9,428
Average collection period (365 days × Closing debtors)/		
Credit sales (days)	147	193

ANALYSIS: It is a matter of satisfaction for the firm that there has been a decrease in inventory holding period as well as debtors collection period in year 2001 *vis-à-vis* year 2000. There seems to be potentials of further reduction in debtors collection period. Debtors collection period of nearly 5 months (in 2001) *per-se* is high still.

(iii) Return on Equity and Impact of Financial Leverage

(Amount in ₹ crore)

Particulars	2013	2012
(a) Return on equity:		
Profit after tax (EAT)	₹1,468	₹1,215
Shareholders funds (SHF)	10,071	8,930
ROR on equity (EAT/SHF) × 100 (%)	14.58	13.61

(Contd.)

(Contd.)

(b) Return on capital employed (post-tax basis) (%)		
ROCE (before tax)	22.06	18.62
Tax rate	35	35
ROCE	14.34	12.1
(c) Debt funds to total funds:		
Loan funds	245	374
Total funds	10,316	9,304
Share of loan funds to total funds (%)	2.37	4.02

ANALYSIS: The return on equity is marginally higher than the return on total assets/capital employed. The reason is loan funds constitute a meager portion of total funds. In other words, the impact of financial leverage (use of debt to magnify the ROE) is negligible.

P.6.18 The financial statistics pertaining to profitability of Asian Paints (India) Limited for years 1–6 are tabulated below:

LO 6.6	LO D
---------------	-------------

(Amount is in ₹ crore)

Particulars	Year, March 31

Average debtors	—	73.83	80.34	83.31	104.16	120.30

From the above financial information, you are required to prepare a disaggregative analysis related to ROA and ROE (both on pre-tax and post-tax basis) and interpret the results.

Solution

Disaggregation of Pretax ROA and ROE of Asian Paints (India) Ltd

Year	(I) Return on Assets (TA)				(II) Return on Equity (EF)		
	Operating profit margin (%)	Assets turnover (times)	Pre-interest and tax ROA (%)	Interest on Assets (%)	Post-interest ROA (%)	Leverage (times)	Pretax ROE (%)
	$EBIT/sales$	$\times Sales/ATA^*$	$= EBIT/ATA$	$- I/ATA$	EBT/ATA	$\times ATA/AEF$	EBT/AEF
2	11.54	1.77	20.43	3.31	17.12	2.43	41.6
3	10.86	1.74	18.90	3.35	15.55	2.36	36.70
4	11.82	1.90	22.46	2.79	19.67	2.20	43.27
5	11.61	1.85	21.48	2.68	18.80	2.15	40.42
6	11.75	1.87	21.97	1.64	20.33	2.16	43.91
Average	11.521.83	21.08	2.75	18.33	2.26	41.18	

*Average total assets.

Component Disaggregation of Return on Equity (After-tax) of Asian Paints

Year	Profitability (x)	Assets turnover	EAT/ATA (x)	(x) Solvency =	ROE
	(EAT/Sales) (x)	Sales/ATA =		ATA/AEF =	EAT/AEF
	(%)	(times)	(%)	(times)	(%)
2	6.42	1.77	11.36	2.43	27.60
3	6.86	1.74	11.94	2.36	28.18
4	7.04	1.90	13.38	2.20	29.44
5	6.92	1.85	12.80	2.15	27.52
6	6.89	1.87	12.88	2.16	27.82
Average	6.83	1.83	12.50	2.26	28.11

Five-component Disaggregation of ROE (After-tax) of Asian Paints

Effects of:	Profitability (x) Turnover			EAT/Sales (x)	Sales/ATA =	(x) Solvency = ROE		
	Taxes	Financing	Operations			EAT/ATA	ATA/AEF	EAT/AEF
Year	EAT/EBT (x)	EBT/EBIT (x)	EBIT/Sales (=)	(%)	(times)	(%)	(times)	(%)
	(times)	(times)	(%)					
2	0.67	0.83	11.54	6.42	1.77	11.36	2.43	27.60
3	0.77	0.82	10.86	6.86	1.74	11.94	2.36	28.18
4	0.68	0.88	11.82	7.04	1.90	13.38	2.20	29.44
5	0.68	0.88	11.61	6.92	1.85	12.80	2.15	27.52
6	0.63	0.93	11.75	6.89	1.87	12.88	2.16	27.82
Average	0.69	0.87	11.52	6.83	1.83	12.50	2.26	28.11

INTERPRETATION: There has been no significant change in ROA (based on EBIT) of Asian Paints during year 2–6 (and in particular 4–6). The two components of ROA, namely, operating profit margin and assets turnover also do not show any noticeable change during the period. Except during year 3, the EBIT/sales ratio varied in a narrow range of 11.54 per cent and 11.82 per cent. Minor change is also observed in respect of assets turnover, the range being 1.74 – 1.90. Between the two components, the change in the operating profit margin largely accounted for the change in ROA.

MINI CASES

6.C.1 The financial statistics pertaining to profitability of Asian Paints (India) Limited for years 1–6 are tabulated below:

(Amount is in ₹ crore)

Notes:

- Liquid assets = Total current assets - Inventories - Advances
- Cost of goods sold = Opening stock of finished goods + Production cost* - Closing stock of finished goods
- Production cost* = Opening stock in process + Raw material consumed + Cash manufacturing expenses + Depreciation + Other purchases (as per profit and loss account) - Closing stock in process
- Total credit purchases = Purchases of raw materials* + Other purchases
- Purchases of raw material* = Raw material consumed + Closing stock of raw materials - Opening stock of raw materials
- Total assets = Shareholders' funds + Long term borrowings + Deferred tax liability + Current liability & provisions
- Total external obligations = Long term borrowings + Current liabilities & provisions + Deferred tax liability
- Average total capital employed = Average long term assets used (excluding capital work-in-progress as it does not contribute to operating income) + Net working capital
- EBIT = EBT + Interest
- ROCE = (EAT + Interest) / Average capital employed
- ROR (Total assets) = (EAT + Interest) / Average assets
- Cost of goods manufactured = Cost of goods sold + Closing stock of finished goods - Opening stock of finished goods

Solution

The appraisal of financial health of RIL is presented below.

I. Liquidity Analysis: The liquidity position of RIL during the period of 2005-16 has shown both upward and downward trends. For instance, in the initial years, the current ratio was alarmingly low (1.01 in 2006 and less than one, i.e., 0.97 in 2007). Then, it steadily improved through the years 2008 to 2013 and increased from 1.23 to 1.68. However, in the subsequent years, from 2014, the current ratio witnessed a downward trend again. It decreased to 1.37 in 2014 to 1.20 in 2015 and finally was at alarmingly low level of less than one, in 2016. This sharp decrease in current ratio is a matter of concern. The closer analysis indicates that from 2015 to 2016, there has been a reduction in inventory, debtors, cash and bank balances and current investment; further, there has been a significant increase in 'other current liabilities', which has been the main driver for pulling the current ratio below 1.

We observe a similar pattern for the acid test ratio. A very low ratio in the initial years (0.38 in 2006 and 0.27 in 2007), has steadily improved from 2008 to 2012. In fact, in 2012 and 2013, the ratio was very satisfactory at 1.24 and 1.08 respectively (Conventionally, the ratio of 1:1 is considered satisfactory). However, from 2014 onwards acid test ratio started declining. It reached an alarmingly low level of 0.40 in 2016. Following the trend of current ratio, we find that significant increase in 'other current liabilities' along with decrease in debtors, cash and bank balances and current investment have contributed to such low/ unsatisfactory levels of acid test ratio.

The other notable observation is that RIL seems to be banking on bank borrowings (may be in the form of cash credit, enabling it to operate at lower liquidity ratios) to finance its working capital requirements as reflected in a substantial increase in such borrowing over the years. From ₹3,440.71 crore (in 2005), the amount steadily increased to ₹8,522.50 crore (by 2008) and to ₹10,593 crore by 2012 and finally touching ₹14,490 crore by 2016 (registering more than 4 times increase in 2016 compared to 2005).

The net working capital position has shown both an upward and downward trend during the period 2005-16. During the period 2008-2013, the net working capital position showed commendable improvement. From the negative sum of ₹832.61 crore in 2007, the amount has consistently increased over the years, the relevant figures being ₹27,288.81 crore and 59,287 crore in 2011 and 2012 respectively. From 2014, the net working capital has started to decline from ₹35,401 crore in 2014 to ₹18,088 crore in 2015 and has become negative ₹39,431 crore in 2016.

The other notable observation is that RIL has the advantage of much higher creditors payment period compared to debtors collection period. The debtors collection period (varying from 17 days in 2005 to around 20 days in 2012) has shown a further improvement in that the collection period has decreased to 10 days in 2014 and 7 days in 2016. Evidently, the debtors collection period is at a very satisfactory level.

In marked contrast, the creditors payment period is very high. It varied in the range of 66 days to 92 days till 2015. However; in 2016, it saw a sharp rise to 130 days. In 2016, the creditors payment period is 18 times the debtors collection period. This favourable gap provides some leverage to RIL to operate at relatively low liquidity ratios. However, a point of caution must not be ignored here. RIL has witnessed decreasing revenues from 2014 to 2016. A very low debtors turnover ratio could be responsible for the same and requires thorough investigation.

To conclude, the liquidity position of RIL at present does not appear to be satisfactory; it needs improvement.

II. Solvency Ratios: The solvency position of RIL is sound for two reasons: First, it has a satisfactory level of interest coverage ratio during all these years, being in the impressive range of 7.17 and 24.38. It is not likely to commit default in payment of interest to its lenders as its operating profits (EBIT) have incredible margins to meet its interest obligations.

Secondly, its various capital structure ratios have shown a substantial decrease (improvement) over the years. For instance, its total debt to equity ratio has shown a notable decrease from 0.57 in 2005 to 0.44 by 2016. Likewise, long-term debt to equity ratio has registered a substantial decrease from 0.49 in 2005 to 0.39 by 2016. Similarly, total external obligations

to assets ratio has recorded a decrease (albeit small) over the years. In view of this commendable financial statistics, it can be concluded that solvency position of RIL is sound. As a result, it enjoys a very high credit rating among international credit rating agencies as well as domestic ones.

III. Profitability Ratios: The profit margins (gross, operating and net) of the RIL over the years had increased in the initial years (2005-08). After that (from 2009-12), the gross, operating and net profit margins have declined significantly. For instance, gross profit margins have declined to 9.97%, operating profit margins declined to 6.52% and net profit margins to 6.07% in the year 2012. Then, in the year 2013, gross profit margin hit a high of 18%, but subsequently dropped to 8% and 10% in 2014 and 2015 respectively. It has again shown a sharp rise in 2016, by jumping straight up to 19%.

The operating profit ratio and net margin ratio remained relatively stable at around 6% from 2012 to 2015. But, in 2016, they also jumped to 12% and 11% respectively.

This trend in operating profit margins has had an impact on the ROR on capital employed which has come down from 21.28% in 2008 to 10.46% in 2012 and is now at 8.98% in 2016.

It is also significant to note that there has been a significant decline in other rates of return too. For instance, the ROR on total assets has come down to 7.35% in 2010 from 15.37% in 2008. It has been consistently decreasing since 2009 and touched 5.94% in 2015. However, it showed improvement in 2016 by increasing to 6.41%.

Likewise, a notable decrease has been observed in ROR on equity funds. From 26.76 percent in 2008, it has decreased to 12.62% in 2012. Since then, it has been relatively stable in the range of 11 percent to 12% till 2016.

All this decline is primarily (perhaps) attributable to increase in the cost of goods sold ratio which touched a peak level of 90% in 2012 from 76 percent in 2008. Even when the cost of goods sold ratio declined considerably from 90% in 2012 to 80% in 2016, considerable improvement in ROR has not been noticed.

In conclusion, the profitability position of Reliance is less satisfactory and declining profits is a matter of concern and requires investigation.

IV. Efficiency: In terms of inventory turnover, raw materials holding period has varied in the range of 20 to 30 days during the period 2005-11. This period, *prima-facie*, appears to be satisfactory. However, it showed a sharp increase to 39 days in 2016. Such high inventory holding period merits a close examination.

In terms of debtors, debtors collection period of 20 to 28 days till 2012 appears to be satisfactory. However, its subsequent decrease to 7 days in 2016 compared to 13 days in 2013 though *prima-facie*, is a sign of notable improvement in the efficiency of debtors collection department, it needs to be carefully evaluated as the lower credit period offered to debtors may or could be the cause of lower sales (and hence of unsatisfactory profits) of RIL.

The Current assets turnover ratio during the period under study has been in the range of 2.89 to 4.66.

The fixed assets turnover ratio varied from 1.30 in 2010 to 2.62 in 2015. However, it has shown a sharp decrease in 2016 to 1.53.

RIL, being a capital intensive industry, the ratio of more than 2 (in most of the year, 2010-2016) seems to be indicative of the fact that long-term assets, by and large, operate at their higher levels of capacity.

To summarise its financial position, RIL has a sound solvency position. However, its liquidity position at present (2016) does not appear to be satisfactory. It needs improvement. Although its business operations are profitable, its margins of profits (on sales) as well as rates of return (on total assets, on capital employed and equity funds) have witnessed decline during 2012-16. Finally, it goes to the credit of RIL that it manages its assets/resources (by and large) well (as indicated by efficiency ratios).

C.6.3 From the following selected financials of ITC for the period 2011-12 to 2015-16, appraise its financial health from the point of view of liquidity, solvency, profitability and efficiency.

Solution

The appraisal of the financial health of ITC is presented below:

I. Liquidity Analysis: The liquidity ratios of ITC appears to be satisfactory. In 2011, the current ratio was around 1.59 and it increased to 2.05 in 2014-15. Conventionally, a ratio of 2:1 is considered satisfactory. However, in 2015-16, the current ratio took a sharp decrease to 1.65. Closer analysis shows that there has been a substantial increase in current liabilities, contributing to the decrease in current ratio.

Similar trends are observed for the acid test ratio. A ratio of 0.97 in 2011-12, got stronger over the years and touched a high of 1.38 in 2014-15. However, it decreased in 2015-16 and reached 1.07 by the end of the 2016. A quick ratio of 1:1 is considered ideal, which ITC has maintained throughout.

Another observation is that net working capital of ITC has consistently increased during the period under reference. But, it has improved from ₹5,341 crores in 2011-12 to ₹12,273 crores in 2014-15. There has been a decline in net working capital in 2016 to ₹9,546 crores; in spite of this decrease, the liquidity position of ITC can be considered as satisfactory.

We also observe that ITC is enjoying a much higher creditors payment period as compared to the debtors collection period. The debtors collection period varied in the range of 9-12 days during 2012-16. In contrast, the creditors payment period was in the range of 53-55 days during the same period. This favourable gap provides leverage for the company and ensures better liquidity position of ITC to meet its short-term maturing obligations in time.

II. Solvency Analysis: The solvency position of ITC appears robust. Firstly, the interest coverage ratio is exorbitantly high. It was already very high i.e. 133 in 2011, and this further increased to become 305 in 2016. With such high ratio, the company is not likely to face any problem paying in interest to its lenders.

The various leverage ratios have been relatively stable and shows ITC does not heavily depend on debt for its financing. The total debt to assets ratio has been around 0.03 to 0.04 during the period under study. Similarly, the long-term debt to assets ratio has also been in the same range. Total debt to equity

and long term debt to equity ratio has been stable around 0.05 to 0.06.

Evidently, the solvency position of the company is very sound.

III. Profitability Analysis: The profitability analysis is equally impressive. Over the years, there has been stability in its profitability ratios. For instance, the gross profit ratio has been in the range of 48% to 53%. Its net profit ratio also is stable in the range of 24% to 27%.

The rates of return on capital employed as well as total assets are also notable. For instance, ROR on capital employed has been as high as 51% and ROR on total assets touched a high of 35% in 2013-14. The ROR on equity funds is also lucrative at 31% to 35% during the five year period of the study.

IV. Efficiency Ratios: Analysing the performance with respect to utilisation of assets, we find it is unsatisfactory. The fixed assets turnover ratio has substantially declined from 2.89 in 2011-12 to 2.60 in 2015-16. The Current assets turnover ratio has also declined from 1.83 in 2011-12 to 1.53 in 2015-16. Better utilisation of assets can further augment its profitability.

To conclude, the financial health of ITC is sound given its liquidity, solvency and profitability ratios. However, the efficiency ratios have potential for further improvement.

C.6.4 From the following selected financials of Tata Motors for the period 2011-12 to 2015-16, appraise its financial health from the point of view of liquidity, solvency, profitability and efficiency.

(Amount in ₹ crore)

Particulars	2011-12	2012-13	2013-14	2014-15	2015-16
(I) Related to Liquidity Analysis					
CURRENT ASSETS	13633.39	10027.16	6700.55	8506.83	10616.45
Current Investment	2590.26	1762.68	100.85	20.22	1736.00

Working capital turnover ratio	-5.21	-3.33	-2.41	-2.80	-5.02

Solution

The appraisal of the financial health of Tata Motors is presented below:

I. Liquidity Analysis: The liquidity ratios of Tata Motors do not portray its satisfactory position. In 2011, the current ratio was around 0.62 and it substantially reduced to an alarmingly low level of 0.36 in 2013-14. Although, since then the ratio improved to 0.60 (close to what it was in 2011), still it is at an unsatisfactory level. Conventionally, a ratio of 2:1 is considered satisfactory and Tata Motors is way below that level. Similar trends are observed for the acid test ratio. A weak ratio of 0.42 in 2011, got weaker over the years and touched a low of 0.15 in 2013. In spite of the fact that it has shown improvement and reached 0.32 by the end of the 2016, it remains at unsatisfactory level. There has been a substantial decrease in cash and bank balances since 2012-13, and this appears to be a significant contributor to the decreased levels of current ratio and acid test ratio.

Another observation is that the net working capital of Tata Motors has consistently been negative during the period. But, it has improved from ₹8,500 crores in 2011-12 to ₹7,100 crores in 2015-16. The decline in the sales revenue during the years could also be a factor for the reduced working capital needs.

We also observe that Tata Motors is enjoying a much higher creditors payment period as compared to the debtors collection period. The debtors collection period was about 17 days in 2011 and further dipped to 10 days in 2015. In contrast, the creditors payment period was 80 days in 2011 and increased to 109 days by the end of the period under study. This favourable gap provides some leverage/solace for the company to operate at such low liquidity ratios. However, a point of caution is the decreasing debtors collection period. A low credit period of 10 days could be the reason of declining sales and requires thorough investigation.

II. Solvency Analysis: The solvency position of Tata Motors also appears to be unsatisfactory. Firstly, the interest coverage ratio is inadequate. It was somewhat at a satisfactory level of 3.27 in 2011, it decreased to become -2 in 2014 (when the company suffered losses and had a negative EBIT). However, since then this ratio improved to 1.46. Even though the ratio is positive now, it is not satisfactory and may pose problems for the company to service its interest payments to lenders.

The total debt to assets ratio has increased from 0.81 in 2011-12 to 2.43 in 2014-15 and then decreased to 1.30 in 2015-16. Similarly, the long-term debt to assets ratio has increased from 0.59 in 2011-12 to 1.53 in 2014-15 and then decreased to 0.99 in 2015-16. Although there has been a decrease in total external obligations/debt to assets ratio as well as long term debt to assets ratio in 2016, given its very low interest coverage ratio, the level of debt of the firm seems to be on the higher side and needs to be reduced.

III. Profitability Analysis: The profitability analysis looks disturbing. Over the years, there has been a dip in its profitability ratios. For instance, the gross profit ratio decreased from 18% in 2011-12 to 15% in 2015-16. Its net profit ratio also decreased from 2% in 2011-12 to become negative in 2015 and finally to 1% in 2015-16. Consequently, the rates of return on capital employed as well as total assets declined during the period. ROR on capital employed declined from 10% to 6% and ROR on total assets declined from 5% to 3%. The ROR on equity funds presents a dismal picture as it turns negative in 2014-15. However, this ratio did improve in the subsequent year.

Overall, the profitability of Tata Motors is a matter of serious concern.

IV. Efficiency Ratios: Analysing the performance with respect to utilisation of assets, we find it is unsatisfactory. The total assets turnover ratio has declined from 0.82 in 2011-12 to 0.07 in 2015-16.

Also, the fixed assets turnover ratio has substantially declined from 3.12 in 2011-12 to 2.27 in 2015-16. For an automobile manufacturer, fixed assets form an important part in the total assets, and a decline in this ratio implies unutilised capacity.

The current assets turnover ratio has been stable varying from 3.59 in 2011-12 to 3.72 in 2015-16. This could be due to the inadequate amount of current assets with the company.

Conclusion: We can thus conclude, that the financial health of Tata Motors is not sound given its unsatisfactory liquidity, solvency, profitability and efficiency ratios.

REVIEW QUESTIONS

LOD: Easy

RQ.6.1 Indicate whether the following statements are true or false:

[LO 6.2.3,4,5]

- (i) Current ratio and acid-test ratio of a business firm are virtually the same; this implies that the firm has low investment in inventory.
- (ii) A company's current ratio is 2.0. If it uses cash to pay creditors, this transaction would cause a decrease in current ratio.
- (iii) Solvency ratios measure the firm's ability to cater to the obligations arising out of long-term debt.
- (iv) Equity funds are greater than equity capital in a loss-incurring firm.
- (v) In general, low turnover ratios are desirable.
- (vi) Earnings yield is determined dividing EPS by acquisition price per equity share.
- (vii) Return on equity funds is determined by dividing EAT by average net worth.
- (viii) Internal growth rate is the maximum rate at which the firm can grow without external financing of any kind.
- (ix) It is conceptually correct to determine stock turnover ratio (finished goods) by dividing cost of goods sold by average stock.

[Answers: (i) True, (ii) False, (iii) True, (iv) False, (v) False, (vi) False, (vii) False, (viii) True, (ix) True.]

RQ.6.2 Fill in the blanks with the correct answer (out of the choices provided).

[LO 6.2.3,4,5,6]

- (i) An analyst applied the DuPont System to the following data of a company: (a) equity turnover 4.2, (b) net profit margin 5.5%, (c) total assets turnover 2.0 and (d) dividend payout ratio 30%; the company's rate of return on equity is _____ (11%/23.1%).
- (ii) Four-times stock turnover ratio implies _____ months inventory holding period (3/4).
- (iii) The following information is given about a company: (a) current assets ₹900 lakh and current liabilities ₹450 lakh in current year and (b) current assets ₹1,100 lakh and current liabilities ₹530 in previous year. The approximate percentage decrease in current ratio is _____ (0.04%/4.0%).
- (iv) Presently, current assets and current liabilities of a company are ₹16 lakh and ₹8 lakh respectively. The current ratio will _____ (increase/decrease) on purchase of new machinery of ₹6 lakh.
- (v) Purchase of treasury bills will (weaken/not affect) acid-test ratio.
- (vi) Assume that the company's existing debt-equity ratio is 2:1, the ploughing back of profits by a company will _____ (increase/decrease) it.
- (vii) A two-months debtor collection period implies that debtors turnover ratio is _____ (6 times/2 times).
- (viii) _____ is a more rigorous test of the solvency position of a business firm. (Interest coverage ratio/Debt service coverage ratio).
- (ix) ROR on shareholders' equity is computed dividing EAT by _____ (share capital/shareholders' funds).
- (x) Issue of 12% preference shares will _____ debt-equity ratio of a corporate enterprise. (decrease/increase)

[Answers: (i) 23.1%, (ii) 3, (iii) 4.0%, (iv) decrease, (v) not affect, (vi) decrease, (vii) 6 times, (viii) debt service coverage ratio, (ix) shareholders' funds, (x) decrease.]

- RQ.6.3** What is the importance of ratio analysis? Briefly discuss the importance of the following accounting ratios: [LO 6.2,3,4,5]
 (a) Liquidity ratio, (b) Debt-equity ratio, (c) Stock-turnover rate, and (d) Ratio of debtors to turnover.
- RQ.6.4** What procedure would you adopt to study the liquidity of a business firm? [LO 6.2,3,4]
- RQ.6.5** What is indicated when the average age of accounts receivable for a firm is 45 days, but credit terms require customers to pay accounts within 30 days? [LO 6.5]
- RQ.6.6** What are the limitations of financial ratios as a technique for appraising the financial position of a company? [LO 6.5]

LOD: Medium

- RQ.6.7** How would you analyse the financial position of a company from the point of view of (a) an investor, (b) a creditor, and (c) a long-term lender? [LO 6.8]
- RQ.6.8** Discuss the importance of ratio analysis for interfirm and intrafirm comparisons, including circumstances responsible for its limitations. If any. [LO 6.8]
- RQ.6.9** Distinguish between percentage analysis and ratio analysis relating to the interpretation of financial statements. What is the value of these two types of analysis? [LO 6.1,7,8]
- RQ.6.10** How does the acid-test ratio differ from the current ratio? How are they similar? What is the usefulness of the defensive interval ratio? [LO 6.2]
- RQ.6.11** What is the relationship of the assets turnover rate to the rate of return on total assets? [LO 6.6]
- RQ.6.12** Discuss some inherent limitations of single-year financial statements for purposes of analysis and interpretation. To what extent are these limitations overcome by the use of the common size statements? [LO 6.1,7]
- RQ.6.13** You have been furnished with the financial information of Aditya Mills Ltd. for the current year.

Balance sheet, March 31, current year

<i>Liabilities</i>	<i>Amount</i> (₹ thousand)	<i>Assets</i>	<i>Amount</i> (₹ thousand)
Equity share capital (₹100 each)	1,000	Plant and equipment	640
Retained earnings	368	Land and buildings	80
Sundry creditors	104	Cash	160
Bills payable	200	Sundry debtors	360
Other current liabilities	20	Less: Allowances	40
		Stock	480
		Prepaid insurance	12
	1,692		1,692

Statement of profit, year ended March 31, current year

1953

Main body of handwritten text on the left page, consisting of several paragraphs.

Handwritten text at the top of the right page, including a date and introductory lines.

1954

Handwritten text in the middle section of the right page.

Handwritten text in the lower middle section of the right page.

Handwritten text at the bottom of the right page, including a signature or closing.

Sundry debtors and stock at the beginning of the year were ₹3,00,000 and ₹4,00,000 respectively.

- (a) Determine the following ratios of the Aditya Mills Ltd: (i) Current ratio, (ii) Acid-test ratio, (iii) Stock turnover, (iv) Debtors turnover, (v) Gross profit ratio, (vi) Net profit ratio, (vii) Operating ratio, (viii) Earnings per share, (ix) Rate of return on equity capital, and (x) Market value of the shares if P/E ratio is 10 times, [LO 6.2,3,4,5]
- (b) Indicate for each of the following transactions whether the transaction would improve, weaken or have an effect on the current ratio of the Aditya Mills Ltd: (i) Sell additional equity shares, (ii) Sell 10% debentures, (iii) Pay bills payable, (iv) Collect sundry debtors, (v) Purchase additional plant, (vi) Issuing bills payable to creditors, (vii) Collecting bills receivable from debtors, (viii) Purchase of treasury bills, and (ix) Writing off bad debt. [LO 6.2]

RQ.6.14 The XYZ Ltd's financial statement contains the following information: [LO 6.2,3,4,5]

Balance sheet as at March 31, current year

Particulars	Previous year (₹ thousand)	Current year (₹ thousand)
Cash	200	160
Sundry debtors	320	400
Temporary investments	200	320
Stock	1,840	2,160
Prepaid expenses	28	12
Total current assets	2,588	3,052
Total assets	5,600	6,400
Current liabilities	640	800
15% Debentures	1,600	1,600
Equity share capital	2,000	2,000
Retained earnings	468	904

Statement of profits year ended March 31, current year

Particulars	(₹ thousand)
Sales	4,000
Less: Cost of goods sold	2,800
Less: Interest	160
Net profit for current year	1,040
Less: Taxes	364
Earnings after taxes	676
Dividend declared on equity shares	220

From the above, appraise the financial position of the company from the points of view of (a) liquidity, (b) solvency, (c) profitability, and (d) activity.

RQ.6.15 You have been supplied data for Royal Plastic Ltd. and its industry averages. [LO 6.2,3,4,5]

- (a) Determine the indicated ratios for the Royal Plastic Ltd.
- (b) Indicate the company's strengths and weaknesses in terms of liquidity, solvency and profitability, as revealed by your analysis.

Balance sheet, March 31, current year

Liabilities		Assets	
Equity share capital	₹1,00,000	Plant and equipment	₹1,51,000
10% Preference share capital	40,000	Cash	12,300
Retained earnings	27,400	Debtors	36,000
Long-term debt	34,000	Stock	60,800
Sundry creditors	31,500		
Outstanding expenses	1,200		
Other current liabilities	26,000		
	<u>2,60,100</u>		<u>2,60,100</u>

Statement of profit, year ended March 31, current year

Sales—net		₹2,25,000
Less: Cost of goods sold	₹1,52,500	
Selling expenses	29,500	
Administrative expenses	14,800	
Research and development expenses	6,500	
Interest	2,900	2,06,200
Earnings before taxes		18,800
Less: Income taxes (0.35)		6,580
Net income		<u>12,220</u>
Dividends paid to equity holders		5,000

Financial ratios of industry

1. Current ratio	2.2 : 1
2. Stock turnover (times)	2.8
3. Collection period (days)	56
4. Total debt/shareholders' equity (percentage)	45
5. Interest coverage ratio (times)	10
6. Turnover of assets (times)	1.35
7. Income before tax/sales (percentage)	11.9
8. Rate of return on shareholders' equity (percentage)	10.9

RQ.6.16 Below are selected ratios for two companies in the same industry, along with industry average:

[LO 6.2,3,4,5]

Ratios	A	B	Industry
Current ratio	221	561	241
Acid-test ratio	121	301	131
Debt-asset ratio	36	5	35
Operating expenses ratio	18	17.5	20
Number of times interest earned	6	12	5
Stock turnover	8.5	6.5	7.0
Debtors turnover	11.0	15.0	11.4
Rate of return on total assets	17	10	13.5

Can we say on the basis of above ratios and information that company B is better than company A because its ratios are better in six out of eight areas (all except stock turnover and rate of return on total assets)? The company B is better than the industry average in the same six categories.

RQ.6.17 The following data are extracted from the published accounts of two companies, ABC Ltd. and XYZ Ltd., in an industry. [LO 6.2,3,4,5]

Particulars	ABC Ltd.	XYZ Ltd.
Sales	₹32,00,000	₹30,00,000
Net profit after tax	1,23,000	1,58,000
Equity capital (₹10 per share fully paid)	10,00,000	8,00,000
General reserves	2,32,000	6,42,000
Long-term debt	8,00,000	5,60,000
Creditors	3,82,000	5,49,000
Bank credit (short-term)	60,000	2,00,000
Fixed assets	15,99,000	15,90,000
Inventories	3,31,000	8,09,000
Other current assets	5,44,000	4,52,000

Prepare a statement of comparative ratios showing liquidity, profitability, activity and financial position of the two companies.

RQ.6.18 Hypothetical Industries Ltd. (HIL) has submitted the following projections (₹ lakh). You are required to determine yearly debt service coverage ratio (DSCR) and the average DSCR and comment. [LO 6.3]

Year	EAT	Interest on loan	Repayment of term loan
1	20	19	11
2	35	17	18
3	40	15	18
4	20	12	18
5	18	10	18
6	18	7	8
7	16	5	8
8	16	2	8

The net profit (EAT) has been arrived at after charging depreciation of ₹20 lakh every year.

LOD: Difficult

RQ.6.19 There are four groups of financial ratios; liquidity, leverage, activity, and profitability. Financial analysis is conducted by four types of analysts: management, equity investors, long-term creditors and short-term creditors. You are required to (a) explain each type of ratio, (b) explain the emphasis of each type of analyst, (c) state if the same basic approach to financial analysis should be taken by each group of analysts. [LO 6.2, 4.5]

RQ.6.20 Two companies have the same amount of working capital. The paying ability of short-term maturing obligations one company is much weaker than that of the other. Explain how this could occur. [LO 6.2]

RQ.6.21 'A uniform system of accounts, including identical forms for balance sheets and income statements is a prerequisite of inter firm comparisons.' Elucidate. [LO 6.1,7]

RQ.6.22 A partial list of trend and common-size percentage for ABC Ltd. for years 1 and 2 is given below: [LO 6.7]

Particulars	Year 2	Year 1
Trend percentages:		
Sales (net)	120	100
Cost of goods sold	?	100
Gross profit on sales	?	100
Operating expenses and income taxes	?	100
Net income	?	100
Common size percentages:		
Sales (net)	100	100
Cost of goods sold	?	?
Gross profit on sales	40	?
Operating expenses and income taxes	20	25
Net income	20	10
		= (₹20,000)

(a) Determine the missing trend and common-size percentages.

(b) Compute the net income for year 2.

RQ.6.23 Presented below is the financial information of two companies—A and B, belonging to the same industry: [LO 6.3]

Particulars	A	B
Current ratio	3.2:1	2.0:1
Acid-test ratio	1.7:1	1.1:1
Debt-equity ratio (percentage)	30	40
Number of times interest earned	6	5

Assume you are loan officer of a bank and both the companies have requested a loan of equal amount to be repaid over the next two years. Based on the information above,

(a) If you could grant a loan to only one company, which would it be? Explain.

(b) If you could grant a loan to both the companies, would you be willing to do so? Explain.

RQ.6.24 Below are selected ratios for three years ending March 31 for the Worst Company Ltd: [LO 6.2,3,4,5]

Ratios	Year 1	Year 2	Year 3
Current ratio	200	500	150
Acid-test ratio	110	320	80
Debt-asset ratio	15	40	55
Operating expenses ratio	24	25	32
Number of times interest earned	6	6	(-1)
Stock turnover	5	4	3
Debtors turnover	12	10	6
Rate of return on total assets	15	10	5

Outline possible explanations for the drastic changes in some of the ratios during these years.

RQ.6.25 From the following details, prepare a statement of proprietary funds with as many details as possible: [LO 6.2.4.5]

-
- (a) Stock velocity = 6
 (b) Capital turnover = 2
 (c) Fixed assets turnover ratio = 4
 (d) Gross profit turnover ratio = 20
 (e) Debtors velocity = 2 months
 (f) Creditors velocity = 73 days
-

The gross profit was ₹60,000; Reserves and surplus amounted to ₹20,000; Closing stock was ₹5,000 in excess of opening stock.

RQ.6.26 From the following information of a textile company complete the proforma balance sheet if its sales are ₹32,00,000. [LO 6.2.3.4.5]

Sales to net worth (times)	2.3
Current debt to net worth (ratio)	42
Total debt to net worth (ratio)	75
Current ratio (times)	2.9
Net sales to inventory (times)	4.7
Average collection period (days)	64
Fixed assets to net worth (ratio)	53.2

ANSWERS

RQ.6.13 (a) (i) 3:1, (ii) 1.48:1, (iii) 7 times, (iv) 12.12 times, (v) 23 per cent, (vi) 3.9 per cent, (vii) 94 per cent, (viii) ₹15.6 (ix) 11.4 per cent, (x) ₹156,

(b) (i) Improve, (ii) Improve, (iii) Improve, (iv) No effect, (v) Weaken, (vi) No effect, (vii) No effect, (viii) No effect, (ix) Weaken.

RQ.6.14 The company's position is sound from the points of view of (a) liquidity, (b) profitability but its activity ratios do not seem to be adequate.

RQ.6.15 (a) (1) 1.86, (2) 2.51 times, (3) 58 days, (4) 55 per cent, (5) 7.48 times, (6) 0.58 times, (7) 8.36 per cent, (8) 5.45 per cent. (b) Company's position both in terms of profitability and solvency is weaker than that of industry.

RQ.6.16 Not necessarily.

RQ.6.17 ABC Limited is better placed than XYZ Ltd. in respect of liquidity, activity and solvency ratios; XYZ Limited has an edge over ABC Limited in respect of profitability ratio.

RQ.6.18 Average DSCR is 2.46; it is very satisfactory.

RQ.6.22 (a) Trend percentages: Cost of goods sold 110.8 per cent, Gross profit on sales 137.14 per cent, Operating expenses and income taxes 96.00 per cent, Net income 240 per cent; Common-size percentages: Cost of goods sold 60 per cent year 2 and 65 per cent year 1, Gross profit on sales 35 per cent year 1 (b) Net income ₹48,000.

- RQ.6.23** (a) Loan would be granted to company A on account of its lower debt-equity ratio and higher interest coverage ratio. (b) Yes. Company B's debt-equity ratio of 40 per cent and interest coverage ratio of 5 times are fairly satisfactory solvency ratios.
- RQ.6.24** The reasons for the drastic changes may be conceived in terms of the (a) high operating expenses ratio not matched by increase in sales price, (b) excessive interest cost due to large amount of borrowings, (c) higher inventory cost, and (d) liberal grant of credit causing bad debts.
- RQ.6.25** Proprietary funds, ₹1,20,000, Fixed assets, ₹60,000, Stock, ₹42,500, Debtors, ₹50,000, Cash, ₹16,500 and Creditors, ₹49,000.
- RQ.6.26** Net worth ₹13,91,304, Long term debt ₹4,59,130, Current debt ₹5,84,348, Fixed assets ₹7,40,173, Cash ₹4,44,869, Stock ₹6,80,851 and S. debtors ₹5,68,889. Total of balance sheet ₹24,34,782.

Volume-Cost-Profit Analysis

LEARNING OBJECTIVES

LO 7.1	Explain break-even point as well as algebraic and graphical methods through which it is determined
LO 7.2	Discuss break-even analysis applications in profit planning
LO 7.3	Understand cash break-even point and its applications

INTRODUCTION

Profit planning is a function of the selling price of a unit of product, the variable cost of making and selling the product, the volume of product units sold, and, in the case of multi-product companies, sales-mix and, finally, the total fixed costs. The **volume-cost-profit (VCP) analysis** is a management accounting tool to show the relationship between these ingredients of profit planning. The entire gamut of profit planning is associated with VCP inter-relationships. A widely-used technique to study VCP relationships is break-even analysis.

A break-even analysis is concerned with the study of revenues and costs in relation to sales volume and, particularly, the determination of that volume of sales at which the firm's revenues and total costs will be exactly equal. Thus, the break-even point (**BEP**) may be defined as a point at which the firm's total revenues are exactly equal to total costs, yielding zero income. The "no-profit, no-loss" point is a break-even point or a point at which losses cease and profits begin.

Break-even analysis, as a technique, seeks to provide answers to the following questions:

1. What sales volume is necessary to produce an X amount of operating profit?
2. What will the operating profit or loss at X sales volume be?
3. What profit will result from an X per cent increase in sales volume?

- **Volume-cost-profit analysis**
- shows the relationship among the various ingredients of profit planning, namely, unit sale price, variable cost, sales volume, sales mix and fixed cost.

7

Volume-Cost-Profit Analysis

LEARNING OBJECTIVES

- LO 7.1 Analyze an organization's cost structure and prepare contribution margin statements
- LO 7.2 Analyze cost-volume-profit relationships graphically
- LO 7.3 Analyze cost-volume-profit relationships algebraically

INTRODUCTION

Cost-volume-profit (CVP) analysis is the study of the relationship of sales volume, variable costs, and contribution margin to the amount of profit. CVP analysis is a key tool for understanding the relationship between sales volume and profit. It is used to determine the break-even point, the level of sales at which total revenue equals total costs. CVP analysis is also used to determine the margin of safety, the amount of sales above the break-even point. CVP analysis is a useful tool for managers to make decisions about pricing, production, and sales.

CVP analysis is a useful tool for managers to make decisions about pricing, production, and sales. It is used to determine the break-even point, the level of sales at which total revenue equals total costs. CVP analysis is also used to determine the margin of safety, the amount of sales above the break-even point. CVP analysis is a useful tool for managers to make decisions about pricing, production, and sales.

- 1. Analyze an organization's cost structure and prepare contribution margin statements
- 2. Analyze cost-volume-profit relationships graphically
- 3. Analyze cost-volume-profit relationships algebraically

4. What is the additional sales volume required to make good an X per cent reduction in selling prices so as to maintain the current profit level?
5. What will the effect on operating profit be if the company's fixed costs have increased?
6. What will the effect on income be if the firm achieves a reduction in variable costs (say, material or direct labour)?
7. What is the required sales volume to cover the additional fixed charges from the proposed new project?
8. What will the effect on operating profit of the firm be if the sales mix is changed?
9. What will the effect on income be if there is an increase in fixed costs by an X amount due to new plant but will decrease the labour costs by Y amount per unit?
10. What sales volume is needed to achieve the budgeted profit?

LO 7.1 BREAK-EVEN ANALYSIS

A break-even analysis shows the relationship between the costs and profits with sales volume. The sales volume which equates total revenue with related costs and results in neither profit nor loss is called the **break-even volume or point (BEP)**. If all costs are assumed to be variable with sales volume, the BEP would be at zero sales. If all costs were fixed, profits would vary disproportionately with sales and the BEP would be at a point where total sales revenue equalled fixed costs. However, both are purely hypothetical situations. In actual practice, costs consist of both fixed and variable elements.

The BEP can be determined by two methods:

1. Algebraic methods: (a) Contribution margin approach and (b) Equation technique, and
2. Graphic presentation: Break-even chart/Volume-cost-profit chart.

Algebraic Methods

Contribution Margin Approach The logic underlying the determination of the BEP under this approach can be stated by answering the following question:

Contribution margin is the excess of unit sale price over unit variable cost. "How many ice-creams, having a unit cost of ₹20 and a selling price of ₹30, must a vendor sell in a fair to recover the ₹8,000 fees paid by him for getting a selling stall and additional cost of ₹4,000 to install the stall?" The answer can be determined dividing the fixed cost by the difference between the selling price (₹30) and cost price (₹20). Thus,

$$\text{BEP (units)} = \frac{\text{Fixed cost (Entry fees + Stall expenses)}}{\text{(Sales price - Unit variable cost)}} \quad (7.1)$$

$$(\text{₹8,000} + \text{₹4,000})/(\text{₹30} - \text{₹20}) = 1,200 \text{ units}$$

Or,

$$\text{BEP (units)} = \frac{\text{Fixed costs}}{\text{Contribution margin (CM) per unit}} \quad (7.2)$$

Or,

$$\begin{aligned} \text{BEP (amount)}/\text{BEP (Sales revenue)}/\text{BESR} &= \text{BEP (units)} \times \text{Selling price (SP) per unit} \\ &= 1,200 \times \text{₹30} = \text{₹36,000} \end{aligned} \quad (7.3)$$

Or,

$$\text{BEP (amount)} = \frac{\text{Fixed costs}}{\text{Profit volume ratio (P/V ratio)}} \quad (7.4)$$

$$\text{P/V ratio}^1 = \frac{\text{Contribution margin per unit}}{\text{Selling price per unit}} \quad (7.5)$$

$$\frac{\text{₹1}}{\text{₹3}} = \text{or } 33.33 \text{ per cent}$$

$$\text{BEP (amount)} = \text{₹12,000} + 0.3333 = \text{₹36,000}$$

From the P/V ratio, the variable cost to volume ratio (V/V ratio) can be easily derived:

$$\text{V/V ratio} = 1 - \text{P/V ratio} \quad (7.6)$$

In the vendor's case, it is $= 1 - 1/3 = 2/3 = 66.67$ per cent

The V/V ratio, as the name suggests, establishes the relationship between variable costs (VC) and sales volume in amount. The direct method of its computation is:

$$\frac{\text{Variable cost}}{\text{Sales revenue}} = \text{₹20} + \text{₹30} = 66.67 \text{ per cent} \quad (7.7)$$

Thus, P/V ratio + V/V ratio = 1 or 100 per cent

$$(1/3 + 2/3) = 1 \text{ (33.33 per cent + 66.67 per cent) = 100 per cent} \quad (7.8)$$

Margin of Safety The excess of the actual sales revenue (ASR) over the break-even sales revenue (BESR) is known as the **margin of safety**. Symbolically, margin of safety = (ASR - BESR) (7.9)

When the margin of safety (amount) is divided by the actual sales (amount), the margin of safety ratio (M/S ratio) is obtained. Symbolically,

$$\text{M/S ratio} = \frac{\text{(ASR - BESR)}}{\text{ASR}} \quad (7.10)$$

• **Margin of safety** is the excess of actual sales revenue over the break-even sales revenue.

The M/S ratio indicates the percentage by which the actual sales may be reduced before they fall below the break-even sales volume. It is important that there should be a reasonable margin of safety, lest a reduced level of activity should prove disastrous. The higher the margin of safety ratio, the better it is from the point of view of the company as it indicates that a "sizeable" sales volume can fall before the BEP is reached. This measure acquires special significance in depression/recession.

Assume in the vendor's case that sales is 2,000 units (₹60,000); margin of safety (₹60,000 - ₹36,000) = ₹24,000; and the M/S ratio is ₹24,000 ÷ ₹60,000 = 40 per cent.

The amount of profit can be directly determined with reference to the margin of safety and P/V ratio. Symbolically,

$$\text{Profit} = [\text{Margin of safety (amount)}] \times \text{P/V ratio} \quad (7.11)$$

$$\text{Or Profit} = [\text{Margin of safety (units)} \times \text{CM per unit}] \quad (7.12)$$

In the vendor's case, profit = ₹24,000 × 0.3333 (33.33 per cent) = ₹8,000 or 800 × ₹10 = ₹8,000.

¹A better term would be contribution to revenue ratio (C/V) as the numerator is the contribution margin (difference between the selling price and variable costs) and not profit. The P/V ratio in a strict sense of the term represents the relationship between profit and selling price only after the BEP, that is, when fixed costs have been recovered. Therefore, the C/V ratio is more appropriate term. In the text, both the terms have been used.

1
The first part of the report deals with the general situation of the country and the progress of the work done during the year. It is followed by a detailed account of the various projects and the results achieved. The report concludes with a summary of the work done and a list of the names of the staff members who have been engaged in the work.

(C) THE YEAR 1954
The year 1954 has been a very successful one for the organization. It has seen the completion of many of the projects which were planned for the year and the achievement of many of the objectives which were set at the beginning of the year. The work has been carried out in a most efficient and economical manner and the results have been most satisfactory.

The work has been carried out in a most efficient and economical manner and the results have been most satisfactory. The organization has been able to complete many of the projects which were planned for the year and to achieve many of the objectives which were set at the beginning of the year. The work has been carried out in a most efficient and economical manner and the results have been most satisfactory.

2
The second part of the report deals with the financial situation of the organization and the progress of the work done during the year. It is followed by a detailed account of the various projects and the results achieved. The report concludes with a summary of the work done and a list of the names of the staff members who have been engaged in the work.

The financial situation of the organization has been most satisfactory. It has been able to complete many of the projects which were planned for the year and to achieve many of the objectives which were set at the beginning of the year. The work has been carried out in a most efficient and economical manner and the results have been most satisfactory.

The organization has been able to complete many of the projects which were planned for the year and to achieve many of the objectives which were set at the beginning of the year. The work has been carried out in a most efficient and economical manner and the results have been most satisfactory.

The reason is that once the total amount of fixed costs has been recovered, profits will increase by the difference of sales revenue and variable costs.

Equation Technique This is the most general form of analysis, which can be applied to any cost-volume-profit situation. It is based on an income equation: Sales revenue - Total costs = Net profit

Breaking up total costs into fixed and variable, Sales revenue - Fixed costs - Variable costs = Net profit. Or Sales revenue = Fixed costs + Variable costs + Net profit.

If S be the number of units required for break-even and sales revenue (SP) and variable costs (VC) are on per unit basis, the above equation can be written as follows:

$$SP(S) = FC + VC(S) + NI \quad (7.13)$$

Where SP = Selling price per unit

S = Number of units required to be sold to break-even

FC = Total fixed costs

VC = Variable costs per unit

NI = Net income (zero)

$$SP(S) = FC + VC(S) + \text{zero}$$

$$SP(S) - VC(S) = FC$$

or $S(SP - VC) = FC$

$$S = \frac{FC}{SP - VC} \quad (7.14)$$

It can be seen that Eq. 7.14 is identical to Eq. 7.2 (contribution margin approach). Yet, it is *especially useful in situations in which unit price and unit variable costs are not clearly identifiable.*

Example 7.1

SV Ltd, a multi-product company, furnishes you the following data relating to the current year:

Particulars	First half of the year	Second half of the year
Sales	₹45,000	₹50,000
Total costs	40,000	43,000

Assuming that there is no change in prices and variable costs and that the fixed expenses are incurred equally in the two half-year periods, calculate for the year: (i) The profit-volume ratio, (ii) Fixed expenses, (iii) Break-even sales, and (iv) Percentage margin of safety.

Solution

Sales revenue - Total costs = Net profit

$$₹45,000 - ₹40,000 = ₹5,000 \text{ (first half)}$$

$$₹50,000 - ₹43,000 = ₹7,000 \text{ (second half)}$$

On a differential basis: Δ Sales revenue, ₹5,000 - Δ Total costs, ₹3,000 = Δ Total profit, ₹2,000

We know that only VC changes with a change in sales volume and, hence, change in total costs are equivalent to VC (₹3,000). Accordingly, the additional sales of ₹5,000 has earned a contribution margin of ₹2,000 [$₹5,000 (S) - ₹3,000 (VC)$].

$$P/V \text{ ratio} = ₹2,000 \div ₹5,000 = 40 \text{ per cent}$$

$$V/V \text{ ratio} = 100 \text{ per cent} - 40 \text{ per cent} = 60 \text{ per cent}$$

Accordingly, 60 per cent of the total costs are made up of variable costs and the balance represents the total fixed costs (FC).

Sales revenue = Fixed costs + Variable costs + Net profit

$$₹95,000 = FC + 0.60 \times (₹95,000) + ₹12,000$$

$$\begin{aligned}\text{₹}95,000 &= \text{FC} + \text{₹}57,000 + \text{₹}12,000 \\ \text{₹}95,000 - \text{₹}69,000 &= \text{FC or } \text{₹}26,000 = \text{FC} \\ \text{BEP (amount)} &= \text{₹}26,000 + 0.40 = \text{₹}65,000\end{aligned}$$

TABLE 7.1 Verification

Particulars	Amount	Per cent
Break-even sales	₹65,000	100
Variable costs	39,000	60
Contribution	26,000	40
Fixed costs	26,000	40
Net income	Nil	Nil

$$M/S \text{ ratio} = \frac{(\text{₹}95,000 - \text{₹}65,000)}{\text{₹}95,000} = 31.58 \text{ per cent}$$

LO 7.2 BREAK-EVEN ANALYSIS APPLICATIONS

The break-even applications in profit planning are illustrated below.

Sales Volume Required to Produce Desired Operating Profit

One application of a BE analysis is to determine the required sales volume to generate a budgeted amount of profit. The required sales are given by Eq. 7.15.

$$(\text{Fixed expenses} + \text{Desired operating profit}) \div P/V \text{ ratio} \quad (7.15)$$

In Example 7.1, if the desired operating profit of SV Ltd is ₹13,000, required sales volume = (₹26,000 + ₹13,000)/0.40 = ₹97,500

A variant of the above approach is that the management may be interested in knowing the required sales volume to produce the desired profit after taxes. In this case, the analysis must be expanded slightly. Assume that SV Ltd wants a net income after taxes of ₹13,000 and that its current tax rate is 35 per cent, the net income after taxes is 65 per cent of the net income before taxes.

$$\begin{aligned}\text{Required sales volume} &= \frac{\text{Fixed costs} + \left[\frac{\text{Desired income after taxes}}{1 - \text{tax rate}} \right]}{P/V \text{ ratio}} \quad (7.16) \\ &= \frac{\text{₹} 26,000 + \left[\frac{\text{₹} 13,000}{1 - 0.35} \right]}{0.40} = \text{₹} 1,15,000\end{aligned}$$

TABLE 7.2 Verification

Sales volume	₹1,15,000
Less: Variable costs (0.60)	69,000
Contribution	46,000
Less: Fixed costs	26,000
Profits before taxes	20,000
Less: Taxes (0.35)	7,000
Profit after taxes	13,000

Operating Profit at a Given Level of Sales Volume

$$[\text{Actual Sales Revenue (ASR)} - \text{Break-even Sales Revenue (BESR)}] \times P/V \text{ ratio} \quad (7.17)$$

Effect on Operating Profit of a Given Increase in Sales Volume

$$[\text{Budgeted Sales Revenue (BSR)} - \text{BESR}] \times P/V \text{ ratio} \quad (7.18)$$

Suppose that SV Ltd forecasts 10 per cent increase in sales next year, the projected profit will be:

$$(\text{₹}1,04,500 - \text{₹}65,000) \times 0.40 = \text{₹}15,800$$

Additional Sales Volume Required to Offset a Reduction in Selling Price

The sales manager on the basis of a market research/survey may report to the management that due to increased competition in the market and the liberal import policy of the government, the present price is relatively higher. He may advise reduction in prices to stay in competition.

Suppose that SV Ltd reduces its selling price from ₹10 a unit to ₹9. The sales volume needed to offset reduced selling price/maintain a present operating profit of ₹12,000 would be:

$$= \frac{\text{Desired profit (P)} + \text{Fixed expenses (FC)}}{\text{Revised P/V ratio (₹3/₹9)}} = \frac{\text{₹}(12,000 + 26,000)}{0.3333} = \text{₹}1,14,000$$

The required sales volume of ₹1,14,000 represents an increase of about 20 per cent over the present level. The management should explore new avenues of sales potential to maintain the existing amount of profit.

On the other hand, if the firm has the opportunity to increase the unit selling price of the product, the impact of increased sales price would be that the BEP will be reached sooner because an increase in the selling price will raise the contribution margin, assuming no change in the variable costs. An increased contribution margin will decrease the sales volume necessary to reach a desired goals.

Assume that the management of SV Ltd increases the selling price of its product from ₹10 to ₹12, the desired sales volume would be:

$$\frac{FC + P}{\text{Revised P/V ratio}} = \frac{\text{₹}38,000 + 0.50 (\text{₹}6 + \text{₹}12)}{0.50} = \text{₹}76,000$$

Effect of Changes in Fixed Costs

A firm may be confronted with the situation of increasing fixed costs. An increase in the total budgeted fixed costs of a firm may be necessitated either by external factors, such as, an increase in property taxes, insurance rates, factory rent, and so on, or by a managerial decision of an increase in salaries of executives. More important than this in the latter category are expansion of the present plant capacity so as to cope with additional demand. The increase in the requirements of fixed costs would imply the computation of the following:

- (a) Relative break-even points
- (b) Required sales volume to earn the present profits
- (c) Required sales volume to earn the same rate of profit on the proposed expansion programme as on the existing ones.

The effect of the increased FCs will be to raise the BEP of the firm. Assume the management of SV Ltd decides a major expansion programme of its existing production capacity. It is estimated that it will result in extra fixed costs of ₹8,000 on advertisement to boost sales volume and another ₹16,000 on account of new plant facility.

(a) *The relative BEPs will be:*

$$\begin{aligned} \text{Present facilities} &= \text{Fixed costs} + P/V \text{ ratio} = ₹26,000/0.40 = ₹65,000 \\ \text{Proposed facilities} &= (\text{Present FCs} + \text{Additional FCs}) + P/V \text{ ratio} \\ &= (₹26,000 + ₹24,000)/0.40 = ₹1,25,000 \end{aligned} \quad (7.19)$$

It may be noted that increase in FCs (from ₹26,000 to ₹50,000) has caused disproportionate increase in the BEP (from ₹65,000 to ₹1,25,000).

(b) *The required sales volume to earn the present profit:*

$$\begin{aligned} &[\text{Present FCs} + \text{Additional FCs} + \text{Present profit (NI)}] + P/V \text{ ratio} \\ &= [₹26,000 + ₹24,000 + ₹12,000] \div 0.40 = ₹1,55,000 \end{aligned} \quad (7.20)$$

(c) *The required sales volume to earn the present rate of profit on investment:*

$$(\text{Present FCs} + \text{Additional FCs} + \text{Present return on investment} + \text{Return on new investment}) P/V \text{ ratio} \quad (7.21)$$

Let us assume that the present investment is ₹1,00,000 and the new investment will involve an additional financial outlay of ₹60,000. The required sales volume will be $(₹26,000 + ₹24,000 + ₹12,000 + ₹7,200) / (0.12 \times ₹60,000) / 0.40 = ₹1,73,000$

These computations may be reported in a summary form to the management as follows (Table 7.3).

TABLE 7.3 Effect of Changes in Fixed Costs

Particulars	Present facilities	Prospective facilities	Increase
Fixed costs	₹26,000	₹50,000	₹24,000
BEP sales volume	65,000	1,25,000	60,000
BEP sales volume (units)	6,500	12,500	6,000
Sales volume to earn existing profit	95,000	1,55,000	60,000
Sales volume in units to earn existing profit	9,500	15,500	6,000
Sales volume to earn existing ROI	95,000	1,73,000	78,000
Sales volume to earn existing ROI (in units)	9,500	17,300	7,800

Effect of Changes in Variable Costs

Assuming an increase of VC by ₹1 a unit for SV Ltd, the new contribution margin will be: ₹3 (₹10 – ₹7) and the revised P/V ratio 0.30 that is, (₹3 ÷ ₹10).

$$\text{Revised BEP} = (₹26,000)/0.30 = ₹86,667$$

$$\text{Desired sales volume to earn existing profit} = ₹38,000/0.30 = ₹1,26,667$$

Assuming that variable costs of SV Ltd decline by ₹1 per unit, revised BEP = ₹26,000/0.50 = ₹52,000.

$$\text{Desired sales volume to maintain existing profit} = ₹38,000/0.50 = ₹76,000.$$

Effects of Multiple Changes

So far we have assumed that a change takes place in one of the three variable affecting profits—cost, price and sales volume. In cases where more than one factor is affected, the BEP *analysis* can be applied as shown below:

$$FC + FC \text{ (new)} + \left[\frac{\text{Desired EAT}}{1 - \text{tax rate}} \right] \quad (7.22)$$

[Contribution margin per unit (New SP – New VC)] + New selling price (New SP)]

Assuming the following set of new Figures for SV Ltd:

Particulars	Existing data	New data
Selling price per unit	₹10	₹11
Fixed costs	26,000	40,000
Variable cost per unit	6	5.50
Contribution margin per unit	4	5.50
Desired earnings after taxes (to maintain the existing ROI)	12,000	25,000
Tax rate		35 per cent

Solution

Desired sales volume (on the basis of new data) $[\text{₹}26,000 + \text{₹}14,000 + (\text{₹}25,000 \div 0.65)] \div 0.50$, that is $(\text{₹}5.5 \div \text{₹}11) = (\text{₹}78,461.5) \div 0.50 = \text{₹}1,56,923$

Desired sales volume on the basis of existing data = $[\text{₹}26,000 + (\text{₹}12,000 \div 0.65)] \div 0.40$ $(\text{₹}4 + \text{₹}10) = \text{₹}44,462 \div 0.40 = \text{₹}1,11,154$.

VCP Analysis and a Segment of the Business

The fundamental approach of applying the VCP analysis to a segment of the business is the same as applying it to the business as a whole. The VCP approach “may be applied to problems relative to individual product lines, territories, methods of sale, channels of distribution or any particular segment of the business which is under scrutiny”². In all these decisions, fixed costs and P/V ratio are the required inputs. Where fixed costs are inclusive of allocated costs also, in addition to direct costs, two BEPs may be determined.

Example 7.2

SV Ltd has four sales divisions. The relevant data for its northern division is reproduced below:

Direct fixed costs, ₹10,000

P/V ratio, 0.40

Allocated fixed costs from head office, ₹5,000

The sales volume required to cover direct expenses would be: Direct fixed costs/ P/V ratio
 $= \text{₹}10,000 / 0.40 = \text{₹}25,000$ (7.23)

The total sales volume required to cover all fixed costs would be higher as shown by equation 7.24:

$$\frac{\text{Direct FCs} + \text{Allocated FCs}}{\text{P/V ratio}} \quad (7.24)$$

$$= (\text{₹}10,000 + \text{₹}5,000) \div 0.40 = \text{₹}37,500$$

Multi-product Firms (Sales-mix)

So far, we have confined our discussion to a one-product company. However, many manufacturers make more than one type of product. The relative proportion of each product sold in the aggregate sales is known as the sales-mix. A change in the mix of products sold usually affects the weighted average P/V ratio and, hence, the BEP. Thus, when the products have different P/V ratios, changes in the sales-mix/product-mix will affect the BEP and the results from operation.

Example 7.3

The Garware Paints Ltd presents to you the following income statement in a condensed form for the first quarter ending March 31:

Particulars	Product			Total
	X	Y	Z	
Sales	₹1,00,000	₹60,000	₹40,000	₹2,00,000
Variable costs	80,000	42,000	24,000	1,46,000
Contribution	20,000	18,000	16,000	54,000
Fixed costs				27,000
Net income				27,000
P/V ratio	0.20	0.30	0.40	0.27
Break-even sales				1,00,000
Sales-mix (per cent)	0.50	0.30	0.20	100

If ₹40,000 of the sales shown for Product X could be shifted equally to products Y and Z, the profit and the BEP would change as shown in Table 7.4.

TABLE 7.4 Break-even Point

Particulars	Product			Total
	X	Y	Z	
Sales	₹60,000	₹80,000	₹60,000	₹2,00,000
Less: Variable costs	48,000	56,000	36,000	1,40,000
Contribution	12,000	24,000	24,000	60,000
Less: Fixed costs				27,000
Net income				33,000
P/V ratio	0.20	0.30	0.40	0.30
BE sales				90,000
Sales-mix (per cent)	0.30	0.40	0.30	100

Example 7.3 shows that by increasing the mix of high P/V products (Y from 30 to 40 per cent, Z from 20 to 30 per cent) and decreasing the mix of a low P/V product (X from 50 to 30 per cent), the company can increase its overall profitability. In fact, it can further augment its total profits, if it can make, and the market can absorb, more quantities of Y and Z, say ₹1 lakh each (Table 7.5).

TABLE 7.5

Particulars	Product		Total
	Y	Z	
Sales	₹1,00,000	₹1,00,000	₹2,00,000
Less: Variable costs	70,000	60,000	1,30,000
Contribution	30,000	40,000	70,000
Less: Fixed costs			27,000
Net income			43,000
P/V ratio	0.30	0.40	0.35
BE sales			77,143
Sales-mix (per cent)	0.50	0.50	100

From the above, it can be generalised that, other things being equal, management should stress products with higher contribution margins. For individual product line income statements, fixed costs should not be allocated or apportioned.

Finally, it may be stressed that there is a need for a closer study of cost structures of individual product line/department within the same firm or of two different companies. It may be possible that the two departments/companies may have the same profits but very different cost structures. For instance, observe the Figures in Table 7.6 of two departments of SV Ltd.

TABLE 7.6

Particulars	Department X		Department Y	
	Amount	Per cent	Amount	Per cent
Sales revenue	₹1,00,000	(100)	₹1,00,000	(100)
Less: Variable costs	70,000	(70)	20,000	(20)
Contribution / P/V ratio	30,000	(30)	80,000	(80)
Less: Fixed costs	20,000		70,000	
Profit	10,000		10,000	
BEP (amount)	66,667		87,500	
Margin of safety (MS)	33,333		12,500	
Margin of safety ratio	0.3333		0.125	

Department Y is operating closer to the BEP than Department X. Department Y has a narrower margin of safety (12.5 per cent) compared to 33.33 per cent of X. The margin of safety ratio signifies that if the sales of Y decreases by more than 12.5 per cent, it will operate at a loss. In other words, the margin/cushion of safety is relatively smaller. X will not operate at a loss unless its sales volume drops by more than 33.33 per cent.

This type of profit analysis for two different companies is of special significance from the point of view of outside investor who want to invest in one of the two companies. Assuming companies X and Y in place of the departments X and Y in the above tabulation, Company X is certainly less risky than Company Y.

Graphic Presentation

Under the algebraic technique of break-even analysis, separate computations were needed to arrive at the above set of figures. The utility of the graphical technique is that such a set of figures can be determined without involving any separate calculations.

Break-Even Chart/Volume Cost Profit (VCP) Graph The **break even chart** is a graphic relationship between volume, costs and profits. It shows not only the BEP but also the effects of costs and revenue at varying levels of sales. The break-even chart can, therefore, be more appropriately called the volume-cost-profit graph (VCP graph).

Assumptions Regarding the VCP Graph are

1. Costs can be bifurcated into variable and fixed components.
2. Fixed costs will remain constant during the relevant volume range of graph.
3. Variable cost per unit will remain constant during the relevant volume range of graph.
4. Selling price per unit will remain constant irrespective of the quantity sold within the relevant range of the graph.
5. In the case of multi-product companies, in addition to the above four assumptions, it is assumed that the sales-mix remains constant.
6. Finally, production and sales volumes are equal.

The VCP graph may be prepared in a simple or elaborate manner. Figure 7.1 is an example of a simple and traditional form. In Figure 7.1, sales are shown on the horizontal axis; the vertical axis measures costs and revenues corresponding to varying volume of sales. Sales are expressed in terms of units, rupees and percentage level of activity. The VCP relationships portrayed in such a graph are valid only within the relevant range that underlies the construction of the graph. The importance of a relevant range should be recognised because in practice most firms will progressively reduce fixed costs as the volume tends to decrease towards zero activity. Similarly, fixed costs are to be increased beyond a certain volume. Accordingly, in Figure 7.1 the lower limit and upper limit of the VCP have been drawn.

The BEP lies at the point of intersection of the sales line and the total cost line. The vertical distance between the sales revenue and the total cost line measures the estimated net income (after the BEP) and the estimated net loss (before the BEP) at the related sales volume. The fixed cost line is parallel to the horizontal axis. The variable cost line is superimposed on the fixed cost line and moves upward uniformly with sales volume at the variable cost to volume ratio. This is the total cost line. The sales revenue line starts from the point of origin and moves upward uniformly with volume. The meeting point of the total cost line and sales line is the BEP. At this point, an angle is formed known as the angle of incidence. The management objective should be to have an angle of as large a size as possible because a high angle is a sign of a high rate of profit after the fixed costs have been covered; the narrower angle will signify that profits after the fixed costs have been covered; the narrower angle will signify that profits will increase at a lower rate after the BEP, showing that variable costs form a large part of cost of sales. Figure 7.1 is based on the following data relating to Hypothetical Ltd (Example 7.4).

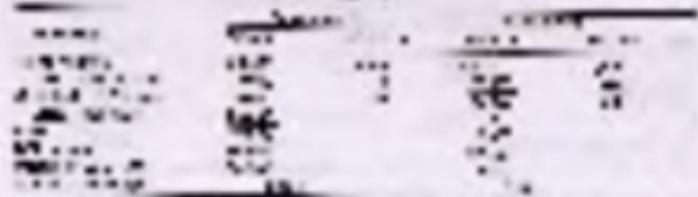

Example 7.4

Selling price per unit	₹10
Fixed costs	60,000
Variable costs per unit	5
Relevant range (units) : Lower limit	6,000
: Upper limit	20,000
Break-up of variable costs per unit:	
Direct material	₹2
Direct labour	1.50
Direct expenses	1
Selling expenses	0.50
Actual sales, 18,000 units (₹1,80,000)	
Plant capacity, 20,000 units (₹2,00,000)	
Tax rate, 50 per cent	

Figure 7.1 has been drawn by using a sales line and a total cost line (including both fixed and variable costs). The steps involved in drawing the VCP graph are enumerated as follows:

1. Select an appropriate scale for sales volume on the horizontal axis, say, 2,000 units (₹20,000) per square, and plot the point for total sales revenues at relevant volume: 6,000 units × ₹10 = ₹60,000. Draw the sales line from the origin to ₹2,00,000 (the upper limit of the relevant range). Ensure that *all the points, 0, ₹60,000 and ₹2,00,000 fall in the same line*. This should be ensured for the total cost line also.
2. Select an appropriate scale for costs and sales revenues on the vertical axis, say, ₹10,000 per square. Draw the line showing ₹60,000 fixed cost parallel to the horizontal axis.
3. Determine the variable portion of costs at two volumes of scales (beginning and ending): 6,000 units × ₹5 = ₹30,000; 20,000 units × ₹5 = ₹1,00,000.
4. Variable costs are to be added to fixed costs (₹30,000 + ₹60,000 = ₹90,000). Plot the point at 6,000 units sales volume and ₹1,00,000 + ₹60,000 = ₹1,60,000. Point is to be plotted at 20,000 units sales volume. This obviously is the total cost line.
5. The point of intersection of the total cost line and sales line is the BEP. To the right of BEP, there is a profit area and to the left of it, there is a loss area.
6. *Verification:* $FC \div CM \text{ per unit} = ₹60,000 \div ₹5 \text{ per unit} = 12,000 \text{ units or } ₹1,20,000$

Figure 7.1 has been drawn using different scales for the horizontal and vertical axis. Figure 7.2 has been drawn on a uniform scale for both axes. Since the scales are the same, the *45° line will always be the proxy of the sales line*. Any amount of sales revenue on the horizontal axis will correspond to costs and revenue on the vertical axis. Let us illustrate taking two sales levels.

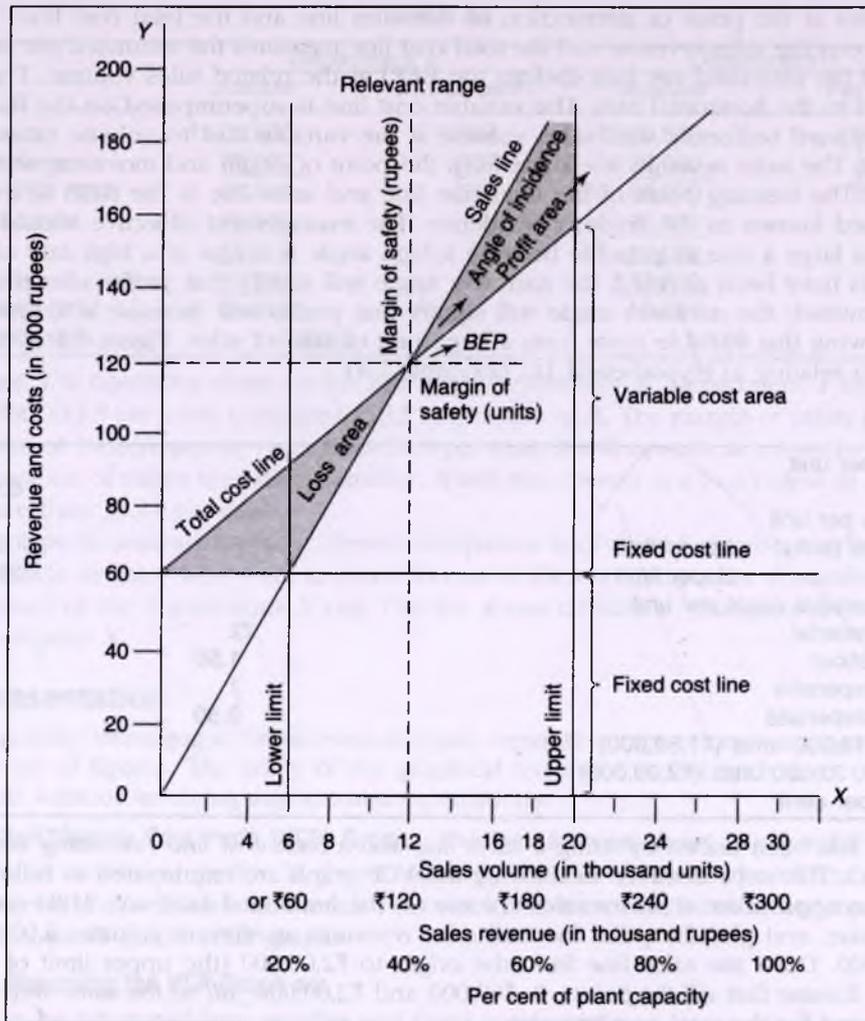

FIGURE 7.1 Volume-Cost-Profit Graph, Different Scale

1. ₹60,000: FC = ₹60,000
 VC = 30,000 (50 per cent variable cost to volume ratio)
 TC = 90,000

Loss = 30,000 (TC, ₹90,000 – ₹60,000, sales revenue)

Thus, ₹60,000 = ₹60,000 (FC) + ₹30,000 (VC) – ₹30,000 (Loss). Point A in Figure 7.2 clearly shows these three relevant figures at the sales volume of ₹60,000.

2. ₹1,80,000: FC = ₹ 60,000
 VC = 90,000
 TC = 1,50,000
 Profit = 30,000

Thus, ₹1,80,000 = ₹60,000 (FC) + ₹90,000 (VC) + ₹30,000 (Profit). Point B in Figure 7.2 portrays these three relevant figures at the sales volume of ₹1,80,000.

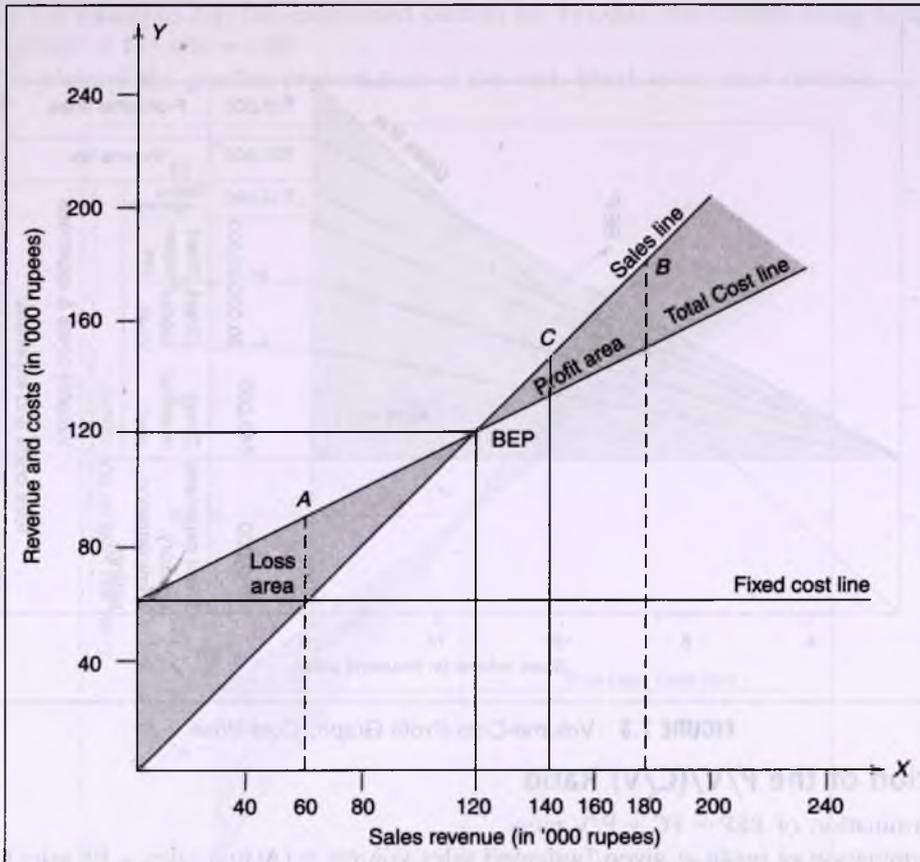

FIGURE 7.2 Volume-Cost-Profit Graph, Same Scale

The VCP graph in Figure 7.3 is drawn with the details of the individual segment of variable cost and is more informative. The steps involved in drawing the graph include an additional step of adding variable costs to the fixed cost. This is to be repeated four times for four different components: material, labour, direct expenses and selling expenses. In fact, fixed costs can also be further split-up into parts. Such a comprehensive graph provides a bird's-eye view of the entire cost structure to the management. By drawing a line perpendicular from any volume (horizontal axis), the corresponding cost and profit variables can be ascertained on the vertical axis. For instance, at 20,000 unit level, following are the various cost figures, as shown by the VCP graph (line A).

Fixed costs	₹60,000
Variable costs:	
Material	40,000
Labour	30,000
Direct expenses	20,000
Selling expenses	10,000
Profit before taxes	40,000

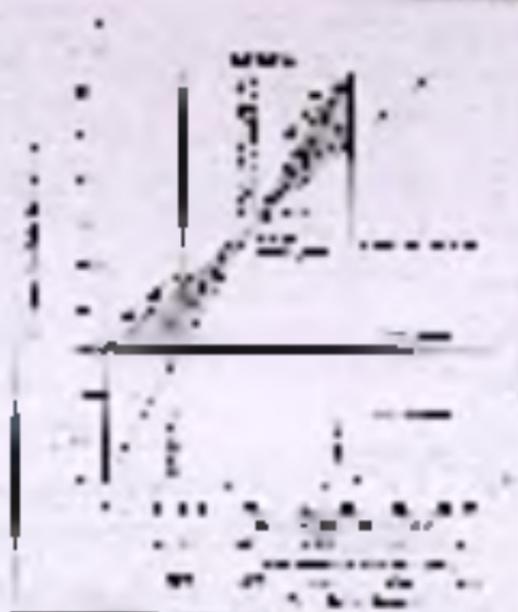

FIG. 1. A line graph showing a positive linear trend.

The following table shows the results of the analysis of variance for the data shown in Figure 1. The total variance is 10.0, and the variance due to the linear trend is 8.0. The variance due to the error is 2.0.

Source of Variation	Sum of Squares	D.F.	Mean Square
Total	10.0	10	1.0
Linear Trend	8.0	1	8.0
Error	2.0	9	0.222

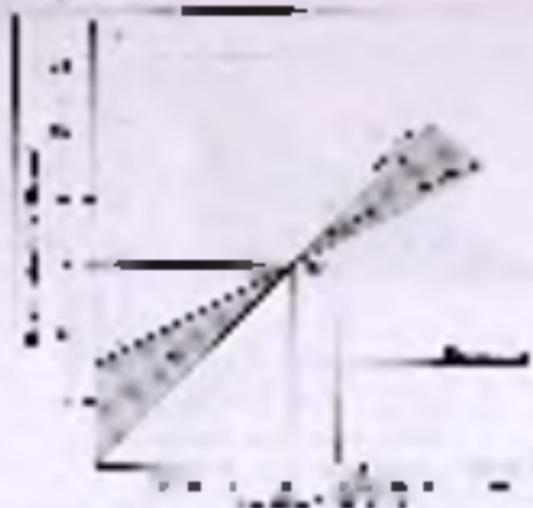

FIG. 2. A line graph showing a positive linear trend.

The following table shows the results of the analysis of variance for the data shown in Figure 2. The total variance is 10.0, and the variance due to the linear trend is 8.0. The variance due to the error is 2.0.

Source of Variation	Sum of Squares	D.F.	Mean Square
Total	10.0	10	1.0
Linear Trend	8.0	1	8.0
Error	2.0	9	0.222

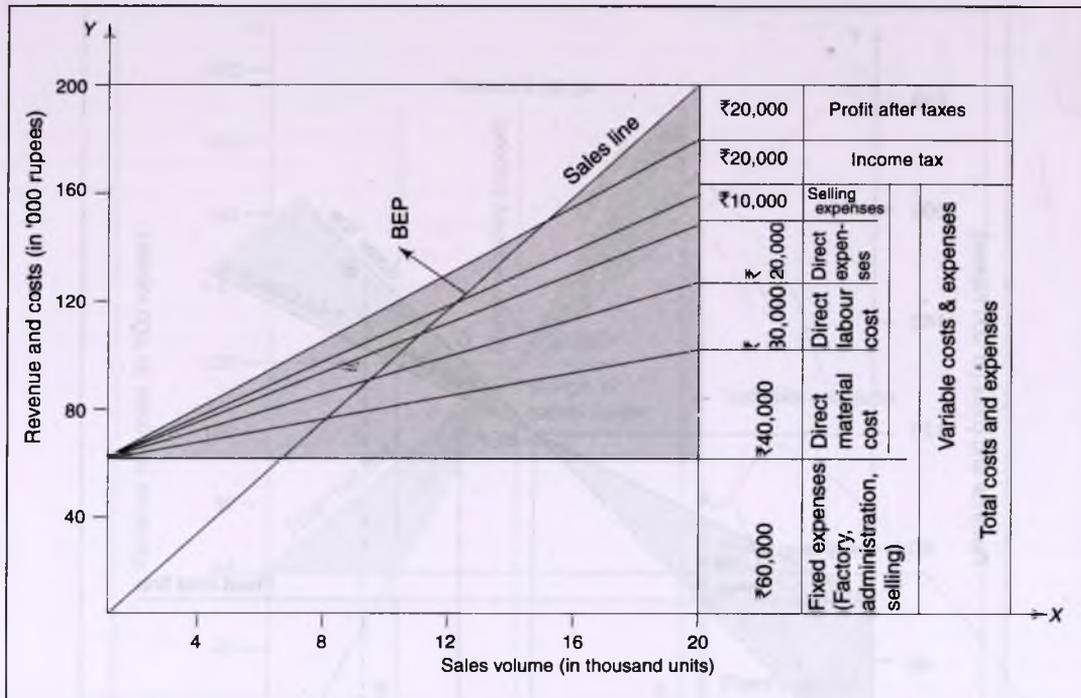

FIGURE 7.3 Volume-Cost-Profit Graph, Cost-Wise

Application of the P/V/(C/V) Ratio

1. Determination of $BEP = FC + P/V$ ratio
2. Determination of profit at given/budgeted sales volume = $(\text{Actual sales} - BE \text{ sales}) \times P/V \text{ ratio}$.
3. Determination of sales volume to earn budgeted profit = $(FC + DP) + P/V$ ratio
4. Determination of change in sales volume to maintain the current level of profit if there is (a) a change in sales price, (b) change in variable cost = $(FC + DP) + \text{Revised } P/V \text{ ratio}$.
5. Determination of the percentage of net profit with the help of margin of safety ratio = $(P/V \text{ ratio} \times MS \text{ ratio})$

(7.25)

LO 7.3 CASH BREAK-EVEN POINT

The VCP relationship can also be used to show the liquidity position of the firm. This is done through the computation of **cash break-even point** or cash break-even sales revenue (CBEP/CBESR). Algebraically:

$$CBEP = \frac{\text{Total cash fixed cost (CFC)}}{\text{Contribution margin per unit}} \quad (7.26)$$

$$CBESR = \frac{\text{Total cash fixed cost}}{P/V \text{ ratio}} \quad (7.27)$$

• **Cash break-even point** is total cash fixed cost divided by contribution margin per unit.

Graphically, the CBEP is determined at the point of intersection of total cash cost line and total sales line. The area to the left of the curve signifies cash losses and the area on the right side is indicative of cash profits.

Assuming for Example 7.4, the cash fixed cost to be ₹15,000, the CBESR using Equation 7.27 would be ₹30,000 = ₹15,000 ÷ 0.50

Figure 7.4 portrays the graphic presentation of the cash break-even sales revenue.

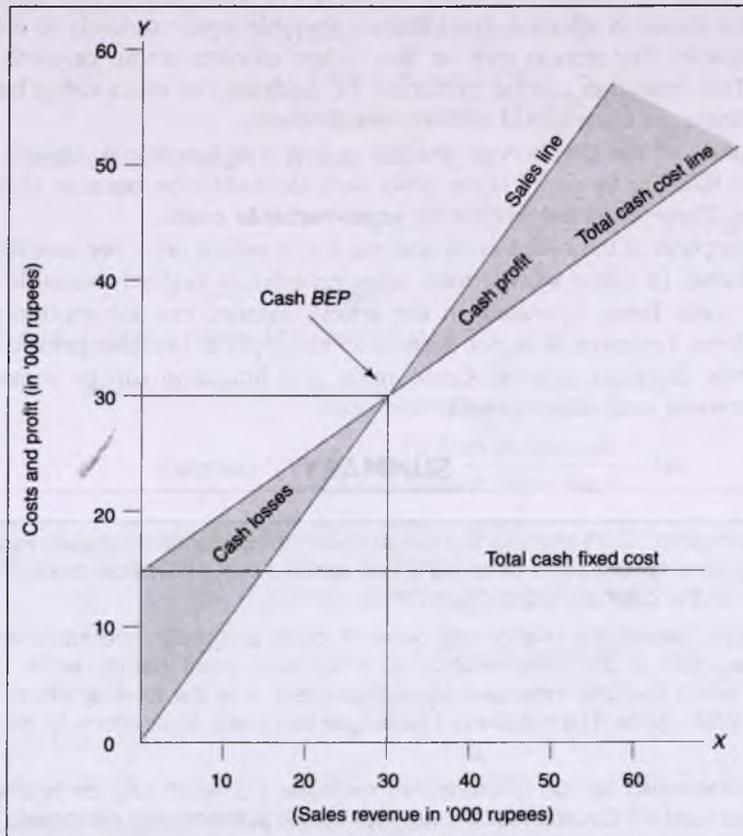

FIGURE 7.4 Cash Break-even Point

To conclude, the uses of break-even analysis, as a technique for profit planning, have been discussed in detail in this chapter. In brief, break-even analysis shows the interplay of profit factors, that is, cost, revenue and volume in a way, which assists management in choosing the best feasible alternative now and in the future. "The break-even system is at once an X-ray, exploratory and planning tool intended for frequent use and a proper cost-volume-profit analysis supported by the break-even chart can eliminate many of the time-consuming reports now being prepared at the company."³

The graphs can be used to analyse the impact of various alternative proposals under consideration on the profit structure. Thus, the break-even system provides more readily understandable facts than conventional accounting or statistical data regarding the profit structure of the company.

However, it is important to recognise its limitations which originate from the given assumptions. The greater the deviation of actual facts from the given assumptions, the more imperfect, incorrect and invalid are the break-even calculations. These limitations limit the usefulness of the break-even chart and must be borne in mind by those who prepare or interpret the break-even chart. These limitations suggest that the validity of the break-even chart is in proportion to the validity of the assumptions. One of the assumptions of the break-even analysis is that an enterprise's cost are

Figure 1

The first figure shows a positive linear correlation between two variables. The data points are scattered around a shaded triangular region, indicating a strong positive relationship. The x-axis is labeled '1' and '2', and the y-axis is labeled '3' and '4'.

The second figure shows a similar positive linear correlation, but with a different distribution of data points. The shaded triangular region is also present, and the axes are labeled similarly to the first figure.

The third figure shows a positive linear correlation with a different set of data points. The shaded triangular region and axis labels are consistent with the previous figures.

The second figure shows a positive linear correlation between two variables. The data points are scattered around a shaded triangular region, indicating a strong positive relationship. The x-axis is labeled '1' and '2', and the y-axis is labeled '3' and '4'.

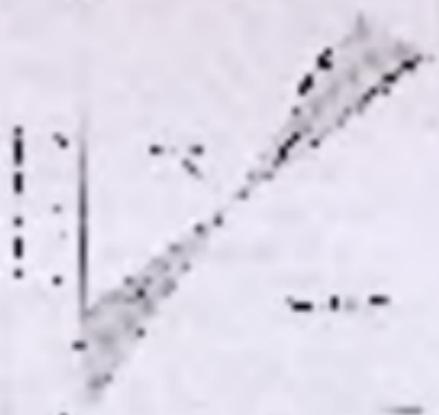

Figure 2

The third figure shows a positive linear correlation between two variables. The data points are scattered around a shaded triangular region, indicating a strong positive relationship. The x-axis is labeled '1' and '2', and the y-axis is labeled '3' and '4'.

either perfectly variable or absolutely fixed over all ranges of operating volume. In other words, variable cost is a linear function of volume: fixed costs are assumed not to be affected by volume at all. In practice, these assumptions are not likely to be valid over all ranges of volume. Even within the relevant range of volume, there is a likelihood of some degree of imprecision and to that extent validity of the results is affected. For instance, variable costs are likely to increase as the firm approaches full capacity. The reason may be due to less efficient labour or costly overtime having been resorted to. This limitation can be overcome by studying the relationship between total costs and volume, non-linear, to correspond with economic reality.

Another assumption of the break-even analysis is that it is possible to classify total costs of an enterprise as either fixed or variable. Many costs defy clear division because they are partly fixed and partly variable. These costs are known as **semi-variable costs**.

Yet another assumption of the break-even analysis is that selling price per unit remains unchanged, irrespective of volume. In other words, total sales revenue is perfectly variable with its physical sales volume. For some firms, operating in the seller's market, this assumption may be perfectly valid. For most others, however, it is not a realistic assumption because price reductions may be necessary to increase the sales volume. Once again, this limitation can be remedied by studying the relationship between total sales revenue and costs.

SUMMARY

The volume-cost-profit (*VCP*) analysis is a tool to show the relationship between various ingredients of profit planning, namely, unit sales price (*SP*), unit variable cost (*VC*), fixed costs (*FC*), sales volume, and sales-mix (in the case of multi-product firms).

The *VCP* analysis shows the relationship between costs and profit, and sales volume. The crucial step in this analysis is the determination of break-even point (*BEP*), which is defined as the sales level at which the total revenues equal total costs. It is the level at which losses cease and beyond which profit starts. The break-even technique has many applications for purposes of the *VCP* analysis.

BEP can be determined by the following two methods; (1) *Algebraic*, comprising (a) Contribution margin approach and (b) Equation technique. (2) *Graphic presentation*, comprising Break-even chart.

In the *contribution margin approach*, *BEP* is computed on the basis of the relationship between the fixed costs and the contribution margin (*CM*). The *CM* represents the difference between the sales revenue and the variable costs.

The *equation technique* is particularly useful in situations where unit price and unit variable costs are not clearly defined. The excess of actual sales over the *BE* sales is the margin of safety. When margin of safety is divided by the actual sales, we get margin of safety ratio which indicates the percentage by which actual sales may decline without causing any loss to the firm.. The break-even analysis is summarised below:

Contribution Margin Approach

$$\begin{aligned}
 (1) \quad \quad \quad \text{BEP (units)} &= \frac{\text{Fixed costs (FC)}}{\text{Unit sale price (SP) - Unit variable cost (VC)}} \\
 (2) \quad \quad \quad &= \frac{\text{Total fixed costs}}{\text{Unit contribution margin (CM)}}
 \end{aligned}$$

LO 7.1

- (3) $BEP \text{ (amount)}/BESR = BEP \text{ (units)} \times SP$
- (4) $= \frac{\text{Total fixed costs}}{\text{Contribution/Profit volume ratio (C/V or P/V ratio)}}$
- (5) $C/V \text{ (P/V) ratio} = \frac{CM}{SP} \times 100$
- (6) $= \frac{\text{Total contribution (TC)}}{\text{Total sales revenue (TSR)}} \times 100$
- (7) Variable cost to volume (V/V) ratio $= \frac{VC}{SP} \times 100$
- (8) $= \frac{\text{Total variable costs (TVC)}}{TSR} \times 100$
- (9) $= 1 - C/V \text{ (P/V) ratio}$
- (10) In brief, $C/V \text{ (P/V) ratio} + V/V \text{ ratio} = 1 \text{ (100\%)}$
- (11) $BESR \text{ (multi-product firm)} = \frac{FC}{\text{Weighted C/V ratio}} \times 100$
- (12) $\text{Weighted C/V ratio} = \frac{TC \text{ from all products}}{TSR \text{ from all products}} \times 100$
- (13) $\text{Margin of safety (MS)} = TSR - BESR$
- (14) $MS \text{ ratio} = \frac{TSR - BESR}{TSR} \times 100$
- (15) $\text{Profit} = MS \text{ (rupees)} \times C/V \text{ (P/V) ratio}$
- (16) $= MS \text{ (units)} \times CM$

Equation Technique

- (17) $BESR = TFC + TVC + \text{zero profit}$

The break-even applications are summarised below:

1. (a) Sales revenue required to earn desired operating profits (EBIT)

$$= \frac{FC + \text{desired EBIT}}{P/V \text{ ratio}}$$

- (b) Sales revenue required to earn desired profits/earnings after taxes (EAT)

$$= \frac{FC + (\text{EAT} / (1 - \text{tax rate, } t))}{P/V \text{ ratio}}$$

2. Operating profit at a given sales volume

$$= (TSR - BESR) \times P/V \text{ ratio}$$

3. Sales revenue to off-set reduction in sales price to maintain existing operating profits

$$= \frac{FC + EBIT}{\text{Revised P/V ratio}}$$

4. Effect of changes in fixed costs

- (a) The required sales revenue to maintain present operating profit

$$= \frac{\text{Present FC} + \text{Additional FC} + \text{Present EBIT}}{P/V \text{ ratio}}$$

LO 7.2

(b) *The required sales revenue to earn the present rate of return on investment*

Present F C + Additional FC + Present return on investment + Return on new investment

$$= \frac{\text{Present FC} + \text{Additional FC} + \text{Present return on investment} + \text{Return on new investment}}{\text{P/V ratio}}$$

5. *Effect of changes in variable costs*

The required sales revenue to maintain existing operating profit

$$= \frac{\text{FC} + \text{EBIT (Existing)}}{\text{Revised P/V ratio}}$$

6. *Effect of multiple changes*

The required sales revenue to earn desired EAT

$$= \frac{\text{FC} + \text{Additional FC} + [\text{Desired EAT}/(1-t)]}{\text{Revised P/V ratio}}$$

7. *Effect of change in sales-mix*

The desired sales revenue to maintain existing EBIT

$$= \frac{\text{FC} + \text{EBIT}}{\text{Revised Weighted P/V ratio}}$$

$$\text{Revised weighted P/V ratio} = \frac{\text{Total contribution at revised mix}}{\text{Total sales revenue at revised mix}} \times 100$$

The break-even chart is a graphic presentation of the relationship between costs, profits, and sales. It shows not only the break-even sales but also the estimated costs and profit at various levels of the sales revenue. It is, therefore, also referred to as volume-cost-profit (VCP) graph/chart.

The volume-profit graph shows a direct relationship between sales revenue and profits.

The VCP relationship is also useful to assess the liquidity position of the firm. For the purpose, cash break-even point (CBEP) or cash break-even sales revenue is computed.

$$1. \text{ Cash BEP (in units)} = \frac{\text{Total cash Fixed cost}}{\text{Contribution margin per unit}}$$

$$2. \text{ Cash BESR (in amount)} = \frac{\text{Total cash Fixed cost}}{\text{P/V ratio}}$$

SOLVED PROBLEMS

P.7.1 From the following data, calculate the:

1. Break-even point expressed in terms of sale amount/revenue.
2. Number of units that must be sold to earn a profit of ₹60,000 per year.

LO 7.1,2

LOD
E

Sales price (per unit)	₹20
Variable manufacturing cost per unit	11
Variable selling cost per unit	3
Fixed factory overheads (per year)	5,40,000
Fixed selling costs (per year)	2,52,000

Solution

- BEP (amount) = (Fixed factory overheads + Fixed selling costs)/P/V ratio (Sales price – Variable manufacturing cost – Variable selling cost) + Sales price = $(₹5,40,000 + ₹2,52,000)/0.30$ (₹6 + ₹20) = ₹26,40,000
- Desired sales volume (in units) to earn a profit of ₹60,000 = $(₹7,92,000 + ₹60,000)/₹6$ (CM per unit) = ₹1,42,000 units

P.7.2 Two businesses, AB Ltd and CD Ltd, sell the same type of product in the same type of market. Their budgeted profit and loss accounts for the current year ending March 31, are as follows:

LO 7.1	LOD E
--------	-------

Particulars	AB Ltd	CD Ltd
Sales	₹150,000	₹1,50,000
Less: Variable costs	₹1,20,000	₹1,00,000
Fixed costs	15,000	35,000
Net budgeted profit	15,000	15,000

You are required to:

- Calculate the break-even points of each business; and
- State which business is likely to earn greater profits in conditions of: (a) heavy demand for the product, (b) low demand for the product.

Solution

- BEP (amount) = Fixed cost/ P/V ratio; P/V ratio = Contribution/Sales revenue
 BEP (AB Ltd) = $₹15,000/0.20 = ₹75,000$
 P/V ratio = $₹30,000/₹1,50,000 = 20$ per cent
 BEP (CD Ltd) = $₹35,000/0.3333 = ₹1,05,000$
 P/V ratio = $₹50,000/₹1,50,000 = 33.33$ per cent
- Projected profit (heavy demand for the products):
 - CD Ltd is likely to earn larger profits in conditions of heavy demand of the product because its P/V ratio is higher than that of AB Ltd.
 - AB Ltd is likely to earn larger profits in condition of low demand of the product because its burden of fixed costs is much smaller than that of CD Ltd.

P.7.3 The Soft-Flow Ink Ltd's income statement for the preceding year is presented below. Except as noted, the cost/revenue relationship for the coming year is expected to follow the same pattern as in the preceding year. Income statement for the year ending March 31 is as follows:

LO 7.2	LOD M
--------	-------

Sales (2,00,000 bottles @ ₹2.5 each)		₹5,00,000
Variable costs	₹3,00,000	
Fixed costs	1,00,000	4,00,000
Pre-tax profit		1,00,000
Less: Taxes		35,000
Profit after tax		65,000

- What is the break-even point in amount and units?
- Suppose that a plant expansion will add ₹50,000 to fixed costs and increase capacity by 60 per cent. How many bottles would have to be sold after the addition to break-even?
- At what level of sales will the company be able to maintain its present pre-tax profit position even after expansion?

4. The company's management feels that it should earn at least ₹10,000 (pre- tax per annum) on the new investment. What sales volume is required to enable the company to maintain existing profits and earn the minimum required return on new investments?
5. Suppose the plant operates at full capacity after the expansion, what profit will be earned?

Solution

1. $BEP \text{ (amount)} = ₹1,00,000 / 0.40 \text{ (} ₹2,00,000 \div ₹5,00,000 \text{)} = ₹2,50,000$
 $BEP \text{ (units)} = ₹1,00,000 / ₹1.0 = 1,00,000 \text{ units}$
2. $BEP \text{ (increase in FC)} = [₹1,00,000 + ₹50,000 \text{ (Additional FC)}] \div ₹1.0 \text{ per unit} = 1,50,000 \text{ units}$
3. $\text{Desired sales volume to maintain a pre- tax profit of } ₹1,00,000 = [₹1,50,000 \text{ (FC)} + ₹1,00,000] / 0.40 = ₹6,25,000 \text{ (or } 2,50,000 \text{ bottles)}$
4. $\text{Desired sales volume to earn a profit of } ₹1,10,000 \text{ (} ₹1,00,000 + ₹10,000 \text{)} = [₹1,50,000 + ₹1,10,000] / 0.40 = ₹6,50,000 \text{ (or } 2,60,000 \text{ bottles)}$
5. Present capacity (assumed operating at 100 per cent capacity) (bottles) 2,00,000
Add: Additional capacity (60 per cent) 1,20,000
 Total capacity (bottles) 3,20,000

Statement of income (3,20,000 units)

Sales (3,20,000 bottles @ ₹2.5)	₹8,00,000
Less: Variable costs, 0.60	4,80,000
Contribution	3,20,000
Less: Fixed costs	1,50,000
Pre-tax profits	1,70,000
Less: Income tax	59,500
Profits after income tax	1,10,500

P.7.4 The following data are obtained from the records of a factory:

LO 7.2 LO
M

Sales (4,000 units @ ₹25 each)	₹1,00,000
Variable costs:	
Materials consumed	₹40,000
Labour charges	20,000
Variable overheads	10,000
Fixed overheads	18,000
	88,000
Net profit	12,000

Calculate:

1. Number of units by selling which the company will break-even.
2. Sales needed to earn a profit of 20 per cent on sales.
3. Extra units, which should be sold to obtain the present profit if it is proposed to reduce the selling price by 20 per cent and 25 per cent.
4. Selling price to be fixed to bring down its break-even point to 600 units under present conditions.

Solution

1. $BEP \text{ (units), Fixed overheads} = ₹18,000 / CM \text{ per unit, } ₹7.50 = 2,400 \text{ units}$

Determination of CM per unit

Sales revenue (4,000 units)		₹1,00,000
Less: Variable costs		
Materials consumed	₹40,000	
Labour charges	20,000	
Variable overheads	10,000	70,000
Contribution (4,000 units)		30,000
CM per unit (₹30,000 ÷ 4,000)		7.5

2. (a) Sales revenue (SR) is a sum of total costs (TC) and total profits (TP) or (SR = TC + TP).
- (b) TC can be split into FC and VC.
- (c) VC will vary in direct proportion to SR.
- (d) Accordingly, SR = FC + VC (SR) + TP (SR). Let us suppose, SR = 100 per cent; TC = 80 per cent; TP = 20 per cent; VC = 70 per cent (₹70,000/₹1,00,000); FC = ₹18,000

Substituting the values, we have,

$$100\% \text{ SR} = ₹18,000 + 0.70 \text{ SR} + 0.20 \text{ SR}$$

$$0.10 \text{ SR} = ₹18,000$$

$$\text{SR} = ₹18,000 / 0.10 = ₹1,80,000$$

Verification

Sales revenue		₹1,80,000
Less: Variable cost (0.70)	₹1,26,000	
Less: Fixed overheads	18,000	1,44,000
Net profit		36,000
Net profit as percentage of sales revenue		20

3. Revised contribution margin per unit and additional units required to maintain profit of ₹12,000

Particulars	Selling price reduced by	
	20 per cent	25 per cent
Revised selling price	₹20.00	₹18.75
Less: Variable cost (0.70 × ₹25, original sales price)	17.50	17.50
Contribution	2.50	1.25
Desired sales volume (FC + NP) ÷ CM	30,000/2.50	30,000/1.25
Number of units required	12,000	24,000
Less: Existing number of units sold	4,000	4,000
Extra units to be sold to maintain a profit of ₹12,000	8,000	20,000

4. BEP = FC/CM per unit

$$\text{CM per unit} = \text{FC} / \text{BEP} = ₹18,000 / 600 \text{ units} = ₹30$$

$$\text{Sales price (per unit)} = \text{CM per unit} + \text{Variable cost per unit} = ₹30 + ₹17.50 = ₹47.5$$

P.7.5 ABC Ltd manufactures and sells four types of products under the brand names of A, B, C and D. The sales-mix in value comprises 33.33, 41.67, 16.67 and 8.33 per cents for products A, B, C and D respectively. The total budgeted sales (100 per cent) are ₹60,000 per month. Operating costs are:

LO 7.1 **LOD D**

Variable costs as per cent of selling price: Product A, 60, B, 68, C, 80, and D 40. Fixed costs, ₹14,700 per month.

Calculate the break-even point for the products on an over-all basis.

Solution

Determination of weighted PV ratio

Product	Sales revenue	(%)	Variable costs	(%)	Contribution	P/V ratio (%)
A	₹20,000	(33.33)	₹12,000	(60)	₹8,000	40
B	25,000	(41.67)	17,000	(68)	8,000	32
C	10,000	(16.67)	8,000	(80)	2,000	20
D	5,000	(8.33)	2,000	(40)	3,000	60
Total	60,000	(100)	39,000	(65)	21,000	35

BEP = Fixed costs/ Weighted P/V ratio = ₹14,700/0.35 = ₹42,000

Confirmation

Variable costs (0.65 × ₹42,000)	₹27,300
Fixed costs	14,700
Total costs	42,000
Total sales revenue	42,000

MINI CASES

7.C.1 (Break-even Point) Sybergrid Solutions is a Web Publishing firm involved in the design and hosting of websites for corporates and business houses. As the initial investment required to start web publishing is low, several new entrants have entered/are planning to enter this business. There are also some established players who are willing to operate at low margins. Website publishing is highly competitive coupled with low market demand.

A website consists of a number of web pages. On average, any website would be made up of 50 web pages. The costs, revenues and time are calculated on the basis of production of one web page, that is 1 unit = 1 web page (selling as ₹1,000).

Besides, Biplab Saha, the owner of Sybergrid Solutions, there are three permanent employees—a visualiser who does the conceptualising and designing the graphics, a DTP operator to enter data and make the design on the computer and an office boy. One contract programmer is also hired as and when Sybergrid gets an order for developing a website. The total hours available in a month are (7.5 × 25 × 3) 564 hours. The annual capacity is (564 × 12) 6,768 hours. The total man-hours per web page to make 1 web page are 8 hours consisting of 3 hours each taken by visualiser and owner/entrepreneur and 2 hours by the DTP operator.

The monthly man-power expenses are as follows: (i) Owner/entrepreneur, ₹12,000 (ii) Visualiser, ₹5,000, (iii) DTP operator, ₹4,000 and (iv) Office boy, ₹1,500.

The investments and operational expenses are summarised below:

Capital cost:

Computers (2)	₹80,000	
Printer (1)	12,000	
Scanner (1)	35,000	
Internet connection per annum	15,000	₹1,42,500

Fixed cost per month:

Rent	3,000	
Telephone	600	
Electricity	1,000	
Floppy disk, stationery and office expenses	500	
Books	250	
Magazines/newspapers	150	
Conveyance	1,000	6,500

The variable costs are given below:

Cost	Rate	Time taken per web page
Additional labour	₹30/hr	1 hour
Telephone	1.5/minute	10 minutes
Electricity	₹20 per web page	

These costs are classified into fixed and variable in Exhibit 1.

EXHIBIT 1 Fixed and Variable Costs

Cost element	Fixed cost (annual)	Variable cost per 100 web page		
		Direct labour	Direct expenses	Selling expenses
Labour:		₹3,000		
Owner/entrepreneur	₹1,44,000			
Visualiser	60,000			
DTP operator	48,000			
Office boy	18,000			
	<u>2,70,000</u>			
Rent	36,000			
Telephone	7,200		₹1,500	
Electricity	12,000		2,000	
Internet connection	15,000			
Floppy disks, stationery and office expenses	6,000		1,000	₹200
Depreciation (10%)	12,700			
Interest (13%)	16,500			
Conveyance	12,000			500
Magazine/newspapers	1,800			
Books	3,000			
Total	<u>3,92,000</u>	<u>3,000</u>	<u>4,500</u>	<u>700</u>

₹1,27,000 (₹80,000 + ₹12,000 + ₹35,000) × 0.10

₹1,27,000 × 0.13 (This is the opportunity cost of interest lost on owners funds used to buy computer, scanner and printer).

Required

- Compute break-even sales revenue to establish viability of business.
- Compute number of orders to make operating profit of ₹15,000 per month.
- Determine sales volume required to offset reduction in sale price from ₹1,000 to ₹700 to maintain operating profit of ₹15,000 per month.
- Determine selling price at which Sybergrid would not suffer cash losses.

Solution

(a) Viability of business:

- Breakeven point (amount): Fixed cost ÷ CV ratio = ₹3,92,000 ÷ 0.918^o = ₹4,27,015
^oSales price, ₹1,000 – ₹82, variable cost per unit (₹8,200 ÷ 100) = ₹918 + ₹1,000 = 91.8% = 0.918
- Break-even point (units) = ₹4,27,015 ÷ ₹1,000 = 427 pages
 Number of orders for website to break-even in one year = 427 pages ÷ 50 pages for an order on website = 8.54 (9) orders.

Man-hours required = $398 \times 8 = 3,184$

Total capacity = 6,278 man-hours

Capacity utilisation = $6,278 \div 3,184 = 50\%$

(b) Number of orders to get a desired profit of ₹15,000 per month (₹1,80,000 annual)

= $[\text{Fixed expenses} + \text{Desired profit}] \div \text{C/V ratio}$

= $(₹3,92,000 + ₹1,80,000) \div 0.918 = ₹6,23,094 \div ₹1,000 = 623 \text{ pages}$

Number of website sale to make classified profit = $623 \text{ pages} \div 50 \text{ pages} = 12.46(13) \text{ orders per year}$
to get the desired profit of ₹15,000 per month

(c) Additional sales volume required to offset a reduction in selling price from ₹1,000 to ₹700

Contribution (₹700 – ₹82) = ₹618 (revised)

C/V ratio = 88.29%

Sales volume to offset reduced selling price = $[\text{Desired profit} + \text{Fixed expenses}] \div \text{Revised C/V ratio}$

= $₹5,72,000 \div 0.8829 = ₹6,47,865 \div 100 = 648 \text{ web pages to be sold}$

Number of orders per year = $648 \text{ pages} \div 50 \text{ pages} = 13 \text{ orders}$

(d) Lowest selling price at which Sybergrid would not suffer cash losses.

Cash fixed cost = ₹3,92,000 – ₹12,700 Depreciation = ₹3,79,300

Desired Contribution per page = $₹3,79,300/427 \text{ BEP} = ₹888.29$

Desired selling price per page = Desired contribution (₹888.29) per page + Variable cost (₹82) per page = ₹970.29

Thus, the minimum price per web page should be ₹970.29 to avoid any cash losses.

Scan the QR Code given at the end of chapter to access comprehensive cases.

REVIEW QUESTIONS

LOD: Easy

RQ.7.1 In the following multiple choice questions, select the correct answers.

[LO 7.1.2]

- (i) The margin of safety for a firm in a very volatile market is 5 per cent. Which of the following is true?
- (a) The margin of safety is probably too high, (b) The margin of safety is probably too low, (c) The margin of safety is adequate, (d) We can't tell.
- (ii) Contribution per unit is ₹100. Fixed costs are ₹6,00,000. Production and sales are 8,000 units. When sales rise
- (a) total contribution rises by an amount greater than profit, (b) total contribution rises by an amount smaller than profit, (c) total contribution and profit rise by the same amount, (d) contribution margin drops.
- (iii) Contribution per unit is ₹100. Fixed costs are ₹6,00,000. Production and sales are 8,000 units. Total contribution is
- (a) ₹6,00,000, (b) ₹4,00,000, (c) ₹8,00,000, (d) None of the above.
- (iv) Contribution per unit is ₹100. Fixed costs are ₹6,00,000. Production and sales are 8,000 units. Profit is
- (a) ₹2,00,000, (b) ₹6,00,000, (c) ₹6,00,000, (d) None of the above.
- (v) Break-even is not affected with changes in
- (a) sales price per unit, (b) variable cost per unit, (c) total fixed costs, (d) number of units sold.
- (vi) Contribution margin ratio (C/V ratio) is 25%. The fixed costs are ₹30,00,000. The break even point is
- (a) ₹1,20,00,000, (b) ₹60,00,000, (c) ₹30,00,000, (d) ₹15,00,000.

- (vii) Variable cost is ₹400 per unit, fixed costs are ₹80,00,000, selling price per unit is ₹900, sales are 5,000 units. If selling price increases by ₹100, contribution increases by
(a) ₹10,00,000, (b) ₹100, (c) ₹5,00,000, (d) ₹80,00,000.
- (viii) Variable cost is ₹400 per unit, fixed costs are ₹80,00,000, selling price per unit is ₹900, sales are 5,000 units. If fixed costs increase by ₹10,00,000, contribution
(a) increases by ₹10,00,000, (b) decreases by ₹10,00,000, (c) remains unchanged, (d) can't say.
- (ix) Variable cost is ₹400 per unit, fixed costs are ₹80,00,000, selling price per unit is ₹900, sales are 5,000 units. If sales decrease by 2,000 units, contribution margin
(a) increases by ₹10,00,000, (b) decreases by ₹10,00,000, (c) remains unchanged, (d) can't say.
- (x) Variable cost is ₹400 per unit, fixed costs are ₹80,00,000, selling price per unit is ₹900, sales are 5,000 units. The target profit is ₹1,00,00,000. What must the sales revenue be?
(a) ₹3,24,00,000, (b) ₹2,00,00,000, (c) ₹1,60,00,000, (d) ₹3,53,00,000.
- (xi) Company B sells two products:
Product A: [Contribution margin ratio = 20%, Sales = ₹100,000]
Product B: [Contribution margin ratio = 40%, Sales = ₹200,000]
If actual sales were (A) ₹200,000 and (B) ₹100,000, total contribution would:
(a) increase by ₹20,000, (b) decrease by ₹20,000, (c) increase by ₹40,000, (d) decrease by ₹40,000
- (xii) Company B sells two products:
Product A: [Contribution margin ratio = 20%, Sales = ₹100,000]
Product B: [Contribution margin ratio = 40%, Sales = ₹200,000]
If actual sales were (A) ₹200,000 and (B) ₹100,000, fixed costs are ₹50,000. The break-even point in sales revenue would be
(a) ₹175,000, (b) ₹200,000, (c) ₹150,000, (d) ₹187,970.
- (xiii) One of the following is not an assumption that underlies CVP analysis.
(a) Fixed costs per unit will remain the same throughout the relevant range. (b) Variable cost per unit will increase as sales increases. (c) Variable costs have a linear relationship with sales. (d) Selling price is constant throughout the relevant range.
- (xiv) Which is the correct equation that calculates P (profit before tax)
Assume, Selling Price per unit = ₹S, Variable Cost per unit = ₹V, Number of units sold = U units and Total Fixed costs = ₹F.
(a) $P = SV - F$, (b) $P = U(S - V) - F$, (c) $P = FS - V$, (d) $P = S(V - S)$.
- (xv) The break-even point is 10,000 units, sales are 12,000 units. The margin of safety expressed in percentage is:
(a) 16.67%, (b) 80%, (c) 120%, (d) 20%.

[Answer: (i) b (ii) c (iii) c (iv) a (v) d (vi) a (vii) c (viii) c (ix) b (x) a
(xi) b (xii) d (xiii) b (xiv) b (xv) a.]

RQ.7.2 Define break-even analysis and outline its uses and applications. [LO 7.2.]

RQ.7.3 (a) Discuss the importance of the following in relation to break-even analysis: [LO 7.1.2.]

- (1) Break-even point (2) Margin of safety (3) Contribution (4) Profit volume ratio.

(b) Write a short note on the angle of incidence in a break-even chart.

RQ.7.4 Explain the limitations of a break-even analysis. [LO 7.2.]

RQ.7.5 What is cash break-even point? Draw a cash break-even chart with hypothetical figures. [LO 7.3.]

RQ.7.6 Asian Industries Ltd. specialises in the manufacture of small capacity motors. The cost structure of a motor is as under: Material, ₹50; Labour, ₹80; Variable overheads, 75 per cent of labour cost. Fixed overheads of the company amount to ₹2.40 lakh per annum. The sale price of the motor is ₹230 each. [LO 7.3.]

- (a) Determine the number of motors that have to be manufactured and sold in a year in order to break-even.

Dear Mother
 I received your letter of the 11th and was
 glad to hear from you. I am well and
 hope these few lines will find you the same.
 I have not much news to write at present.
 I am still in the hospital and am
 getting on my feet. I shall be home
 in a few days. I shall be glad to hear
 from you again. I am your affectionate
 son,
 John

- (b) How many motors have to be made and sold to make a profit of ₹1 lakh per year?
 (c) If the sale price is reduced by ₹15 each, how many motors have to be sold to break-even?

LOD: Medium

- RQ.7.7** Explain the significance and objective of a break-even chart and state the factors which would cause the break-even point to change. [LO 7.2]
- RQ.7.8** A “break-even chart must be used with intelligent discrimination, with an adequate grasp of assumptions underlying the technique surrounding its practical application.” Elucidate the statement giving illustrations. [LO 7.2]
- RQ.7.9** (a) What is the significance to financial management, of increase in output, fixed costs, variable cost and selling price? [LO 7.2]
 (b) Draw a break-even chart with a few illustrative figures. Explain the VCP relationship. How would a change in selling price affect the above? [LO 7.2]
- RQ.7.10** The “volume-cost-profit relationships provide management with a simplified framework for organising its thinking on a number of problems.” Discuss. [LO 7.2]
- RQ.7.11** The per cycle price structure of a cycle made by the Cycle Company Ltd. is as follows: [LO 7.2]

Material	₹60
Labour	20
Variable overheads	20
	100
Fixed overheads	50
Profit	50
Selling price	200

This is based on the manufacture of 1 lakh cycles per annum.

The company expects that due to competition, they will have to reduce selling price, but they want to keep the total profit intact. What level of production will have to be reached, that is, how many cycles will have to be made to get the same amount of profits, if: (a) the selling price is reduced by 10 per cent, (b) the selling price is reduced by 20 per cent?

- RQ.7.12** A company is considering expansion. Fixed costs amount to ₹4,20,000 and are expected to increase by 1,25,000 when plant expansion is completed. The present plant capacity is 80,000 units a year. Capacity will increase by 50 per cent with expansion. Variable costs are currently ₹6.80 per unit and are expected to go down by ₹0.40 per unit with the expansion. The current selling price is ₹16 per unit and is expected to remain the same under each alternative. What are the break-even points under each alternative? Which alternative is better, and why? [LO 7.2]

LOD: Difficult

- RQ.7.13** “The effect of a price increase is always to increase the P/V ratio, to bring down the break-even point and to widen the margin of safety.” Discuss. [LO 7.2]
- RQ.7.14** A, B, and C are three similar plants under the same management; it wants to merge them for better operation. The details are as under: [LO 7.2]

Plant	A	B	C
Capacity operated (%)	100	70	50
Turnover (₹ lakh)	300	280	150
Variable costs	200	210	75
Fixed costs	70	50	62

You are to find out: (i) the capacity of the merged plant for breaking even, (ii) the profit at 75 per cent capacity of the merged plant, and (iii) the turnover from the merged plant to give a profit of ₹28 lakh.

- RQ.7.15** The sales of Forma Ltd. in the first half of the current year amounted to ₹2,70,000 and profit earned was ₹7,200. The sales in the second half year registered an increase and amounted to ₹3,42,000. The profit earned was ₹20,700 in that half year. Assuming no change in fixed cost, calculate (i) the *P/V* ratio, (ii) the amount of profit when sales are ₹2,16,000, and (iii) the amount of sales required to earn a profit of ₹36,000. [LO 7.2]

ANSWERS

- 7.6 (a) 6,000 (b) 8,500 (c) 9,600
 7.11 (a) 1,25,000 (b) 1,66,667
 7.12 BEP Pre-expansion 45,653;
 Post-expansion 56,771; The alternative of expansion appears to be better one.
 7.14 (i) 52 per cent (ii) ₹80.5 lakh (iii) ₹600 lakh
 7.15 (i) 18.75 per cent (ii) (₹2,925), 6 months; (₹46,350), 12 months (iii) ₹6,55,200

CHAPTER

8

Budgeting and Profit Planning

LEARNING OBJECTIVES

LO 8.1	Understand the planning process
LO 8.2	Explain the definition, meaning and purpose of a budget
LO 8.3	Discuss types of budgets and illustrate their preparation

INTRODUCTION

Budgets are an important tool of profit planning. The purpose of this chapter is to present a general view of budgeting as a device of planning and illustrate the preparation of various types of budgets. The chapter provides a brief account of the planning process *vis-à-vis* budgeting. It also elaborates on the meaning of a budget and the purpose of budgeting. The important types of budgets are discussed and illustrated subsequently. The major points are summarised by way of recapitulation.

LO 8.1 PLANNING PROCESS

Budgeting, as a tool of planning, is closely related to the broader system of planning in an organisation. **Planning** involves the specification of the basic objectives that the organisation will pursue and the fundamental policies that will guide it. In operational terms, it involves four stages: (i) Objectives (ii) Goals (iii) Strategies, and (iv) Plans/Budgets.

- **Planning**
- involves
- specifications of
- basic objectives
- and fundamental
- policies.

Objectives

The first stage in the planning and control system is setting the **objectives** which are defined as the *broad and long-range desired state or position in the future*. They are motivational or directional in nature and are expressed in qualitative terms.

- **Objectives**
- are broad and
- long-range desired
- state or position in
- future.

CHAPTER OBJECTIVES

- | | |
|----|--------------------------------------|
| 21 | Define budgeting. |
| 22 | Explain the importance of budgeting. |
| 23 | Describe the types of budgets. |

LEARNING OBJECTIVES

After studying this chapter, you should be able to:

1. Define budgeting and explain its importance.
2. Describe the types of budgets.
3. Prepare a budgeted income statement, a budgeted balance sheet, and a budgeted cash flow statement.

BUDGETING

Budgeting is a financial plan for a specific period of time. It is a statement of the expected financial position of the organization at the end of the period. It is a statement of the expected financial position of the organization at the end of the period.

IMPORTANCE

Budgeting is important for the following reasons:

1. It helps in the planning and control of the organization.
2. It helps in the allocation of resources.
3. It helps in the measurement of performance.

Examples of fundamental objectives are identification of the line of business, customer satisfaction, employee welfare, and so on. Thus, they are the basic policies.

Goals

Goals are quantitative targets to be achieved in specified period.

The second stage in the planning process is specifying the **goals**. The term goal, as an element in planning, represents targets, specific in quantitative terms, to be achieved in a specific period of time. The timing of introducing new products, purchase of new plant and machinery and expected rate of return are examples of time and quantity-oriented goals.

Strategies

Strategies represent specific course of action to achieve goals.

The next step involves laying down the strategies. **Strategies** denote specific methods/courses of action to achieve the goals, for instance, promotion of sales through price reduction or aggressive advertisement, financial alternatives, and so on.

Plans/Budgets

The final step is the preparation of budgets/profit plans. Basically, budgeting is the periodic planning to implement the alternatives during a particular fiscal period, usually one year. It converts, in other words, goals and strategies into annual operating plans.

LO 8.2 BUDGET—DEFINITION, MEANING AND PURPOSE

A budget is defined as a 'comprehensive and coordinated plan, expressed in financial terms, for the operations and resources of an enterprise for some specified period in the future.'¹ According to this definition, the essential elements of a budget are: (i) Plan, (ii) Operations and resources, (iii) Financial terms, (iv) Specified future period, (v) Comprehensiveness, and (vi) Coordination.

Plan

The first ingredient of a budget is its plan. The term 'plan' with reference to budgeting has a *specific connotation*. It includes two aspects which have a bearing on the operations of an enterprise. One set of factors, which determine a firm's future operations are wholly external and beyond its control. Included in this category of factors are general business conditions, government policy and size and composition of population. The second set of factors affecting future activities are within the firm's control and discretion, that is, they are internal. The promotional programmes and manufacturing processes are illustration of these factors. Budgeting, as a plan, covers both these aspects. In other words, budgeting not only suggests what should happen but should also make things happen.² In brief, a budget (plan) is an expression partly of what the management expects to happen and partly of what the management intends to happen.

Operations and Resources

A budget is a mechanism to plan for the firm's operations and resources. The operations are reflected in revenues and expenses. This means that a budget should quantify the revenues to be realised from products/services and the expenses to be incurred on goods/services used in generating revenues.

The plan also covers the resources of the firm. The planning of resources means the planning of the various assets and the sources of capital to finance these assets. The assets could be fixed assets as well as current assets.

Financial Terms

Budgets are prepared in financial terms, that is, in terms of monetary value such as the rupee, dollar, and so on. The reason is that the monetary unit is a common denominator. The various activities and operations are expressed in different units, for example, material in terms of weight, labour in terms of number/man-hours, sales in terms of territories, advertisement in terms of magazine space, and so on. If they have to be integrated in a plan, they must be expressed in comparable units of measurement. Monetary units provide such a measure.

Specified Future Period

A budget relates to a specified period of time, usually one year. If it is not related to a time horizon, it will be meaningless. Planning merely for a given amount of, say, sales/profits will not constitute a budget unless a time dimension is added, that is, the budget sales/profit is planned to be achieved in a predetermined time framework.

Comprehensiveness

A budget is comprehensive in that all the activities and operations of an organisation are included in it. It covers the organisation as a whole and not only some segments. The *modus operandi* is that budgets are prepared for each segment/facet/activity/division of an organisation. These are integrated into an overall budget for the entire organisation. The overall budget is referred to as the **master budget**.

- **Master budget**
- is the overall
- budget for
- the entire
- organisation.

Coordination

Budgets are prepared for the different components/segments/divisions/facets/activities of an organisation so as to take care of the situations and problems of each component. The budgets for each of the components are prepared in harmony with each another. This is called coordination.

Budgets—Purpose

As a tool, budgets serve as a guide to the conduct of operations and a basis for evaluating actual results. The main objectives of budgeting are: (i) Explicit statement of expectations, (ii) Communication, (iii) Coordination, and (iv) Expectations as a framework for judging performance.³

Explicit Statement of Expectations One purpose of budgeting is to state expectations in formal terms so that most of the underlying assumptions may be identified. A firm has the basic objective of optimising long-run profit. Its long-range goals also include survival, consumer satisfaction, employee welfare, personal power and prestige, and so on. These long-range objectives can be achieved in successive phases over a period of time. In other words, long-range objectives have to be split into short-term operational plans. Thus, a budget can be said to be a device to express goals which are sought to be achieved in a short period of time. In other words, it is a means to establish congruence between short-term goals and the long-term objectives of the firm. Therefore, budgets formulate targets of expected performance. The advantage is that by laying down targets, budgets contain an explicit statement of expectations. These targets help direct their operations, identify problems, help motivate lower-level employees and clarify the relationship between current activities and future policies.⁴ Another implication is that budgets explicitly state the underlying assumptions and goal and/or the means of attaining it. To illustrate, if the sales target (projected sales) for any given period is ₹5,00,000, the budget will not only indicate this figure but will also give details about the

...

... ..

...

... ..

... ..

assumed prices, quantity, sales efforts, and so on. This explicit statement of assumption is one of the most important contributions of budgeting for managerial planning and control.

However, a budget does not lay down a statement of expectations in rigid terms. Budgets, as observed earlier, are based on factors which are either uncertain or are beyond the control of management. Some of these are economic, social and business conditions; supply and demand; competition; consumer taste; technological innovations; and so on. A budget should be modified when necessary in the light of the changes in the factors/assumptions on which the original estimates were based.

Communication Another purpose of budgeting is to communicate or inform others of the goals and methods selected by top management. Since budgeting deals with fundamental policies and objectives, it is prepared by top management. A formal budget by itself will not ensure that a firm's operations will be automatically geared to the achievement of the goals set in the budget. For this to happen, the managers and lower-level employees have to understand the goals and support them and coordinate their efforts to attain them. In other words, the employees should be aware well in advance of the level of performance expected of them. It is for this reason that a budget is viewed as a means of communicating to the employees the level of performance expected of them so that the goals set out in the budget can be accomplished.

Coordination Yet another purpose of budgeting is coordination. The term 'coordination' refers to the operation of all departments of an organisation in such a way that there is no bottleneck or imbalance. In other words, coordination implies a harmonious relationship between various departments to ensure smooth and uninterrupted operation of each of them. If an organisation is to achieve its long-run goals, coordination in the activities of all its departments is necessary. If there is no coordination, imbalances will be created which will hinder smooth operation and stand in the way of the accomplishment of the goals of the budgets.

To illustrate, one type of imbalance may be between the manufacturing/production and sales departments. The manufacturing department may be producing goods, which the sales department may not be able to sell. Conversely, the sales department may like the production department to produce goods which the production department is incapable of producing. Another example of lack of coordination is the purchasing-manufacturing imbalance when the production schedule is not related to the raw material purchases. Further, the production schedule may not be based on the capability of employees and capacity of plant and machinery.

In view of the above, coordination is a major function of budgeting. Budgets should be drafted in such a way that the operations of the various departments are related to each other for the achievement of the overall goal. Apart from the interdepartmental reconciliation, budgets also provide for flexibility to accommodate plans and operations to unexpected situations.

Expectations as a Framework for Judging Performance Finally, a budget establishes expectations as a framework for judging employee performance. A budget, as observed earlier, defines the goals, the means of implementing them and the level of performance by the employees. The extent to which employees have succeeded in the task assigned to them, can be judged on the basis of a comparison of the actual performance/achievement with the budget. If the actual performance equals or exceeds the budgeted level, it may be termed satisfactory, otherwise not. Thus, a budget can serve as a yardstick to judge employee performance or as a control device.

To conclude, budgeting, as a tool of planning and control, serves as a guide to conduct operations and a basis for evaluating actual results. Actual results can be judged satisfactory or unsatisfactory in the light of the relevant budgeted data and also in the light of changes in conditions. However,

a budget should not be regarded as a rigid requirement of performance. Many of the factors upon which a budget is based are beyond the control of management and all of them are uncertain. The budget should, therefore, be regarded as a plan, not an immutable commitment of performance; it is a means of control, but not a straitjacket on operations.⁵ In view of its significance as a managerial tool, the preparation of a budget is illustrated in the pages that follows.

LO 8.3 PREPARATION/TYPES OF BUDGETS

It may be recalled that a budget with reference to planning and control refers to a comprehensive and coordinated budget generally known as master budget. In operational terms, a comprehensive or overall budget has several components. A master budget normally consists of three types of budgets: **(i)** Operating budgets, **(ii)** Financial budgets, and **(iii)** Special decision budgets. Another classification of a master budget is: **(i)** Fixed/static budget and **(ii)** Flexible/variable/sliding budget. In the discussions that follow we illustrate the preparation of the various components of a master budget, namely, operating and financial budgets. The mechanics of the preparation of a flexible budget is also discussed.

Operating Budgets

Operating budgets relate to the physical activities/operations of a firm such as sales, production, purchasing, debtors collection and creditors payment schedules. In specific terms, an **operating budget** has the following components:

1. Sales budget,
2. Production budget,
3. Purchase budget,
4. Direct labour budget,
5. Manufacturing expenses budget, and
6. Administrative and selling expenses budget, and so on.

- **Operating budgets**
- relate to physical activities/operations such as sales, production, and so on.

Financial Budgets

Financial budgets are concerned with expected cash receipts/disbursements, financial position and results of operations. In other words, a financial budget has the following components:

1. Budgeted income statement,
2. Budgeted statement of retained earnings,
3. Cash budget, and
4. Budgeted balance sheet.

- **Financial budgets**
- are concerned with expected cash flows, financial position and result of operations.

Cash Budget The principal aim of the cash budget, as a tool of planning, is to ascertain whether, at any time, there is likely to be an excess or shortage of cash. The preparation of a cash budget involves various steps.

The *first* element of a cash budget is the selection of the period of time to be covered by the budget. Alternatively, it is referred to as the 'planning horizon'. The planning horizon means the *time span* and the sub-periods within that time span over which the cash flows are to be projected. There is no hard and fast rule. The period coverage of a cash budget will differ from firm to firm depending upon its nature and the degree of accuracy with which the estimates can be made. As a general rule, the period selected should be neither too long nor too short. If it is too long, it is likely that the estimates will be upset as we cannot visualise them at the time of the preparation

* Discussed separately in detail in Chapter 14.

... ..

... ..

... ..

of the budget. If on the other hand, the time span is too small, the disadvantages are: **(i)** Failure to take into account important events which lie just beyond the period covered by the budget; **(ii)** Heavy workload in preparation; and **(iii)** Abnormal factors that may be operative.

The planning horizon of a cash budget should be determined in the light of the circumstances and requirements of a particular case. For instance, if the flows are expected to be stable and dependable, such a firm may prepare a cash budget covering a long period, say, a year and divide it into quarterly intervals. In the case of a firm whose flows are uncertain, a quarterly budget divided into monthly intervals may be appropriate. Where flows are affected by seasonal variations, monthly sub-divided into weekly or even daily budgets may be necessary. If the flows are subject to extreme fluctuations, a daily budget may be called for. The idea behind sub-dividing the budget period into smaller intervals is to highlight the movement of cash from one sub-period to another. The sub-division will provide information on the fluctuations in the cash reservoir level during the time span covered by the budget.

The *second* element of the cash budget is the factors that have a bearing on cash flows. The items included in the cash budget are the cash items only, non-cash items such as *depreciation* are excluded.⁶ The factors that generate cash flow are generally divided, for purposes of constructing a cash budget, into two broad categories: **(a)** Operating and **(b)** Financial. This two-fold classification of cash budget items is based on their 'nature'. While the former category includes cash flows generated by the operations of the firms and are known as the 'operating cash flows,' the latter consist of the 'financial cash flows.' The major components of the two types of cash flows are outlined below.

Operating Cash Flows The main operating factors/items which generate cash outflows and inflows over the time span of a cash budget are tabulated in Exhibit 8.1.

EXHIBIT 8.1 Operating Cash Flow Items

<i>Cash inflows/Receipts</i>	<i>Cash outflows/Disbursements</i>
1. Cash sales	1. Accounts payable/Payable payments
2. Collection of accounts receivable	2. Purchase of raw materials
3. Disposal of fixed assets	3. Wages and salary (pay roll)
	4. Factory expenses
	5. Administrative and selling expenses
	6. Maintenance expenses
	7. Purchase of fixed assets

Among the operating factors affecting cash flows, the collection of accounts receivable (inflows) and accounts payable (outflows) are the most important. The terms of credit and the speed with which the customers pay would determine the lag between the creation of the accounts receivable and their collection. Also, discounts and allowances for early payments, return from customers and bad debts affect the cash inflows. Similarly, accounts payable relating to credit purchases are affected by the purchase terms.

Financial Cash Flows The major financial factors/items affecting generation of cash flows are depicted in Exhibit 8.2.

EXHIBIT 8.2 Financial Cash Flow Items

<i>Cash inflows/Receipts</i>	<i>Cash outflows/Payments</i>
1. Loans/borrowings	1. Income tax/tax payments
2. Sale of securities	2. Redemption of loan
3. Interest received	3. Re-purchase of shares
4. Dividend received	4. Interest paid
5. Rent received	5. Dividends paid
6. Refund of tax	
7. Issues of new shares and securities	

After the time span of the cash budget has been decided upon and pertinent operating and financial factors have been identified, the final step is the construction of the cash budget.

The preparation of the master budget is illustrated in Example 8.1.

Example 8.1

The following data relate to Hypothetical Limited:

Balance Sheet as at March 31, Current Year

Liabilities	Amount	Assets	Amount
Accounts payable (all for March purchases)	₹40,000	Cash	₹3,00,000
Taxes payable (all for March income)	25,000	Accounts receivable (all from March sales)	2,50,000
Share capital	11,00,000	Inventories:	
Retained earnings	10,26,800	Raw materials (9,600 kgs × ₹3)	28,800
		Finished goods (1,800 units × ₹35)	63,000
		Fixed assets:	
		Cost	₹20,00,000
		Less: Accumulated depreciation	(4,50,000)
			15,50,000
	<u>21,91,800</u>		<u>21,91,800</u>

2. *Sales forecasts:* Assume the marketing department has developed the following sales forecast for the first quarter of the next year and the selling price of ₹50 per unit.

Month	Units sales
April	9,000
May	12,000
June	16,000

3. The management desires closing inventory to equal 20 per cent of the following month's sales.
4. The manufacturing costs are as follows:

Direct materials: (5 kgs × ₹3) (per unit)	₹15
Direct labour	5
Variable overheads	9
Total fixed overheads (per annum)	7,20,000

5. Normal capacity is 1,20,000 units per annum. Assume absorption costing basis.
6. Each unit of final product requires 5 kgs of raw materials. Assume management desires closing raw material inventory to equal 20 per cent of the following month's requirements of production.
7. Assume fixed selling and administrative expenses are ₹20,000 per month and variable selling and administrative expenses are ₹5 per unit sold.
8. All sales are on account. Payment received within 10 days from the date of sale are subject to a 2 per cent cash discount. In the past, 60 per cent of the sales were collected during the month of sale and 40 per cent are collected during the following month. Of collections during the month of sale, 50 per cent are collected during the discount period. Accounts receivable are recorded at the gross amount and cash discounts are treated as a reduction in arriving at net sales during the month they are taken.
9. Tax rate is 35 per cent.

10. Additional information:

- (a) All purchases are on account. Two-thirds are paid for in the month of purchase and one-third, in the following month.
- (b) Fixed manufacturing costs include depreciation of ₹20,000 per month.
- (c) Taxes are paid in the following month.
- (d) All other costs and/or expenses are paid during the month in which incurred.
- From the foregoing information prepare a master budget for the month of April only.

Solution

1. Production Budget

Particulars	April	May
Sales (units)	9,000	12,000
Add: Desired closing inventory (0.20 × next month's sales)	2,400	3,200
Total finished goods requirement	11,400	15,200
Less: Opening inventory	(1,800)	(2,400)
Required production (units)	9,600	12,800

2. Manufacturing Cost Budget

Particulars	April
Required production (units)	9,600
Direct material cost (5 kgs × ₹3 per kg)	× ₹15
Total direct material cost	₹1,44,000
Total direct labour cost (₹5 per unit)	48,000
Total variable overhead cost (₹9 per unit)	86,400
Total variable manufacturing costs	2,78,400
All fixed manufacturing overheads (₹7,20,000 ÷ 12 months)	60,000
Total manufacturing cost	3,38,400

3. Purchase Budget (Raw Materials)

Particulars	April	May
Production requirement (units)	9,600	12,800
Raw material required for production @ 5 kgs per unit (kgs)	48,000	64,000
Add: Desired closing inventory (0.20 × May requirements)	12,800	
Total requirements	60,800	
Less: Opening inventory	(9,600)	
Purchase requirement	51,200	
Purchase requirement (amount @ ₹3 per kg)	₹1,53,600	

4. Selling and Administrative Expenses Budget

Particulars	April
Units sales	9,000
Variable costs @ ₹5 per unit	₹45,000
Fixed costs	20,000
Total selling and administrative expenses	65,000

5. Cost of Goods Sold Budget

Particulars	April
Units sold	9,000

(Contd.)

(Contd.)

Cost per unit		
Variable	₹29	
Fixed (₹60,000 ÷ 10,000 units)	6	× ₹35
Total cost		3,15,000

6. Budgeted Income Statement for the Month of April

Gross sales (9,000 × ₹50)	₹4,50,000
Less: Cash discount (₹4,50,000 × 0.6 × 0.5 × 0.02)	2,700
Net sales	4,47,300
Less: Cost of goods sold	3,15,000
Gross margin (unadjusted)	1,32,300
Less: Capacity variance unfavourable (400 units × ₹6)	2,400
Gross margin (adjusted)	1,29,900
Less: Selling and administrative expenses	65,000
Earnings before taxes	64,900
Less: Taxes (0.35)	22,715
Earning after taxes	42,185

7. Budgeted Statement of Retained Earnings

Opening balance	₹10,26,800
Add: Earnings after taxes	42,185
Closing balance	10,68,985

8. Cash Budget (April)

Opening balance		₹3,00,000	
Cash inflows:			
Collection from debtors:			
March sales		₹2,50,000	
April sales (gross) (₹4,50,000 × 0.60)	₹2,70,000		
Less: Cash discount	2,700	2,67,300	5,17,300
(₹2,70,000 × 0.5 × 0.02)			₹8,17,300
Cash outflows:			
Payment to creditors:			
For March purchases		40,000	
For April purchases (₹1,53,600 × 2/3)		1,02,400	1,42,400
Direct labour			48,000
Variable manufacturing overhead			86,400
Fixed manufacturing overhead		60,000	
Less: Depreciation		(20,000)	40,000
Variable selling and administrative overheads			45,000
Fixed selling and administrative overheads			20,000
Taxes			25,000
Closing balance			4,10,500

9. Proforma Balance Sheet as at March 31, Next Year

Liabilities	Amount	Assets	Amount
Accounts payable		Cash	₹4,10,500
(₹40,000 + ₹1,53,600		Accounts receivable	
- ₹1,42,400)	₹51,200	(₹4,50,000 × 0.40)	1,80,000

(Contd.)

(Contd.)

Taxes payable (₹25,000 + ₹22,715 – ₹25,000)	22,715	Inventories:		
Share capital	11,00,000	Raw material	₹38,400	
Retained earnings	10,68,985	(12,800 × ₹3)		
		Finished goods		
		(2,400 × ₹35)	84,000	1,22,400
		Fixed assets:		
		Cost	20,00,000	
		Less: Accumulated depreciation	(4,70,000)	15,30,000
	<u>22,42,900</u>			<u>22,42,900</u>

Special Decision Budgets

The third category of budgets are special decision budgets. They relate to inventory levels, break-even analysis, and so on. These are discussed comprehensively in other chapters of this volume.⁷ The long-term capital budgets are covered in detail in Chapters 9 and 10.

Flexible Budgets

Flexible budget estimates costs at several levels of activity.

The discussion of the **master budget** and its components in the preceding section was based on the assumption of fixed level of activity. In other words, the budgets were related to a specific level of operation implying thereby that a firm can accurately and precisely forecast the level of its behaviour/operations in a given period of time. If the business environment is capable of accurate prediction, this approach to budgeting is likely to yield dependable results. If, however, changes take place during the budget

period, the budget will serve no useful purpose. Such a budget is technically referred to as a fixed/static budget. In other words, budgets prepared at a single level of activity, with no prospect of modification in the light of the changed circumstances, are fixed or static budgets. The alternative to fixed budgets are **flexible/variable/sliding budgets**. The term 'flexible' is the most apt description of the essential features/characteristics of these budgets and is used here to refer to such budgets.

A **flexible budget** estimates costs at several levels of activity. The merit of a flexible budget is that instead of one estimate it contains several estimates/plans in different assumed circumstances. Since business activities cannot be accurately predicted as the business conditions/environment are uncertain, it is a useful tool in real business situations, that is, an unpredictable environment. In view of its significance as a more realistic basis of budgeting, the setting up of a flexible budget is demonstrated in the discussions that follow.

It may at the outset be noted that the construction of a flexible budget is similar to that of a fixed budget except in one respect. While the fixed budget is based on costs and other business operations/activities at one level, the flexible budget considers several alternatives/levels/volumes of activity. The term 'volume/level' of activity refers to the usage of capacity. In other words, volume/level of activity signifies the percentage use of capacity. The term 'capacity' means the *installed capacity* of plant and personnel, that is, the fixed amount invested in these. For instance, if a plant when fully operated can produce 5,000 units, its capacity is 5,000 units of production. Assuming 2,500 units of production in a given period, the volume/level of activity is 50 per cent.

Thus, the essence of a flexible budget is the presentation of estimated cost data in a manner that permits their determination at various levels of volume. This means that all costs must be identified as to how they behave with a change in volume—whether they vary or remain fixed.

The conceptual framework of flexible budgeting, therefore, relates to: **(i)** Measure of volume and **(ii)** Cost behaviour identified with change in volume.

Measure of Volume The volume measure selected for any given department/firm should be that quantity which displays the greatest degree of correlation with those costs that vary with the level of operating activity. Different departments may use different measures of volume. In the first place, the measure of volume may be expressed in terms of the activity or factor that causes costs to vary, for example, labour costs vary on the basis of number of hours worked, material costs vary due to quantity of materials consumed. Secondly, the volume measure should be related to factors controllable by management, that is, number of hours worked, the quantity of materials consumed and number of machine hours operated. Further, the activity chosen as a unit of measure should be one that is not greatly affected by factors other than volume, that is, quantity more useful than cost as indicator of volume. In brief, volume should be expressed in terms of some unit of input, such as direct labour hours, direct labour cost or machine hours. The measure applied in any particular case will depend on the peculiarities. For instance, in the light machinery department, direct labour hours may be an appropriate measure. But for the heavy machinery department, machine hours may be the best indicator of cost behaviour.

Cost Behaviour with Change in Volume Three different types of cost behaviour can be visualised with changes in volume/level of activity: **(i)** Fixed costs, **(ii)** Variable costs, and **(iii)** Mixed costs.

Fixed Costs The fixed costs are associated with inputs that do not fluctuate in response to changes in the total activity or output of the firm, within relevant range for a given budget period. They may also be called *non-variable costs*. They are normally fixed for a relevant range of volume but fluctuate beyond that range. Moreover, fixed costs are to be analysed in relation to a given period of time; they are subject to change over a period of time.

Fixed costs may be: **(i)** Committed and **(ii)** Discretionary. Fixed costs that are associated with the acquisition of capacity-producing assets are known as the committed fixed costs. The identifying characteristic of a committed cost is that its occurrence as well as amount are predetermined and can be altered only by another major decision to reverse or amend the earlier commitment. Also known as *managed costs*, discretionary costs result from management decisions. They are incurred as well as reduced at the discretion of the management.

Each of the two types of fixed costs has a different implication for the budgetary process. Committed fixed costs can be budgeted on the basis of past commitment. Discretionary fixed cost, on the other hand, can be budgeted on the basis of inquiry from the decision-makers/management.

Variable Costs The variable costs are costs that are assumed to fluctuate in direct proportion to production activity/sales activity/some other measure of volume within relevant range for a given budget period. The level of variable costs at any volume can be estimated easily if the relationship between costs and volume is shown.

Mixed Costs The mixed costs are composed of both fixed and variable elements. The fixed part of mixed costs often represents a cost of capacity, while the variable element is influenced by changed in activity. For budgeting purposes, mixed costs must be broken down into their fixed and variable components/segments. Once this is done, the amount of fixed costs and the rate at which total variable costs change in proportion to total changes in output/volume can be worked out. That is, the fixed costs remain constant regardless of activity, but the variable portion is assumed to

- Fixed costs
- are fixed for a
- relevant range of
- volume for a given
- budget period.

- Variable costs
- fluctuate in direct
- proportion to
- activity/volume
- within relevant
- range for a given
- budget period.

- Mixed costs
- are composed of
- both fixed and
- variable
- elements.

Year	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928	1929	1930

The following table shows the membership of the American Medical Association from 1910 to 1930. The membership has increased steadily from 1,000 in 1910 to 3,000 in 1930. The number of officers and delegates has remained constant at 10 and 50, respectively.

For 1930

The American Medical Association is a non-profit corporation organized for the purpose of promoting the science and art of medicine and the health of the people. It is composed of all duly qualified physicians and surgeons who are members of one of the State Medical Societies or of the American Medical Association. The Association is organized into a hierarchy of local, State, and National Societies. The National Society is the American Medical Association, which is composed of all the State Societies. The State Societies are composed of all the local Societies. The local Societies are composed of all the physicians and surgeons who are members of the Association in that State. The Association is organized into a hierarchy of local, State, and National Societies. The National Society is the American Medical Association, which is composed of all the State Societies. The State Societies are composed of all the local Societies. The local Societies are composed of all the physicians and surgeons who are members of the Association in that State.

change in direct proportion to change in labour hours, labour costs, machine hours, material costs/material quantity, and so on.

The main elements in the construction of a flexible budget have been outlined above. To summarise, a flexible budget, in a sense, is a series of fixed budgets and an increase or decrease (any change) in the level/volume of activity must be reflected in it. Each expense in each department/segment is to be categorised into fixed, variable and mixed components. A budget may be first prepared at the expected level of activity, say, 100 per cent of capacity. Additional columns may then be added for costs below and above 100 per cent, say, 90 per cent and 110 per cent.

Hypothetical flexible budgets corresponding to the procedure described above for two departments of a firm: Maintenance and Manufacture, are illustrated in Tables 8.1 and 8.2.

TABLE 8.1 Hypothetical Ltd—Flexible Budget (Maintenance Department)

Volume (labour-hours)	400	450	500	550	600
Variable costs:					
Labour	₹6,000	₹6,750	₹7,500	₹8,250	₹9,000
Material	2,400	2,700	3,000	3,300	3,600
Others	800	900	1,000	1,100	1,200
Mixed costs:					
Labour	2,300	2,400	2,500	2,600	2,700
Maintenance	1,400	1,450	1,500	1,550	1,600
Other supplies	2,500	2,750	3,000	3,250	3,500
Discretionary fixed costs:					
Training	1,500	2,000	2,000	2,000	2,500
Experimental methods	3,500	4,000	4,000	4,000	4,500
Committed fixed costs:					
Depreciation	5,000	5,000	5,000	5,000	5,000
Rent, lease cost	3,500	3,500	3,500	3,500	3,500
Total	28,900	31,450	33,000	34,550	37,100

TABLE 8.2 Hypothetical Ltd—Flexible Budget (Manufacturing Department)

Volume(machine-hours)	50	60	70	80	90
Variable costs:					
Power	₹500	₹600	₹700	₹800	₹900
Helpers	250	300	350	400	450
Discretionary fixed costs:					
Training	800	900	900	900	1,000
Tools	200	200	200	300	300
Committed fixed costs:					
Depreciation	1,200	1,200	1,200	1,200	1,200
Rent	1,000	1,000	1,000	1,000	1,000
Total	3,950	4,200	4,350	4,600	4,850

Modified Flexible Budgets From the preceding discussion it should be clear that flexible budgets, as a tool of planning and control, are superior to fixed budgets. The major weaknesses of static budgets are their inability to: (i) Disclose the potential variability of various estimates used in preparing the budget and (ii) Indicate the range within which costs can be expected to fall. They are not useful, therefore, in an uncertain and unpredictable environment. Flexible budgets are better in that they

present estimates of costs at different level/volume of activity. But their one limitation is that they do not explicitly consider the relative probability that any particular volume or cost will be achieved.⁸ This limitation can be overcome by using a modified flexible budget, which will include columns for different levels of estimates—most likely, optimistic and pessimistic. The hypothetical modified flexible budget is shown in Table 8.3.

TABLE 8.3 Hypothetical Ltd—Modified Flexible Budget (Manufacturing Department)

	<i>Pessimistic</i>	<i>Most likely</i>	<i>Optimistic</i>
<i>Volume (labour-hours)</i>	425	500	585
Variable costs:			
Labour	₹6,375	₹7,500	₹8,775
Materials	2,650	3,000	3,510
Others	850	1,000	1,170
Mixed costs:			
Labour	2,350	2,500	3,425
Maintenance	1,425	1,500	1,585
Other supplies	2,625	3,000	2,670
Discretionary fixed costs:			
Training	1,750	2,000	2,250
Experimental methods	3,750	4,000	4,250
Committed fixed costs:			
Depreciation	5,000	5,000	5,000
Rent, etc.	3,500	3,500	3,500
Total	30,275	33,000	36,135

SUMMARY

LO 8.1

Budgeting is a tool of planning. Planning involves specification of the basic objectives that the organisation will pursue and the fundamental policies that will guide it. In operational terms, it involves four steps: **(i)** Objectives defined as the broad and long-range desired state/position of the firm, **(ii)** Specified goals-targets in quantitative terms to be achieved in a specified period of time, **(iii)** Strategies or specific methods/course of action to achieve these goals, and **(iv)** Budgets to convert goals and strategies into annual operating plans.

LO 8.2

A budget is defined as a comprehensive and coordinated plan, expressed in financial terms, for the operations and resources of an enterprise for some specified period in the future. The essential elements of a budget are: **(i)** Plan, **(ii)** Financial terms, **(iii)** Operations and resources, **(iv)** Specific future period, **(v)** Comprehensive coverage, and **(vi)** Coordination. As a tool, a budget serves as a guide to conduct operations and a basis for evaluating actual results. The main objectives of budgeting are: **(i)** Explicit statement of expectations, **(ii)** Communication, **(iii)** Coordination, and **(iv)** Expectations as a framework for judging performance.

The overall budget is known as the master budget. It has the following components: **(i)** Sales budget, **(ii)** Production budget, **(iii)** Purchase budget, **(iv)** Direct labour budget, **(v)** Manufacturing expenses budget, **(vi)** Administrative and selling expenses budget, **(vii)** Budgeted income statement, **(viii)** Cash budget, and **(ix)** Budgeted balance sheet.

The cash budget is a device to help a firm to plan for and control the use of cash. It is a statement showing the estimated cash inflows and cash outflows over the planning period. The principal aim of the cash budget, as a tool to predict cash flows over a period of time, is to ascertain whether there is likely to be excess/shortage of cash at any time.

The preparation of a cash budget involves several steps. The first element of a cash budget is the selection of the period of the budget, that is, the planning horizon. The planning horizon of a cash budget should be determined in the light of the circumstances and requirements of a particular case. The second element of the cash budget is the selection/identification of the factors that have a bearing on cash flows. The factors that generate cash are generally divided into two broad categories: (i) Operating and (ii) Financial. The first category includes cash flows from the operations of the firm, for example, sales, collections of receivables and so on. The second category of cash flows comprise collections and payment of financial nature, for example, borrowings, dividends paid, taxes paid and so on.

Budgets prepared at a single level of activity, with no prospect of modification in the light of changed circumstances, are referred to as fixed budgets.

The alternative to fixed budgets are flexible/variable/sliding budgets. The term 'flexible' is an apt description of the essential features of these budgets. A flexible budget estimates costs at several levels of activity. Its merit is that instead of one estimate, it contains several estimates/plans in different assumed circumstances. It is a useful tool in real world situations, that is, unpredictable environment. A flexible budget, in a sense, is a series of fixed budgets and any increase/decrease in the level/volume of activity must be reflected in it. The conceptual framework of flexible budgeting relates to: (i) Measure of volume and (ii) Cost behaviour with change in volume. Each expense in each department/segment is to be categorised into fixed, variable and mixed components. A budget may first be prepared at the expected level of activity, say, 100 per cent capacity. Additional columns may then be added for costs below and above, 90 per cent and 110 per cent capacity and so on.

Flexible budgets, as a tool of planning and control, are superior to fixed budgets. The major weaknesses of fixed budgets are their inability to: (i) Show the potential variability of various estimates used in the preparation of the budget, and (ii) Indicate the range within which costs may be expected to vary. They are, therefore, not useful in an uncertain and unpredictable environment. Flexible budgets present estimates at different levels of activity, and are more useful.

Flexible budgets suffer from one limitation in that they do not explicitly consider the relative probability of a particular volume/cost being achieved. This limitation can be overcome by using a modified flexible budget which will include columns for different levels of estimates: most likely, optimistic and pessimistic.

SOLVED PROBLEMS

P.8.1 Your company manufactures two products, A and B. A forecast of the units to be sold in the first seven months of the year is given below:

LO 8.3

Month	Product A	Product B
January	1,000	2,800
February	1,200	2,800
March	1,600	2,400
April	2,000	2,000
May	2,400	1,600
June	2,400	1,600
July	2,000	1,800

It is anticipated that (a) there will be no work-in-process at the end of any month, and (b) finished units equal to half the sale for the next month will be in stock at the end of each month (including the previous December).

Budgeted production and production costs for the whole year are as follows:

Particulars	Product A	Product B
Product (units)	22,000	24,000
Per unit direct material	₹12.50	₹19.00
Per unit direct labour	4.50	7.00
Total factory overhead (apportioned)	66,000	96,000

Prepare for the six months period ending June 30 (i) (a) production budget for each month, and (ii) a summarised production cost budget.

Solution

(i) Production budget of products A and B (units) for six months (January to June)

Month	Sales		Planned inventory				Budget production	
			closing		opening		(Col. 2 + 4 - 6)	(Col. 3 + 5 - 7)
	A	B	A	B	A	B	A	B
1	2	3	4	5	6	7	8	9
January	1,000	2,800	600	1,400	500	1,400	1,100	2,800
February	1,200	2,800	800	1,200	600	1,400	1,400	2,600
March	1,600	2,400	1,000	1,000	800	1,200	1,800	2,200
April	2,000	2,000	1,200	800	1,000	1,000	2,200	1,800
May	2,400	1,600	1,200	800	1,200	800	2,400	1,600
June	2,400	1,600	1,000	900	1,200	800	2,200	1,700

(ii) Cost of production budget for six months from January to June of products A and B

Particulars	Product A			Product B			Total cost (A + B)
	Cost per unit	Number of units produced	Total cost	Cost per unit	Number of units produced	Total	
Variable costs:							
Direct material	₹12.50	11,100	₹1,38,750	₹19	12,700	₹2,41,300	₹3,80,050
Direct labour	4.50	11,100	49,950	7	12,700	88,900	1,38,850
Fixed costs:							
Factory overheads apportioned at the rate of ₹3 (A) and ₹4 (B)	3.00	11,100	33,300	4	12,700	50,800	84,100
	<u>20.00</u>	<u>11,100</u>	<u>2,22,000</u>	<u>30</u>	<u>12,700</u>	<u>3,81,000</u>	<u>6,03,000</u>

P.8.2 The following data relate to the working of a factory at Wardha for the current year:

LO 8.3 LOD M

Capacity worked, 50 per cent

Fixed costs:

Salaries	₹84,000	
Rent and rates	56,000	
Depreciation	70,000	
Other administrative expenses	80,000	₹2,90,000

Variable costs:

Materials	2,40,000	
Labour	2,56,000	
Other expenses	38,000	5,34,000

Possible sales at various levels of working are:

Capacity (per cent)	Sales
60	₹9,50,000
75	11,50,000
90	13,75,000
100	15,25,000

Prepare a flexible budget and show the forecast of profit at 60, 75, 90, and 100 per cent capacity operations.

Solution

Flexible budget

Percentage of capacity worked	60	75	90	100
Sales revenue	₹9,50,000	₹11,50,000	₹13,75,000	₹15,25,000
Less: Costs:				
Variable costs:				
Materials	2,88,000	3,60,000	4,32,000	4,80,000
Labour	3,07,200	3,84,000	4,60,800	5,12,000
Other expenses	45,600	57,000	68,400	76,000
(A) Total variable cost	<u>6,40,800</u>	<u>8,01,000</u>	<u>9,61,200</u>	<u>10,68,000</u>
Fixed costs:				
Salaries	84,000	84,000	84,000	84,000
Rent and rates	56,000	56,000	56,000	56,000
Depreciation	70,000	70,000	70,000	70,000

Forecast profits	19,200	59,000	1,23,800	1,67,000

P.8.3 The operating results of a manufacturing company for the current years are summarised below:

LO 8.3 

	(₹ in lakh)
Sales (40,000 units)	₹48.00
Less: Trade discount	2.40
Net sales	45.60
Cost of sales	
Direct material	14.40
Direct labour	12.60
Factory overheads	6.30
Administration expenses	3.60
Selling and distribution expenses	4.50

The following changes are anticipated during the next year:

- Units to be sold to increase by 25 per cent
- Material price to increase by 15 per cent
- Direct wages to increase by 12 per cent
- Overheads—Factory overheads will be limited to ₹6.56 lakh; administration and selling and distribution expenses are estimated to increase by 8 per cent and 14 per cent respectively
- Inventory—No change in opening and closing inventories in quantity. The change in value may be ignored.
- Trade discount—No change in the rate
- Profit target for the year—₹6 lakh.

Calculate the unit selling price and present the budgeted operating results for the next year.

Solution

Budgeted operating income statement of a manufacturing company (₹ in lakh)

Particulars	Amount
Sales (50,000 units)	60.00
Less: Trade discount (5 per cent)	3.00
Net sales	57.00
Less: Variable costs	
Direct material @ ₹41.40 per unit (₹36 + 15%)	20.70
Direct labour @ ₹35.28 per unit (₹31.50 + 12%)	17.64
	18.66
Contribution	
Less: Fixed overheads	
Factory	6.560
Administration (₹3.60 lakh + 8%)	3.888
Selling and distribution (₹4.50 lakh + 14%)	5.130
Net income (indicated)	3.082
Net income (desired)	6.000
Additional income needed	2.918
Contribution required (₹18.66 lakh + ₹2.918 lakh)	21.578
Add: Variable costs	38.340
Net sales	59.918
Add: Trade discount	3.154
Gross sales (50,000 units) [(₹59.918/95) × 100]	63.072
Sales price per unit	126.144

REVIEW QUESTIONS

LOD: Easy

- RQ.8.1** Fill in the following blanks: [LO 8.1.2.3]
- (i) Overall budget is also known as _____.
 - (ii) Budgets prepared at the single level of activity are referred to as _____.
 - (iii) _____ estimates costs at several levels of activity.
 - (iv) For most of the business firms, _____ is key budget.
 - (v) Budgets are an important tool of _____.
 - (vi) Minimum desired cash balance concept is useful in the preparation of _____ budget.
 - (vii) Cash budget is a tool of _____ financial planning.
 - (viii) Factors generating cash are categorized into two broad categories, namely, _____.
 - (ix) The primary objective of cash budget is to ascertain whether there is likely to be _____ of cash at any time.
 - (x) Sales and production budgets are _____ budgets.

[Answers: (i) master budget, (ii) fixed budgets, (iii) flexible budget, (iv) sales budget, (v) profit planning, (vi) cash budget, (vii) short-term, (viii) operating and financial, (ix) excess/shortage, (x) operating.]

- RQ.8.2** Are you in agreement with the view that budgeting should better be called 'profit planning and control'? [LO 8.1.2]
- RQ.8.3** In what respects does the production budget contribute to managerial (i) planning, (ii) coordination, and (iii) control. [LO 8.2.3]
- RQ.8.4** Write a note on the advantages and limitations of budgeting. [LO 8.2]
- RQ.8.5** Define budgetary control and discuss the objectives of introducing a budgetary control system in a business organisation. [LO 8.1.2]
- RQ.8.6** What do you understand by the terms budget and budgetary control? What are the advantages of budgetary control? [LO 8.2]

LOD: Medium

- RQ.8.7** 'If sales forecast is subject to error, then, there is no purpose of budgeting.' Do you agree? Also explain how a flexible budget can be used by management to help control costs. [LO 8.3]
- RQ.8.8** Why do responsible people in an organisation tend to accept budgetary control in theory but resist in practice? Explain. [LO 8.1.2]
- RQ.8.9** A manufacturing company operating a system of budgetary control finds that their production capacity during the year varies between 75 per cent and 90 per cent as against the budgeted capacity of 80 per cent for the year. It has been suggested that a system of flexible budgets should be introduced to effectively control costs. Outline the steps you would take to implement this suggestion keeping in mind that the management would still require periodic comparison with their overall budget during the year. [LO 8.3]
- RQ.8.10** Readymade Textiles Ltd. makes and sells baby suits. It has brisk sales in the October-December period as shown by the following sales budget (in units): [LO 8.3]

July	5,000	October	8,000
August	5,000	November	10,000
September	5,500	December	12,500

The firm's normal inventory policy has been to have a two months' supply of finished product on hand. The production manager has criticised the policy because it requires wide swings in production, which adds to costs. He estimates that unit-variable manufacturing cost is ₹2 higher than normal for each unit produced in excess of 9,000 units per month. The finance manager also supports the production manager on this. He estimates that it costs the firm ₹1 per unit in ending inventory, consisting of insurance, financing, and handling costs. He stresses that these costs are variable.

All the managers agree that the firm should have 22,500 units on hand by the end of October. The production manager wants to spread the required production equally over the four months.

- (i) Prepare a production budget for July-October following the firm's current policy. Inventory on July 1 is 10,000 units.
- (ii) Prepare a production budget using the production manager's preference.
- (iii) Determine which budget gives lower costs.

RQ.8.11 Lookahead Ltd. produces and sells a single product. Sales budget for the current calendar year by quarter is as under: [LO 8.3]

Quarter	Units to be sold
I	12,000
II	15,000
III	16,500
IV	18,000

The year is expected to open with an inventory of 4,000 units of finished product and close with an inventory of 6,500 units. Production is customarily scheduled to provide for two-thirds of the current quarter's sales demand plus one-third of the following quarter's demand. The standard cost details for one unit of the product is as follows:

Direct material, 10 lbs @ 50 paise per lb

Direct labour, 1 hour 30 minutes @ ₹4 per hour

Variable overheads, 1 hour 30 minutes @ ₹1 per hour

Fixed overheads, 1 hour 30 minutes @ ₹2 per hour based on a budgeted production volume of 90,000 direct labour-hours for the year.

- (i) Prepare a production budget, by quarters, showing the number of units to be produced and the total costs of direct material, direct labour, variable overheads and fixed overheads.
- (ii) If the budgeted selling price per unit is ₹17, what would be the budgeted profit for the year as a whole?
- (iii) In which quarter of the year is the company expected to break-even?

RQ.8.12 The demand for output of a certain company is very elastic and a modern plant recently installed is capable of greatly increased production. Output at present is 80,000 units per year, and 5 lakh units are estimated to be within the capacity of the new plant. The present selling price per unit is ₹15.

The need for flexible budgeting is recognised and six alternative levels of output, in addition to the present level, are contemplated. Six equal increments in annual output level, up to a maximum of 5,00,000 units, would involve corresponding reductions of ₹1 each in unit price to ₹9 per unit at the maximum output. [LO 8.3]

The present variable costs amount to ₹4,00,000. Fixed costs which at present amount to ₹2,00,000 are not expected to increase for any of the six alternative output levels contemplated. Semi-fixed cost are expected to vary from the present annual figure of ₹2,30,000 to ₹3,20,000, the upward steps being to ₹2,60,000 at 2,20,000 units, ₹2,80,000 at 3,60,000 units, and ₹3,20,000 at 5,00,000 units. The costs classified as variable at the six projected levels of output are calculated to be as follows:

₹7,50,000	₹11,00,000	₹15,00,000
17,50,000	20,50,000	25,00,000

RQ.8.13 Prepare the flexible budget and identify the volume which should be set for the budgeted output. Prepare a flexible budget from the following data made available in respect of a half-yearly period and forecast the working results at 70, 85, and 100 per cents of capacity when the respective sales are ₹50 lakh, ₹60 lakh, and ₹85 lakh. While fixed expenses remain constant, semi-variable expenses are constant between 55 and 75 per cent of capacity, increasing by 10 per cent between 75 and 90 per cent of capacity and by 20 per cent between 90 and 100 per cent of capacity. The expenses at 60 per cent capacity are as follows: (*Amount in lakh of rupees*) [LO 8.3]

<i>Semi-variable:</i>	Maintenance and repairs	1.25
	Indirect labour	5.00
	Sales department expenses	1.50
	Sundry overheads	1.25
<i>Variable:</i>	Material	12.00
	Labour	13.00
	Other expenses	2.00
<i>Fixed:</i>	Wages and salaries	4.20
	Rent, rates and taxes	2.80
	Depreciation	3.50
	Sundry overheads	4.50
		51.00

LOD: Difficult

RQ.8.14 Budgeting is profit planning. Elaborate this statement. What accounting devices would you use where output varies? [LO 8.2]

ANSWERS

RQ.8.10 (i) Product budget: July 5,500 units, August 8,000 units, September 10,000 units, October 12,500 units.

(ii) Monthly production 9,000 units.

(iii) Current budget provides lower costs (of ₹2,500).

RQ.8.11 (i) Production budget : Quarter I (13,000 units), Quarter II (15,500 units), Quarter III (17,000), Quarter IV (18,500 units)
Total cost: Quarter I (₹2,07,500) Quarter II (₹2,38,750),
Quarter III (₹2,57,500) Quarter IV (₹2,76,250)

(ii) Budgeted profit ₹96,750.

(iii) Quarter III (BEP = 40,000 units)

RQ.8.12 4,30,000 units; Budgeted profit is ₹17,70,000.

RQ.8.13 Budgeted loss at ₹5.5 lakh (at 70%), loss ₹3.15 lakh (at 85%), profit ₹14.20 lakh (at 100%).

OF CAPITAL**

Chapter 12

**ANALYSIS OF RISK AND
UNCERTAINTY**

It has been argued in Chapter 1 that financial management focuses not only on the procurement of funds but also on their efficient use with the objective of maximising the owner's wealth. The allocation of funds is, therefore, an important function of financial management. The allocation of funds involves the commitment of funds to assets and activities. It is also referred to as the investment decision, that is, making a choice regarding the assets in which funds will be invested. These assets fall into two broad categories: (i) short-term or current assets, and (ii) long-term or fixed assets. Accordingly, there are two types of investment decisions. The first is the short-term investment decision. It is also known as management of current assets or working capital management. The second type of decision is the long-term investment decision. This is widely known as capital budgeting or the capital expenditure decision. The various dimensions of working capital management are covered in detail in Part IV of this volume. This part is devoted to an in-depth and comprehensive discussion of capital budgeting/capital expenditure management decisions. Chapter 9 is concerned with the general principles of capital budgeting and evaluation techniques. Additional aspects of capital budgeting, namely, comparison of NPV and IRR, projects with unequal lives, capital rationing and inflation are described in Chapter 10. Cost of capital and the analysis of risk and uncertainty are examined subsequently in Chapters 11 and 12.

CHAPTER

9

Capital Budgeting I: Principles and Techniques

LEARNING OBJECTIVES

LO 9.1	Discuss the nature of capital budgeting
LO 9.2	Explain the relevant data requirement for capital budgeting decisions
LO 9.3	Describe, evaluate and interpret the traditional and time-adjusted capital budgeting evaluation techniques
LO 9.4	Summarise capital budget practices by Corporates in India

INTRODUCTION

This Chapter is devoted to a discussion of the principles and techniques of capital budgeting. The nature of capital budgeting in terms of meaning, importance, difficulties, rationale and types is discussed first. The identification of relevant data for capital budgeting decisions is explained subsequently. The chapter also examines the evaluation techniques. It also outlines the capital budgeting practices in India. The main points are summarised by way of recapitulation.

LO 9.1 NATURE OF CAPITAL BUDGETING

Meaning

Capital budgeting decisions pertain to fixed/long-term assets which by definition refer to assets which are in operation, and yield a return, over a period of time, usually, exceeding one year. They, therefore, involve a current outlay or series of outlays of cash resources in return for an anticipated flow of future benefits.¹ In other words, the system of capital budgeting is employed to evaluate expenditure decisions which involve current outlays but are likely to produce benefits over a period of time longer than one year. These benefits may be either in the form of increased revenues or reduced costs. **Capital expenditure** management, therefore, includes addition, disposition,

Capital expenditure is an outlay of funds that is expected to produce benefits over a period of time exceeding one year.

Capital budgeting is the process of evaluating and selecting long-term investments that are consistent with the goal of shareholders (owners) wealth maximisation.

CHAPTER
9

Capital Budgeting I:
Principles and
Techniques

- 1.1 Introduction
- 1.2 The Investment Decision
- 1.3 The Payback Period
- 1.4 Net Present Value
- 1.5 Internal Rate of Return

PROBLEMS

1. A firm is considering an investment in a new machine that will cost \$100,000 and will have a useful life of 5 years. The machine will generate cash flows of \$25,000 per year. The firm's cost of capital is 10%. Should the firm invest in the machine?

ANSWERS TO PROBLEMS

1. The net present value of the investment is calculated as follows:
$$NPV = -100,000 + \frac{25,000}{1.1} + \frac{25,000}{1.1^2} + \frac{25,000}{1.1^3} + \frac{25,000}{1.1^4} + \frac{25,000}{1.1^5}$$
$$NPV = -100,000 + 22,727.27 + 20,661.16 + 18,782.96 + 17,075.46 + 15,068.59$$
$$NPV = -100,000 + 83,615.44 = -16,384.56$$

Since the NPV is negative, the firm should not invest in the machine.

modification and replacement of fixed assets. From the preceding discussion may be deduced the following basic features of capital budgeting²: **(i)** potentially large anticipated benefits; **(ii)** a relatively high degree of risk; and **(iii)** a relatively long time period between the initial outlay and the anticipated returns. The term capital budgeting is used interchangeably with capital expenditure decision, capital expenditure management, long-term investment decision, management of fixed assets and so on.

Importance

Capital budgeting decisions are of paramount importance in financial decision making. In the first place, such decisions affect the profitability of a firm. They also have a bearing on the competitive position of the enterprise mainly because of the fact that they relate to fixed assets. The fixed assets represent, in a sense, the true earning assets of the firm. They enable the firm to generate finished goods that can ultimately be sold for profit. The current assets are not generally earning assets. Rather, they provide a buffer that allows the firms to make sales and extend credit. True, current assets are important to operations, but without fixed assets to generate finished products that can be converted into current assets, the firm would not be able to operate. Further, they are 'strategic' investment decisions as against 'tactical'—which involve a relatively small amount of funds. Therefore, such capital investment decisions may result in a major departure from what the company has been doing in the past. Acceptance of a strategic investment will involve a significant change in the company's expected profits and in the risks to which these profits will be subject. These changes are likely to lead stockholders and creditors to revise their evaluation of the company.³ Thus, capital budgeting decisions determine the future destiny of the company. An opportune investment decision can yield spectacular returns. On the other hand, an ill-advised and incorrect decision can endanger the very survival even of the large firms. A few wrong decisions and the firm may be forced into bankruptcy.

Secondly, a capital expenditure decision has its effect over a long time span and inevitably affects the company's future cost structure. To illustrate, if a particular plant has been purchased by a company to start a new product, the company commits itself to a sizable amount of fixed costs, in terms of labour, supervisors' salary, insurance, rent of building, and so on. If the investment turns out to be unsuccessful in future or yields less profit than anticipated, the firm will have to bear the burden of fixed costs unless it writes off the investment completely. In short, future costs, break-even point, sales and profits will all be determined by the selection of assets.

Thirdly, capital investment decisions, once made, are not easily reversible without much financial loss to the firm because there may be no market for second-hand plant and equipment and their conversion to other uses may not be financially viable.

Finally, capital investment involves costs and the majority of the firms have scarce capital resources. This underlines the need for thoughtful, wise and correct investment decisions, as an incorrect decision would not only result in losses but also prevent the firm from earning profits from other investments which could not be undertaken for want of funds.

Difficulties

Capital expenditure decisions are of considerable significance as the future success and growth of the firm depends heavily on them. But, they are beset with a number of difficulties.

Firstly, the benefits from investments are received in some future period. The future is uncertain. Therefore, an element of risk is involved. For instance, a decision to acquire an asset that is going to last for 15 years requires a 15-year forecast. A failure to forecast correctly will lead to serious errors which can be corrected only at a considerable expense. Future revenue involves estimating the size of the market for a product and the expected share of the firm in that. These estimates depend on a variety of factors, including price, advertising and promotion, and sales effort and so on. Adding to the uncertainties are the possibilities of shifts in consumer preferences, the actions of competitors, technological developments and changes in the economic or political environment.

Secondly, costs incurred and benefits received from the capital budgeting decisions occur in different time periods. They are not logically comparable because of the time value of money.

Thirdly, it is not often possible to calculate in strict quantitative terms all the benefits or the costs relating to a particular investment decision.

Rationale

The rationale underlying the capital budgeting decision is efficiency. Thus, a firm must replace worn and obsolete plants and machinery, acquire fixed assets for current and new products and make strategic investment decisions. This will enable the firm to achieve its objective of maximising profits either by way of increased revenues or cost reductions. The quality of these decisions is improved by capital budgeting. Capital budgeting decision can be of two types: (i) those which expand revenues, and (ii) those which reduce costs.

Investment Decisions Affecting Revenues Such investment decisions are expected to bring in additional revenue, thereby raising the size of the firm's total revenue. They can be the result of either expansion of present operations or the development of new product lines. Both types of investment decisions involve acquisition of new fixed assets and are income-expansory in nature in the case of manufacturing firms.

Investment Decisions Reducing Costs Such decisions, by reducing costs, add to the total earnings of the firm. A classic example of such investment decisions are the replacement proposals when an asset wears out or becomes outdated. The firm must decide whether to continue with the existing assets or replace them. The firm evaluates the benefits from the new machine in terms of lower operating cost and the outlay that would be needed to replace the machine. An expenditure on a new machine may be quite justifiable in the light of the total cost savings that result.

A fundamental difference between the above two categories of investment decision lies in the fact that cost-reduction investment decisions are subject to less uncertainty in comparison to the revenue-affecting investment decisions. This is so because the firm has a better 'feel' for potential cost savings as it can examine past production and cost data. However, it is difficult to precisely estimate the revenues and costs resulting from a new product line, particularly when the firm knows relatively little about the same.

Kinds

Capital budgeting process refers to the total process of generating, evaluating, selecting and following up on capital expenditure alternatives.⁴ The firm allocates or

- **Capital budgeting process**
- includes four distinct but interrelated steps used to evaluate and select long-term proposals: proposal generation, evaluation, selection and follow up.

budgets financial resources to new investment proposals. Basically, the firm may be confronted with three types of capital budgeting decisions: **(i)** the accept-reject decision; **(ii)** the mutually exclusive choice decision; and **(iii)** the capital rationing decision.

Accept reject decision is the evaluation of capital expenditure proposal to determine whether they meet the minimum acceptance criterion.

Accept-reject Decision This is a fundamental decision in capital budgeting. If the project is accepted, the firm would invest in it; if the proposal is rejected, the firm does not invest in it. In general, all those proposals which yield a rate of return greater than a certain required rate of return or cost of capital are accepted and the rest are rejected. By applying this criterion, all **independent projects** are accepted. Independent projects are projects that do not compete with one another in such a way that the acceptance of one precludes the possibility of acceptance of another. Under the accept-reject decision, all independent projects that satisfy the minimum investment criterion should be implemented.

Independent projects are projects whose cash flows are unrelated/independent of one another; the acceptance of one does not eliminate the others from further consideration.

Mutually Exclusive Project Decisions

Mutually exclusive projects (decisions) are projects that compete with one another; the acceptance of one eliminates the others from further consideration.

Mutually exclusive projects are those which compete with other projects in such a way that the acceptance of one will exclude the acceptance of the other projects. The alternatives are mutually exclusive and only one may be chosen. Suppose, a company is intending to buy a new folding machine. There are three competing brands, each with a different initial investment and operating costs. The three machines represent mutually exclusive alternatives, as only one of these can be selected. It may be noted here that the mutually exclusive project decisions are not independent of the accept-reject decisions. The project(s) should also be acceptable under the latter decision. In brief, in our example, if all the machines are rejected under the accept-reject decision, the firm should not buy a new machine. Mutually exclusive investment decisions acquire significance when more than one proposal is acceptable under the accept-reject decision. Then, some technique has to be used to determine the 'best' one. The acceptance of this 'best' alternative automatically eliminates the other alternatives.

Capital rationing is the financial situation in which a firm has only fixed amount to allocate among competing capital expenditures.

Capital Rationing Decision In a situation where the firm has **unlimited funds**, all independent investment proposals yielding return greater than some predetermined level are accepted. However, this situation does not prevail in most of the business firms in actual practice. They have a fixed capital budget. A large number of investment proposals compete for these limited funds. The firm must, therefore, ration them. The firm allocates funds to projects in a manner that it maximises long-run returns. Thus, **capital rationing** refers to a situation in which a firm has more acceptable investments than it can finance. It is concerned with the selection of a group of investment proposals out of many investment proposals acceptable under the accept-reject decision. Capital rationing employs ranking of the acceptable investment projects. The projects can be ranked on the basis of a predetermined criterion such as the rate of return. The projects are ranked in the descending order of the rate of return. This aspect has been developed further in Chapter 10.

Unlimited funds is the financial situation in which a firm is able to accept all independent projects that provide an acceptable return.

LO 9.2 DATA REQUIREMENT: IDENTIFYING RELEVANT CASH FLOWS

Cash Flows Vs Accounting Profit

Capital budgeting is concerned with investment decisions which yield return over a period of time in future. The foremost requirement for evaluation of any capital investment proposal is to estimate the future benefits accruing from the investment proposal. Theoretically, two alternative criteria are available to quantify the benefits: **(i)** accounting profit, and **(ii)** cash flows. The basic difference between them is primarily due to the inclusion of certain non-cash expenses in the profit and loss account, for instance, depreciation. Therefore, the accounting profit is to be adjusted for non-cash expenditures to determine the actual cash inflow. The cash flow approach of measuring future benefits of a project is superior to the accounting approach as cash flows are theoretically better measures of the net economic benefits of costs associated with a proposed project.

In the first place, while considering an investment proposal, a firm is interested in estimating its economic value. This economic value is determined by the economic outflows (costs) and inflows (benefits) related with the investment project. Only cash flows represent the cash transactions. The firm must pay for the purchase of an asset with cash. This cash outlay represents a foregone opportunity to use cash in some other productive alternatives. Consequently, the firm should measure the future net benefits in cash terms. On the other hand, under the accounting practices, the cost of the investment is allocated over its economic useful life in the nature of depreciation rather than at the time when costs are actually incurred. The accounting treatment clearly does not reflect the original need for cash at the time of inflows and outflows in later years. Only cash flows reflect the actual cash transactions associated with the project. Since investment analysis is concerned with finding out whether future economic inflows are sufficiently large to warrant the initial investment, only the cash flow method is appropriate for investment decision analysis.⁵

Secondly, the use of cash flows avoids accounting ambiguities. There are various ways to value inventory, allocate costs, calculate depreciation and amortise various other expenses. Obviously, different net incomes will be arrived at under different accounting procedures. But there is only one set of cash flows associated with the project. Clearly, the cash flow approach to project evaluation is better than the net income flow approach (accounting approach).

Thirdly, the cash flow approach takes cognisance of the time value of money whereas the accounting approach ignores it. Under the usual accounting practice, revenue is recognised as being generated when the product is sold, not when the cash is collected from the sale; revenue may remain a paper figure for months or years before payment of the invoice is received. Expenditure, too, is recognised as being made when incurred and not when the actual payment is made. Depreciation is deducted from the gross revenues to determine the before-tax earnings. Such a procedure ignores the increased flow of funds potentially available for other uses. In other words, accounting profits which are quite useful as performance measures often are less useful as decision criteria. Therefore, from the viewpoint of capital expenditure management, the cash flow approach can be said to be the basis of estimating future benefits from investment proposals. The data required for the purpose would be cash revenues and cash expenses. The difference between the cash flow approach and the accounting profit approach is depicted in Table 9.1.

The first of the year was a very dry one, and the crops were much injured by the drought. The weather was very hot, and the ground was very hard.

The second of the year was a very wet one, and the crops were much injured by the rain. The weather was very cold, and the ground was very soft.

The third of the year was a very dry one, and the crops were much injured by the drought. The weather was very hot, and the ground was very hard.

The fourth of the year was a very wet one, and the crops were much injured by the rain. The weather was very cold, and the ground was very soft.

The first of the year was a very dry one, and the crops were much injured by the drought. The weather was very hot, and the ground was very hard.

The second of the year was a very wet one, and the crops were much injured by the rain. The weather was very cold, and the ground was very soft.

The third of the year was a very dry one, and the crops were much injured by the drought. The weather was very hot, and the ground was very hard.

The fourth of the year was a very wet one, and the crops were much injured by the rain. The weather was very cold, and the ground was very soft.

TABLE 9.1 A Comparison of Cash Flow and Accounting Profit Approaches

Accounting Approach Towards 'Benefits'		Cash Flow Approach Towards 'Benefits'	
Revenues		₹1,000	₹1,000
Less: Expenses:			
Cash expenses	₹500		₹500
Depreciation	300	800	
Earnings before tax		200	
Taxes (0.35)		70	70
Net earnings after taxes/Cash flow		130	430

Table 9.1 shows that the accounting profits amounting to ₹130 are less than the cash flow (₹430). This difference can be attributed to the depreciation charge of ₹300. The cash available with the firm is ₹430. This can be utilised for further investment. The accounting approach indicates that only ₹130 is available and hence gives only a partial picture of the tangible benefits available. Clearly, such an approach does not bring out the total benefits of the project available for reinvesting. Therefore, in place of earnings, the cash flow information is employed in evaluating capital expenditure alternatives.

Incremental Cash Flow

Relevant cash flow is the incremental after-tax cash outflow (investment) and resulting subsequent inflows associated with a proposed capital expenditure.

The second aspect of the data required for capital budgeting relates to the basis on which the **relevant cash outflows** and inflows associated with proposed capital expenditure are to be estimated. The widely prevalent practice is to adopt incremental analysis. According to incremental analysis, only differences due to the decision need be considered. Other factors may be important but not to the decision at hand.⁶ For purposes of estimating cash flows in the analysis of investments, **incremental cash flows**, that is, those cash flows (and only those cash flows) which are directly attributable to the investment project are taken into account. It is for this reason that fixed overhead costs, which remain the same whether the proposal is accepted or rejected, are not considered. However, if there is an increase in them due to the new proposal, they must be considered.

Incremental cash flows are the additional cash flows (outflows as well as inflows) expected to result from a proposed capital expenditure.

Project may be referred to as a kind of "**mini firm**" with its own future revenues and costs, its own assets, its own earnings and its own cash flows⁷.

Effect of Taxes

Finally, the incremental cash flows are adjusted for tax liability. In other words, taxes paid are deducted from the cash flows to estimate the benefits arising out of the investment decision.

To conclude the above discussion relating to the data required for the capital budgeting decision, the expenses/costs to be considered are 'incremental after-tax cash flows'. Table 9.2 summarises the relevant and irrelevant information in relation to asset selection decisions.

TABLE 9.2 Relevant and Irrelevant Outflows

Relevant Cash Outflows	Irrelevant Cash Outflows
1. Variable labour expenses	1. Fixed overhead expense (existing)
2. Variable material expenses	2. Sunk costs
3. Additional fixed overhead expenses	
4. Cost of the investment	
5. Marginal taxes	

- **Sunk costs**
- are cash outflows
- that have already
- been made (i.e.,
- past outlays) and
- therefore have no
- effect on the cash
- flows relevant to a
- current decision.

Cash Flow Pattern

Cash flow pattern associated with capital investment projects can be classified as conventional or non-conventional.

Conventional Cash Flows They consist of an initial cash outlay followed by a series of cash inflows. Most of the capital expenditure decisions display this pattern of cash flow. To illustrate, the firm may spend ₹1,500 in time period zero and as a result may expect to receive a ₹300 cash inflow at the end of each year for the next 8 years. The conventional cash flow pattern is diagrammed in Fig. 9.1.

- **Conventional cash flow pattern**
- is an initial outflow
- followed by only a
- series of inflows.

Non-Conventional Cash Flows They refer to the cash flow pattern in which an initial cash outlay is not followed by a series of inflows. Alternating inflows and outflows and an inflow followed by outflows are examples of non-conventional cash flow patterns. A classic example of such cash flow patterns is that of the purchase of an asset that generates cash inflows for a period of years, is overhauled, and again generates a stream of cash inflows for a number of years. To illustrate, a machine purchased for ₹1,000 generates cash inflows of ₹250 each for five years. In the sixth year, an outlay of ₹400 is required to overhaul the machine, after which it generates cash inflows of ₹250 for four years. Such a non-conventional pattern of cash flows is shown in Fig. 9.2.

- **Non-conventional cash flow pattern**
- is a pattern in
- which an initial
- outflow is not
- followed by only a
- series of inflows.

		₹ 300	300	300	300	300	300	300	300

FIGURE 9.1 Conventional Cash Flow Pattern

Cash Flow Estimates

For capital budgeting cash flows have to be estimated. There are certain ingredients of cash flow streams.

				Years						

FIGURE 9.2 Non-conventional Cash Flow Pattern

Tax Effect It has been already observed that cash flows to be considered for purposes of capital budgeting are net of taxes. Special consideration needs to be given to tax effects on cash flows if the firm is incurring losses and, therefore, paying no taxes. The tax laws permit carrying losses forward to be set off against future income. In such cases, therefore, the benefits of tax savings would accrue in future years.

Effect on Other Projects Cash flow effects of the project under consideration, if it is not economically independent, on other existing projects of the firm must be taken into consideration. For instance, if a company is considering the production of a new product which competes with the existing products in the product line, it is likely that as a result of the new proposal, the cash flows related to the old product will be affected. Assume that there is a decline of ₹5,000 in the actual flow from the existing product. This should be taken into consideration while estimating the cash streams from the new proposal. In operational terms, the cash flow from the new product should be reduced by ₹5,000. This is in conformity with the general rule of the incremental cash flows which involves identifying changes in cash flows as a result of undertaking the project being evaluated. Clearly, the cash flow effects of the project should not be evaluated in isolation, if it affects other project(s) in any way.

Effect of Indirect Expenses Another factor which merits special consideration in estimating cash flows is the effect of overheads. The indirect expenses/overheads are allocated to the different products on the basis of wages paid, materials used, floor space occupied or some other similar common factor. The question that arises is: should such allocation of overheads be taken into account in the cash flows? The answer hinges upon whether the amount of overheads will change as a result of the investment decision. If yes, it should be taken into account. If, however, overheads will not change as a result of the investment decision, they are not relevant.

A company allocates overheads on the basis of the floor space used. Assume it intends to replace an old machine by a new one. Further assume that the new machine would occupy less space so that there would be a reduction in the overhead charged to it. Since there is no effect on cash flows, a change in the overhead is not relevant to the cash flow streams of the machine being acquired. But if the surplus space is used for an alternative use, and if any cash flow is generated, it will be relevant to the calculations. Thus, the deciding factor is whether there is any alternative use. The alternative use rule is a corollary of the incremental cash flow rule.⁸

Effect of Depreciation Depreciation, although a non-cash item of cost, is deductible expenditure in determining taxable income. Depreciation provisions are prescribed by the Companies Act for accounting purposes and by the Income Tax Act for taxation purposes.

The purpose of the provisions of depreciation contained in the Companies Act is the computation of managerial remuneration, dividend payment and disclosure in financial statements. Since companies in India are regulated by the Companies Act, they should provide depreciation in the books of accounts in accordance with Schedule XIV of the Act which prescribes the rate of depreciation for various types of depreciable assets on written down value (WDV) basis as well as straight line basis. It also permits companies to charge depreciation on any other basis provided it has the effect of writing off 95 per cent of the original cost of the asset on the expiry of the specified period and has the approval of the government. In actual practice, however, companies follow the provisions of the Income Tax Act with the basic objectives of its tax deductibility.

- **Depreciation**
- is a non-cash
- expense that affects
- the taxes paid in
- cash.

The provisions of Income Tax Act relating to depreciation are contained in Section 32. The section envisages three important conditions for following depreciation, namely, (i) the asset is owned by the assessee, (ii) the asset is used by the assessee for the purpose of business and (iii) the asset is in the form of buildings, furniture, machinery and plants including ships, vehicles, books, scientific apparatus, surgical equipments and so on.

The amount of annual depreciation on an asset is determined by (a) the actual cost of the asset and (b) its classification in the relevant block of assets. The actual cost means the cost of acquisition of the asset and the expenses incidental thereto which are necessary to put the asset in a usable state, for instance, freight and carriage inwards, installation charges and expenses incurred to facilitate the use of the asset like expenses on the training of the operator or on essential construction work.

- **Block of assets**
- are assets which
- fall in the same
- class and in respect
- of which the
- same depreciation
- rate is applicable
- irrespective of their
- nature.

Depreciation is charged, with a view to simplify computation, not on an individual asset but on a block of assets. A **block of assets** defined as a group of assets falling within a class of assets, being building, machinery, plant or furniture in respect of which the same rate of depreciation is prescribed. Thus, assets which fall within the same class of assets and in respect of which the same percentage/rate of depreciation has been prescribed irrespective of their nature form one block of assets. For example, all assets under the category of plant and machinery which qualify for depreciation at 15 per cent will form one block and depreciation is computed with reference to the actual cost of the block. Similarly, assets depreciable at 40 per cent will constitute another block; a third block consists of assets depreciable at 50 per cent, and the fourth block comprises assets subject to a 100 per cent write-off.

Depreciation is computed at block-wise rates on the basis of written down value (WDV) method only. Presently, the block-wise rates for plant and machinery are at 15 per cent, 20 per cent, 30 per cent, 40 per cent, 50 per cent, 60 per cent, 80 per cent and 100 per cent. The depreciation allowance on office buildings and furniture and fittings is 10 per cent. If an asset acquired during a year has been used for a period of less than 180 days during the year, depreciation on such assets is allowed only at 50 per cent of the computed depreciation according to the relevant rate.

Apart from the simplification of the computation of the amount of depreciation, a significant implication of categorising assets into blocks is that if an asset falling in a block is sold out, there is no capital gain or terminal depreciation or balancing charge. The sale proceeds of the asset are reduced from the WDV of the block. Capital gain/loss can arise in these situations:

- (i) When the sale proceeds exceeds the WDV of the whole block;
- (ii) When the entire block is sold out; and
- (iii) In case of 100 per cent depreciable assets.

The terminal loss is not allowed in the relevant assessment year but is spread over a number of years to be allowed by way of depreciation.

In case of insufficiency/absence of profit, unabsorbed depreciation can be set off against income under any head against business income as in the case of unabsorbed loss.

The mechanics of computation of depreciation is illustrated in Example 9.1.

Example 9.1

Assume the following facts relating to Avon Ltd (AL):

Block of Assets	Depreciation Rate (percentage)	WDV as on 1.4.20X7 (₹ lakh)	Addition During 20X7-8 (₹ lakh)
A	25	500	250
B	40	300	150

Assets sold during 20X7-8 amounted to ₹35 lakh (Block A) and ₹50 lakh (Block B). It is expected that fresh investments in assets during 20X8-9 will be: Block A (₹160 lakh) and Block B (₹80 lakh). It is also projected by the AL that disinvestment proceeds from the assets will amount to ₹45 lakh in case of Block A and ₹25 lakh in case of Block B. Assume that about 50 per cent of additional investment during 20X8-9 will be made after September 20X8.

Compute the relevant depreciation charge for 20X7-8 and the projected depreciation charge for 20X8-9.

Solution

The relevant depreciation charge for 20X7-8 and the projected depreciation charge for 20X8-9 is calculated in Tables 9.3 and 9.4 respectively.

TABLE 9.3 Computation of Depreciation Charge During 20X7-8

Particulars	Blocks	
	A	B
1. WDV as on 1.4.20 X7	500	300
2. Add: Cost of assets acquired during 20 X7 - 8	250	150
	750	450
3. Less: Sales during 20 X7 - 8	35	50
4. WDV (for depreciation)	715	400
5. Depreciation allowance	179	160
6. WDV as on 1.4. 20 X8	536	240

TABLE 9.4 Computation of Depreciation Charge During 20X8–9

(₹ lakh)

Particulars	Blocks	
	A	B
1. WDV as on 1.4.20X8	536	240
2. Add: Cost of assets acquired during 20X8–9	160	80
	<u>696</u>	<u>320</u>
3. Less: Expected proceeds of sales during 20X8–9	45	25
4. WDV (for depreciation)	651	295
5. Depreciation allowance [®]	153	110
6. WDV as on 1.4. 20X9	<u>498</u>	<u>185</u>
®Normal depreciation allowance	163	118
Less: Depreciation allowance inadmissible in respect of assets acquired after 30.9.20X8	10	8
	<u>(80 × 0.25 × 0.5)</u>	<u>(40 × 0.4 × 0.5)</u>
	<u>153</u>	<u>110</u>

Note: If the entire block of assets is sold during a year for an amount exceeding (1 + 2) or the sale proceeds of the block sold is higher than (1 + 2), the difference represents short-term capital gains subject to tax. Where the sale proceeds are lower than (1 + 2), the difference is short-term capital loss and the AL is entitled to tax shield.

In case block consists of a single asset (e.g. plant and machinery), **no depreciation is to be charged in the terminal year in which it is sold**. The difference between the written down value (WDV) of the machine at the beginning of the year and its sale proceeds represents short-term capital gain (when sale proceeds exceeds written down value/book value of the machine) and short-term capital loss (in case the book value exceeds sale proceeds/salvage value). Such short-term capital gains (STCG) and losses (STCL) have been accorded **special tax treatment**. The STCL can be set off only against STCG or long-term capital gains. In case of inadequate/no profits, the STCL can be carried forward upto eight assessment years.

To illustrate the implication of the tax provisions for capital budgeting, let us assume, a company buys a new machine for ₹10 lakh (forming a separate block). The machine is subject to 20 per cent depreciation on WDV basis. It is expected to have economic useful life of 5 years at the end of which its expected salvage value is ₹1 lakh.

The depreciation in the first four years would be ₹2 lakh, ₹1.6 lakh, ₹1.28 lakh and ₹1.024 lakh respectively. The accumulated depreciation would be ₹5.90 lakh. As a result, the WDV/book value of the machine at the beginning of year-5 would be ₹4.10 lakh. With no depreciation charged in year-5 and sale proceeds of ₹1 lakh, there would be short-term capital loss of ₹3.10 lakh. This loss, in turn, would yield tax shield. Assuming 30 per cent tax rate and adequate STCG in year 5, the tax shield is (₹3.10 lakh × 0.30) ₹92,880. This amount would be reckoned as **cash inflow in year 5**.

The tax shield would be ₹92,880 in financial accounting also. It would consist of two components: (i) depreciation in year 5, ₹81,920 (0.20 × ₹4,09,600) and (ii) loss on sale of machine ₹2,27,680 (₹4,09,600 – ₹1,00,000 – ₹81,920). The tax advantage on depreciation would be ₹24,576 (0.30 × ₹81,920) and on loss ₹68,304 (0.30 × ₹2,27,680). The total (₹24,576 + ₹68,304) is ₹92,880. Thus, the firm does not suffer any loss by not charging depreciation in the terminal year (as per income-tax requirement).

In case block consists of several assets (plants/machinery/equipments), depreciation is charged in the terminal year in which the machine is sold on its **closing balance** (written down value at the beginning of year of sales – sale value). The terminal loss is allowed to be carried forward to be charged as depreciation in subsequent years (though the asset does not exist). This tax provision implies that the terminal loss would provide tax shield in the subsequent years.

To illustrate, continuing with the present example, assuming the machine purchased for ₹10 lakh is one of several machines, depreciation charged in year 5 would be on ₹3,09,600 (₹4,09,600 – ₹1,00,000, sale value) at 20 per cent, that is, ₹61,920. The terminal loss due to sale of machine is (₹3,09,600 – ₹61,920) ₹2,47,680. This loss in terms of unabsorbed depreciation would provide tax advantage in future years.

In practice, as the block is likely to consist of several machines for manufacturing firms, the tax provision puts business firms at disadvantage as the tax advantage on terminal loss is available in a number of years and not in single year.

Working Capital Effect Working capital constitutes another important ingredient of the cash flow stream which is directly related to an investment proposal. The term **working capital** is used here in net sense, that is, current assets minus current liabilities (**net working capital**). If an investment is expected to increase sales, it is likely that there will be an increase in current assets in the form of accounts receivable, inventory and cash. But part of this increase in current assets will be offset by an increase in current liabilities in the form of increased accounts and notes payable. Obviously, the sum equivalent to the difference between these additional current assets and current liabilities will be needed to carry out the investment proposal. Sometimes, it may constitute a significant part of the total investment in a project. The increased working capital forms part of the initial cash outlay. The additional net working capital will, however, be returned to the firm at the end of the project's life. Therefore, the recovery of working capital becomes part of the cash inflow stream in the terminal year. The initial investment in, and the subsequent recovery of, working capital do not balance out each other due to the time value of money.

Net working capital change is the difference between change in current assets and change in current liabilities.

The increase in the working capital may not only be in the zero time period, that is, at the time of initial investment. There can be continuous increase in the working capital as sales increase in later years. This increase in working capital should be considered as cash outflow of the year in which additional working capital is required.

Suppose, there is a project that requires an initial investment of ₹20,000 and has a useful life of 5 years. The requirements of working capital are detailed in Table 9.5.

TABLE 9.5 Working Capital Requirements

Particulars	Year					
	0	1	2	3	4	5
(a) Initial investment	₹20,000					
Sales		₹5,000	₹10,000	₹20,000	₹15,000	₹0
Expenses		1,000	2,000	5,000	4,000	500
(b) Changes in inventory (decrease)		1,000	2,000	6,000	(4,000)	(5,000)
(c) Changes in receivables		1,000	2,000	4,000	(2,000)	(5,000)
(d) Changes in payables		1,500	2,000	5,000	(3,500)	(5,500)
(e) Change in net working capital (b + c - d)		500	2,000	5,000	(2,500)	(4,500)

The changes in the net working capital are given in the last row of Table 9.5. The net working capital has increased in years 1, 2 and 3 representing cash outflows, while it has decreased in years 4 and 5 showing cash inflows as working capital is recovered.

Almost all revenue-expansion capital investment proposals require additional working capital. Likewise, almost all cost-reduction capital investment projects release the existing amount of working capital. Such projects enhance the firm's efficiency in such a way that the amount of inventory on hand or accounts receivable can be reduced. Improved inventory control systems or improved billing and collection systems are some classic examples. From the point of view of evaluating an investment project, the amount of working capital so released should be seen as a cash inflow in the zero time period (when the investment proposal is being considered), reducing the net cash investment required for the project. In the terminating year of the project, it should be treated as a cash outflow and adjusted against the cash inflow of that year.

Conventionally, the amount invested in net working capital at the time of starting the project as well as in subsequent years is assumed to have been recovered fully by the terminal year. In reality, the firm would most probably recover less than 100 per cent primarily because of bad debts and inventory loss. Therefore, the working capital recovered would be less than 100 per cent (say, 95 per cent). Accordingly, the cash inflow due to recovery of working capital in terminal year should be taken at less than 100 per cent amount.⁹ Moreover, **for convenience**, it is assumed that net working capital is recovered instantaneously on termination of the project. In practice, however, it may take several months of the following year to recover it.¹⁰

Finally, tax considerations would not be involved when the net working capital recovered is less than 100 per cent¹¹ because bad debt loss due to some uncollectible debtors and loss due to obsolete inventory are already reckoned in operating costs.

Determination of Relevant Cashflows

The data requirement for capital budgeting are cash flows, that is, outflows and inflows. Their computation depends on the nature of the proposal. Capital projects can be categorised into: (i) single proposal, (ii) replacement situations and (iii) mutually exclusive.

Single Proposal The cash outflows, comprising cash outlays required to carry out the proposed capital expenditure are depicted in Format 9.1, while the computation of the cash inflows after taxes (CFAT) is shown in Format 9.2. The computation is illustrated in Example 9.2 and Example 9.3.

FORMAT 9.1 Cash Outflows of New Project [Beginning of the Period at Zero Time ($t = 0$)]

- (1) Cost of new project
- (2) + Installation cost of plant and equipments
- (3) \pm Working capital requirements

FORMAT 9.2 Determination of Cash Inflows: Single Investment Proposal ($t = 1 - N$)

Particulars	Years					
	1	2	3	4	N
Cash sales revenues						
Less: Cash operating cost						
Cash inflows before taxes (CFBT)						
Less: Depreciation						
Taxable income						
Less: Tax						
Earning after taxes						
Plus: Depreciation						
Cash inflows after tax (CFAT)						
Plus: Salvage value (in n th year)						
Plus: Recovery of working capital (in n th year)						

Example 9.2

An iron ore company is considering investing in a new processing facility. The company extracts ore from an open pit mine. During a year, 1,00,000 tonnes of ore is extracted. If the output from the extraction process is sold immediately upon removal of dirt, rocks and other impurities, a price of ₹1,000 per ton of ore can be obtained. The company has estimated that its extraction costs amount to 70 per cent of the net realisable value of the ore.

As an alternative to selling all the ore at ₹1,000 per tonne, it is possible to process further 25 per cent of the output. The additional cash cost of further processing would be ₹100 per ton. The proposed ore would yield 80 per cent final output, and can be sold at ₹1,600 per ton.

For additional processing, the company would have to instal equipment costing ₹100 lakh. The equipment is subject to 20 per cent depreciation per annum on reducing balance (WDV) basis/method. It is expected to have useful life of 5 years. Additional working capital requirement is estimated at ₹10 lakh. The company's cut-off rate for such investments is 15 per cent. Corporate tax rate is 35 per cent.

Assuming there is no other plant and machinery subject to 20 per cent depreciation, should the company instal the equipment if (a) the expected salvage is ₹10 lakh, (b) there would be no salvage value at the end of year 5 and (c) for tax purposes, the firm would have sufficient short-term capital gains in year 5.

Solution**Financial Evaluation Whether to Instal Equipment for Further Processing of Iron Ore****(A) Cash Outflows**

Cost of equipment	₹ 1,00,00,000
Plus: Additional working capital	10,00,000
	<u>1,10,00,000</u>

(B) Cash Inflows (CFAT)

Particulars	Year				
	1	2	3	4	5
Revenue from processing [(₹1,600 × 20,000) – ₹1,000 × 25,000]	₹ 70,00,000	₹ 70,00,000	₹ 70,00,000	₹ 70,00,000	₹ 70,00,000

(Contd)

Less: Processing costs:					
Cash costs (₹100 × 25,000 tons)	25,00,000	25,00,000	25,00,000	25,00,000	25,00,000
Depreciation (working note 1)	20,00,000	16,00,000	12,80,000	10,24,000	—
Earnings before taxes	25,00,000	29,00,000	32,20,000	34,76,000	45,00,000
Less: Taxes (0.35)	8,75,000	10,15,000	11,27,000	12,16,600	15,75,000
Earnings after taxes (EAT)	16,25,000	18,85,000	20,93,000	22,59,400	29,25,000
Add: Depreciation	20,00,000	16,00,000	12,80,000	10,24,000	—
CFAT	36,25,000	34,85,000	33,73,000	32,83,400	29,25,000

Working Notes**1 Depreciation Schedule**

Year	Depreciation base of equipment	Depreciation @ 20% on WDV
1	₹ 1,00,00,000	₹ 20,00,000
2	80,00,000	16,00,000
3	64,00,000	12,80,000
4	51,20,000	10,24,000
5	40,96,000	Nil [@]

[@]As the block consists of a single asset, no depreciation is to be charged in the terminal year of the project.

(C) (a) Determination of NPV (Salvage Value = ₹10 lakh)

Year	CFAT	PV factor (0.15)	Total PV
1	₹ 36,25,000	0.870	₹ 31,53,750
2	34,85,000	0.756	26,34,660
3	33,73,000	0.658	22,19,434
4	32,83,400	0.572	18,78,105
5	29,25,000	0.497	14,53,725
Salvage value	10,00,000	0.497	4,97,000
Tax benefit on short-term capital loss	10,83,600 b	0.497	5,38,549
Recovery of working capital	10,00,000	0.497	4,97,000
Gross present value			1,28,72,223
Less: Cash outflows			1,10,00,000
Net present value (NPV)			18,72,223

(b) $0.35 \times (\text{₹}40,96,000 - \text{₹}10,00,000) = \text{₹}10,83,600$.

Recommendation The company is advised to instal the equipment as it promises a positive NPV.

(D) Determination of NPV (Salvage Value = Zero)

PV of operating CFAT (1 – 5 years)	₹ 1,13,39,674
Add: PV of tax benefit on short term capital loss (₹40,96,000 × 0.35 = ₹14,33,600 × 0.497, PV factor)	7,12,499
Add: PV of recovery of working capital	4,97,000
Total present value	1,25,49,173
Less: Cash outflows	1,10,00,000
NPV	15,49,173

Since the NPV is still positive, the company is advised to instal the equipment.

IN SENATE, January 10, 1911.

REPORT OF THE COMMISSIONERS OF THE LAND OFFICE, IN ANSWER TO A RESOLUTION PASSED BY THE SENATE, APRIL 11, 1907.

ALBANY: J. B. LIPPINCOTT COMPANY, PRINTERS, 1911.

THE COMMISSIONERS OF THE LAND OFFICE have the honor to acknowledge the receipt of a copy of the report of the COMMISSIONERS OF THE LAND OFFICE, IN ANSWER TO A RESOLUTION PASSED BY THE SENATE, APRIL 11, 1907, and to state that the same has been read and approved by the COMMISSIONERS of the LAND OFFICE.

IN WITNESS WHEREOF, the COMMISSIONERS OF THE LAND OFFICE have hereunto set their hands and the seal of the office, at Albany, this 10th day of January, 1911.

42 Tax Benefit on short-term capital loss							1,083,600	
43								

Enter the years in cells B1 to G1 starting with year 0. Enter the input in cells B2 to B12.

Enter $=-B2$ in cell B14, $=-B3$ in cell B15 for investment in equipment and working capital respectively. Enter $=SUM(B14:B15)$ in cell B16 to calculate the total initial investment.

Enter the formula $=(B4*B6*B7)-(B4*B5)$ in cell C17 and copy the formula in cells D17 to G17 to calculate revenue for all years. Enter the formula $=B4*B8$ in cell C18 and copy the formula to cells D18 to G18 to calculate the processing cost.

Depreciation is worked out in cells C33 to G34. For calculating depreciation enter =B2 in cell C33. Enter the formula =C33*\$B10 in cell C34. Enter =C33-C34 in cell D33 and copy it to cells E33 to G33. Also copy the formula in cell C34 to cells D34 to G34. The Depreciation figures are carried to cells C19 to G19. This is done by entering =C34 in cell C19 and it is copied in cells D19 to G19.

To calculate earnings before taxes, enter =C17-C18-C19 in cell C20 and copy the formula to cells D20 to G20.

To calculate taxes, enter = C20*\$B9 in cell C21 and copy to cells D21 to G21.

To calculate earnings after taxes, enter =C20-C21 in cell C22 and copy to cells D22 to G22.

To calculate operating CFAT, enter =C22+C19 in cell C23 and copy to cells D23 to G23.

Salvage value is entered in cells G24 by entering =B11

Tax benefit on short-term capital loss is worked out in cells G37 to G40. Enter =G33 in cell G37 and =B11 in cell G38. Short-term capital loss is calculated in cell G39 by entering =G37-G38. Tax benefit on short-term capital loss is calculated in cell G40 by entering =G39*B9. This benefit is carried to cell G25 by entering =G40 in cell G25.

Working capital released is entered in cell G26 by providing reference to cell B15 by entering =B15 in cell G26.

Year-wise CFAT are calculated in row 27 by entering =sum(C23:G26) in cell C27 and copying it to cells D27 to G27.

NPV is calculated in cell B28 by entering =NPV(B12, C27:G27)+B16. **(The difference in NPV is due to approximations).**

When Salvage Value is Zero

In case, the salvage value of the equipment is zero, only one change is required in spreadsheet. Enter 0 in cell B11 instead of 1,000,000. The spreadsheet will calculate the new NPV.

Example 9.3

For the company in Example 9.2, assume there are other plants and machinery subject to 20 per cent depreciation (i.e. in the same block of assets). What course of action should the company choose?

Solution

- (a) Cash outflows would remain unchanged.
- (b) The annual depreciation will also remain the same for the first 4 years: In year 5, the depreciation = ₹30,96,000 (opening WDV of equipment, ₹40,96,000 – ₹10,00,000, salvage value) × 0.20 = ₹6,19,200.
- (c) The CFAT (operating) for years, 1-4 will not change. In year 5, it will be shown as below:

Particulars	CFAT ($t = 5$)
Revenue from processing	₹70,00,000
Less: Processing costs:	
Cash costs	25,00,000
Depreciation	6,19,200
Earning before taxes	38,80,800
Less: Taxes (0.35)	13,58,280
EAT	25,22,520
CFAT	31,41,720

Determination of NPV (Salvage Value = ₹10 lakh)

Year	CFAT	PV factor	Total PV
1	₹36,25,000	0.870	₹31,53,750
2	34,85,000	0.756	26,34,660
3	33,73,000	0.658	22,19,434
4	32,83,400	0.572	18,78,105
5	31,41,720	0.497	15,61,435
Salvage value	10,00,000	0.497	4,97,000
Recovery of working capital	10,00,000	0.497	4,97,000
Gross present value			1,24,41,384
Less: Cash outflows			1,10,00,000
Net present value (NPV)			14,41,384 [®]

[®]In fact, the NPV of the equipment is likely to be higher as tax advantage will accrue on the eligible depreciation of ₹24,76,800, i.e. (₹30,96,000 – ₹6,19,200) in future years.

Recommendation The company should instal the equipment.

Determination of NPV (Salvage Value = 0)

- (i) For the first 4 years, depreciation amount will remain unchanged. In the fifth year, depreciation = ₹40,96,000 (₹40,96,000, opening WDV less zero salvage value) × 0.20 = ₹8,19,200.
- (ii) Operating CFAT for years 1 – 4 will remain unchanged. The CFAT for 5th year would be ₹32,11,720 as shown below:

Revenues from processing	₹70,00,000
Less: Processing costs (₹25,00,000 + ₹8,19,200)	33,19,200
EBIT	36,80,800
Less: Taxes (0.35)	12,88,280
EAT	23,92,520
Add: Depreciation	8,19,200
CFAT	32,11,720
(iii) PV of operating CFAT (1 – 4 years)	98,85,949
Add: PV of operating CFAT (5th year) (₹32,11,720 × 0.497)	15,96,225
Add: PV of recovery of working capital	4,97,000
Total PV	1,19,79,174
Less: Cash outflows	1,10,00,000 [®]
NPV	9,79,174

[®]In effect, NPV would be higher as tax advantage will accrue on depreciation of ₹32,76,800 in future years.

Recommendation The decision does not change, as NPV is positive.

Replacement Situation In the case of replacement of an existing machine (asset) by a new one, the relevant cash outflows are after-tax incremental cash flows. If a new machine is intended to replace an existing machine, the proceeds so obtained from its sale reduce cash outflows required to purchase the new machine and, hence, part of relevant cash flows. The calculation of after-tax incremental cash outflows is illustrated in Format 9.3 and Format 9.4 which provide depreciation base in the case of replacement situations.

FORMAT 9.3 Cash Outflows in a Replacement Situation

1. Cost of the new machine
2. + Installation Cost
3. ± Working Capital
4. – Sale proceeds of existing machine

FORMAT 9.4 Depreciation Base of New Machine in a Replacement Situation

1. WDV of the existing machine
2. + Cost of the acquisition of new machine (including installation costs)
3. – Sale proceeds of existing machine

The computation is illustrated in Example 9.4.

Example 9.4

Royal Industries Ltd is considering the replacement of one of its moulding machines. The existing machine is in good operating condition, but is smaller than required if the firm is to expand its operations. It is 4 years old, has a current salvage value of ₹2,00,000 and a remaining life of 6 years. The machine was initially purchased for ₹10 lakh and is being depreciated at 20 per cent on the basis of written down value method.

The new machine will cost ₹15 lakh and will be subject to the same method as well as the same rate of depreciation. It is expected to have a useful life of 6 years, salvage value of ₹1,50,000 at the sixth year end. The management anticipates that with the expanded operations, there will be a need of an additional net working capital of ₹1 lakh. The new machine will allow the firm to expand current operations and thereby increase annual revenues by ₹5,00,000; variable cost to volume ratio is 30 per cent. Fixed costs (excluding depreciation) are likely to remain unchanged.

The corporate tax rate is 35 per cent. Its cost of capital is 10 per cent. The company has several machines in the block of 20 per cent depreciation.

Should the company replace its existing machine? What course of action would you suggest, if there is no salvage value?

Solution**Financial Evaluation Whether to Replace Existing Machine****(A) Cash Outflows (Incremental)**

Cost of the new machine	₹15,00,000
Add: Additional working capital	1,00,000
Less: Sale value of existing machine	2,00,000
	14,00,000

(B) Determination of Incremental CFAT (Operating)

Year	Incremental contribution ^a	Incremental depreciation ^b	Taxable income	Taxes (0.35)	EAT [Col.4 – Col.5]	CFAT [Col.6 + Col.3]
1	2	3	4	5	6	7
1	₹3,50,000	₹2,60,000	₹90,000	₹31,500	₹58,500	₹3,18,500
2	3,50,000	2,08,000	1,42,000	49,700	92,300	3,00,300
3	3,50,000	1,66,400	1,83,600	64,260	1,19,340	2,85,740
4	3,50,000	1,33,120	2,16,880	75,908	1,40,972	2,74,092
5	3,50,000	1,06,496	2,43,504	85,226	1,58,278	2,64,774
6	3,50,000	55,197	2,94,803	1,03,181	1,91,622	2,46,819

^a₹5,00,000 – [₹5,00,000 × 0.30, variable cost to value (V/V) ratio] = ₹3,50,000

^b(Working note)

Working Notes

1. Incremental Depreciation ($t = 1 - 6$)

Year	Incremental asset cost base	Depreciation (20% on WDV)
1	₹13,00,000	₹2,60,000
2	10,40,000	2,08,000
3	8,32,000	1,66,400
4	6,65,600	1,33,120
5	5,32,480	1,06,496
6	4,25,984	55,197 ^c

^c $0.20 \times (\text{₹}4,25,984 - \text{₹}1,50,000, \text{ salvage value}) = \text{₹}55,197$

2. (i) Written Down Value (WDV) of Existing Machine at the Beginning of the Year 5

Initial cost of machine	₹10,00,000
Less: Depreciation @ 20% in year 1	2,00,000
WDV at beginning of year 2	8,00,000
Less: Depreciation @ 20% on WDV	1,60,000
WDV at beginning of year 3	6,40,000
Less: Depreciation @ 20% on WDV	1,28,000
WDV at beginning of year 4	5,12,000
Less: Depreciation @ 20% on WDV	1,02,400
WDV at beginning of year 5	4,09,600

(ii) Depreciation Base of New Machine

WDV of existing machine	4,09,600
Add: Cost of the new machine	15,00,000
Less: Sale proceeds of existing machine	2,00,000
	17,09,600

(iii) Base for Incremental Depreciation

Depreciation base of a new machine	17,09,600
Less: Depreciation base of an existing machine	4,09,600
	13,00,000

(C) Determination of NPV (Salvage Value = ₹1.50 lakh)

Year	CFAT	PV factor (0.10)	Total PV
1	₹3,18,500	0.909	₹2,89,517
2	3,00,300	0.826	2,48,048
3	2,85,740	0.751	2,14,591
4	2,74,092	0.683	1,87,205
5	2,64,774	0.621	1,64,424
6	2,46,819	0.564	1,39,206
6 Salvage value	1,50,000	0.564	84,600
6 Recovery of working capital	1,00,000	0.564	56,400
Gross present value			13,83,991
Less: Cash outflows			14,00,000
Net present value			(16,009)

Recommendation Since the NPV is negative, the company should not replace the existing machine. However, in effect, the NPV is likely to be positive as tax advantage will accrue on the eligible depreciation of ₹2,19,803 (₹4,25,984 – ₹1,50,000 – ₹55,197) in the future years.

Determination of NPV (Salvage Value = Zero)

(i) For the first 5 years, depreciation will remain unchanged. In the sixth year, it will be	
= ₹4,25,984 × 0.20 = ₹85,197.	
(ii) Operating CFAT for years 1–5 will remain unchanged.	
CFAT for year 6 would be:	
Incremental contribution	₹3,50,000
Less: Incremental depreciation	85,197
Taxable income	2,64,803
Less: Taxes (0.35)	92,681
EAT	1,72,122
Add: Depreciation	85,197
CFAT	2,57,319
(iii) PV of operating CFAT (1 – 5 years)	
Add: PV of operating CFAT (6th year) (₹2,57,319 × 0.564)	1,45,128
Add: PV of working capital	56,400
Total present value	13,05,313
Less: Cash outflows	14,00,000
NPV	(94,687)

Recommendation Since the NPV is negative, the existing machine should not be replaced.

SPREADSHEET SOLUTION

(See the excel sheet screen shot on next page)

Enter the inputs in cells B1 to B11

Enter the years in row 16, starting with year 0.

Enter =-B1 in cell B17, =-B6 in cell B18 and =B3 in cell B19 for investment in equipment, working capital and salvage value of existing equipment respectively. Enter =SUM(B17:B19) in cell B20 to calculate the total initial investment.

Enter the formula =B7 in cell C21 and copy the formula in cells D21 to H21 to calculate incremental revenue for all years. Enter the formula =C21*B8 in cell C22 and copy the formula to cells D22 to H22 to calculate the incremental variable cost.

Depreciation is worked out in cells B38 to H42. For calculating depreciation, enter =B2*(1-B9)^B4 in cell B38. Enter the formula =B18+B1-B3 in cell B39. Enter =B39-B38 in cell B40 and copy it to cell C40. Enter =C40*B9 in cell C41 and copy the formula in cells D41 to H41. Enter =C40-C41 in cell C42 and copy the formula in cell D42 to H42. The depreciation figures are carried to cells C23 to H23. This is done by entering =C41 in cell C23 and it is copied in cell D23 to H23.

To calculate taxable income, enter =C21-C22-C23 in cell C24 and copy the formula to cells D24 to H24.

To calculate taxes, enter =C24*B11 in cell C25 and copy to cells D25 to H25.

To calculate earnings after taxes, enter =C24-C25 in cell C26 and copy to cells D26 to H26.

To calculate operating CFAT, enter =C26+C23 in cell C28 and copy to cells D28 to H28.

Salvage value is entered in cell H29 by entering =B5

Working capital released is entered in cell H28 by providing reference to cell B6 by entering =B6 in cell H28

Year-wise CFAT are calculated in row 30 by entering =SUM(C27:C29) in cell C30 and copying it to cells D30 to H30.

NPV is calculated in cell B31 by entering =NPV(B10, C30:H30)+B20. **(The difference in NPV is due to approximations).**

Section 1

Income Statement

Account	1954	1953
Net Sales	100.00	95.00
Cost of Goods Sold	(40.00)	(38.00)
Gross Profit	60.00	57.00
Operating Expenses	(20.00)	(19.00)
Operating Income	40.00	38.00
Other Income	5.00	4.00
Income Before Taxes	45.00	42.00
Taxes	(10.00)	(9.00)
Net Income	35.00	33.00

Balance Sheet

Account	1954	1953
Assets		
Current Assets	80.00	75.00
Fixed Assets	20.00	20.00
Total Assets	100.00	95.00
Liabilities and Equity		
Current Liabilities	30.00	28.00
Long-Term Liabilities	10.00	10.00
Equity	60.00	57.00
Total Liabilities and Equity	100.00	95.00

Continuation of the financial report for the year 1954. This section details the company's performance and financial position.

Statement of Cash Flows

Account	1954	1953
Operating Activities	30.00	28.00
Investing Activities	(10.00)	(10.00)
Financing Activities	15.00	15.00
Net Change in Cash	35.00	33.00

Summary of the financial report for the year 1954.

Notes

1. The company has adopted the accrual basis of accounting.

2. The financial statements are prepared in accordance with generally accepted accounting principles.

3. The company has no significant contingencies or commitments.

4. The company's operations are seasonal, with higher sales during the first half of the year.

5. The company's assets are primarily tangible and have been valued at cost less accumulated depreciation.

6. The company's liabilities are primarily current and have been valued at their face value.

7. The company's equity is composed of common stock and retained earnings.

8. The company's cash and cash equivalents are held in a bank account.

9. The company's income tax expense is based on the federal income tax return for the year.

10. The company's financial statements are unaudited.

SPREADSHEET SOLUTION 9.2

Financial Evaluation Whether to Replace Existing Machine (when salvage value is ₹1,50,000)

	A	B	C	D	E	F	G	H
1	Cost of new machine (Rs)	1,50,000						
2	Original cost of existing machine (Rs)	1,00,000						
3	Sale value of existing machine (Rs)	200,000						
4	Age of existing machine (years)	4						
5	Salvage value of new machine (Rs)	150,000						
6	Additional working capital (Rs)	100,000						
7	Incremental revenue per year (Rs)	500,000						
8	Variable cost as percentage of revenue	0.3						
9	Depreciation rate	0.2						
10	Cost of capital	0.1						
11	Corporate tax rate	0.35						
12								
13								
14								
15								
16	Year	0	1	2	3	4	5	6
17	Cost of new equipment	-1,50,000						
18	Working capital	-100,000						
19	Sale value of existing machine	200,000						
20	Initial investment	-1,40,000						
21	Investmental revenue		500,000	500,000	500,000	500,000	500,000	500,000
22	Variable cost		150,000	150,000	150,000	150,000	150,000	150,000

43								

When Salvage Value is Zero

In case, the salvage value of the equipment is zero, only one change is required in the spreadsheet. Enter 0 in cell B5 instead of ₹150,000. The spreadsheet will calculate the new NPV.

Mutually Exclusive Situations In the case of mutually exclusive proposals, the selection of one proposal precludes the choice of other(s). The calculation of the cash outflows and inflows are on lines similar to the replacement situations. This is illustrated in Example 9.5.

Example 9.5

A company is considering two mutually exclusive proposals, X and Y. Proposal X will require the purchase of machine X, for ₹1,50,000 with no salvage value but an increase in the level of working capital to the tune

of ₹50,000 over its life. The project will generate additional sales of ₹1,30,000 and require cash expenses of ₹30,000 in each of the 5 years of its life. Proposal Y will require the purchase of machine Y for ₹2,50,000 with no salvage value and additional working capital of ₹70,000. The project is expected to generate additional sales of ₹2,00,000 with cash expenses aggregating ₹50,000.

Both the machines are subject to written down value method of depreciation at the rate of 20 per cent. Assuming the company does not have any other asset in the block of 20 per cent; has 12 per cent cost of capital, would have sufficient STCG in year 5 and is subject to 35 per cent tax, advise which machine it should purchase? What course of action would you suggest if Machine X and Machine Y have salvage values of ₹10,000 and ₹25,000 respectively?

Solution

Financial Evaluation of Proposals, X and Y

Proposal X

Cash outflows		
Cost price of machine		₹1,50,000
Additional working capital		50,000
Initial investment		<u>2,00,000</u>
CFAT and NPV		
(i) Incremental sales revenue		1,30,000
Less: Cash expenses		<u>30,000</u>
Incremental cash profit before taxes		1,00,000
Less: Taxes (0.35)		<u>35,000</u>
CFAT (t = 1 – 5)		65,000
(x) PV factor of annuity for 5 years (0.12)		<u>× 3.605</u>
Present value		<u>2,34,325</u>

(ii) PV of Tax Savings Due to Depreciation

Year	Depreciation	Tax savings	PVF	Present value
1	₹30,000	₹10,500	0.893	₹9,377
2	24,000	8,400	0.797	6,695
3	19,200	6,720	0.712	4,785
4	15,360	5,376	0.636	3,419
				<u>24,276</u>

(iii) PV of tax savings on short-term capital loss (STCL):

(₹61,440 STCL × 0.35 × 0.567) 12,193

(iv) Release of working capital (₹50,000 × 0.567)

28,350

Total present value 2,99,144

Less: Cash outflows 2,00,000

NPV 99,144

Proposal Y

Cash outflows		
Cost price of machine		2,50,000
Additional working capital		70,000
Initial investment		<u>3,20,000</u>
CFAT and NPV		
(i) Incremental sales revenue		2,00,000
Less: Cash expenses		<u>50,000</u>
Incremental cash profits before taxes		1,50,000
Less: Taxes (0.35)		<u>52,500</u>
CFAT (t = 1 – 5)		97,500
(x) PV factor of annuity for 5 years (0.12)		<u>× 3.605</u>
Present value		<u>3,51,488</u>

(ii) **PV of Tax Savings Due to Depreciation**

Year	Depreciation	Tax savings	PVF	Present value	
1	₹50,000	₹17,500	0.893	₹15,628	
2	40,000	14,000	0.797	11,158	
3	32,000	11,200	0.712	7,974	
4	25,600	8,960	0.636	5,699	40,459

(iii) PV of tax savings on short-term capital loss (₹1,02,400 × 0.35 × 0.567) 20,321

(iv) Release of working capital (₹70,000 × 0.567) 39,690

Total present value 4,51,958

Less: Cash outflows 3,20,000

NPV 1,31,958

Advice: Proposal Y is recommended in view of its higher NPV.

Alternatively (Incremental Cashflow Approach)**Incremental Cash Outflows**

Investment required in Proposal Y ₹3,20,000

Less: Investment required in Proposal X 2,00,000

1,20,000

Incremental CFAT and NPV

(i) Incremental sales revenue (Y - X) 70,000

Less: Incremental cash expenses (Y - X) 20,000

Incremental cash profit before taxes 50,000

Less: Taxes (0.35) 17,500

Incremental CFAT (t = 1 - 5) 32,500

(x) PV of annuity for 5 years (0.12) × 3.605

Incremental present value 1,17,162

(ii) **PV of Tax Savings Due to Incremental Depreciation**

Year	Incremental depreciation	Tax savings	PVF	Present value	
1	₹ 20,000	₹ 7,000	0.893	₹6,251	
2	16,000	5,600	0.797	4,463	
3	12,800	4,480	0.712	3,190	
4	10,240	3,584	0.636	2,279	16,183

(iii) PV of tax savings on incremental (Y - X) short term capital loss (STCL):
(₹1,02,400 - ₹61,440) × 0.35 × 0.567 8,129

(iv) Incremental (Y - X) working capital (₹70,000 - ₹50,000) × 0.567 11,340

Incremental present value 1,52,814

Less: Incremental cash outflows 1,20,000

Incremental NPV 32,814

Recommendation Proposal Y is better.**Financial Evaluation of Proposals, Assuming Salvage Value of Machines X and Y (Incremental Approach)**

(a) Sum of PV of items (i), (ii) and (iv) (₹1,17,162 + ₹16,183 + ₹11,340)@ ₹1,44,685

(b) PV of incremental salvage value (₹15,000 × 0.567) 8,505

(c) PV of tax savings on incremental STCL@@ (₹77,400 - ₹54,440) × 0.35 × 0.567 5,152

Incremental present value 1,58,342

Less: Incremental cash outflows 1,20,000

Incremental NPV 38,342

Decision: Decision (superiority of proposal Y) remains unchanged.

① Items (i), (ii) and (iv) when there is no salvage will not change due to salvage value.

②② As a result of salvage value, the amount of short-term capital loss (STCL) will change.

LO 9.3 EVALUATION TECHNIQUES

We discuss below the important evaluation techniques for capital budgeting. Included in the methods of appraising an investment proposal are those which are objective, quantified and based on economic costs and benefits.

The methods of appraising capital expenditure proposals can be classified into two broad categories: **(i)** traditional, and **(ii)** time-adjusted. The latter are more popularly known as discounted cash flow (DCF) techniques as they take the time factor into account. The first category includes **(i)** average rate of return method and **(ii)** pay back period method. The second category includes **(i)** net present value method, **(ii)** internal rate of return method, **(iii)** net terminal value method, and **(iv)** profitability index.

Traditional Techniques

Average Rate of Return

Computation The average rate of return (ARR) method of evaluating proposed capital expenditure is also known as the accounting rate of return method. It is based upon accounting information rather than cash flows. There is no unanimity regarding the definition of the rate of return. There are a number of alternative methods for calculating the ARR. The most common usage of the average rate of return (ARR) expresses it as follows:

$$\text{ARR} = \frac{\text{Average annual profits after taxes}}{\text{Average investment over the life of the project}} \times 100 \quad (9.1)$$

The average profits after taxes are determined by adding up the after-tax profits expected for each year of the project's life and dividing the result by the number of years. In the case of annuity, the average after-tax profits are equal to any year's profits.

The average investment is determined by dividing the net investment by two. This averaging process assumes that the firm is using straight line depreciation, in which case the book value of the asset declines at a constant rate from its purchase price to zero at the end of its depreciable life. This means that, on the average, firms will have one-half of their initial purchase price in the books.¹² Consequently, if the machine has salvage value, then only the depreciable cost (cost-salvage value) of the machine should be divided by two in order to ascertain the average net investment, as the salvage money will be recovered only at the end of the life of the project. Therefore, an amount equivalent to the salvage value remains tied up in the project throughout its life time. Hence, no adjustment is required to the sum of salvage value to determine the average investment.¹³ Likewise, if any additional net working capital is required in the initial year which is likely to be released only at the end of the project's life, the full amount of working capital should be taken in determining relevant investment for the purpose of calculating ARR. Thus,

$$\text{Average investment} = \text{Net working capital} + \text{Salvage value} + 1/2 (\text{Initial cost of machine} - \text{Salvage value}) \quad (9.2)$$

For instance, given the information: initial investment (purchase of machine), ₹11,000, salvage value, ₹1,000, working capital, ₹2,000, service life (years) 5 and that the straight line method of depreciation is adopted, the average investment is: ₹1,000 + ₹2,000 + 1/2 (₹11,000 - ₹1,000) = ₹8,000.

Example 9.6

Determine the average rate of return from the following data of two machines, A and B.

Particulars	Machine A	Machine B
Cost	₹56,125	₹56,125
Annual estimated income after depreciation and income tax:		
Year 1	3,375	11,375
2	5,375	9,375
3	7,375	7,375
4	9,375	5,375
5	11,375	3,375
	<u>36,875</u>	<u>36,875</u>
Estimated life (years)	5	5
Estimated salvage value	3,000	3,000

Depreciation has been charged on straight line basis.

Solution

$$ARR = (\text{Average income}/\text{Average investment}) \times 100$$

$$\text{Average income of Machines A and B} = (\text{₹}36,875/5) = \text{₹}7,375$$

$$\text{Average investment} = \text{Salvage value} + 1/2(\text{Cost of machine} - \text{Salvage value})$$

$$= \text{₹}3,000 + 1/2 (\text{₹}56,125 - \text{₹}3,000) = \text{₹}29,562.50$$

$$ARR \text{ (for machines A and B)} = (\text{₹}7,375/\text{₹}29,562.50) = 24.9 \text{ per cent}$$

In addition to the above, there are other approaches to calculate the average rate of return (ARR). One approach, which is a variation of the above, involves using original rather than the average cost of the project. In the case of this alternative approach, the ARR for both the machines would be 13.1 per cent ($(\text{₹}7,375 + \text{₹}56,125)$).

Accept-reject Rule With the help of the ARR, the financial decision maker can decide whether to accept or reject the investment proposal. As an accept-reject criterion, the actual ARR would be compared with a predetermined or a minimum required rate of return or cut-off rate. A project would qualify to be accepted if the actual ARR is higher than the minimum desired ARR. Otherwise, it is liable to be rejected. Alternatively, the ranking method can be used to select or reject proposals. Thus, the alternative proposals under consideration may be arranged in the descending order of magnitude, starting with the proposal with the highest ARR and ending with the proposal having the lowest ARR. Obviously, projects having higher ARR would be preferred to projects with lower ARR.

Evaluation of ARR In evaluating the ARR, as a criterion to select/reject investment projects, its merits and drawbacks need to be considered. The most favourable attribute of the ARR method is its easy calculation. What is required is only the figure of accounting profits after taxes which should be easily obtainable. Moreover, it is simple to understand and use. In contrast to this, the discounted flow techniques involve tedious calculations and are difficult to understand. Finally, the total benefits associated with the project are taken into account while calculating the ARR. Some methods, pay back for instance, do not use the entire stream of incomes.

However, this method of evaluating investment proposals suffers from serious deficiencies. The principal shortcoming of the ARR approach arises from the use of accounting income instead of cash flows. The cash flow approach is markedly superior to accounting earnings for project evaluation. The earnings calculations ignore the reinvestment potential of a project's benefits while the cash flow takes into account this potential and, hence, the total benefits of the project.

The second principal shortcoming of ARR is that it does not take into account the time value of money. The timing of cash inflows and outflows is a major decision variable in financial decision making. Accordingly, benefits in the earlier years and later years cannot be valued at par. To the extent the ARR method treats these benefits at par and fails to take account of the differences in the time value of money, it suffers from a serious deficiency. Thus, in Example 9.6, the ARR in case of both machines, A and B is the same, although machine B should be preferred since its returns in the early years of its life are greater. Clearly, the ARR method of evaluating investment proposals fails to consider this.

Thirdly, the ARR criterion of measuring the worth of investment does not differentiate between the size of the investment required for each project. Competing investment proposals may have the same ARR, but may require different average investments, as shown in Table 9.6. The ARR method, in such a situation, will leave the firm in an indeterminate position.

TABLE 9.6

Machines	Average Annual Earnings	Average Investment	ARR (per cent)
1	2	3	4
A	₹6,000	₹30,000	20
B	2,000	10,000	20
C	4,000	20,000	20

Finally, this method does not take into consideration any benefits which can accrue to the firm from the sale or abandonment of equipment which is replaced by the new investment. The 'new' investment, from the point of view of correct financial decision making, should be measured in terms of incremental cash outflows due to new investments, that is, new investment minus sale proceeds of the existing equipment ± tax adjustment. But the ARR method does not make any adjustment in this regard to determine the level of average investments. Investments in fixed assets are determined at their acquisition cost.

For these reason, the ARR leaves much to be desired as a method for project selection.

Pay Back Method

Payback (period) method is the exact amount of time required for a firm to recover its initial investment in a project as calculated from cash inflows.

Computation The **pay back method** (PB) is the second traditional method of capital budgeting. It is the simplest and, perhaps, the most widely employed, quantitative method for appraising capital expenditure decisions. This method answers the question: How many years will it take for the cash benefits to pay the original cost of an investment, normally disregarding salvage value? Cash benefits here represent CFAT ignoring interest payment. Thus, the pay back method (PB) measures the number of years required for the CFAT to pay back the **original outlay** required in an investment proposal.

- **Original/initial investment (outlay)** is the relevant cash outflow for a proposed project at time zero (t = 0).

There are two ways of calculating the PB period. The first method can be applied when the cash flow stream is in the nature of **annuity** for each year of the project's life, that is, CFAT are uniform. In such a situation, the initial cost of the investment is divided by the constant annual cash flow:

- **Annuity** is a stream of equal cash inflows.

$$PB = \frac{\text{Investment}}{\text{Constant annual cash flow}} \quad (9.3)$$

For example, an investment of ₹40,000 in a machine is expected to produce CFAT of ₹8,000 for 10 years,

$$PB = ₹40,000/₹8,000 = 5 \text{ years}$$

Mixed stream is a series of cash inflows exhibiting any pattern other than that of an annuity.

The second method is used when a project's cash flows are not uniform (**mixed stream**) but vary from year to year. In such a situation, PB is calculated by the process of cumulating cash flows till the time when cumulative cash flows become equal to the original investment outlay. Table 9.7 presents the calculations of pay back period for Example 9.6.

TABLE 9.7 Calculation of Payback Period

Year	Annual CFAT		Cumulative CFAT	
	A	B	A	B
1	₹14,000	₹22,000	₹14,000	₹22,000
2	16,000	20,000	30,000	42,000
3	18,000	18,000	48,000	60,000
4	20,000	16,000	68,000	76,000
5	25,000*	17,000*	93,000	93,000

* CFAT in the fifth year includes ₹3,000 salvage value also.

The initial investment of ₹56,125 on machine A will be recovered between years 3 and 4.

The pay back period would be a fraction more than 3 years. The sum of ₹48,000 is recovered by the end of the third year. The balance ₹8,125 is needed to be recovered in the fourth year. In the fourth year CFAT is ₹20,000. The pay back fraction is, therefore, 0.406 (₹8,125/₹20,000). The pay back period for machine A is 3.406 years. Similarly, for machine B the pay back period would be 2 years and a fraction of a year. As ₹42,000 is recovered by the end of the second year, the balance of ₹14,125 needs to be recovered in the third year. In the third year CFAT is ₹18,000. The pay back fraction is 0.785 (₹14,125/₹18,000). Thus, the PB period for machine B is 2.785 years.

Accept-Reject Criterion The pay back period can be used as a decision criterion to accept or reject investment proposals. One application of this technique is to compare the actual pay back with a predetermined pay back, that is, the pay back set up by the management in terms of the maximum period during which the initial investment must be recovered. If the actual pay back period is less than the predetermined pay back, the project would be accepted; if not, it would be rejected. Alternatively, the pay back can be used as a ranking method. When mutually exclusive projects are under consideration, they may be ranked according to the length of the pay back period. Thus, the project having the shortest pay back may be assigned rank one, followed in that order so that the project with the longest pay back would be ranked last. Obviously, projects with shorter pay back period will be selected.

Evaluation The pay back method has certain merits. It is easy to calculate and simple to understand. Moreover, the pay back method is an improvement over the ARR approach. Its superiority arises due to the fact that it is based on cash flow analysis. The results of Example 9.6 illustrated in Table 9.10

can be cited in support of this. Thus, though the average cash flows for both the machines under the ARR method were the same, the pay back method shows that the pay back period for machine B is shorter than for machine A. The pay back period approach shows that machine B should be preferred as it refunds the capital outlay earlier than machine A.

The pay back approach, however, suffers from serious limitations. Its major shortcomings are as follows:

The first major shortcoming of the pay back method is that it completely ignores all cash inflows after the pay back period. This can be very misleading in capital budgeting evaluations. Table 9.8 reveals alternative projects with the same pay back period (3 years).

TABLE 9.8

<i>Particulars</i>	<i>Project X</i>	<i>Project Y</i>
Total cost of the project	₹ 15,000	₹ 15,000
Cash inflows (CFAT)		
Year 1	5,000	4,000
2	6,000	5,000
3	4,000	6,000
4	0	6,000
5	0	3,000
6	0	3,000
Pay back period (years)	3	3

In fact, the projects differs widely in respect of cash inflows generated after the pay back period. The cash flow for project X stops at the end of the third year, while that of Y continues up to the sixth year. Obviously, the firm would prefer project Y because it makes available to the firm cash inflows of ₹12,000, in years 4 through 6, whereas project X does not yield any cash inflow after the third year. Under the pay back method, however, both the projects would be given equal ranking, which is apparently incorrect. Therefore, it cannot be regarded as a measure of profitability. Its failure lies in the fact that it does not consider the total benefits accruing from the project.

Another deficiency of the pay back method is that it does not measure correctly even the cash flows expected to be received within the pay back period as it does not differentiate between projects in terms of the timing or the magnitude of cash flows. It considers only the recovery period as a whole. This happens because it does not discount the future cash inflows but rather treats a rupee received in the second or third year as valuable as a rupee received in the first year. In other words, to the extent the pay back method fails to consider the pattern of cash inflows, it ignores the time value of money.

Table 9.9 shows that both the projects A and B have **(i)** the same cash outlays in the zero time period; **(ii)** the same total cash inflows of ₹15,000; and **(iii)** the same pay back period of 3 years. But project A would be acceptable to the firm because it returns cash earlier than project B, enabling A to repay a loan or reinvest it and earn a return. A possible solution to this problem is provided by determining the pay back period of discounted cash flows. This is illustrated in the subsequent section of this chapter.

The discounted payback method still has significant drawbacks. The major one is that the cut-off period is still arbitrarily set. As a result, there is a possibility that a project with positive NPV may be rejected because the cutoff is too short. Also, it does not ensure that a project accepted under shorter discounted payback period has necessarily the maximum NPV.¹⁴

TABLE 9.9 Cashflows of Projects

Particulars	Project A	Project B
Total cost of the project	₹15,000	₹15,000
Cash inflows (CFAT)		
Year 1	10,000	1,000
2	4,000	4,000
3	1,000	10,000

Another flaw of the pay back method is that it does not take into consideration the entire life of the project during which cash flows are generated. As a result, projects with large cash inflows in the latter part of their lives may be rejected in favour of less profitable projects which happen to generate a larger proportion of their cash inflows in the earlier part of their lives. Table 9.10 presents the comparison of two such projects. On the basis of the pay back criterion, project A will be adjudged superior to project B.

TABLE 9.10

Particulars	Project A	Project B
Total cost of the project	₹40,000	₹40,000
Cash inflows (CFAT)		
Year 1	14,000	10,000
2	16,000	10,000
3	10,000	10,000
4	4,000	10,000
5	2,000	12,000
6	1,000	16,000
7	Nil	17,000
Pay back period (years)	3	4

It is quite evident just from a casual inspection that project B is more profitable than project A, since the cash inflows of the former amount to ₹45,000 after the expiry of the pay back period and the cash flows of the latter beyond the pay back period are only ₹7,000.

The above weaknesses notwithstanding, the pay back method can be gainfully employed under certain circumstances.¹⁵ In the first place, where the long-term outlook, say in excess of three years, is extremely hazy, the pay back method may be useful. In a politically unstable country, for instance, a quick return to recover the investment is the primary goal, and subsequent profits are almost unexpected surprises. Likewise, this method may be very appropriate for firms suffering from liquidity crisis. A firm with limited liquid assets and no ability to raise additional funds, which nevertheless wishes to undertake capital projects in the hope of easing the crisis, might use pay back as a selection criterion because it emphasises quick recovery of the firm's original outlay and little impairment of the already critical liquidity situation. Thirdly, the pay back method may also be beneficial in taking capital budgeting decisions for firms which lay more emphasis on short-run earning performance rather than its long-term growth. The pay back period is a measure of liquidity of investments rather than their profitability. Thus, the pay back period should more appropriately be treated as a constraint to be satisfied than as a profitability measure to be maximised.¹⁶ In spite of the weakness of the payback period method, the method can be used in conjunction with other more sophisticated methods. It can be used to screen potential projects to the few that merit more careful scrutiny with more sophisticated methods such as DCFs.¹⁷ Finally, the pay back period is useful, apart from measuring liquidity, in making calculations in certain situations. For instance, the

internal rate of return can be computed easily from the pay back period. The pay back method is a good approximation of the internal rate of return which otherwise requires a trial and error approach.

To conclude the discussion of the traditional methods of appraising capital investment decisions, there are two major drawbacks of these techniques. They do not consider the total benefits in terms of (i) the magnitude and (ii) the timing of cash flows. For these reasons, the traditional methods are unsatisfactory as capital budgeting decision criteria. The two essential ingredients of a theoretically sound appraisal method, therefore, are that (i) it should be based on a consideration of the total cash stream, and (ii) it should consider the time value of money as reflected in both the magnitude and the timing of expected cash flows in each period of a project's life. The time-adjusted (also known as discounted cash flow) techniques satisfy these requirements and, to that extent, provide a more objective basis for selecting and evaluating investment projects.

Discounted Cashflow (DCF)/Time-Adjusted (TA) Techniques

The distinguishing characteristics of the DCF capital budgeting techniques is that they take into consideration the time value of money while evaluating the costs and benefits of a project. In one form or another, all these methods require cash flows to be discounted at a certain rate, that is, the cost of capital. The cost of capital (K) is the minimum discount rate earned on a project that leaves the market value unchanged.

The second commendable feature of these techniques is that they take into account all benefits and costs occurring during the entire life of the project.

In the discussions that follow, we have attempted to discuss the DCF evaluation methods. First, we have explained the general procedure behind DCF. This is followed by a discussion of the first DCF technique, namely, net present value (NPV). We have then covered the internal rate of return (IRR) method. The two variations of the NPV method, that is, terminal value and profitability index (PI) or benefit-cost ratio are also discussed. An attempt has also been made to compare the NPV method with IRR and the PI.

Present Value (PV)/Discounted Cash Flow (DCF)

General Procedure The present value or the discounted cash flow procedure recognises that cash flow streams at different time periods differ in value and can be compared only when they are expressed in terms of a common denominator, that is, present values. It, thus, takes into account the time value of money. In this method, all cash flows are expressed in terms of their present values. The procedure to determine present value is comprehensively covered in Chapter 2.

The present value of the cash flows in Example 9.6 are illustrated in Table 9.11.

TABLE 9.11 Calculations of Present Value of CFAT

Year	Machine A			Machine B		
	CFAT	PV factor (0.10)	Present value	CFAT	PV factor (0.10)	Present value
1	2	3	4	5	6	7
1	₹14,000	0.909	₹12,726	₹22,000	0.909	₹19,998
2	16,000	0.826	13,216	20,000	0.826	16,520
3	18,000	0.751	13,518	18,000	0.751	13,518
4	20,000	0.683	14,660	16,000	0.683	10,928
5	25,000*	0.621	15,525	17,000*	0.621	10,557
			69,645			71,521

*includes salvage value.

The PV so determined is compared with the PV of cash outflows. The present values of cash inflows of both the machines are higher than cash outflows, and, therefore both are acceptable.

The PV of CFAT (Col. 4 and Col. 7 of Table 9.11) now can be used to determine the 'discounted' pay back period. It is determined on the basis of discounted present value of CFAT vis-a-vis

unadjusted cash flows (Col. 2 and Col. 5 of Table 9.11) used in the 'simple' pay back method. The relevant values of the 'discounted' pay back period are 4.2 and 3.66 years for Machines A and B respectively in Example 9.6.

Net present value (NPV) is found by subtracting a project's initial investment from the present value of its cash inflows discounted at the firm's cost of capital.

Net Present Value (NPV) Method The first DCF/PV technique is the NPV. NPV may be described as the summation of the present values of cash proceeds (CFAT) in each year minus the summation of present values of the net cash outflows in each year. Symbolically, the NPV for projects having conventional cash flows would be:

$$NPV = \sum_{t=1}^n \frac{CF_t}{(1+K)^t} + \frac{S_n + W_n}{(1+K)^n} - CO_0 \quad (9.4)$$

If cash outflow is also expected to occur at some time other than at initial investment (non-conventional cash flows) the formula would be:

$$NPV = \sum_{t=1}^n \frac{CF_t}{(1+K)^t} + \frac{S_n + W_n}{(1+K)^n} - \sum_{t=0}^n \frac{CO_t}{(1+K)^t} \quad (9.5)$$

The decision rule for a project under NPV is to accept the project if the NPV is positive and reject if it is negative. Symbolically,

$$(i) \text{ NPV} > \text{zero, accept, } (ii) \text{ NPV} < \text{zero, reject} \quad (9.6)$$

Zero NPV implies that the firm is indifferent to accepting or rejecting the project. However, in practice it is rare if ever such a project will be accepted, as such a situation simply implies that only the original investment has been recovered¹⁸.

In Example 9.6 we would accept the proposals of purchasing machines A and B as their net present values are positive. The positive NPV of machine A is ₹13,520 (R 69,645 – ₹56,125) and that of B is ₹15,396 (₹71,521 – ₹56,125).

In Example 9.6, if we incorporate cash outflows of ₹25,000 at the end of the third year in respect of overhauling of the machine, we shall find the proposals to purchase either of the machines are unacceptable as their net present values are negative. The negative NPV of machine A is ₹6,255 (₹68,645 – ₹74,900) and of machine B is ₹3,379 (₹71,521 – ₹74,900).

As a decision criterion, this method can also be used to make a choice between mutually exclusive projects. On the basis of the NPV method, the various proposals would be ranked in order of the net present values. The project with the highest NPV would be assigned the first rank, followed by others in the descending order. If, in our example, a choice is to be made between machine A and machine B on the basis of the NPV method, machine B having larger NPV (₹15,396) would be preferred to machine A (NPV being ₹12,520).

Evaluation The present value method including the NPV variation possesses several merits. The first, and probably the most significant, advantage is that it explicitly recognises the time value of money. In Example 9.6, for instance (Table 9.11), the total cash inflows (CFAT) pertaining to the two machines (A and B) are equal. But the present value as well as the NPV is different. As can be seen from Table 9.11, this is primarily because of the differences in the pattern of the cash streams. The magnitude of CFAT in the case of machine A is lower in the earlier years as compared to the

machine B while it is greater in the latter years. Because of larger inflows in the first two years, the NPV of machine B is larger than that of machine A. The need for recognising the time value of money is, thus, satisfied by this method.

Secondly, it also fulfills the second attribute of a sound method of appraisal in that it considers the total benefits arising out of the proposal over its lifetime.

Thirdly, a changing discount rate can be built into the NPV calculations by altering the denominator. This feature becomes important as this rate normally changes because the longer the time span, the lower is the value of money and the higher is the discount rate.

Fourthly, this method is particularly useful for the selection of mutually exclusive projects. This aspect will be discussed in detail in the latter part of the chapter, where it is shown that for mutually exclusive choice problems, the NPV method is the best decision-criterion.

Finally, this method of asset selection is instrumental in achieving the objective of financial management which is the maximisation of the shareholders' wealth. The rationale behind this contention is the effect on the market price of shares as a result of the acceptance of a proposal having present value exceeding the initial outlay or, as a variation having NPV greater than zero. The market price of the shares will be affected by the relative force of what the investors expect and what actual return is earned on the funds. The discount rate that is used to convert benefits into present values is the minimum rate or the rate of interest is that when the present values of cash inflows is equal to the initial outlay or when the $NPV = 0$, the return on investment just equals the expected or required rate by investors. There would, therefore, be no change in the market price of shares. When the present value exceeds the outlay or the $NPV > 0$, the return would be higher than expected by the investors. It would, therefore, lead to an increase in share prices. The present value method is, thus, logically consistent with the goal of maximising shareholders' wealth in terms of maximising the market price of the shares.

In brief, the present value method is a theoretically correct technique for the selection of investment projects. Nevertheless, it has certain limitations also.

In the first place, it is difficult to calculate as well as understand and use in comparison with the pay back method or even the ARR method. This, of course, is a minor flaw.

The second, and a more serious problem associated with the present value method, involves the calculation of the required rate of return to discount the cash flows. The discount rate is the most important element used in the calculation of the present values because different discount rates will give different present values. The relative desirability of a proposal will change with a change in the discount rate. For instance, for a proposal involving an initial outlay of ₹9,000, having annuity of ₹2,800 for 5 years, the net present values for different required rates of return are given in Table 9.12.

TABLE 9.12 Net Present Value with Different Discount Rates

<i>Discount rate (per cent)</i>	<i>Net present value</i>
Zero	₹5,000.00
4	3,465.00
8	2,179.50
10	1,614.00
12	1,093.50
16	168.00
20	(626.50)

The importance of the discount rate is, thus, obvious. But the calculation of the required rate of return presents serious problems. The cost of capital is generally the basis of the discount rate. The calculation of the cost of capital is very complicated. In fact, there is a difference of opinion even regarding the exact method of calculating it.

Another shortcoming of the present value method is that it is an absolute measure. Prima facie between two projects, this method will favour the project which has higher present value (or NPV). But it is likely that this project may also involve a larger initial outlay. Thus, in case of projects involving different outlays, the present value method may not give dependable results.

Finally, the present value method may also not give satisfactory results in the case of two projects having different effective lives. In general, the project with a shorter economic life would be preferable, other things being equal. A project which has a higher present value may also have a larger economic life so that the funds will remain invested for a longer period, while the alternative proposal may have shorter life but smaller present value. In such situations, the present value method may not reflect the true worth of the alternative proposals.

Internal Rate of Return (IRR) Method The second discounted cash flow (DCF) or time-adjusted method for appraising capital investment decisions is the internal rate of return (IRR) method. This technique is also known as yield on investment, marginal efficiency of capital, marginal productivity of capital, rate of return, time-adjusted rate of return and so on. Like the present value method, the IRR method also considers the time value of money by discounting the cash streams. The basis of the discount factor, however, is different in both cases. In the case of the net present value method, the discount rate is the required rate of return and being a predetermined rate, usually the cost of capital, its determinants are external to the proposal under consideration. The IRR, on the other hand, is based on facts which are internal to the proposal. In other words, while arriving at the required rate of return for finding out present values the cash flows—inflows as well as outflows—are not considered. But the IRR depends entirely on the initial outlay and the cash proceeds of the project which is being evaluated for acceptance or rejection. It is, therefore, appropriately referred to as internal rate of return.

Internal rate of return (IRR) is the discount rate that equates the present values of cash inflows with the initial investment associated with a project, thereby causing NPV = 0.

The **internal rate of return** is usually the rate of return that a project earns. It is defined as the discount rate (r) which equates the aggregate present value of the net cash inflows (CFAT) with the aggregate present value of cash outflows of a project. In other words, it is that rate which gives the project NPV of zero.

Assuming conventional cash flows, mathematically, the IRR is represented by the rate, r , such that

$$CO_0 = \sum_{t=1}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} \quad (9.7)$$

$$\text{Zero} = \sum_{t=1}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} - CO_0 \quad (9.8)$$

For unconventional cash flows, the equation would be:

$$= \sum_{t=0}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} - \sum_{t=1}^n \frac{CO_0}{(1+r)^t} \quad (9.9)$$

$$= \sum_{t=1}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} - \sum_{t=0}^n \frac{CO_t}{(1+r)^t} = \text{Zero} \quad (9.10)$$

where r = The internal rate of return,
 CF_t = Cash inflows at different time periods,
 S_n = Salvage value,
 W_n = Working capital adjustments and
 CO_t = Cash outlay at different time periods

Accept-Reject Decision The use of the IRR, as a criterion to accept capital investment decisions, involves a comparison of the actual IRR with the required rate of return also known as the cut-off rate or hurdle rate. The project would qualify to be accepted if the IRR (r) exceeds the cut-off rate (k). If the IRR and the required rate of return are equal, the firm is indifferent as to whether to accept or reject the project.

Computation Unlike the NPV method, calculating the value of IRR is more difficult. The procedure will depend on whether the cash flows are annuity or mixed stream.

Annuities The following steps are taken in determining IRR for an annuity:

- Determine the pay back period of the proposed investment.
- In Table A-4 (present value of an annuity) look for the pay back period that is equal to or closest to the life of the project.
- In the year row, find two PV values or discount factor (DF_r) closest to PB period but one bigger and other smaller than it.
- From the top row of the table, note interest rate (r) corresponding to these PV values (DF_r).
- Determine actual IRR by interpolation. This can be done either directly using Equation 9.11 or indirectly by finding present values of annuity (Equation 9.12).

$$\text{IRR} = r - \left(\frac{\text{PB} - DF_r}{DF_{rL} - DF_{rH}} \right) \quad (9.11)$$

where PB = Pay back period,
 DF_r = Discount factor for interest rate r ,
 DF_{rL} = Discount factor for lower interest rate,
 DF_{rH} = Discount factor for higher interest rate and
 r = Either of the two interest rates used in the formula
 Alternatively,

$$\text{IRR} = r - \left(\frac{\text{PV}_{\text{CO}} - \text{PV}_{\text{CFAT}}}{\Delta \text{PV}} \right) \times \Delta r \quad (9.12)$$

where PV_{CO} = Present value of cash outlay,
 PV_{CFAT} = Present value of cash inflows ($DF_r \times \text{annuity}$),
 r = Either of the two interest rates used in the formula,
 Δr = Difference in interest rates and
 ΔPV = Difference in calculated present values of inflows

The computations are shown in Example 9.7.

Example 9.7

A project costs ₹36,000 and is expected to generate cash inflows of ₹11,200 annually for 5 years. Calculate the IRR of the project.

Solution

- (1) The pay back period is 3.214 (₹36,000/₹11,200)
- (2) According to Table A-4, discount factors closest to 3.214 for 5 years are 3.274 (16 per cent rate of interest) and 3.199 (17 per cent rate of interest). The actual value of IRR which lies between 16 per cent and 17 per cent can, now, be determined using Equations 9.11 and 9.12.

$$\text{Substituting the values in Equation 9.11 we get: } IRR = 16 + \left(\frac{3.274 - 3.214}{3.274 - 3.199} \right) = 16.8 \text{ per cent}$$

$$\text{Alternatively (starting with the higher rate), } IRR = 17 - \left(\frac{3.214 - 3.199}{3.274 - 3.199} \right) = 16.8 \text{ per cent}$$

Instead of using the direct method, we may find the actual IRR by applying the interpolation formula to the present values of cash inflows and outflows (Equation 9.12). Here, again, it is immaterial whether we start with the lower or the higher rate.

$$PV_{CFAT} (0.16) = ₹11,200 \times 3.274 = ₹36,668.8$$

$$PV_{CFAT} (0.17) = ₹11,200 \times 3.199 = ₹35,828.8$$

$$IRR = 16 + \left(\frac{36,668.8 - 36,000}{36,668.8 - 35,828.8} \right) \times 1 = 16.8 \text{ per cent}$$

$$\text{Alternatively (starting with the higher rate), } IRR = r - \frac{(PV_{CO} - PV_{CFAT})}{\Delta PV} \times \Delta r$$

$$IRR = 17 - \left(\frac{36,000 - 35,828.8}{840} \right) \times 1 = 16.8 \text{ per cent}$$

For a Mixed Stream of Cash Flows Calculating the IRR for a mixed stream of cash flows is more tedious. In a mixed stream of cash flows, the inflows in various years are uneven or unequal. One way to simplify the process is to use 'fake annuity' as a starting point.¹⁹ The following procedure is a useful guide to calculating IRR:

1. Calculate the average annual cash inflow to get a 'fake annuity'.
2. Determine 'fake pay back period' dividing the initial outlay by the average annual CFAT determined in step 1.
3. Look for the factor, in Table A-4, closest to the fake pay back value in the same manner as in the case of annuity. The result will be a rough approximation of the IRR, based on the assumption that the mixed stream is an annuity (fake annuity).
4. Adjust subjectively the IRR obtained in step 3 by comparing the pattern of average annual cash inflows (as per step 1) to the actual mixed stream of cash flows. If the actual cash flows stream happens to be higher in the initial years of the project's life than the average stream, adjust the IRR a few percentage points upward. The reason is obvious as the greater recovery of funds in the earlier years is likely to give a higher yield rate (IRR). Conversely, if in the early years the actual cash inflows are below the average, adjust the IRR a few percentage

points downward. If the average cash flows pattern seems fairly close to the actual pattern, no adjustment is to be made.

5. Find out the present value (using Table A-3) of the mixed cash flows, taking the IRR as the discount rate as estimated in step 4.
6. Calculate the PV, using the discount rate. If the PV of CFAT equals the initial outlay, that is, NPV is zero, it is the IRR. Otherwise, repeat step 5. Stop, once two consecutive discount rates that cause the NPV to be positive and negative, respectively have been calculated. Whichever of these two rates causes the NPV to be closest to zero is the IRR to the nearest 1 per cent.
7. The actual value can be ascertained by the method of interpolation as in the case of an annuity.

Example 9.8

Let us apply this procedure for determining the IRR of Example 9.6 of a mixed stream of CFAT for machines A and B. The cash flows associated with the machines are given in Table 9.7.

Solution

1. The sum of cash inflows of both the machines is ₹93,000 which when divided by the economic life of the machine (5 years), results in a 'fake annuity' of ₹18,600.
2. Dividing the initial outlay of ₹56,125 by ₹18,600, we have 'fake average pay back period' of 3.017 years.
3. In Table A-4, the factor closest to 3.017 for 5 years is 2.991 for a rate of 20 per cent.
4. Since the actual cash flows in the earlier years are greater than the average cash flows of ₹18,600 in machine B, a subjective increase of, say, 1 per cent is made. This makes an estimated rate of IRR 21 per cent for machine B. In the case of machine A, since cash inflows in the initial years are smaller than the average cash flows, a subjective decrease of, say, 2 per cent is made. This makes the estimated IRR rate 18 per cent for machine A.
5. Using the PV factors for 21 per cent (Machine B) and 18 per cent (Machine A) from Table A-3 for years 1-5, the PVs are calculated in Table 9.13.

TABLE 9.13 Computation of Present Value (PV)

Year	Machine A			Machine B		
	CFAT	PV factor (0.18)	Total PV	CFAT	PV factor (0.21)	Total PV
1	₹14,000	0.847	₹11,858	₹22,000	0.826	₹18,172
2	16,000	0.718	11,488	20,000	0.683	13,660
3	18,000	0.609	10,962	18,000	0.564	10,152
4	20,000	0.516	10,320	16,000	0.467	7,472
5	25,000	0.437	10,925	17,000	0.386	6,562
Total present value			55,553			56,018
Less: Initial investment		56,125			56,125	
NPV			(572)			(107)

6. Since the NPV is negative for both the machines, the discount rate should be subsequently lowered. In the case of machine A the difference is of ₹572 whereas in machine B the difference is ₹107. Therefore, in the former case the discount rate is lowered by 1 per cent in both the cases. As a result, the new discount rate would be 17 per cent for A and 20 per cent for B.

The calculations given in Table 9.14 shows that the NPV at discount rate of 17 per cent is ₹853 (machine A) and ₹1,049 for machine B at 20 per cent discount.

TABLE 9.14 Computation of Present Value (PV)

Year	Machine A			Machine B		
	CFAT	PV factor (0.17)	Total PV	CFAT	PV factor (0.20)	Total PV
1	₹14,000	0.855	₹11,970	₹22,000	0.833	₹18,326
2	16,000	0.731	11,696	20,000	0.694	13,880
3	18,000	0.624	10,232	18,000	0.579	10,422
4	20,000	0.534	10,680	16,000	0.484	7,712
5	25,000	0.456	11,400	17,000	0.442	6,834
PV of cash inflows			56,978			57,174
Less: Initial outlay			56,125			56,125
Net present value			853			1,049

- (a) For machine A: Since 17 per cent and 18 per cent are consecutive discount rates that give positive and negative net present values, interpolation method can be applied to find the actual IRR which will be between 17 and 18 per cent.

$$\text{IRR} = 17 + \left[\frac{\text{₹}56,978 - \text{₹}56,125}{\text{₹}56,978 - \text{₹}55,553} \right] \times 1 = 17.6 \text{ per cent}$$

- (b) For machine B: $\text{IRR} = 20 + \left[\frac{\text{₹}57,174 - \text{₹}56,125}{\text{₹}57,174 - \text{₹}56,018} \right] \times 1 = 20.9 \text{ per cent}$

Evaluation of IRR The IRR method is a theoretically correct technique to evaluate capital expenditure decisions. It has the advantages which are offered by the NPV criterion such as: (i) it considers the time value of money, and (ii) it takes into account the total cash inflows and outflows.

In addition, the IRR is easier to understand. Business executives and non-technical people understand the concept of IRR much more readily than they understand the concept of NPV. They may not be following the definition of IRR in terms of the equation but they are well aware of its usual meaning in terms of the rate of return on investment. For instance, business executives will understand the investment proposal in a better way if told that IRR of machine B is 21 per cent and k is 10 per cent instead of saying that the NPV of machine B is ₹15,396.

Another merit of IRR is that it does not use the concept of the required rate of return/the cost of capital. It itself provides a rate of return which is indicative of the profitability of the proposal. The cost of capital, of course, enters the calculations later on.

Finally, it is consistent with the overall objective of maximising shareholders' wealth. According to IRR, as a decision-criterion, the acceptance or otherwise of a project is based on a comparison of the IRR with the required rate of return. The required rate of return is, by definition, the minimum rate which investors expect on their investment. In other words, if the actual IRR of an investment proposal is equal to the rate expected by the investors, the share prices will remain unchanged. Since, with IRR, only such projects are accepted as have $\text{IRR} > \text{required rate}$, the share prices will tend to rise. This will naturally lead to the maximisation of shareholders' wealth.

Its theoretical soundness notwithstanding, the IRR suffers from serious limitations.

First, it involves tedious calculations. As shown above, it generally involves complicated computational problems. Secondly, it produces multiple rates which can be confusing. This aspect is further developed later in this chapter. Thirdly, in evaluating mutually exclusive proposals, the project with the highest IRR would be picked up to the exclusion of all others. However, in practice, it may not turn out to be the one which is the most profitable and consistent with the objectives of the firm, that is, maximisation of the shareholders' wealth. This aspect also has been discussed in detail later in this

chapter. Finally, under the IRR method, it is assumed that all intermediate cash flows are reinvested at the IRR. In our example, the IRR rates for machines A and B are 17.6 per cent and 20.9 per cent respectively. In operational terms, 17.6 per cent IRR signifies that all cash inflows of machine A can be reinvested at 17.6 per cent whereas that of B at 20.9 per cent. It is rather ridiculous to think that the same firm has the ability to reinvest the cash flows at different rates.

There is no difference in the 'quality of cash' received either from project A or B. The reinvestment rate assumption under the IRR method is, therefore, very unrealistic. Moreover, it is not safe to assume always that intermediate cash flows from the project will be reinvested at all. A portion of cash inflows may be paid out as dividends. Likewise, a portion of it may be tied up in current assets such as stocks, debtors or cash. Clearly, the firm will get a wrong picture of the capital project if it assumes that it invests the entire intermediate cash proceeds. Further, it is not safe to assume, as is often done, that they will be reinvested at the same rate of return as the company is currently earning on its capital (IRR) or at the current cost of capital, k . In order to have correct and reliable results it is obvious, therefore, that they should be based on realistic estimates of the interest rate (if any) at which income will be reinvested. Terminal value takes care of this aspect.

Terminal Value Method The terminal value approach (TV) even more distinctly separates the timing of the cash inflows and outflows. The assumption behind the TV approach is that each cash inflow is reinvested in another asset at a certain rate of return from the moment it is received until the termination of the project. Consider Example 9.9.

Example 9.9

Original outlay, ₹10,000; Life of the project, 5 years; Cash inflows, ₹4,000 each for 5 years; and Cost of capital (k), 10 per cent.

Expected interest rates at which cash inflows will be reinvested:

Year-end	Per cent
1	6
2	6
3	8
4	8
5	8

Solution

We would reinvest ₹4,000 received at the end of the year 1 for 4 years at the rate of 6 per cent. The cash inflows in year 2 will be re-invested for 3 years at 6 per cent, the cash inflows of year 3 for 2 years and so on.

There will be no reinvestment of cash inflows received at the end of the fifth year. The total sum of these compounded cash inflows is then discounted back for 5 years at 10 per cent and compared with the present value of the cash outlays, that is, ₹10,000 (in this case).

The PV of the terminal sum is given in Table 9.15.

TABLE 9.15 Computation of Terminal Value

Year	Cash inflows	Rate of interest	Years for investment	Compounding factor	Total compounded sum
1	2	3	4	5	6
1	₹4,000	6	4	1.262	₹5,048
2	4,000	6	3	1.191	4,764
3	4,000	8	2	1.166	4,664
4	4,000	8	1	1.080	4,320
5	4,000	8	0	1.000	4,000
					22,796

Now, we have to find out the present value of ₹22,796. The discount rate would be the cost of capital, k (0.10). The sum of ₹22,796 would be received at the end of year 5. Its present value = ₹22,796 × 0.621 = ₹14,156.3.

Accept-reject Rule The decision rule is that if the present value of the sum total of the compounded reinvested cash inflows (PVTS) is greater than the present value of the outflows (PVO), the proposed project is accepted otherwise not. Symbolically,

$$\begin{aligned} \text{PVTS} > \text{PVO} & \text{ accept} \\ \text{PVTS} < \text{PVO} & \text{ reject} \end{aligned} \quad (9.13)$$

The firm would be indifferent if both the values are equal. Thus, since the PVTS of ₹14,156.31 exceeds the original outlay of ₹10,000, we would accept the assumed project under the TV criterion.

A variation of the terminal value method (TV) is the net terminal value (NTV). Symbolically it can be represented as $\text{NTV} = (\text{PVTS} - \text{PVO})$. If the NTV is positive, accept the project, if the NTV is negative, reject the project. In the above example, the NTV is positive. Its value is ₹4,156.31. Therefore, the project is acceptable.

The NTV method is similar to NPV method, with the difference that while in the former, values are compounded, in the latter, they are discounted. Both the methods will give the same results provided of course the same figures have been discounted as have been compounded and the same interest rate (rates) is used for both discounting and compounding.

Evaluation The NTV (or TV) method has a number of advantages.

Firstly, these methods explicitly incorporate the assumption about how the cash inflows are reinvested once they are received and avoid any influence of the cost of capital on the cash inflow stream itself. Secondly, it is mathematically easier, making simple the process of evaluating the investment worth of alternative capital projects. Thirdly, this method would be easier to understand for business executives who are not trained in accountancy or economics than NPV for IRR, as the 'compounding technique', appeals more than 'discounting'. Fourthly, it is better suited to cash budgeting requirements. The NPV computation in spite of being a cash flow approach does not explicitly show all the cash inflows. It does not take into account cash inflows in respect of interest earnings.

The major practical problem of this method lies in projecting the future rates of interest at which the intermediate cash inflows received will be reinvested.

Profitability Index (PI) or Benefit-Cost Ratio (B/C Ratio) Yet another time-adjusted capital budgeting technique is profitability index/present value index (PI) or benefit-cost ratio (B/C). It is similar to

Profitability index measures the present value of returns per rupee invested.

- the NPV approach. The **profitability index** approach measures the present value of
- returns per rupee invested, while the NPV is based on the difference between the
- present value of future cash inflows and the present value of cash outlays. A major
- shortcoming of the NPV method is that, being an absolute measure, it is not a reliable
- method to evaluate projects requiring different initial investments. The PI method
- provides a solution to this kind of problem. It is, in other words, a relative measure.

It may be defined as the ratio which is obtained dividing the present value of future cash inflows by the present value of cash outlays. Symbolically,

$$\text{PI} = \frac{\text{Present value cash inflows}}{\text{Present value of cash outflows}} \quad (9.14)$$

This method is also known as the B/C ratio because the numerator measures benefits and the denominator costs. A more appropriate description would be present value index.

Accept-Reject Rule Using the B/C ratio or the PI, a project will qualify for acceptance if its PI exceeds one. When PI equals 1, the firm is indifferent to the project.

When PI is greater than, equal to or less than 1, the net present value is greater than, equal to or less than zero respectively. In other words, the NPV will be positive when the PI is greater than 1; will be negative when the PI is less than one. Thus, the NPV and PI approaches give the same results regarding the investment proposals.

The selection of projects with the PI method can also be done on the basis of ranking. The highest rank will be given to the project with the highest PI, followed by others in the same order.

In Example 9.6 (Table 9.15) of machine A and B, the PI would be 1.22 for machine A and 1.27 for machine B:

$$\text{PI (Machine A)} = ₹68,645/₹56,125 = 1.22$$

$$\text{PI (Machine B)} = (₹71,521/₹56,125) = 1.27$$

Since the PI for both the machines is greater than 1, both the machines are acceptable.

Though it is common to define PI as the ratio of the PV of the cash inflows divided by the PV of cash outflows, the PI may also be measured on the basis of the net benefits of a project against its current cash outlay rather than measure its gross benefits against its total cost over the life of the project. This aspect becomes very important in situations of capital rationing.¹⁹ In such a situation, the decision rule would be to accept the project if the PI is positive and reject the project if it is negative.

Evaluation Like the other discounted cash flow techniques, the PI satisfies almost all the requirements of a sound investment criterion. It considers all the elements of capital budgeting, such as the time value of money, totality of benefits and so on. Conceptually, it is a sound method of capital budgeting. Although based on the NPV, it is a better evaluation technique than NPV in a situation of capital rationing. For instance, two projects may have the same NPV of ₹10,000 but project A requires an initial investment of ₹50,000 whereas B only of ₹25,000. Project B should be preferred as will be suggested by the PI method. The NPV method, however, will give identical rankings of both the projects. Thus, the PI method is superior to the NPV method as the former evaluates the worth of projects in terms of their relative rather than absolute magnitudes. However, in some problems of a mutually exclusive nature, the NPV method would be superior to the PI method. The comparison of PI and NPV is further explored in Chapter 10.

This method is, however, more difficult to understand. Also, it involves more computation than the traditional methods but less than IRR.

LO 9.4

CAPITAL BUDGETING PRACTICES IN INDIA

The capital budgeting practices by corporate enterprises in India are summarised below.

- The discounted cash flow (DCF) tools/techniques/methodology are more popular now.
- The corporates firms use multiple criteria in their projected selection decisions. Vast majority of the sample corporates use a combination of traditional as well as DCF techniques.
- The IRR is the most frequently used (85 per cent) capital budgeting technique.
- The NPV technique is also used widely (65 per cent). The IRR method is preferred over the NPV method.
- The pay back period is equally popular method of project selection (68 per cent)
- Large firms more frequently use NPV while pay back period is more widely used by small firms. Similarly, high growth firms use IRR more frequently than small firms.
- PI technique is used more by public sector units than private sector firms.
- The survey (2011–2012) reveals that paucity of funds is not a major hurdle for exploring profitable capital budgeting decisions for a large majority of the sample companies.

- Capital budgeting decisions are undertaken at the top management level/central (Head) office and are planned in advance. The corporates follow mostly top-down approach in this regard.
- However, in several corporates (two-third of the sample corporates) investment proposals originate at plant/divisional levels as well.
- Highly competitive and volatile conditions seem to have restricted the planning horizon to the next five years only.
- The corporates are not guided by ad-hoc approach and they follow systematic approach to capital budgeting.
- Very high fixed-cost components of capital projects and the irregularities in prediction of future cash flows due to increased competition seem to be the major factors leading to failures of capital budgeting decisions for the sample companies.

Jain and Surendra S. Yadav, "Capital Budgeting Decisions: Evidence from India" *Journal of Advances in Management Research*, Vol. 9, No. 1, 2012, pp 96-112.

SUMMARY

Capital budgeting decisions relate to long-term assets which are in operation and yield a return over a period of time. They, therefore, involve current outlays in return for series of anticipated flow of future benefits.

Such decisions are of paramount importance as they affect the profitability of a firm, and are the major determinants of its efficiency and competing power. While an opportune investment decision can yield spectacular returns, an ill-advised/incorrect decision can endanger the very survival of a firm. A few wrong decisions and the firm may be forced into bankruptcy.

Capital expenditure decisions are beset with a number of difficulties. The two major difficulties are: (i) The benefits from long-term investments are received in some future period which is uncertain. Therefore, an element of risk is involved in forecasting future sales revenues as well as the associated costs of production and sales; (ii) It is not often possible to calculate in strict quantitative terms all the benefits or the costs relating to a specific investment decision.

Such decisions are of two types, namely, revenue expanding investment decisions and cost reducing investment decisions. The latter types of decisions are subject to less risk as the potential cash saving can be estimated better from the past production and cost data. It is more difficult to estimate revenues and costs of a new product line.

The capital outlays and revenue benefits associated with such decisions are measured in terms of cash flows after taxes. The cash flow approach for measuring benefits is theoretically superior to the accounting profit approach as it (i) avoids the ambiguities of the accounting profits concept, (ii) measures the total benefits and (iii) takes into account the time value of money.

The major difference between the cash flow and the accounting profit approaches relates to the treatment of depreciation. While the accounting approach considers depreciation in cost computation, it is recognised, on the contrary, as a source of cash to the extent of tax advantage in the cash flow approach.

For taxation purposes, depreciation is charged (on the basis of written down value method) on a block of assets and not on an individual asset. A block of assets is a group of assets (say, of plant and machinery) in respect of which the same rate of depreciation is prescribed by the Income-Tax Act. Depreciation is charged on the year-end balance of the block which is equal to the opening balance plus purchases made during the year (in the block considered) minus sale proceeds of the assets during the year.

LO 9.1

In case the entire block of assets is sold during the year (the block ceases to exist at year-end), no depreciation is charged at the year-end. If the sale proceeds of the block sold is higher than the opening balance, the difference represents short-term capital gain which is subject to tax. Where the sale proceeds are less than the opening balance, the firm is entitled to tax shield on short-term capital loss. The adjustment related to the payment of taxes/tax shield is made in terminal cash inflows of the project.

The data requirement for capital budgeting are after tax cash outflows and cash inflows. Besides, they should be incremental in that they are directly attributable to the proposed investment project. The existing fixed costs, therefore, are ignored. In brief, incremental after-tax cash flows are the only relevant cash flows in the analysis of new investment projects.

The investment in new capital projects can be categorised into (i) a single proposal, (ii) a re-placement proposal and (iii) mutually exclusive proposals.

In the case of single/independent investment proposal, cash outflows primarily consist of (i) purchase cost of the new plant and machinery, (ii) its installation costs and (iii) working capital requirement to support production and sales (in the case of revenue expanding proposals/release of working capital in cost reduction proposals).

The cash inflows after taxes (CFAT) are computed by adding depreciation (D) to the projected earnings after taxes (EAT) from the proposal. In the terminal year of the project, apart from operating CFAT, the cash inflows include salvage value (if any, net of removal costs), recovery of working capital and tax advantage/taxes paid on short-term capital loss/gain on sale of machine (if the block ceases to exist).

In the case of replacement situation, the sale proceeds from the existing machine reduce the cash outflows required to purchase the new machine. The relevant CFAT are *incremental* after-tax cash inflows.

In the case of mutually exclusive proposals, the selection of one proposal precludes the selection of the other(s). The computation of the cash outflows and cash inflows are on lines similar to the replacement situation.

The capital budgeting evaluation techniques are: (i) traditional, comprising (a) average/accounting rate of return (ARR) and (b) pay back (PB) period; (ii) discounted cash flow (DCF), primarily consisting of (a) net present value (NPV), (b) internal rate of return (IRR) and (iii) profitability/present value index (PI).

The ARR is obtained dividing annual average profits after taxes by average investments. Average investment = $\frac{1}{2} (\text{Initial cost of machine} - \text{Salvage value}) + \text{Salvage value} + \text{net working capital}$. Annual average profits after taxes = Total expected after tax profits/Number of years

The ARR is unsatisfactory method as it is based on accounting profits and ignores time value of money.

The pay back method measures the number of years required for the CFAT to pay back the initial capital investment outlay, ignoring interest payment. It is determined as follows:

- (i) In the case of annuity CFAT: Initial investment/Annual CFAT.
- (ii) In the case of mixed CFAT: It is obtained by cumulating CFAT till the cumulative CFAT equal the initial investment.

Although the pay back method is superior to the ARR method in that it is based on cash flows, it also ignores time value of money and disregards the total benefits associated with the investment proposal.

The DCF methods satisfy all the attributes of a good measure of appraisal as they consider the total benefits (CFAT) as well as the timing of benefits.

LO 9.2

LO 9.3

The first part of the report is devoted to a general
 description of the country and its resources. It
 is followed by a detailed account of the
 various industries and occupations of the
 people. The report concludes with a summary
 of the principal facts and a list of the
 names of the persons who were engaged
 in the expedition.

REPORT

The second part of the report is devoted to a
 detailed description of the various
 occupations and industries of the
 people. It is followed by a summary
 of the principal facts and a list of the
 names of the persons who were engaged
 in the expedition.

The third part of the report is devoted to a
 detailed description of the various
 occupations and industries of the
 people. It is followed by a summary
 of the principal facts and a list of the
 names of the persons who were engaged
 in the expedition.

REPORT

The fourth part of the report is devoted to a
 detailed description of the various
 occupations and industries of the
 people. It is followed by a summary
 of the principal facts and a list of the
 names of the persons who were engaged
 in the expedition.

The NPV may be described as the summation of the present values of (i) operating CFAT (CF) in each year and (ii) salvages value(S) and working capital(W) in the terminal year(n) minus the summation of present values of the cash outflows(CO) in each year. The present value is computed using cost of capital (k) as a discount rate. Symbolically,

$$NPV = \sum_{t=1}^n \frac{CF_t}{(1+k)^t} + \frac{S_n + W_n}{(1+k)^n} - \sum_{t=0}^n \frac{CO_t}{(1+k)^t}$$

The project will be accepted in case the NPV is positive.

The IRR is defined as the discount rate (r) which equates the aggregate present value of the operating CFAT received each year and terminal cash flows (working capital recovery and salvage value) with aggregate present value of cash outflows of an investment proposal. Symbolically,

$$IRR = \sum_{t=1}^n \frac{CF_t}{(1+r)^t} + \frac{S_n + W_n}{(1+r)^n} - \sum_{t=1}^n \frac{CO_t}{(1+r)^t}$$

The project will be accepted when IRR exceeds the required rate of return.

The profitability index/present value index measures the present value of returns per rupee invested. It is obtained dividing the present value of future cash inflows (both operating CFAT and terminal) by the present value of capital cash outflows. The proposal will be worth accepting if the PI exceeds one.

18. It may be noted that (i) NPV value is based on the assumption that cash inflows (CFAT) accrue at year end. However, in practice, CFAT accrue through out the period. Therefore, the actual NPV is likely to be higher than the estimated value. It also implies that determination of NPV is conservative in nature. (ii) As a corollary of (i) it implies that the project may be worth accepting even at zero NPV.

SOLVED PROBLEMS

P.9.1 A company is considering an investment proposal to instal new milling controls at a cost of ₹50,000. The facility has a life expectancy of 5 years and no salvage value. The tax rate is 35 per cent. Assume the firm uses straight line depreciation and the same is allowed for tax purposes. The estimated cash flows before depreciation and tax (CFBT) from the investment proposal are as follows:

LO 9.3	LOD E
---------------	--------------

Year	CFBT
1	₹10,000
2	10,692
3	12,769
4	13,462
5	20,385

Compute the following:

- (i) Pay back period, (ii) Average rate of return, (iii) Internal rate of return, (iv) Net present value at 10 per cent discount rate, (v) Profitability index at 10 per cent discount rate.

Solution

Determination of cashflows after taxes (CFAT)

Year	CFBT	Depreciation (₹50,000/5)	Profits before tax (Col.2 – Col.3)	Taxes (0.35)	EAT (Col.4 – Col.5)	CFAT (Col.6+Col.3)
1	2	3	4	5	6	7
1	₹10,000	₹10,000	Nil	Nil	Nil	₹10,000
2	10,692	10,000	₹692	₹242	₹450	10,450
3	12,769	10,000	2,769	969	1,800	11,800
4	13,462	10,000	3,462	1,212	2,250	12,250
5	20,385	10,000	10,385	3,635	6,750	16,750
					11,250	61,250

- (i) Pay back (PB) period

Year	CFAT	Cumulative CFAT
1	₹10,000	₹10,000
2	10,450	20,450
3	11,800	32,250
4	12,250	44,500
5	16,750	61,250

The recovery of the investment falls between the fourth and fifth years. Therefore, the PB is 4 years plus a fraction of the fifth year. The fractional value = ₹5,500 ÷ ₹16,750 = 0.328. Thus, the PB is 4.328 years.

(ii) Average rate of return (ARR) = $\frac{\text{Average income}}{\text{Average investment}} \times 100 = \frac{₹2,250 \text{ (₹11,250} \div 5)}{₹25,000 \text{ (₹50,000} \div 2)} \times 100 = 9 \text{ per cent}$

(iii) Internal rate of return (IRR) $₹50,000 = \frac{₹10,000}{(1+r)^1} + \frac{₹10,450}{(1+r)^2} + \frac{₹11,800}{(1+r)^3} + \frac{₹12,250}{(1+r)^4} + \frac{₹16,750}{(1+r)^5}$

The fake pay back period = 4.0816 (₹50,000/₹12,250). From Table A-4, the value closest to the fake pay back period of 4.0816 against 5 years is 4.100 against 7 per cent. Since the actual cash flow stream in the initial years is slightly below the average cash flow stream, the IRR is likely to be lower than 7 per cent. Let us try with 6 per cent.

Year	CFAT	PV factor		Total PV	
		(0.06)	(0.07)	(0.06)	(0.07)
1	₹10,000	0.943	0.935	₹9,430	₹9,350
2	10,450	0.890	0.873	9,300	9,123
3	11,800	0.840	0.816	9,912	9,629
4	12,250	0.792	0.763	9,702	9,347
5	16,750	0.747	0.713	12,512	11,942
Total PV				50,856	49,391
Less: Initial outlay				50,000	50,000
NPV				856	(609)

The IRR is between 6 and 7 per cent. By interpolation, IRR = 6.6 per cent.
(iv) Net present value (NPV)

Year	CFAT	PV factor (0.10)	Total PV
1	₹10,000	0.909	₹9,090
2	10,450	0.826	8,632
3	11,800	0.751	8,862
4	12,250	0.683	8,367
5	16,750	0.621	10,401
Total PV			45,352
Less: Initial outlay			50,000
NPV			(4,648)

$$(v) \text{ Profitability index (PI) } PI = \frac{\text{PV of cash inflows}}{\text{PV of cash outflows}} = \frac{₹45,352}{₹50,000} = 0.907$$

P.9.2 A project costing ₹5,60,000 is expected to produce annual net cash benefits (CFAT) of ₹80,000 over a period of 15 years. Estimate the internal rate of return (IRR). Also, find the pay back period and obtain the IRR from it. How do you compare this IRR with the one directly estimated?

LO 9.3 **LOD E**

$$\text{Solution } \text{PB value} = \frac{₹5,60,000}{₹80,000} = 7.000$$

The factors closet to 7.000 are 7.191 at 11 per cent rate of discount and 6.811 at 12 per cent rate of discount against 15 years (Table A-4). The actual IRR would be between 11 and 12 per cent.

Using interpolation, the IRR would be $0.11 + 0.005(0.19 + 0.38) = 11.5$ per cent.

IRR determination through PB period: The reciprocal of the PB period is a good approximation of the IRR if, (i) the life of the project is at least twice the PB period, and (ii) the project generates annuity cash inflows. Accordingly, IRR would be the reciprocal of the PB period, i.e. $1/7 = 0.1428 = 14.28$ per cent.

Comparison: The two IRRs are different. But the IRR which is directly estimated is correct as at this rate of discount, NPV of cash flow stream of the project would be zero. The NPV cannot be zero at 14.28 per cent. The IRR through the PB period is only an approximate measure.

P.9.3 Modern Enterprises Ltd is considering the purchase of a new computer system for its research and development division, which would cost ₹35 lakh. The operation and maintenance costs (excluding depreciation) are expected to be ₹7 lakh per annum. It is estimated that the useful life of the system would be 6 years, at the end of which the disposal value is expected to be ₹1 lakh.

LO 9.3 **LOD M**

The tangible benefits expected from the system in the form of reduction in design and draftmanship costs would be ₹12 lakh per annum. The disposal of used drawing office equipment and furniture initially is anticipated to net ₹9 lakh.

As capital expenditure in research and development, the proposal would attract a 100 per cent write-off for tax purposes. The gains arising from disposal of used assets may be considered tax free. The effective tax rate is 35 per cent. The average cost of capital of the company is 12 per cent.

After appropriate analysis of cash flows, advise the company of the financial viability of the proposal. Ignore tax on salvage value.

Solution

Assessment of financial viability of proposal

(Amount in lakh of rupees)

Incremental cash outflows	
Cost of new computer system	35
Less: Sale proceeds from drawing office equipment and furniture	9
	<u>26</u>
Incremental CFAT and NPV:	
(a) Cost savings (years 1–6)	
Reduction in design and draftmanship costs	12
Less: Operation and maintenance costs	7
Cost savings (earnings) before taxes	5
Less: Taxes (0.35)	1.75
Earnings after taxes (CFAT)	3.25
(×) PV factor of annuity for 6 years (0.12)	× 4.111
Total PV of cost savings	<u>13.36</u>
(b) Tax savings on account of depreciation	
Cost of new computer system (₹35 lakhs × 0.35)	12.25
(×) PV factor for year 1	× 0.892
Total PV	<u>9.93</u>
(c) Terminal salvage value at the end of year, 6 (₹1 lakh × 0.507)	<u>0.507</u>
(d) Gross PV of CFAT [(a) + (b) + (c)]	<u>24.797</u>
Less: Cash outflows	<u>26.000</u>
NPV	<u>(1.203)</u>

Recommendation Since NPV is negative, the proposal is not financially viable.

P.9.4 SCL Limited is engaged in the manufacture of power intensive products. As part of its diversification plans, the company proposes to put up a windmill to generate electricity. The details of the scheme are as follows:

LO 9.3 LOD M

1. Cost of the windmill, ₹300 lakhs
2. Cost of land, ₹15 lakhs
3. Subsidy from state government to be received at the end of first year of installation, ₹15 lakh.
4. Cost of electricity will be ₹2.25 per unit in year 1. This will increase by ₹0.25 per unit every year till year 7. After that, it will increase every year by ₹0.50 per year till year 10.
5. Maintenance cost will be ₹4 lakh in year 1 and the same will increase by ₹2 lakh every year.
6. Estimated life, 10 years.
7. Cost of capital, 15 per cent.
8. Residual value, nil. However, land value will go up to ₹60 lakh, at the end of year 10.
9. Depreciation will be 100 per cent of the cost of the windmill in year 1 and the same will be allowed for tax purposes.

Year	1950	1951	1952	1953	1954
Income	100	110	120	130	140
Expenses	80	85	90	95	100
Profit	20	25	30	35	40

Year	1955	1956	1957	1958	1959
Income	150	160	170	180	190
Expenses	120	125	130	135	140
Profit	30	35	40	45	50

Summary of financial data for the period 1950-1959. The data shows a steady increase in both income and profit over the decade, with expenses also increasing but at a slower rate than income.

Additional notes regarding the financial performance and trends observed during this period. The overall growth is positive, indicating a healthy business environment.

Continuation of financial data and analysis from the previous page. The trends remain consistent, showing sustained growth and profitability.

Year	1960	1961	1962	1963	1964
Income	200	210	220	230	240
Expenses	150	155	160	165	170
Profit	50	55	60	65	70

Final summary of the financial data for the period 1960-1964. The data indicates continued growth and a strong profit margin, reflecting the overall success of the business operations.

10. As windmills are expected to work based on wind velocity, the efficiency is expected to be on an average 30 per cent. Gross electricity generated at this level will be 25 lakh units per annum; 4 per cent of which will be committed to the state electricity board as per the agreement.
11. Tax rate, 35 per cent.

From the above information, you are required to calculate the net present value. Ignore tax on capital profits. Use present value up to two digits.

Solution

Determination of NPV of windmill

(Amount in lakh of rupees)

Incremental cash outflows	
Cost of land	15
Cost of the windmill	300
Less: Subsidy from state government (₹15 lakh × 0.87)	13
	302

Incremental CFAT and NPV

Year	Gross savings on 24 lakh units	Maintenance	Net savings	Taxes	CFAT costs	PVF (0.15)	Total PV
1	54	4	50	(87.5)	137.5	0.87	119.62
2	60	6	54	18.9	35.1	0.76	26.68
3	66	8	58	20.3	37.7	0.66	24.88
4	72	10	62	21.7	40.3	0.57	22.97
5	78	12	66	23.1	42.9	0.50	21.45
6	84	14	70	24.5	45.5	0.43	19.56
7	90	16	74	25.9	48.1	0.38	18.28
8	102	18	84	29.4	54.6	0.33	18.02
9	114	20	94	32.9	61.1	0.28	17.11
10	126	22	104	36.4	67.6	0.25	16.90
10	Land				60.0	0.25	15.00
Total present value							320.47
Less: Incremental cash outflows							302.00
NPV							18.47

*Assuming taxable income from other sources, there will be tax savings of ₹87.5 lakhs on negative EAT of ₹250 lakh (₹300 lakhs, depreciation – ₹50 lakh, net savings).

P.9.5 Techtronics Ltd is considering a new project for manufacture of pocket video games involving a capital expenditure of ₹600 lakh and working capital of ₹150 lakh. The capacity of the plant is for an annual production of 12 lakh units and capacity utilisation during the 6 year working life of the project is expected to be as indicated below:

LO 9.3 **LOD M**

Year	Capacity utilisation (per cent)
1	33.33
2	66.67
3	90
4-6	100

The average price per unit of the product is expected to be ₹200 netting a contribution of 40 per cent. The annual fixed costs, excluding depreciation, are estimated to be ₹480 lakh per annum from the third year onwards; for the first and second year, it would be ₹240 lakh and ₹360 lakh respectively. The average rate of depreciation for tax purposes is 33.33 per cent on the capital assets. The rate of income tax may be taken at 35 per cent. Cost of capital is 15 per cent.

At the end of the third year, an additional investment of ₹100 lakh would be required for working capital.

Terminal value for the fixed assets may be taken at 10 per cent and for the current assets at 100 per cent. For the purpose of your calculations, the recent amendments to tax laws with regard to balancing charge may be ignored.

Solution

Cash outflows	(Amount in lakh of rupees)
Cost of capital expenditure	600.00
Add: Working capital required:	
At the beginning of the project life	150.00
At the end of year 3, (₹100 × 0.658)	65.80
	<u>815.80 = 816</u>

Cash inflows (CFAT) and NPV

Particulars	Year						
	1	2	3	4	5	6	
Sales revenue	800	1,600	2,160	2,400	2,400	2,400	
Less: Variable costs	480	960	1,296	1,440	1,440	1,440	
Less: Fixed costs	240	360	480	480	480	480	
Less: Depreciation (D) (working note 1)	200	133	89	59	40	26	
Earnings before taxes	(120)	147	295	421	440	454	
Less: Taxes (0.35)	(42)	51	103	147	154	159	
EAT	(78)	96	192	274	286	295	
CFAT (EAT + D)	122 [®]	229	281	333	326	321	
Add: Recovery of working capital						250	
Add: Effective sale proceeds of fixed assets (working note 2)						58	
						629	
Multiplied by PV factor	0.87	0.756	0.657	0.571	0.497	0.432	
Total PV (t = 1 - 6)	106	173	185	190	162	272	1,089
Less: PV of outflows							816
NPV							<u>273</u>

Recommendation Since the NPV is positive, the project should be accepted.

[®] There will be tax savings of ₹42 lakh on the loss of ₹120 lakh. Therefore CFAT would be = ₹80 Lakh + ₹42 lakh = ₹122 lakh.

Working Notes

(1) Determination of depreciation as per written down value method

Year	Cost/Written down value (₹lakh)	Depreciation (₹lakh)
1	600	200
2	400	133
3	267	89
4	178	59
5	119	40
6	79	26

Handwritten notes at the top of page 121, including a title and introductory text.

Table with multiple columns and rows of handwritten data, possibly a ledger or record book.

Handwritten notes at the bottom of page 121, including a signature and date.

Handwritten notes at the top of page 123, including a title and introductory text.

Table with multiple columns and rows of handwritten data, similar to the one on page 121.

Handwritten notes at the bottom of page 123, including a signature and date.

(2) Sales proceeds of fixed assets	60
Less: Written down value (₹79 – ₹26)	53
Profit on sale of fixed assets	7
Less: Taxes on profit (7 × 0.35)	2.45
Effective sale proceeds (60 – 2.45)	57.55

P.9.6 A plastic manufacturer has under consideration the proposal of production of high quality plastic glasses. The necessary equipment to manufacture the glasses would cost ₹1 lakh and would last 5 years. The tax relevant rate of depreciation is 20 per cent on written down value. There is no other asset in this block. The expected salvage value is ₹10,000. The glasses can be sold at ₹4 each. Regardless of the level of production, the manufacturer will incur cash cost of ₹25,000 each year if the project is undertaken. The overhead costs allocated to this new line would be ₹5,000. The variable costs are estimated at ₹2 per glass. The manufacturer estimates it will sell about 75,000 glasses per year; the tax rate is 35 per cent. Should the proposed equipment be purchased? Assume 20 per cent cost of capital and additional working requirement, ₹50,000. Also assume that the firm would have sufficient short-term capital gains in year-5.

LO 9.3	LOB M
--------	----------

Solution Cash outflows

Cost of production equipment	₹1,00,000
Additional working capital requirement	50,000
	1,50,000

Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5
Sales revenue (75,000 × 4)	₹3,00,000	₹3,00,000	₹3,00,000	₹3,00,000	₹3,00,000
<i>Less: Costs:</i>					
Variable costs (75,000 × 2)	1,50,000	1,50,000	1,50,000	1,50,000	1,50,000
Additional fixed costs	25,000	25,000	25,000	25,000	25,000
Depreciation (D)	20,000	16,000	12,800	10,240	Nil [Ⓐ]
Earnings before taxes	1,05,000	1,09,000	1,12,200	1,14,760	1,25,000
<i>Less: Taxes</i>	36,750	38,150	39,270	40,166	43,750
Earnings after taxes (EAT)	68,250	70,850	72,930	74,594	81,250
CFAT (EAT + D)	88,250	86,850	85,730	84,834	81,250
<i>Add: Recovery of WC</i>					50,000
<i>Add: Salvage value (SV)</i>					10,000
<i>Add: Tax benefit on short term capital loss[Ⓑ]</i>					10,836
					1,52,086
Multiplied by PV factor 0.20	0.833	0.694	0.579	0.482	0.402
PV (CFAT × PV factor)	73,512	60,274	49,638	40,890	61,139
Total PV (t = 1 – 5)					2,85,453
<i>Less: Cash outflows</i>					1,50,000
NPV					1,35,453

[Ⓐ]As the block consists of single asset, no depreciation is to be charged in the terminating year as the asset has been sold in the year.

[Ⓑ](₹1,00,000 – ₹59,040 accumulated depreciation – ₹10,000, SV) × 0.35 = ₹10,836.

Recommendation The company is advised to buy the proposed equipment.

P.9.7 The Domanhill Colliery, an underground mine, owned by the public sector Coal India Ltd has been producing coal through manual operations for the last eight years. The past and projected revenues and cost data are summarised below.

LO 9.3 **LO D**

Past and projected revenue and cost data (₹ crore)

Year	Sales revenue	Direct labour cost	Administrative and selling expenses	Fixed expenses (excluding depreciation)	Variable expenses
Past Data:					
1	70	14	12	15	23
2	81	16	14	17	25
3	101	21	17	22	30
4	123	30	22	25	39
5	162	34	25	31	45
6	201	41	33	49	64
7	245	48	40	51	77
8	302	61	53	68	94
Projected Data:					
9	309	62	52	68	89
10	342	69	58	75	97
11	375	76	63	83	106
12	408	82	69	91	115
13	441	88	75	98	124

With the liberalisation and opening up the coal sector to private firms, the Board of Directors of Coal India Ltd have decided to undertake a feasibility study for semi-mechanisation of Domanhill Colliery by introducing side dump and load (SDL) machine. With the introduction of the SDL machine, the following changes in the operating parameters are forecast:

- Increase in projected sales revenue by 25 per cent due to faster speed of work;
- Decrease in direct labour cost by 5 per cent resulting from ban on new recruitments;
- Fifteen per cent increase in administrative and selling expenses to support increased semi-mechanised production and sale;
- 10 per cent increase in fixed cost on account of setting up of additional maintenance facility;
- Increase in variable expenses, 50 per cent, as a result of additional electricity consumption;
- Loss in terms of disturbance charge due to opposition, strike and lockout: year 9, ₹2 crore, year 10 ₹0.80 crore and year 11, ₹0.30 crore;
- The semi-mechanisation would require acquisition of 20 machines at a cost of ₹1 crore each. An additional ₹2 crore would have to be spent on creation of additional facility like transformer, special cables and installation of the machines. The machines including the additional facility created would be depreciated over a five year period on the basis of written down value method @ 20 per cent. At the end of year 5, they are expected to be sold at ₹2 crore. The colliery does not have other machines in the block of 20 per cent. Also assume that the firm would have sufficient short-term capital gains in year 5.

Assuming tax-adjusted effective cost of capital of 8 per cent on World Bank loan to finance the project and 35 per cent tax, present a financial analysis of the feasibility of semi-automation of the Domanhill Colliery. As a financial consultant, what recommendation would you make to the Board of Directors of Coal India Ltd?

Solution Financial analysis for semi-mechanisation of Domanhill Colliery (using NPV method)

Incremental cash outflows	(Amount in crore of rupees)
Cost of new machine (SDL) (20 × ₹1 crore)	20
Additional cost of semi-mechanisation	2
	<u>22</u>

Incremental CFAT and NPV

Particulars	Year				
	1	2	3	4	5
Incremental sales revenue (0.25 × projected sales revenue)	77.25	85.5	93.75	102	110.25
Add: Savings in direct labour cost (0.05 × DLC)	3.10	3.45	3.8	4.1	4.4
Less: Incremental administrative and selling expenses (0.15 × ASE)	7.8	8.70	9.45	10.35	11.25
Less: Incremental fixed costs (0.10 × FC)	6.8	7.5	8.3	9.1	9.8
Less: Increase in variable costs (0.50 × VC)	44.5	48.5	53	57.5	62
Less: Disruption charges	2.0	0.8	0.3	—	—
Less: Depreciation	4.4	3.52	2.82	2.25	Nil. [®]

CFAT (operating)	14.05	16.47	18.21	19.73	20.5
Salvage value					2.0
Tax benefit on short-term capital loss (0.35 × ₹7.01)					2.45
(x) PV factor (0.08)	0.926	0.857	0.794	0.735	0.681
Present value	13.01	14.11	14.46	14.50	16.99
Total present value ($t = 1 - 5$)					73.07
Less: Cash outflows					22.00
Net present value					51.07

[®] No depreciation is charged in terminal year, as block ceases to exist.

Recommendation Since the NPV is positive, the proposal is financially viable.

P.9.8 The Projects Consultants (P) Ltd is a consultancy firm. Its main business is conducting market studies, surveys and techno-economic feasibility and industry reviews. Its final product is in the form of a printed report. The normal procedure is to produce handwritten drafts of the report and get it printed through an independent word processing service agency. Three copies of each report are prepared for submission to the clients.

LO 9.3 **LOD D**

On an average 35 studies are completed every year. The average size of the report is 100 pages. In addition, about 50 proposals are sent in duplicate to various companies every year, the average size of these being 20 pages. The reports as well as the proposals are in laser print on bond paper. The handwritten drafts (printed 3 times for reports and 2 times for proposals) are on ordinary paper.

The external word processing is done at a rate of ₹10 per page with one draft free of cost. The variable overheads are 2 telephone calls a day to the word processing agency for 300 days @ ₹1 per call.

Recently, the firm has been offered a computer system with software and laser printer for ₹1,20,000. The system would have no salvage value at the end of 5 years. The maintenance cost of the system would include ₹5,000 on account of annual maintenance contract and ₹15,000 for spares. The annual insurance of the system is likely to be 1 per cent of the cost. The other associated annual costs are expected to be as follows:

- Cost of bond paper, ₹0.35 per sheet; cost of ordinary paper @ ₹0.18 per sheet. The experience has been that there is 10 per cent wastage of both bond and ordinary paper sheets;
- Laser toner, ₹0.10 per sheet;
- Draft print at ₹0.05 per sheet;
- Power charges, ₹3,000;
- Telephone charges, ₹100;
- Manpower charges, ₹3,000 per month as salary of a part-time computer operator;
- Additional working capital requirement, ₹25,000.

The firm is in the 35 per cent tax bracket. Assuming it would use written down value method of depreciation at the rate of 20 per cent and its required rate of return is 10 per cent, should the Projects Consultants (P) Ltd install its own computer system as an alternative to hiring word processing service from an outside agency? Assume further that the company does not have any other asset in the 20 per cent block and would have sufficient short-term capital gains in year 5.

Solution Financial analysis to purchase computer system

Cash outflows

Cost of computer system	₹1,20,000
Increased working capital required	25,000
Initial investment required	<u>1,45,000</u>

Incremental CFAT and NPV

Particulars	Year				
	1	2	3	4	5
Savings in word processing cost:					
— Reports ($35 \times 3 \times 100 \times ₹10$)	₹1,25,000	₹1,25,000	₹1,25,000	₹1,25,000	₹1,25,000

P.9.9 BS Electronics is considering a proposal to replace one of its machines. In this connection, the following information is available.

LO 9.3 LOD M

The existing machine was bought 3 years ago for ₹10 lakh. It was depreciated at 20 per cent per annum on reducing balance basis. It has remaining useful life of 5 years, but its annual maintenance cost is expected to increase by ₹50,000 from the sixth year of its installation. Its present realisable value is ₹6 lakh. The company has several machines, having 20 per cent depreciation.

The new machine costs ₹15 lakh and is subject to the same rate of depreciation. On sale after 5 years, it is expected to net ₹9 lakh. With the new machine, the annual operating costs (excluding depreciation) are expected to decrease by ₹1 lakh. In addition, the new machine would increase productivity on account of which net revenues would increase by ₹1.5 lakh annually.

The tax rate applicable to the firm is 35 per cent and the cost of capital is 10 per cent.

Is the proposal financially viable? Advise the firm on the basis of NPV of the proposal.

Solution

Financial evaluation whether to replace an existing machine (using NPV method)

(A) Incremental cash outflows

Cost of new machine	₹15,00,000
Less: Sale value of existing machine	6,00,000
	9,00,000

(B) Determination of CFAT (operating)

Year	Incremental cash profits before taxes	Incremental depreciation	Taxable income (col. 2 – col. 3)	Taxes (0.35)	EAT (col. 4 – col. 5)	CFAT (col. 6 + col. 3)
1	2	3	4	5	6	7
1	₹2,50,000	₹1,80,000	₹70,000	₹24,500	₹45,500	₹2,25,500
2	2,50,000	1,44,000	1,06,000	37,100	68,900	2,12,900
3	3,00,000	1,15,200	1,84,800	64,680	1,20,120	2,35,320
4	3,00,000	92,160	2,07,840	72,740	1,35,096	2,27,256
5	3,00,000	73,728	2,26,272	79,195	1,47,077	2,20,805

(C) Determination of net present value

Year	CFAT	PV factor (0.10)	Total present value
1	₹2,25,500	0.909	₹2,04,980
2	2,12,900	0.826	1,83,010
3	2,35,320	0.751	1,75,855
4	2,27,256	0.683	1,55,216
5	2,20,805	0.620	1,36,899
5	9,00,000 (Net salvage value)*	0.620	5,58,000
	Total present value		14,13,960
	Less: Incremental cash outflows		9,00,000
	Net present value		5,13,960

*at the beginning of year 6.

It is important to note that machine is sold after 5 years and not at the end of year 5.

Recommendation Since NPV is positive, the company is advised to replace the existing machine.

Working Notes

(i) WDV of existing machine in the beginning of year 4

Initial cost of machine	₹10,00,000
Less: Depreciation @ 20% in year 1	2,00,000
WDV at beginning of year 2	8,00,000

Less: Depreciation @ 20% on WDV	1,60,000
WDV at beginning of year 3	<u>6,40,000</u>
Less: Depreciation @ 20% on WDV	1,28,000
WDV at beginning of year 4	<u>5,12,000</u>
(ii) Depreciation base of new machine	
WDV of existing machine	5,12,000
Plus: Cost of the new machine	15,00,000
Less: Sale proceeds of existing machine	<u>(6,00,000)</u>
	<u>14,12,000</u>
(iii) Base for incremental depreciation	
Depreciation base of new machine	14,12,000
Less: Depreciation base of existing machine	<u>(5,12,000)</u>
	<u>9,00,000</u>

(iv) Incremental depreciation ($T = 1 - 5$)

Year	Incremental asset cost base	Depreciation @ 20% on WDV
1	₹9,00,000	₹1,80,000
2	7,20,000	1,44,000
3	5,76,000	1,15,200
4	4,60,800	92,160
5	3,68,640	73,728

(v) Incremental cash profits before taxes (in terms of decrease in operating costs and increase in revenues) owing to the new machine

Year	Savings in operating costs	Increase in revenue	Incremental cash profit before taxes
1	₹1,00,000	₹1,50,000	₹2,50,000
2	1,00,000	1,50,000	2,50,000
3	1,50,000 [⊙]	1,50,000	3,00,000
4	1,50,000	1,50,000	3,00,000
5	1,50,000	1,50,000	3,00,000

[⊙]Maintenance expenses of existing machine are expected to increase by ₹50,000 from sixth year of installation.

P.9.10 Seshasayee Industries Ltd is considering replacing a hand-operated weaving machine with a new fully automated machine. Given the following information, advise the management whether the machine should be replaced or not. Assume the company has only this machine in 20 per cent block of assets and the block will cease to exist after the useful life of the automated machine.

LO 9.3 LOD
M

Also assume that the firm would have sufficient short-term capital gains in year 5.

Existing situation:

- One full-time operator's salary, ₹36,000
- Variable overtime, ₹3,000
- Fringe benefits, ₹3,000
- Cost of defects, ₹3,000
- Original price of hand-operated machine, ₹60,000
- Expected life, (years), 10
- Age, (years) 5
- Depreciation method, written down value
- Current salvage value of old machine, ₹36,000
- Marginal tax rate, 35
- Required rate of return, 15

Proposed situation:

- Fully-automated operation, No operator is necessary
- Cost of machine, ₹1,80,000
- Transportation charges, ₹3,000
- Installation costs, ₹15,000
- Expected economic life (years), 5
- Depreciation method, written down value
- Annual maintenance, ₹3,000
- Cost of defects, ₹3,000
- Salvage value at year-end 5, ₹20,000.

Solution

Incremental cash outflows

Cost of machine	₹1,80,000
Add: Transportation charges	3,000
Add: Installation costs	15,000
Less: Cash inflow from the sale of old machine	36,000
	<u>1,62,000</u>

Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5
Cost savings	₹39,000	₹39,000	₹39,000	₹39,000	₹39,000

CFAT (EAT + D)	36,690	34,422	32,608	31,156	25,350
Add: Salvage value					20,000
Add: Tax advantage [®]					16,224
(×) PV factor (0.15)	0.870	0.756	0.656	0.572	0.497
Present value	31,920	26,023	21,391	17,821	30,602
Total PV (t = 1 - 5)					<u>1,27,757</u>
Less: Cash outflows					<u>1,62,000</u>
Net present value					<u>(34,243)</u>

[®] on short-term capital loss (₹66,355 - ₹20,000) × 0.35 = ₹16,224.

Recommendation Since the NPV is negative, the machine is not recommended for purchase.

Working Notes

(i) Incremental depreciation (if machine is purchased)

(a) WDV of existing machine in the beginning of year 6:

Initial cost of machine	₹60,000
Less: Depreciation charges (year 1 to 5)	
Year 1 (₹60,000 × 0.20)	₹12,000
2 (48,000 × 0.20)	9,600
3 (38,400 × 0.20)	7,680
4 (30,720 × 0.20)	6,144
5 (24,576 × 0.20)	4,915
	<u>40,339</u>
	<u>19,661</u>

(b) Depreciation base of new machine:

WDV of existing machine	19,661
Add: Cost of new machine (₹1,80,000 + ₹3,000 + ₹15,000)	1,98,000
Less: Sale of existing machine	(36,000)
	<u>1,81,661</u>
(c) Base of incremental depreciation (₹1,81,661 - ₹19,661)	<u>1,62,000</u>

(d) Incremental depreciation (t = 1 – 5)

Year	Incremental WDV base	Depreciation
1	₹1,62,000	₹32,400
2	1,29,600	25,920
3	1,03,680	20,736
4	82,944	16,589
5	66,355	Nil (as machine is sold)

(ii) Cost savings (if machine is purchased)

	Existing situation	Proposed situation	Differential cost savings
Salary	₹36,000	—	₹36,000
Variable overtime	3,000	—	3,000
Fringe benefits	3,000	—	3,000
Cost of defects	3,000	₹ 3,000	Nil
Annual maintenance	—	3,000	(3,000)
	<u>45,000</u>	<u>6,000</u>	<u>39,000</u>

P.9.11 An existing company has a machine which has been in operation for 2 years; its estimated remaining useful life is 4 years with no salvage value in the end. Its current market value is ₹25,000. The management is considering a proposal to purchase an improvement model of the machine which gives increased output. The relevant particulars are as follows:

LO 9.3 LOD
M

Particulars	Existing machine	New machine
Purchase price (₹)	60,000	1,07,500
Estimated life (years)	6	4
Salvage value	0	0
Annual operating hours	1,000	1,000
Selling price per unit (₹)	3	3
Material per unit (₹)	0.40	0.40
Output per hour (units)	15	30
Labour cost per hour (₹)	11	16
Consumable stores per year (₹)	2,000	1,000
Repairs and maintenance per year (₹)	3,000	2,000
Working capital (₹)	10,000	20,000
Income-tax rate	35	35

Should the existing machine be replaced? Assume that (i) required rate of return is 10 per cent, and (ii) the company uses written down value method of depreciation @ 20 per cent and it has several machines in the 20 per cent block.

Solution

Incremental cash outflows

Purchase price of new machine	₹1,07,500
Add: Additional working capital	10,000
Less: Sale value of old machine	25,000
	<u>92,500</u>

Determination of CFAT and NPV

Particulars	Years			
	1	2	3	4
Incremental revenues	₹36,000	₹36,000	₹36,000	₹36,000
Less: Incremental depreciation	16,500	13,200	10,560	8,448

(Contd)

Repairs and maintenance	3,000	2,000	1,000
Incremental revenues	23,000	59,000	36,000

(ii) Incremental depreciation (if machine is purchased)

(a) WDV of existing machine in the beginning of year 3

Initial cost of machine ₹60,000

Less: Depreciation charges (years 1 and 2):

Year 1 ($₹60,000 \times 0.20$)

₹12,000

2 ($₹48,000 \times 0.20$)

9,600

21,600

38,400

(b) Depreciation base of new machine:

WDV of existing machine 38,400

Add: Cost of new machine

1,07,500

Less: Sale value of existing machine

(25,000)

1,20,900

(c) Base for incremental depreciation: ($₹1,20,900 - ₹38,400$)

82,500

(d) Incremental depreciation ($t = 1 - 4$)

Year	WDV	Depreciation
1	₹82,500	₹16,500
2	66,000	13,200
3	52,800	10,560
4	42,240	8,448

Note: There will be an additional tax advantage on depreciation of ₹33,792 ($₹42,240 - ₹8,448$) in the future years.

P.9.12 XYZ Company manufactures several different products. One of the principal products sells for ₹20 per unit. The sales manager of XYZ has stated repeatedly that he could sell more units of this product if they were available. To substantiate his claim, he conducted a market research study last year at a cost of ₹35,000. The study indicated that XYZ could sell 18,000 units of this product annually for the next five years.

LO 9.3	LOD D
--------	----------

The equipment currently in use has the capacity to produce 11,000 units annually. The variable production costs are ₹9 per unit. The equipment has a value of ₹60,000 for tax purposes and a remaining useful life of five years. The salvage value of the equipment is negligible now and will be zero in five years.

A maximum of 20,000 units could be produced annually on the new machinery which can be purchased. The new equipment costs ₹2,50,000 and has an estimated useful life of five years with no salvage value. The production manager estimates that the new equipment would provide increased production efficiencies that would reduce the variable production costs to ₹7 per unit.

XYZ Company uses written down value method of depreciation on all of its equipments. The firm is subject to a 35 per cent tax and its after-tax cost of capital is 15 per cent.

The sales manager felt so strongly about the need for additional capacity that he attempted to prepare an economic justification for the equipment although this was not one of his responsibilities. His analysis, presented below, disappointed him because it did not justify acquiring the equipment.

Purchase price of new equipment	₹2,50,000
Disposal of existing equipment:	
Loss on disposal	₹60,000
Less: Tax benefit (0.35)	<u>(21,000)</u>
Cost of market research study	35,000
Total investment	<u>3,24,000</u>
Contribution margin from product:	
Using the new equipment [18,000 × (₹20 – 7)]	2,34,000
Using the existing equipment [11,000 × (₹20 – 9)]	1,21,000
Increase in contribution	1,13,000
Less: Depreciation	50,000
Increase in before-tax income	63,000
Income tax (0.35)	22,050
Increase in income	40,950
Less: Cost of capital on the additional investment required (0.15 × ₹3,24,000)	48,600
Net annual return of proposed investment in new equipment	<u>(7,650)</u>

The controller of XYZ Company plans to prepare a discounted cash flow analysis for this investment proposal. He has asked you to prepare corrected calculations of: (a) the required investment in new equipment, and (b) the recurring annual cash flows. Give your recommendation on the basis of above information and assuming 25 per cent depreciation on the block of assets to which the machine belongs.

Solution

Financial evaluation whether to replace existing equipment

(a) Required investment in new equipment:	
Purchase price of new equipment	₹2,50,000
(b) Recurring annual cash flows:	
(i) Depreciation base of new machine:	
Book value of existing machine	60,000
Add: Cost of new machine	<u>2,50,000</u>
	<u>3,10,000</u>
(ii) Base for incremental depreciation:	
Depreciation base of new machine	3,10,000
Less: Book value of existing machine	60,000
	<u>2,50,000</u>

The first part of the report deals with the general situation of the country. It is noted that the economy is showing signs of recovery, but that the unemployment rate remains high. The government has implemented various measures to stimulate growth, but more needs to be done.

In the second part, the focus is on the agricultural sector. There has been a significant increase in production, particularly in grain and livestock. This is attributed to improved weather conditions and the implementation of modern farming techniques. However, the sector still faces challenges such as limited access to credit and infrastructure.

The third part of the report discusses the industrial sector. There has been a steady increase in industrial output, with a particular emphasis on manufacturing. The government has provided incentives to attract investment and has supported the development of new industries. Despite these efforts, the industrial sector remains vulnerable to external shocks and needs further support.

The fourth part of the report addresses the social sector. There has been a notable improvement in living standards, with a decrease in poverty levels. The government has invested in social services, including education and healthcare, which has contributed to the overall well-being of the population. However, there are still significant disparities in income and access to services.

In the fifth part, the focus is on the external sector. The country has achieved a trade surplus, which is a positive sign for the economy. This is due to an increase in exports and a decrease in imports. The government has implemented policies to promote exports and attract foreign investment. However, the external sector remains sensitive to global economic conditions.

The final part of the report provides a summary of the findings and recommendations. It is concluded that the country has made significant progress in various areas, but there is still a long way to go. The government should continue to implement reforms and invest in infrastructure and social services to ensure sustainable growth and development.

(iii) Incremental depreciation ($t = 1 - 5$):

Year	Incremental WDV base	Depreciation
1	₹2,50,000	₹62,500
2	1,87,500	46,875
3	1,40,625	35,156
4	1,05,469	26,367
5	79,102	19,775

Note: Unabsorbed depreciation is ₹59,327 (₹79,102 – 19,775); tax advantage on this will be available in future years.

(c) Determination of CFAT and NPV

Particulars	Years				
	1	2	3	4	5
Incremental contribution	₹1,13,000	₹1,13,000	₹1,13,000	₹1,13,000	₹1,13,000
Less: Incremental depreciation	62,500	46,875	35,156	26,367	19,775
Incremental taxable income	50,500	66,125	77,844	86,633	93,225
Less: Taxes	17,675	23,144	27,245	30,322	32,629
Earnings after taxes	32,825	42,981	50,599	56,311	60,596
CFAT (EAT + Depreciation)	95,325	89,856	85,755	82,678	80,371
(x) PV factor (0.15)	0.870	0.756	0.658	0.572	0.497
Present value	82,933	67,931	56,427	47,292	39,944
Total present value ($t = 1 - 5$)					2,94,527
Less: Purchase price of new equipment					2,50,000
Net present value					44,527

Recommendation The company is advised to replace the existing equipment.

P.9.13 A company has spent ₹2,00,000 on research in developing a new product. It wants to launch this product in the market. For the purpose of financial analysis, the following information has been collected:

LO 9.3	LOD D
--------	-------

- The estimated life of the product is 3 years.
- Projected sales are as follows:

Year	Sales revenue
1	₹15,00,000
2	20,00,000
3	6,00,000

On account of new machine, it is expected that it would result in additional sales of existing products, yielding additional contribution of ₹25,000 each year for next three years.

- Variable cost to manufacture and sell the product are estimated at 60 per cent of the selling price.
- Each year, the present cash fixed costs will increase by ₹35,000 to cover insurance, and maintenance of new equipment, and allocated fixed costs would be ₹30,000.
- Advertising of the new product will total ₹1,25,000 in the first year, and ₹75,000 and ₹60,000 in the years 2 and 3 respectively.
- New machinery will be purchased at an estimated cost of ₹7,50,000. The machinery will be depreciated at the rate of 20 per cent on the basis of written down value method of depreciation. The salvage value at the year-end 3 is estimated at ₹50,000. There are no other machines in the block of assets.

7. The working capital required is ₹2 lakh in year 1. Additional working capital of ₹1 lakh would be required at beginning of year 2. Total working capital required in the beginning of the year 3 is ₹80,000.
 8. The new product will be stored in a company owned warehouse in a portion that is on rent of ₹15,000 per year at present.
 9. The firm pays 30 per cent tax on its income.
 10. Cost of capital of the firm is 15 per cent
 11. The firm would have sufficient short-term capital gains in year 3.
- Should the proposal be accepted? You may state your assumptions, if any.

Solution

Incremental cash outflows

Cost of new machine	₹7,50,000
Working capital (WC) requirement	<u>2,00,000</u>
	9,50,000

Incremental CFAT and NPV

Particulars	Year		
	1	2	3
Sales revenue	₹15,00,000	₹20,00,000	₹6,00,000
Add: Incremental contribution of existing products	<u>25,000</u>	<u>25,000</u>	<u>25,000</u>
Less: Costs:			
Variable costs	9,00,000	12,00,000	3,60,000
Additional fixed cost	35,000	35,000	35,000
Advertising cost	1,25,000	75,000	60,000
Depreciation	1,50,000	1,20,000	Nil [@]
Opportunity cost of Rented portion	<u>15,000</u>	<u>15,000</u>	<u>15,000</u>
Earnings before tax	3,00,000	5,80,000	1,55,000
Less: Taxes (30%)	<u>90,000</u>	<u>1,74,000</u>	<u>46,500</u>
Earnings after tax	2,10,000	4,06,000	1,08,500
CFAT (EAT + D)	3,60,000	5,26,000	1,08,500
Less: Additional WC	1,00,000		
Add: Recovery of WC		2,20,000	80,000
Add: Salvage value			50,000
Add: Tax benefit on short term capital loss ^{@@}			<u>1,29,000</u>
	<u>2,60,000</u>	<u>7,46,000</u>	<u>3,67,500</u>
Multiplied by PV factor @15%	0.870	0.756	0.658
PV(CFAT × PV factor)	2,26,200	5,63,976	<u>2,41,815</u>
Total PV			10,31,991
Less: Cash outflows			<u>9,50,000</u>
NPV			81,991

[@] As, the block consists of single asset, no depreciation will be charged in the terminating year as the asset has been sold in that year.

^{@@} $(₹7,50,000 - ₹2,70,000 \text{ accumulated depreciation} - ₹50,000, \text{SV}) \times 0.30 = ₹1,29,000.$

Recommendation Since the NPV is positive, the company is advised to purchase the new machine for new product.

MINI CASES

9.C.1 (Net Present Value) The Hotel Seawind is one of the premier four-star hotels in Goa. Since its inception in 1990, it has been the favourite choice of the visitors to the city. It boasts of facilities such as swimming pools, a gymnasium, boutiques, a discotheque, 24 × 7 coffee shop and multi-cuisine restaurant. It has rooms which are classified into three types, as shown below:

Class	Number of rooms	Daily tariff
Economy	200	₹2,500
Executive	100	4,000
Deluxe	25	6,000

The current financial details of Seawind are summarized below:

(i) Staff salaries

Grade	Number	Amount per annum per person	Total
(1)	(2)	(3)	(4)
A	1	₹20,00,000	₹20,00,000
B	25	8,00,000	2,00,00,000
C	70	3,00,000	2,10,00,000
D	200	1,50,000	3,00,00,000
Total			7,30,00,000

(ii) Profit from restaurant: ₹1,00,00,000

(iii) Profits from the coffee shop: ₹30,00,000

(iv) Profit from the boutique and discotheque: ₹25,00,000

(v) Room tariffs:

• Economy class: $200 \times ₹2,500 \times 350 \text{ days} \times 0.40$ (occupancy)	₹7,00,00,000
• Executive class: $100 \times ₹4,000 \times 350 \times 0.40$	5,60,00,000
• Deluxe class: $25 \times ₹6,000 \times 350 \times 0.40$	2,10,00,000
	14,70,00,000

(vi) Annual maintenance cost (electricity charges, land tax, water tax, office stationery and other miscellaneous expenses): ₹5,00,00,000

(vii) Profits before tax (PAT/EBT): Total revenues – Total cost

Total revenues

• Room tariffs	₹14,70,00,000	
• Profit from restaurant	1,00,00,000	
• Profit from coffee shop	30,00,000	
• Profit from boutique/discotheque	25,00,000	₹16,25,00,000
Total costs		
• Salary	7,30,00,000	
• Maintenance cost	5,00,00,000	12,30,00,000
		3,95,00,000

(viii) Profit after tax (PAT)

• Tax		1,38,25,000
		2,56,75,000

In the past few years, the occupancy in Seawind has declined from 55 per cent to 40 per cent which has dented its profits attributed to **(i)** stiff competition from new four-star hotels that have come up recently and **(ii)** its inability to offer value-added services to its customers.

In order to check the decline in profits and to plan out the future strategy to maximise its revenues, Rahul Singh, the CEO of Seawind, has hired the Trump Consultants.

The Trump Consultants have suggested two proposals for the consideration of the CEO of Hotel Seawind as detailed below:

Proposal I: The first proposal is to increase its rating from four-star to five-star. Due to this, the occupancy rate of new rooms would be 50 per cent; however, the occupancy rate of existing rooms would remain unchanged. The upgradation would involve the following:

- Increase in the number of rooms: economy class, 100; executive class, 80; and deluxe class, 25.
- Build a casino and a ball room.
- Increase in staff: B grade, 40; C grade, 100; and D grade, 300.

The upgradation plan would require additional expenses detailed below:

1. Cost of building of casino and ball room: ₹4,00,00,000
2. Cost of building extra rooms in the hotel;
 - Economy class, ₹8,00,000 per room
 - Executive class, ₹12,00,000 per room
 - Deluxe class, ₹20,00,000 per room

The additional maintenance cost would amount to ₹1,40,00,000.

As a result, incremental profit from casino would be ₹50 lakh and coffee shop would be ₹24 lakh.

Proposal II: The details of the second proposal of the consultants are given below:

- (i) Creation of casino and entertainment centre at a cost of ₹4,00,00,000.
- (ii) Creation of an *ayurveda* spa at a cost of ₹50,00,000
- (iii) Creation of a helipad at a cost of ₹20,00,000
- (iv) Increase in staff: B grade, 2; C grade, 10; and D grade, 30.

The incremental profit generated from the proposal would be as shown below:

- From casino, spa helipad and the entertainment centre, ₹2,50,00,000
- From restaurant, coffee shop and discotheque, ₹50,00,000
- Increase in occupancy rate to 45 per cent

The additional maintenance cost would be ₹1,00,00,000.

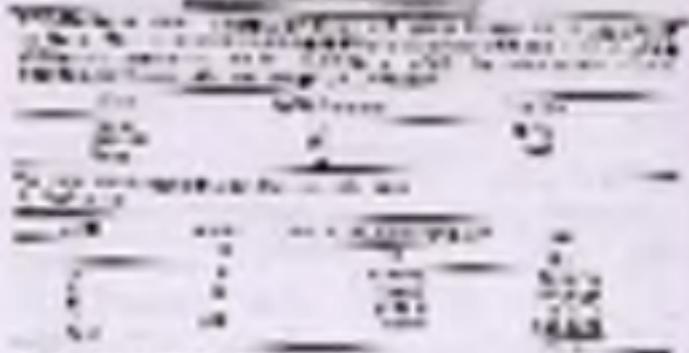

Required Which proposal of Trump Consultant should Rahul Singh accept? Why? Ignore depreciation for tax purposes. Assume cost of capital as 13%. Assume both proposals would provide incremental profits/room tariffs for next 4 years only. Assume national sale value of capital assets built in proposal I as ₹15 crore at year-end 4.

Solution

Evaluation of Proposal I (Upgradation to 5-star Level)

(A) Incremental Cash Outflows (t=0)	
(1) Expenditure on building extra rooms ¹	₹22,60,00,000
(2) Expenditure on building casino and ball room	4,00,00,000
	26,60,00,000
(B) Incremental Cash Inflows After Taxes (t = 1 – 4)	
(1) Incremental revenue from hotel rooms ³	12,60,00,000
(2) Incremental profit from casino	50,00,000
(3) Incremental profit from coffee shop and discotheque	24,00,000
(4) Additional staff and maintenance cost	5,00,00,000
Total incremental earnings before taxes	8,34,00,000
(5) Less taxes (0.35)	2,91,90,000
Total incremental earnings after taxes (t = 1 – 4) [CFAT]	5,42,10,000

Deluxe class: 25 rooms × 6,000 × 350 × 0.50		2,62,50,000
		<u>12,60,00,000</u>

Evaluation of Proposal II (Creation of Casino, Entertainment Centre and Helipad)

Incremental Cash outflows: (t = 0)		
Expenditure on casino and entertainment centre		₹4,00,00,000
Expenditure on <i>ayurveda</i> spa		50,00,000
Expenditure on helipad		20,00,000
		<u>4,70,00,000</u>
Increment Cash Inflows: (t = 1 - 4)		
Revenue from rooms (increase in occupancy) ²		1,83,75,000
Profit from casino, spa and helipad		2,50,00,000
Profit from restaurant, coffee shop and discotheque		50,00,000
Additional staff and maintenance costs		(1,91,00,000)
Total incremental before tax		2,92,75,000
Less taxes (0.35)		1,02,46,250
Incremental CFAT (t = 1 - 4)		<u>1,90,28,750</u>

Determination of NPV

Year	CFAT	PVIF (0.13)	Total PV
1-4	₹1,90,28,750	2.974	₹5,65,91,502
Less incremental cash outflows			4,70,00,000
NPV			<u>95,91,502</u>

1 B Grade : 2 × ₹80,000	=	₹16,00,000
C Grade: 10 × ₹3,00,000	=	30,00,000
D Grade: 30 × ₹1,50,000		45,00,000
Additional maintenance cost		1,00,00,000
Total		<u>1,91,00,000</u>

2 Room tariffs: (at 45% occupancy)	
Economy class: $200 \times ₹2,500 \times 350 \times 0.45$	₹7,87,50,000
Executive class: $100 \times ₹4,000 \times 350 \times 0.45$	6,30,00,000
Deluxe class: $25 \times ₹6,000 \times 350 \times 0.45$	2,36,25,000
	16,53,75,000
Less existing (at 40% occupancy)	14,70,00,000
	<u>1,83,75,000</u>

Decision: Proposal II, that is creation of casino and entertainment centre, an *ayurvedic* spa and a helipad should be accepted as it has a positive NPV.

9.C.2 (Hiring Vs Buying) Tel Samrat is a large Indian conglomerate with interest in petroleum, petroleum products, textiles, telecom and life sciences. It has a refinery in Ankleshwar in Gujarat. The refinery has a peak capacity for producing 27 lakh tons of finished petroleum products. Ankaleshwar is a major oil terminal with sophisticated state of art facility for docking of very large crude carrier (VLCC) and ultra large crude carrier (VLCC). Tel Samrat imports crude oil from the Middle East for its refinery operations and has its own fleet of oil tankers for this purpose.

Tel Samrat has been availing of the services of rented oil barges from the British Company, MAR-OIL for loading fuel oil for running its tankers in Ankaleshwar. MAR-OIL has an Indian subsidiary—MAR OIL INDIA (MOI) which provides the barge services in India. Tel Samrat pays MOI for its services at the rate of ₹40,000 per hour to cover running and maintenance costs. On an average, Tel Samrat has been hiring barges for 90 hours per month for its fleet of 15 tankers. However, the contract with MOI stipulates payment for at least 100 hours.

An alternative to hiring the barges from MOI is to acquire oil barges. A Japanese firm Ichikawa Harima Heavy Industries (IHI) is offering two oil barges for 40 million Yen with a service life of 10 years. The barges would have a salvage value of 4 million Yens. [Exchange rate: Current, ₹2.5/Yen; After 10 years, ₹5/Yen).

The insurance cost for the barges would be 1 per cent per year for 1–5 years and 2 per cent for years 6–10 as per the Loyd Registrar of Shipping (LRS) regulations. The running and maintenance costs for the two barges would be ₹20,00,000 per year for the first 5 years and ₹40,00,000 annually for the next 5 years.

The yearly employee/staff/crew cost for the first 5 years would be as given below:

Rank	Number	Monthly salary
Captain	1	₹80,000
Chief Engineer	1	80,000
Chief Officer	1	60,000
Duty Engineer	1	60,000
Oil man	1	15,000
Seaman	1	15,000
Shore staff	2	14,000
		<u>3,24,000</u>

After 5 years, the salary of employees/crew/staff would increase by 10 per cent.

Required Should Tel Smart acquire the two barges from IHI? Or should it continue availing of the services of MOI? Assume 12 per cent required rate of return.

Solution

Financial Evaluation of Hiring Vs Buying of Barges

Incremental Cash Outflows:	Years	
	1-5	6-10
Present scenario (Hiring of barges)	₹4,80,00,000	₹4,80,00,000
Proposed scenario (Buying of barges)	1,48,80,000 ¹	1,82,80,000 ¹
Cost savings (EBT)	3,31,20,000	2,97,20,000
Less tax (0.375)	1,24,20,000	1,11,45,000
EAT	2,07,00,000	1,85,75,000
Add back depreciation	80,00,000	80,00,000
Savings in Cost (CFAT)	2,87,00,000	2,65,75,000

Determination of NPV:

Year	CFAT	PV factor (0.12)	Total PV
1-5	₹2,87,00,000	3.605	₹10,34,63,500
6-10	2,65,75,000	2.045 [®]	5,43,45,875
10 salvage value	(-20,00,000)	0.322	(-6,44,000)
	(4 million Yen × ₹5)		
Total			15,71,65,375
Less cash outflow (cost of barges) (40 million Yen × ₹2.5)			10,00,00,000
NPV			5,71,65,375

[®]PV annuity for 6-0 years = PV for annuity for 10 years - PV of annuity for 5 years = 5.65 - 3.605 = 2.045
1
Cost estimates

	Year 1-5	Year 6-10
Running and maintenance cost	₹20,00,000	₹40,00,000
Employee cost (₹3,24,000 × 12)	38,80,000	42,80,000 [*]
Insurance cost	10,00,000	20,00,000
Depreciation (₹10,00,00,000 + 20,00,000) ÷ 10	80,00,000	80,00,000
Total	1,48,80,000	1,82,80,000

^{*}(₹3,24,000 × 1.10 × 12)

Decision: Since the NPV is positive (₹5,71,65,375), Tel Samrat should buy the two barges from IHI. It should stop hiring them from MOI.

9.C.3 (Net Present Value) Choolah Chimney Ltd (CCL) is a leading manufacturer of items used in kitchens such as gas stoves, electric chimneys, ovens and so on. It has grown significantly under the CEO Vivek Razdan's dynamic leadership. In line with his belief to enhance competitiveness by using research and development for launching innovative products in the market, the CCL has recently developed a zero Maintenance Electric Chimney (known as Zimney) which is ideally suited for Indian cooking. The research and development cost of Zimney amounts to ₹20,00,000.

To gauge the market prospects for Zimney, a market survey was conducted by Bazar Gyani, the V.P., Marketing, at an estimated cost of ₹5,00,000. The results of the survey were very positive showing a significant demand for Zimney. The survey report also indicated that Zimney could capture 8 per cent of the current market size of 1,00,000 units of gas electric chimney. Considering the growth of satellite towns/cities and residential colonies, the market is expected to grow at 2 per cent annually. The VP, Marketing suggested to the CEO that a market penetration pricing strategy would be most suitable and Zimney should

be priced at ₹5,000 per unit in the initial year of the launch. The price could be raised in subsequent years by 5 per cent annually. The marketing and administrative costs are expected to be ₹4,00,000 per year.

The CCL is presently using 6 machines acquired 3 years ago at a cost of ₹10,00,000 each, having a useful life of 7 years, with no salvage value. These machines are currently being used for manufacturing other types of chimneys. They could be sold for ₹2,00,000 per machine with a removal cost of ₹30,000 for each.

The machine to manufacture Zimney is available in that market for ₹1,00,00,000 with a useful life of 4 years and salvage value of ₹10,00,000. It can produce other types of chimneys also.

The new machine, being state of the art technology would improve the productivity of the workers as well reduce the unit variable cost of manufacture to ₹600, which would increase by 5 per cent annually. Exhibit 1 summarises the labour cost with the existing machine and the new equipment.

Category	Existing		New Machine/Equipment	
	Number	Monthly salary	Number	Monthly salary
Skilled labour	20	₹4,000	15	₹4,000
Maintenance men	2	6,000	1	6,000
Floor managers	3	8,000	2	8,000

The maintenance costs currently amount to 1,00,000 per year (existing machine). They would total ₹70,000 with the new equipment. The net working capital required to start production of Zimney would be ₹60,00,000.

The policy of CCL is to pay five months salary as compensation in case of lay-off of employees.

Required

Should the CCL launch the Zimney. Assume the following: (i) Tax, 35 per cent (ii) Required rate of return, 14 per cent and (iii) Straight line depreciation for the tax purposes.

Solution

Financial Evaluation of Proposal to launch Zimney

(A) Incremental Cash Outflow (t = 0):

1. Cost of new machine	₹1,00,00,000
2. Less sale proceeds of existing machines ^a	(10,20,000)
3. Less tax benefits on loss of sale of existing machines ^b	(8,42,999)
4. Cost of laying-off workers ^c	1,70,000
5. Additional working capital	60,00,000
	<u>1,43,07,001</u>

^aSale proceeds of existing machines [(6 × ₹2,00,000, sale price) – (6 × ₹30,000, removal cost)] = ₹10,20,000

^bTax benefits on loss of existing machine

1. Book value of existing machine [(6 × ₹10,00,000) – (3 × ₹8,57,142, annual depreciation i.e. ₹60,00,000 ÷ 7)] = ₹60,00,000 – ₹25,71,428 = ₹34,28,571.

2. Loss on sale of existing machine [book value, ₹34,28,571 – ₹10,20,000, sale proceeds] = ₹24,08,571.

3. Tax benefit (₹24,08,571 × 0.35) = ₹8,42,999.

^cCost of lay-off:

1. Skilled labour 5 × ₹4,000 × 5 (months)	=	₹1,00,000
2. Floor manager = 1 × ₹8,000 × 5	=	40,000
3. Maintenance person = 1 × ₹6,000 × 5	=	30,000
		<u>1,70,000</u>

2 [(0.08 × 1,02,000 × ₹630) + ₹4,00,000]	=	55,40,000
3 [(0.08 × 1,04,040 × ₹661) + ₹4,00,000]	=	59,05,796
4 [(0.08 × 1,06,120 × ₹694) + ₹4,00,000]	=	62,96,663

^eIncremental depreciation:

1. New equipment (₹1,00,00,000 – ₹10,00,000) ÷ 4	₹22,50,000
2. Existing (Book value, ₹34,28,571 – 0) ÷ 4	8,57,142

13,92,858

(C) Computation of NPV

Year	Incremental cash inflows	PV factor (0.14)	Total PV
1	₹2,33,92,200	0.877	₹2,05,14,959
2	2,50,16,680	0.769	1,92,37,826
3	2,67,56,498	0.675	1,80,60,636
4	3,46,16,734	0.592	2,04,93,106
Total			7,83,06,527
Less Incremental cash outflow			1,43,07,001
NPV			6,39,99,526

Decision: The Chola Chimney should launch the Zimney

Note:

The research and development cost of Zimney (₹20,00,000) and expenses incurred on market survey (₹5,00,000) are sunk cost and, therefore, irrelevant for analysis.

9.C.4 (Buying Vs Hiring) The Continental Construction Ltd (CCL) has recently got a contract for construction of National Highway-8 near Gurgaon. The Continental would require vehicles to be used by its engineers for inspection of the sites.

One option before the Continental is to hire the inspection vehicle from Convenient Tours and Travels Ltd (CTL). Hiring charges would be ₹900 per day for 80 kms/eight hours and ₹7/km beyond 80 kms. The overtime rate for drivers would be ₹25/hour beyond 8 hours. It is estimated that, on an average, the inspection vehicle would be required for 10 hours/day and 100 kms/day. The hiring charges would be increased by 10 per cent every year.

The Chief Engineer, Himanshu Pandey, has submitted an alternative proposal to the CEO, Neeraj Bodra, to buy a Mahindra Bolero costing ₹7 lakh; Mahindra and Mahindra has an arrangement to buy back its vehicles after 5 years for ₹2,00,000. The associated operating costs are estimated as follows:

- Drivers' salary, ₹8000 per month; annual increments, 3 per cent
- Drivers' overtime beyond 8 hours, ₹30/hour
- Insurance of the vehicle, 1 per cent of depreciated value
- Annual maintenance cost, years 3 – 5, ₹15,000
- Fuel charges: year 1 – 2, ₹3/km; year 3, ₹3.5/km; and years, 4 – 5, ₹4/km
- Annual depreciation, 20 per cent (₹1,00,000)

Required The CEO seeks the opinion of the CFO, Vishnu Rawat, on the two alternative proposals for the required inspection vehicle. What advice should Rawat give? Why? Assume 35 per cent tax and 15 per cent required rate of return for the Continental.

Solution**Savings in Costs**

	Year				
	1	2	3	4	5
1 Hiring charges (Working note 1)	₹3,92,400	₹4,31,640	₹4,74,804	₹5,22,284	₹5,74,513
2 Buying Charges (note 2)	3,32,600	3,34,480	3,69,446	3,89,502	3,91,649
3 Savings before taxes	59,800	97,160	1,05,358	1,32,782	1,82,864
4 Taxes (0.35)	20,930	34,006	36,875	46,474	64,002
5 Savings after taxes	38,870	63,154	68,483	86,308	1,18,862
6 Add depreciation	1,00,000	1,00,000	1,00,000	1,00,000	1,00,000
7 Net savings in costs	1,38,870	1,63,154	1,68,483	1,86,308	2,18,862
8 Salvage value	—	—	—	—	2,00,000
					4,18,862
9 PVIF (0.15)	0.870	0.756	0.658	0.572	0.497
10 Present values	1,20,817	1,23,344	1,10,862	1,06,568	2,08,174
11 Total ($t = 1 - 5$)		₹6,69,765			
12 Cash outflow (cost of Bolero)		(7,00,000)			
13 NPV		(30,235)			

Advice: Since the NPV of the net savings in cost is negative, the proposal to buy the Bolero from Mahindra and Mahindra is not financially viable and the Continental would be well advised to hire the inspection vehicle from the Convenient Tours and Travels Ltd.

Working Notes**1 Annual hiring charges**

Year 1 = ₹900 (daily charges) + ₹140 (₹7 × 20 kms) extra charges + ₹50 (₹25 × 2 hours) extra charges
= ₹1,090 × 30 (days) × 12 (months) = ₹3,92,400

Year 2 = 3,92,400 × 1.10 = ₹4,31,640

3 = 4,31,650 × 1.10 = 4,74,804

4 = 4,74,804 × 1.10 = 5,22,284

5 = 5,22,284 × 1.10 = 5,74,513

2. Operating costs associated with the inspection vehicles

	Year				
	1	2	3	4	5
1 Salary of driver [®]	₹96,000	₹98,880	₹1,01,846	₹1,04,902	₹1,08,049
2 Overtime payment ^{®®}	21,600	21,600	21,600	21,600	21,600

9.C.5 AMR Paints (NPV) AMR Paints Ltd (APL) is a large paint company in India with a 32 per cent market share. The demand for decorative paints is expected to increase due to robust growth in the housing and the real estate sector. The current installed capacity of the APL is 3,54,000 tpa. It envisages a huge demand for premium emulsions in the decorative paints segment and plans to launch new products to cater to this rising demand and lay the foundation for its future growth.

The APL is planning to set up a greenfield plant at Kurukshetra in Haryana with an installed capacity of 1,50,000 kl on 130 acres of land. The initial cost of setting up the project is ₹407.25 crore to be financed from internal sources. The APL has purchased plant and machinery for ₹170 crore (salvage value after 10 years being ₹5 crore) and acquired land for ₹150 crore. Pre-construction clearing and development of land would cost ₹9 crore. A further ₹7 crore would be required for factory building and other civil construction. The machinery is subject to 20 per cent block depreciation. There is no other machine in this block.

The APL's expected percentage capacity utilisation of the Kurukshetra plant is as follows: Year 1, 50; Year 2, 55; Year 3, 65; Year 4, 70; Year 5, 75; Year 6-7, 80; and Years 8-10, 85. The working capital requirements of APL during the 10-year period are projected at ₹71.25 crore. The paint could be sold at a mark-up of ₹5 per litre on the industry average price of ₹90/L. The projected operating expenses per rupee of sales are as shown below:

(a) Material cost 0.5; Employee cost, 0.05; Manufacturing/selling distribution expenses, 0.059 (Total, 0.609).

The AMR Paints Ltd is listed on the NSE Ltd and the Nifty index has given an average of 19 per cent return over the last 10 years. The current yield on Government of India securities is 7.29 per cent. The APL's beta is 0.40. Its current balance sheet (as at March 31, Year 1) is given below.

<i>Liabilities</i>	<i>Amount (₹ crore)</i>	<i>Assets</i>	<i>Amount (₹ crore)</i>
Shareholders funds:		Fixed assets	727.33
■ Capital	95.92	Investments	234.77
■ Reserves and surplus	1100.00	Current assets, loans and advances	1,228.11
Loans*	138.00		
Current liabilities and provisions	856.29		
	2,190.21		2,190.21

*Annual interest, ₹16 crore.

Required The CEO of the APL, Mustafa Hakimuddin, is examining the feasibility of setting up of the new plant. He seeks the advice of the CFO, Rishi Singhal, in the matter. What advice should he give and why?

Solution

Computation of NPV (₹ crore)

(a) Cash outflows ($t = 0$):

Cost of plant and machinery	170.00
Cost of land and buildings	150.00
Land and site development	9.00
Building and other civil construction	7.00
Working capital requirement	71.25
	407.25

(b) Cash inflow

	Year (capacity utilisation)									
	1 (0.50)	2(0.55)	3(0.65)	4(0.70)	5(0.75)	6(0.80)	7(0.80)	8(0.85)	9(0.85)	10(0.85)
1 Sales:										
(i) Litres sold (lakh)	750	825	975	1,050	1,125	1,200	1,200	1,275	1,275	1,275
(ii) Price per litre (₹)	95	95	95	95	95	95	95	95	95	95
	712.50	783.75	926.25	997.50	1,068.75	1,140.00	1,140.00	1,211.25	1,211.25	1,211.25
2 Operating expenses (Working note 1)	433.91	477.30	564.09	607.48	650.87	694.26	694.26	737.65	737.65	737.65
3 Profit before depreciation	278.59	306.45	362.16	390.02	417.88	445.74	445.74	473.60	473.60	473.60
4 Depreciation (Working note 2)	34.00	27.20	21.76	17.41	13.93	11.14	8.91	7.13	5.70	4.56
5 Profits before tax	244.59	279.25	340.40	372.61	403.95	434.60	436.83	466.47	467.90	469.04
6 Tax (0.35)	85.61	97.74	119.14	130.41	141.38	152.11	152.89	163.26	163.76	164.16
7 Profit after tax	158.98	181.51	221.26	242.20	262.57	282.49	283.94	303.21	304.14	304.88
8 Depreciation	34.00	27.20	21.76	17.41	13.93	11.14	8.91	7.13	5.70	4.56

(c) Computation of NPV

Year	CFAT (₹ crore)	PVIF	Present value (₹ crore)
1	192.98	0.9034	174.34
2	208.71	0.8162	170.35
3	243.02	0.7373	179.18
4	259.61	0.6661	172.93
5	276.50	0.6018	166.40
6	293.63	0.5437	159.65
7	292.85	0.4912	143.85
8	310.34	0.4437	137.70
9	309.84	0.4009	124.22
10	390.33	0.3622	141.38
			1,570
Cash outflows			407.25
NPV			1,162.75

Advice: My advice is to set up the proposed plant as it would have a positive present value and add to value to the AMR Paints.

Working Notes

1. Depreciation schedule (₹ crore)

Year	1	2	3	4	5	6	7	8	9	10
Written down value (WDV) [beginning]	170.0	136.0	108.8	87.04	69.63	55.71	44.56	35.65	28.52	22.82
Depreciation (0.20)	34.0	27.2	21.76	17.41	13.93	11.14	8.91	7.13	5.70	4.56
WDV (at year-end 10)										18.26

2. Weighted average cost of capital

Source	Amount (₹ crore)	Weight	Cost (%)	Weighted cost
Equity [⊗]	95.92	0.072	0.1197	0.0086
Debt ^{⊗⊗}	138.00	0.103	0.754	0.0078
Retained earnings ^{⊗⊗⊗}	1,100.00	0.825	0.1097	0.0905
Total	1,333.92			0.1069

[⊗]Using CAPM, $K_e = R_f + b (R_m - R_f) = 0.729 + [0.40 \times (0.19 - 0.0729)] = 0.1197$

^{⊗⊗} $K_d = \text{Interest (₹16 crore)} - \text{tax [₹5.6 crore (₹16 crore} \times 0.35, \text{ tax rate)]}$
 $= ₹10.4 \div ₹138 = 0.754$

^{⊗⊗⊗} Assumed lower than K_e (by 1 per cent).

3. Operating expenses = Raw material (0.50) + Wages (0.05) + Manufacturing, administration, selling and per rupee of sales distribution expenses (0.059) = 0.609

REVIEW QUESTIONS

LOD: Easy

- RQ. 9.1(a)** Indicate whether the following statements are true or false. **[LO 9.2.3]**
- (i) Two mutually exclusive projects (A and B) have been evaluated. Project A has an NPV of ₹8 lakh and an IRR of 16 per cent; Project B has NPV of ₹7 lakh but has IRR or 18 per cent. Since Project B has higher IRR, it should be selected.
 - (ii) The cost of capital for new projects is 15 per cent. Two competing projects (X and Y) respectively have IRRs of 14 per cent and 12 per cent respectively; since IRR of project X is higher, it should be selected.
 - (iii) Two competing projects have the following NPVs: Project X, + ₹5 lakh (with initial outlay of ₹25 lakh) and Project Y, + ₹4,20,000 (with initial outlay of ₹20,00,000). The company should opt for project X as it has higher NPV.
 - (iv) A project requires an initial investment of ₹10,00,000. The estimated cash inflows from the project are as follows: ₹3 lakh (year 1), ₹1 lakh (year 2), ₹3 lakh (year 3), ₹6 lakh (Year 4) and ₹4 lakh (year 5). The pay back of the project is 4 years.
 - (v) A project requires an investment of ₹20 lakh. The estimated profit after tax for years 1-5 are: ₹3 lakh, ₹3 lakh, ₹3 lakh, ₹6 lakh and ₹8 lakh. The accounting rate of return is 21 per cent
 - (vi) In the case of independent investment projects, if the NPV of the project is zero, IRR is equal to cost of capital.
 - (vii) A company has evaluated 3 investment proposals under IRR method, yielding different rates of return. Though the IRR values are varying, reinvestment rate of intermediate cash inflows is assumed to be the same for all these 3 proposals.
 - (viii) Since IRR is expressed in percentage figure, it is the best method for evaluating capital budgeting projects.
 - (ix) The more distant the CFAT, the higher is the present value of such cash flows.
 - (x) NPV is the best method of evaluating long-term investment proposals.
- (b)** Fill in the following blanks:
- (xi) _____ present value tables can be used only when cashflows are uniform to determine NPV.
 - (xii) In the case of mixed stream of cash flows, _____ present value tables are used to determine NPV.
 - (xiii) _____ determines the number of years required to recover initial investment outlay.
 - (xiv) In the case of _____ investment proposals, IRR and NPV method provides the same result.
 - (xv) In the case of conflict in ranking, _____ method provides better result than _____ method.

[Answers: (i) False (ii) False (iii) True (iv) False (v) False (vi) True (vii) False (viii) False (ix) False (x) True (xi) Annuity (xii) simple (xiii) Payback method (xiv) independent (xv) NPV, IRR

- RQ. 9.2** Why is it important to evaluate capital budgeting projects on the basis of after-tax cash incremental flows? Why not use accounting data instead of cash flow? **[LO 9.2]**
- RQ. 9.3** What are the components of net cash outlay in the capital budgeting decision? At what time is such an outlay incurred in the case of conventional cash flows? **[LO 9.2]**
- RQ. 9.4** What is pay back period? Also, discuss the utility of the pay back period in determining the internal rate of return. **[LO 9.3]**
- RQ. 9.5** What does the profitability index signify? What is the criterion for judging the worth of investments in the capital budgeting technique based on the profitability index? **[LO 9.3]**

RQ. 9.6 Arvind Mills Ltd is considering two mutually exclusive investment proposals for its expansion programme. Proposal A requires an initial investment of ₹7,50,000 and yearly cash operating costs of ₹50,000. Proposal B requires an initial investment of ₹5,00,000 and yearly cash operating costs of ₹1,00,000. The life of the equipment used in both the investment proposals will be 12 years, with no salvage value; depreciation is on the straight line basis for tax purposes. The anticipated increase in revenues is ₹1,50,000 per year in both the investment proposals. The firm's tax rate is 35 per cent and its cost of capital is 15 per cent. Which investment proposal should be undertaken by the company? [LO 9.3]

LOD: Medium

RQ. 9.7 How should working capital and sunk costs be treated in analysing investment opportunities? Explain with suitable examples. [LO 9.2]

RQ. 9.8 Explain clearly the concept of block of assets *vis-a-vis* depreciation in the context of replacement situations of capital budgeting. [LO 9.2]

RQ. 9.9 It is said that only cash costs are relevant for capital budgeting decision. However, depreciation which is a non-cash cost is a prominent part of cash flow analysis for such an investment decision. How do you explain this paradox? [LO 9.2]

RQ. 9.10 What are the critical factors to be observed while making replacement investment decision? [LO 9.3]

RQ. 9.11 Do the profitability index and the NPV criterion of evaluating investment proposals lead to the same acceptance-rejection and ranking decisions? [LO 9.3]

RQ. 9.12 One project of XYZ Ltd is doing poorly and is being considered for replacement. Three mutually exclusive projects A, B and C have been proposed. The projects are expected to require ₹2,00,000 each, and have an estimated life of 5 years, 4 years and 3 years, respectively, and have no salvage value. The company's required rate of return is 10 per cent. The anticipated cash inflows after taxes (CFAT) for the three projects are as follows: [LO 9.3]

Year	CFAT		
	A	B	C
1	₹50,000	₹80,000	₹1,00,000
2	50,000	80,000	1,00,000
3	50,000	80,000	10,000
4	50,000	30,000	—
5	1,90,000	—	—

(i) Rank each project applying the methods of PB, NPV, IRR and profitability index.

(ii) What would the profitability index be if the IRR equalled the required return on investment? What is the significance of a profitability index less than one?

(iii) Recommend the project to be adopted and give reasons.

RQ. 9.13 Royal Industries Ltd is considering the replacement of one of its moulding machines. The existing machine is in good operating condition, but is smaller than required if the firm is to expand its operations. The old machine is 5 years old, has a current salvage value of ₹30,000 and a remaining depreciable life of 10 years. The machine was originally purchased for ₹75,000 and is being depreciated at ₹5,000 per year for tax purposes. [LO 9.3]

The new machine will cost ₹1,50,000 and will be depreciated on a straight line basis over 10 years, with no salvage value. The management anticipates that, with the expanded operations, there will be need of an additional net working capital of ₹30,000. The new machine will allow the firm to expand current operations, and thereby increase annual revenues of ₹40,000, and variable operating costs from ₹2,00,000 to ₹2,10,000. The company's tax rate is 35 per cent and its cost of capital is 10 per cent.

Should the company replace its existing machine? Assume that the loss on sale of existing machine can be claimed as short-term capital loss in the current year itself.

LOD: Difficult

RQ. 9.14A A toy manufacturing company is considering replacing an existing piece of equipment with one of the two new, more sophisticated machines. The old machine was purchased 3 years ago at a cost of ₹70,000. The machine originally had a projected life of 7 years and was to be depreciated straight line to zero salvage value. The two new pieces of equipment being considered are machine X and machine Y. [LO 9.3]

Machine X would cost ₹80,000 to purchase, and ₹20,000 to install. Due to expansion in operation, the management estimates the net working capital requirement of machine X at ₹10,000. It has a 4-year life with no salvage value. It will be depreciated straight line.

Machine Y would cost ₹1,15,000 and ₹25,000 to install. It also has 4-year life with no salvage value. This machine would require a net working capital of ₹20,000.

The old machine can be sold for ₹25,000 on 1 year credit. The firm is taxed at 35 per cent. Assuming the cost of capital to be 10 per cent, which machine, if either, should the company acquire? The projected profits before depreciation and taxes currently and with each of the new machines are as follows:

Year	With present Machine	With Machine X	With Machine Y
1	₹25,000	₹50,000	₹90,000
2	25,000	50,000	90,000
3	25,000	50,000	90,000
4	25,000	50,000	90,000

What would be your answer, if the company has under consideration only the proposal to purchase machine X?

RQ. 9.15 Suppose a firm is considering replacing an old machine with a new one. The firm does not anticipate that any new revenues will be created by the replacement since demand for the product generation by both the machines is the same. However, in the CFAT work sheet used in evaluating the proposal, the analyst shows positive CFBT in the operating cash flow section. What creates operating CFBT in this situation? [LO 9.2.3]

ANSWERS

9.6 Proposal B should be accepted, since NPV is negative.

9.12 (i) PB: C, B, A; NPV: A, B; IRR: A, B

(ii) The profitability index would be 1. The significance of a PI less than 1 is that NPV is negative and the project should not be undertaken.

(iii) Project A, because its NPV is the highest.

9.13 NPV ₹9,915. The company should replace the existing machine.

9.14 The company should acquire machine Y, with NPV ₹1,05,912.

If the company has the proposal to buy machine X only, then it should continue with the existing machine because NPV of existing machine ₹62,607 is more than NPV from X which is ₹55,567.

1. The first part of the report is devoted to a general survey of the situation in the country. It is found that the economy is in a state of depression and that the government is unable to meet its financial obligations.

2. The second part of the report deals with the causes of the depression. It is pointed out that the main cause is the overvalued exchange rate, which has led to a loss of export earnings and a consequent shortage of foreign exchange.

3. The third part of the report discusses the measures which have been taken by the government to deal with the depression. It is noted that the government has adopted a policy of deflation, which has led to a reduction in the money supply and a consequent fall in prices.

Year	1930	1931	1932	1933
Production	100	85	70	60
Exports	100	90	80	70
Imports	100	110	120	130

4. The fourth part of the report discusses the prospects for the future. It is noted that the government has adopted a policy of gradualism, which is aimed at restoring the economy to a state of equilibrium. It is expected that the economy will begin to recover in the near future.

The following table shows the results of the survey conducted in the various districts of the country. It is seen that the situation is generally similar to that in the country as a whole.

5. The fifth part of the report discusses the results of the survey. It is noted that the situation is generally similar to that in the country as a whole. It is found that the economy is in a state of depression and that the government is unable to meet its financial obligations.

6. The sixth part of the report discusses the measures which have been taken by the government to deal with the depression. It is noted that the government has adopted a policy of deflation, which has led to a reduction in the money supply and a consequent fall in prices.

District	1930	1931	1932	1933
District A	100	85	70	60
District B	100	85	70	60
District C	100	85	70	60

7. The seventh part of the report discusses the prospects for the future. It is noted that the government has adopted a policy of gradualism, which is aimed at restoring the economy to a state of equilibrium. It is expected that the economy will begin to recover in the near future.

CHAPTER

10

Capital Budgeting II: Additional Aspects

LEARNING OBJECTIVES

LO 10.1	Use present value profiles to compare and evaluate NPV, IRR and PI techniques in context of conflicting rankings
LO 10.2	Describe project selection under capital rationing
LO 10.3	Explain the procedure to incorporate impact of inflation on capital budgeting decisions

INTRODUCTION

The simple accept-reject investment decisions with primarily conventional cash flows were discussed in the preceding Chapter. A firm generally faces complex investment situations and has to choose among alternatives. The evaluation techniques discussed earlier can be extended to handle such decisions. The focus of this Chapter is on extension of these techniques to complex investment situations. The chapter is devoted to a comparison of the DCF methods, namely, NPV, IRR and PI. It also outlines the conceptual framework of evaluating projects with unequal lives. Project selection under capital rationing is explained subsequently. The impact of inflation on capital budgeting decisions is also analysed. The major points are summarised by way of recapitulation.

LO 10.1 NPV, IRR, PROFITABILITY INDEX METHODS — A COMPARISON

NPV Vs. IRR Methods

The NPV and IRR methods would in certain situations give the same accept-reject decision. But they may also differ in the sense that the choice of an asset under certain circumstances may be mutually contradictory. The comparison of these methods, therefore, involves a discussion of (i) the similarities between them, and (ii) their differences, as also the factors which are likely to cause such differences.

CHAPTER**10****Capital Budgeting II:
Additional Aspects****PROBLEMS TO SOLVE**

- LO 10.1** Analyze a project with a constant cash flow and a constant discount rate.
LO 10.2 Analyze a project with a constant cash flow and a constant discount rate.
LO 10.3 Analyze a project with a constant cash flow and a constant discount rate.

INTRODUCTION

The main purpose of this chapter is to provide you with the tools and techniques to analyze a project with a constant cash flow and a constant discount rate. The chapter is divided into three sections. The first section discusses the basic concepts of capital budgeting. The second section discusses the calculation of the net present value (NPV) of a project. The third section discusses the calculation of the internal rate of return (IRR) of a project. The chapter concludes with a discussion of the relationship between NPV and IRR.

LO 10.1 ANALYZING A PROJECT WITH A CONSTANT CASH FLOW AND A CONSTANT DISCOUNT RATE

The first step in analyzing a project is to determine the cash flows. The cash flows are the expected future payments from the project. The next step is to determine the discount rate. The discount rate is the rate of return that the firm can earn on its investments. The final step is to calculate the NPV of the project. The NPV is the sum of the present values of the cash flows. If the NPV is positive, the project is profitable. If the NPV is negative, the project is not profitable.

NPV and IRR: Similarities The two methods-IRR and NPV- would give consistent results in terms of acceptance or rejection of investment proposals in certain situations. That is, if a project is sound, it will be indicated by both the methods. If, however, it does not qualify for acceptance, both the methods will indicate that it should be rejected.

Conventional investment projects are projects which cash outflows are confined to the initial period.

The situations in which the two methods will give a concurrent accept-reject decision will be in respect of conventional and independent projects. A **conventional investment** is one in which the cash flow pattern is such that an initial investment (outlay or cash outflow) is followed by a series of cash inflows. Thus, in the case of such investments, cash outflows are confined to the initial period. The **independent proposals** refer to investments the acceptance of which does not preclude the acceptance of others so that all profitable proposals can be accepted and there are no constraints in accepting all profitable projects. The reason why both the methods are equivalent and support or reject a proposal is simple. The decision-criterion with these methods may be recalled here. According to the NPV method, the decision rule is that a project will be accepted if it has a positive NPV, that is, NPV exceeds zero. The IRR method would support projects in whose case the IRR is more than the required rate of return (r exceeds k). When the NPV = zero or the IRR = k , the project may be accepted or rejected. The projects which have positive net present values will also have an IRR higher than the required rate of return.

Independent projects are all profitable projects that can be accepted.

Thus, Fig. 10.1 portrays NPV as (i) positive; (ii) zero; and (iii) negative corresponding to three situations (a) $IRR > K$; (b) $IRR = K$; (c) $IRR < K$.

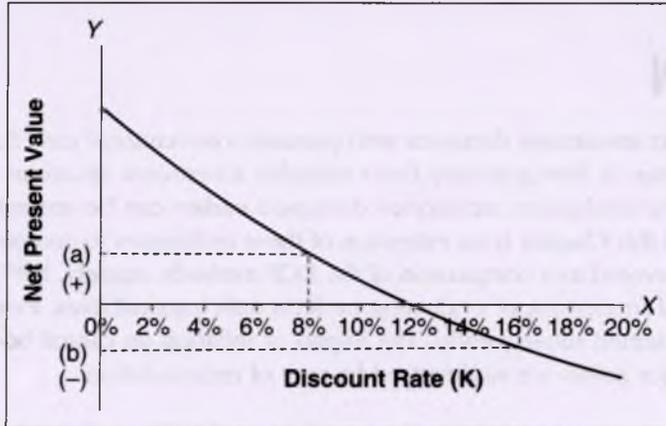

FIGURE 10.1 NPV and Discount Rate

Figure 10.1 shows the relationship between the NPV of a project and the discount rate. If there is no K , or discount rate is zero (a very unreal situation), NPV is maximum. As the value of K increases, the NPV starts declining. At 12 per cent rate of discount, the NPV is zero. This is the IRR also because by definition it is that rate of discount which reduces the NPV to zero. Assuming cost of capital to be 8 per cent, we find that NPV is positive by amount (a) and the project is acceptable and so is it under IRR as its value is $> K$ ($0.12 > 0.08$). If we assume K to be 16 per cent, the project is unacceptable as the NPV is negative by amount (b) and so is it under IRR as $IRR < K$ ($0.12 < 0.16$). The two approaches lead to identical results with regard to the accept-reject decision.

NPV and IRR Methods: Differences Thus, in the case of independent conventional investments, the NPV and IRR methods will give concurrent results. However, in certain situations they will give contradictory results such that if the NPV method finds one proposal acceptable, IRR favours another. This is so in the case of mutually exclusive investment projects. If there are alternative courses of action, only one can be accepted. Such alternatives are mutually exclusive. The mutual exclusiveness of the investment projects may be of two types: (i) technical, and (ii) financial. The term **technical exclusiveness** refers to alternatives having different profitabilities and the selection of that alternative which is the most profitable. Thus, in the case of a purchase or lease decision the more profitable out of the two will be selected. The mutual exclusiveness may also be financial. If there are resource constraints, a firm will be forced to select that project which is the most profitable rather than accept all projects which exceed a minimum acceptable level (say, k). The exclusiveness due to limited funds is popularly known as **capital rationing**.

The **different ranking** given by the NPV and IRR methods can be illustrated under the following heads:

1. Size-disparity problem;
2. Time-disparity problem; and
3. Unequal expected lives.

Size-disparity Problem This arises when the initial investment in projects under consideration, that is, mutually exclusive projects, is different. The cash outlay of some projects is larger than that of others. In such a situation, the NPV and IRR will give a different ranking. Consider Example 10.1.

Example 10.1

A and B are two mutually exclusive investments involving different outlays. The details are:

Particulars	Project A	Project B	Project B-A
Cash outlays	(₹5,000)	(₹7,500)	(₹2,500)
Cash inflows at the end of year, 1	6,250	9,150	2,900
IRR (%)	25	22	16
Cost of capital, k_0 (%)		10	
NPV	681.25	817.35	

Thus, the two methods rank the projects differently. Project A has a higher IRR (0.25) than project B (0.22) but the NPV of project B (₹817.35) is more than that of A (₹681.25). The important question is which method, in such a situation, gives better results? The answer should be related to the effect of the decision on the maximisation of the shareholders' wealth. The IRR method is not compatible with the goal of wealth maximisation. It is concerned with the rate of return on investment or yield rather than the total yield on the investment. In the above example, assuming 10 per cent to be the required rate of return, the firm would be left with ₹750 [₹6,250 - (₹5,000 + 0.10 × ₹5,000)] after one year in case project A is accepted and ₹900 [₹9,150 - (₹7,500) + 0.10 × ₹7,500] in case project B is accepted. The NPV method suggests that project B is better. This recommendation is consistent with the goal of the firm of maximising shareholders' wealth. When faced with mutually exclusive projects, each having a positive NPV, the one with the largest NPV will have the most beneficial effect on shareholders wealth. Since the selection criterion under the NPV method is to pick up the project with the largest NPV, the NPV is the best operational criterion. As long as the firm accepts the mutually exclusive investment proposal with the largest NPV, it will be acting consistently with

- **Conflicting ranking**
- is conflict in the ranking of a given project by NPV or IRR resulting from differences in magnitude or timing of cashflows.

- **Size-disparity**
- arises when the initial investment in mutually exclusive projects is different.

... of the ...

... of the ...

... of the ...

... of the ...

... of the ...

...
...
...
...

... of the ...

the goal of maximising shareholders' wealth. This is because the project with the largest NPV will cause the share price and shareholders' wealth to increase more than will be possible with any of the other projects.¹

Incremental Approach The conflict between the NPV and IRR in the above situation can be resolved by modifying the IRR so that it is based on incremental analysis. According to the incremental

Incremental analysis involves computation of IRR of the incremental outlay of the project requiring bigger initial investment.

approach, when the IRR of two mutually exclusive projects whose initial outlays are different exceeds the required rate of return, the IRR of the incremental outlay of the project requiring a bigger initial investment should be calculated. This involves the following steps:

1. Find out the differential cash flows between the two proposals.
2. Calculate the IRR of the incremental cash flows.
3. If the IRR of the differential cash flows exceeds the required rate of return, the project having greater investment outlays should be selected, otherwise it should be rejected.

The logic behind the incremental approach is that the firm would get the profits promised by the project involving smaller outlay plus a profit on the incremental outlay. In general, projects requiring larger outlay would be more profitable if IRR on differential cash outlays exceeds the required rate or return. The modified IRR for mutually exclusive proposals involving size-disparity problem would provide an accept-reject decision identical to that given by the NPV method.

In Example 10.1, the IRR of the differential cash outlay of Project B is 16 per cent. The required rate of return is 10 per cent. Thus, project B is better than project A in spite of the fact that IRR in the latter is lower because it offers the benefits offered by project A plus a return in excess of the required return on ₹2,500, that is, differential cash outlays.

Time-disparity arises when the cash flow pattern of mutually exclusive projects is different.

To summarise the above discussion, the NPV method is superior to the IRR because the former supports projects which are compatible with the goal of maximisation of shareholders' wealth while the latter does not. On modifying the IRR method by adopting the incremental approach, IRR would give results identical to the NPV

method. The modified IRR method has other merits also. It is easier to interpret and apply than the NPV measure. However, it requires additional computation, whereas the NPV method provides the correct answer in the first instance itself.

Time-disparity Problem The mutually-exclusive proposals may differ on the basis of the pattern of cash flows generated, although their initial investments may be the same. This may be called the time-disparity problem. The time-disparity problem may be defined as the conflict in ranking of proposals by the NPV and IRR methods which have different patterns of cash inflows. In such a situation, like the size-disparity problem, the NPV method would give results superior to the IRR method. This is illustrated in Example 10.2.

Example 10.2

Year	Cashflows	
	Project A	Project B
0	₹1,05,000	₹1,05,000
1	60,000	15,000
2	45,000	30,000

(Contd.)

(Contd.)

3	30,000	45,000
4	15,000	75,000
IRR (%)	20	16
NPV (0.08)	23,970	25,455

We find on the basis of a comparison of the internal rate of returns that project A is better, but the NPV method suggests that project B is better. Since the cost of capital is 8 per cent, given the objective of the firm to maximise wealth, project B is definitely better.

Under the time-disparity problem it is the cost of capital which will determine the ranking of projects. If we take $k = 0.10$, we shall find project A is better as its net present value would be ₹19,185 compared to ₹18,435 of B. Its IRR is also more than that of B. Both the methods give identical prescription. But it does not imply that the IRR is superior to the NPV method, as the NPV is giving the same ranking as the IRR. In the event of conflicting rankings, the firm should rely on the rankings given by the NPV method.

Projects with Unequal Lives Another situation in which the IRR and NPV methods would give a conflicting ranking to mutually exclusive projects is when the projects have different expected lives. This is shown in Example 10.3.

Example 10.3

There are two projects A and B. A has a service life of one year, while B's useful life is five years. The initial cash outlay for both the projects may be assumed to be ₹20,000 each. The cash proceeds from project A (at the end of the first year) amount to ₹24,000. The cash generated by project B at the end of the fifth year is likely to be ₹40,200. Assume that the required rate of return is 10 per cent. Compute the NPV and the IRR of the two projects.

Solution

IRR and NPV of Projects A and B

Project	IRR (per cent)	NPV
A	20	₹1,816
B	15	4,900

Obviously, the ranking given by the IRR and NPV methods is different. According to the IRR method, the recommendation would favour project A while the NPV method would support project B. The conflict in the ranking by the two methods in such cases may be resolved by adopting a modified procedure. There are two approaches to do this: (i) **common time horizon approach** and (ii) **equivalent annual value/cost approach**.

According to the first approach, in order to have valid comparisons between the projects, they must be compared over the same period of time. The comparison may, thus, extend over multiples of the lives of each. Thus, if the service life of one project is 3 years and of another 4 years, the comparison must be over a 12 year period with replacements occurring for each.² Consider Example 10.4.

- Common time horizon approach makes a comparison between projects that extends over multiples of the lives of each.

Example 10.4

Particulars	Project A	Project B
Initial outlay	₹10,000	₹20,000
Cash inflows after taxes		
Year-end 1	8,000	8,000
2	7,000	9,000

(Contd.)

The first part of the report deals with the general economic situation in the country during the period under review. It discusses the growth of the economy, the performance of different sectors, and the impact of government policies.

The second part of the report provides a detailed analysis of the agricultural sector. It examines the production of major crops, the state of the rural economy, and the challenges faced by farmers. It also discusses the government's efforts to improve agricultural productivity and the welfare of the rural population.

The third part of the report focuses on the industrial sector. It looks at the growth of manufacturing, the performance of different industries, and the role of the government in promoting industrial development. It also discusses the challenges of industrialization and the need for investment in infrastructure and technology.

The fourth part of the report deals with the services sector. It examines the growth of the tertiary sector, the performance of different service industries, and the impact of government policies. It also discusses the challenges of service sector development and the need for investment in human capital and infrastructure.

The fifth part of the report discusses the external sector. It examines the balance of payments, the foreign trade situation, and the impact of international trade policies. It also discusses the challenges of external sector development and the need for investment in infrastructure and technology.

Year	1980	1981	1982
GDP (Rs. crore)	1000	1100	1200
Industrial production (Index)	100	105	110
Agricultural production (Index)	100	102	104
Services production (Index)	100	103	106
Export (Rs. crore)	200	220	240
Import (Rs. crore)	150	160	170

The sixth part of the report discusses the social sector. It examines the state of the economy, the performance of different sectors, and the impact of government policies. It also discusses the challenges of social sector development and the need for investment in infrastructure and technology.

The seventh part of the report discusses the external sector. It examines the balance of payments, the foreign trade situation, and the impact of international trade policies. It also discusses the challenges of external sector development and the need for investment in infrastructure and technology.

The eighth part of the report discusses the social sector. It examines the state of the economy, the performance of different sectors, and the impact of government policies. It also discusses the challenges of social sector development and the need for investment in infrastructure and technology.

The ninth part of the report discusses the external sector. It examines the balance of payments, the foreign trade situation, and the impact of international trade policies. It also discusses the challenges of external sector development and the need for investment in infrastructure and technology.

The tenth part of the report discusses the social sector. It examines the state of the economy, the performance of different sectors, and the impact of government policies. It also discusses the challenges of social sector development and the need for investment in infrastructure and technology.

Year	1980	1981	1982
GDP (Rs. crore)	1000	1100	1200
Industrial production (Index)	100	105	110
Agricultural production (Index)	100	102	104
Services production (Index)	100	103	106
Export (Rs. crore)	200	220	240
Import (Rs. crore)	150	160	170

(Contd.)

Less: Salvage value:					
6th year (A)	2,000		0.564	1,128.00	—
10th year (B)		5,000	0.386	—	1,930
Present value of total costs				79,139.25	98,096.50
Divided by annuity PV factor for 10 per cent corresponding to the life of the project (capital recovery factor)					
				4.355	6.145
Equivalent annual cost (EAC)				18,172	15,963.63

Recommendation Since Machine B has a lower equivalent annual cost, it is preferred investment.

Working Notes

Determination of Operating Costs

Particulars	Machine A	Machine B
Cash running cost	₹15,000	₹12,000
Less: Tax shield @35 per cent (assuming profitable operations)	5,250	4,200
Less: Tax advantage on depreciation charged every year:		
Machine A (₹8000 × 0.35)	2,800	—
Machine B (₹6,000 × 0.35)	—	2,100
Effective operating cash outflows	6,950	5,700

Reinvestment Rate Assumption The preceding discussions have revealed that in the case of mutually exclusive projects, the NPV and IRR methods would rank projects differently where (a) the projects have different cash outlays initially, (b) the pattern of cash inflows is different, and (c) the service lives of the projects are unequal. It has also been found that the ranking given by the NPV method in such cases is theoretically more correct. The conflict between these two methods is mainly due to different assumptions with regard to the reinvestment rate on funds released from the proposal. The assumption underlying the IRR method seems to be incorrect and deficient. The IRR criterion implicitly assumes that the cash flow generated by the projects will be reinvested at the internal rate of return, that is, the same rate as the proposal itself offers. With the NPV method, the assumption is that the funds released can be reinvested at a rate equal to the cost of capital, that is, the required rate of return. The crucial factor is which assumption is correct? The assumption of the NPV method is considered to be superior theoretically because it has the virtue of having a rate which can consistently be applied to all investment proposals. Moreover, the rate of return (k) represents an opportunity rate of investment. In contrast to the NPV method, the IRR method assumes a high reinvestment rate for investment proposals having a high IRR and a low investment rate for investment proposals having a low IRR. The **implicit reinvestment rate** will differ depending upon the cash flow stream for each investment proposal. Obviously, under the IRR method, there can be as many rates of reinvestment as there are investment proposals to be evaluated unless some investment proposals turn out to have an IRR which is equal to that of some other project(s).

The superficiality of the reinvestment rate under the IRR method can be demonstrated by comparing the following two investment projects.⁴

Implicit Investment rate is the rate at which interim cash flows can be invested.

Project	Initial investment	Cash inflows	
		Year 1	Year 2
A	₹100	₹200	0
B	100	0	₹400

Under the IRR method, both projects have a rate of return of 100 per cent. If ₹100 were invested for one year at 100 per cent, it would grow to ₹200, and if invested for two years, to ₹400. Since both the projects have the same IRR, the firm should be indifferent regarding their acceptability, if only one of two projects is to be picked up as both the projects are equally profitable. For this to be true, it is necessary that ₹200 received at the end of year 1 in case of project A should be equal to ₹400 at the end of year 2. In order to achieve this, it necessarily follows that the firm must be able to reinvest the first year's earnings at 100 per cent. If not, it would be unable to transform ₹200 at the end of the first year into ₹400 at the end of the second. And if it cannot transform ₹200 into ₹400 in a year's time, the two projects A and B cannot be ranked equal. There is no reason to believe that a firm can find other investment opportunities at precisely the required rate.

In contrast, the present value method does not pose any problem. Let us calculate the present value of Example 10.7, assuming cost of capital (k) as 10 per cent.

Example 10.7

Year	Project A			Project B		
	Cashflows	PV factor	Total PV	Cashflows	PV factor	Total PV
1	₹200	0.909	₹181.80	0	—	—
2	0	—		₹400	0.826	₹330.40
			181.80			330.40
	Less: Initial outlay		100.00			100.00
	Net present value		81.80			230.40

The PV method indicates that project B is preferable to project A as its net present value is greater. The reinvestment rate in the PV method seems more realistic and reasonable. It assumes that earnings are reinvested at the same rate as the market cost of capital.

However, the IRR can be modified assuming the cost of capital to be the reinvestment rate. The **intermediate cash inflows** will be compounded by using the cost of capital. The compounded sum so arrived at and the initial cost outflows can be used as the basis of determining the IRR. The limitation of IRR arising out of the inconsistency in the reinvestment rate assumption can be obviated through the modified approach.

Modified IRR Method Since investment at the cost of capital is generally more realistic, the modified IRR (MIRR) is a better indicator of a project's true profitability. The MIRR also solves the problem of multiple IRRs.⁵

The MIRR can be computed by using Equation 10.2

$$CO_0 = \frac{\text{Compounded sum}_n}{(1 + \text{MIRR})^n} \quad (10.2)$$

- Intermediate
- cash flows
- are cash inflows
- received prior to
- the termination of
- the project.

[Illegible text]

[Illegible text]

[Illegible text]

[Illegible text]

[Illegible text]

[Illegible text]

For facts contained in Example 9.6, the MIRR of Machine A is 14.57 per cent as shown below:

Year	CFAT	Compounded factor at 10% for n – 1 years	Compounded sum
1	₹14,000	1.464 (for 4 years)	₹20,496
2	16,000	1.331 (for 3 years)	21,296
3	18,000	1.210 (for 2 years)	21,780
4	20,000	1.110 (for 1 year)	22,200
5	25,000	No compounding	25,000
Total compounded sum at year-end 5			1,10,772

Note: Cost of capital is 10 per cent (Compounded factors are as per Table A-1.)

$$₹56,125 = \frac{₹1,10,772}{(1 + \text{MIRR})^5}$$

1. Dividing the compound sum/terminal value (₹1,10,772) by the initial outlay (₹56,125), we have growth factor (1.9737).
2. In Table A-1, the factors closet to 1.9737 for 5 years are 1.925 (at 14%) and 2.011 (at 15%).
3. The MIRR would be between 14% and 15% as shown below.

₹56,125 compounds at 15% for 5 years = ₹1,12,867

₹56,125 compounds at 14% for 5 years = 1,08,041

Difference of 1 per cent 4,826

Based on interpolation:

$$\text{MIRR} = 14\% + \left(\frac{₹1,10,772 - ₹1,08,041 = ₹2,731}{₹4,826} \right) \times 1 = 14.57 \text{ per cent.}$$

(It may be noted that IRR for Machine A was 17.6 per cent).

The MIRR method, *prima-facie*, appears to be better than the standard IRR. But its superiority is open to question.⁶ In the first place, the MIRR may look like a rate of return, but it is not a rate of return on the project's annual cash flows; instead, it is a rate of return on a modified set of cash flows. Secondly, therefore, in view of observation 1, it cannot be reckoned as a true 'internal' rate of return which depends only on cash flows generated from the investment project and, finally, the value of a project does not depend on what the firm does with the cash flows accruing from the project.

Thus, the assumption regarding the reinvestment rate of the cash inflows generated at the intermediate stage is theoretically more correct in the case of NPV as compared to the IRR. This is mainly because the rate is a consistent figure for the NPV but it can widely vary for the IRR according to the cash flow patterns.

Computational Problems Apart from inconsistency in the application of the reinvestment rate, the IRR method also suffers from computational problems. These may be discussed with reference to two aspects.

Computation in Conventional Cash Flows It has been shown while computing the IRR that the calculation of the IRR involves a trial-and-error procedure as a result of which complicated computation has to be done. In conventional proposals having a constant cash inflow stream (i.e. annuity) the computation, is not so tedious. But when the cash inflows are unequal over the years, laborious calculations are involved. The calculations of the NPV, on the other hand, is relatively simple and presents no special problems.

Computation in Non-conventional Flows The problem of computation of IRR gets accentuated when cash flow patterns are non-conventional. The complications in such cases are (a) that the IRR is indeterminate, and (b) there may be multiple IRRs.

Indeterminate IRR For the following pattern of cash flows of an investment proposal, the IRR cannot be determined.⁷

Example 10.8

$$\begin{aligned} \text{CO}_0 &= ₹1 \\ \text{CFAT}_1 &= 2 \\ \text{CO}_2 &= 2 \end{aligned}$$

Where subscripts 0, 1, 2 refer to respective time periods, CFAT = cash inflows, CO = cash outflows
The required equation to solve the IRR is:

$$1 + \frac{2}{(1+r)^2} = \frac{2}{(1+r)}, \quad \text{which leads to } r^2 = -1$$

Clearly, the value of IRR is intermediate. On the other hand, the NPV of this project, given k as 10 per cent, can be easily ascertained. This would be negative (₹-0.834), as shown below:

Year	Cash flows	PV factor	Total present value
0	₹(1)	1.000	₹1.000
1	+2	0.909	1.818
2	(2)	0.826	(1.652)
			(0.834)

Multiple Rates of IRR Another serious computational deficiency of IRR method is that it can yield multiple internal rates of return. This is illustrated in Example 10.9.⁸

Example 10.9

Initial cost	Year 0	(₹20,000)
Net cash flow	1	90,000
Net cash flow	2	(80,000)

The required equation is: $₹20,000 = \frac{₹90,000}{(1+r)} - \left(\frac{₹80,000}{(1+r)^2} \right)$

Let $(1+r)$ be = X and divide both sides of equation by ₹10,000, $2 = \frac{9}{X} - \frac{8}{X^2} = 0$

Multiplying by X^2 , we can transform the equation into the quadratic form,

$$2X^2 - 9X + 8 = 0$$

Such an equation with a variable to the second power has 2 roots which can be identified as:

$$X = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad (10.2)$$

where a = coefficient of the variable raised to the second power
 b = coefficient of the variable raised to the first power
 c = constant or coefficient of the variable raised to the zero power

Substituting the values for a , b , and c into the quadratic formula produces value for X of 1.21. Since $X = (1+r)$, the internal rates for this project are 21.9 and 228 per cent.

Thus, the project yields a dual IRR. This kind of problem does not arise when the NPV method is used. The problem with the IRR is that if two rates of return make the present value of the project zero, (21.9 and 228 per cent respectively in our example), which rate should be used for decision-making purposes?

To conclude the discussion relating to the comparison of NPV and IRR methods, the two methods would give similar accept-reject decisions in the case of independent conventional investments. They would, however, rank mutually exclusive projects differently in the case of the (i) size-disparity problem, (ii) time-disparity problem, and (iii) unequal service life of projects. The ranking by the NPV decision criterion would be theoretically correct as it is consistent with the goal of maximisation of shareholders' wealth. Further, the reinvestment rate of funds released by the project is based on assumptions which can be consistently applied. The IRR can, of course, be modified by adopting the incremental approach to resolve the conflict in ranking. But it involves additional computation. Another deficiency of the IRR is that it may be indeterminate and give multiple rates in the case of a non-conventional cash flow pattern. In sum, therefore, the NPV emerges as a superior evaluation technique.

Net Present Value Vs. Profitability Index

In most situations, the NPV and PI, as investment criteria, provide the same accept and reject decision, because both the methods are closely related to each other. Under the PI method, the investment proposal will be acceptable if the PI is greater than one; it will be greater than one only when the proposal has a positive net present value. Likewise, PI will be less than one when the investment proposal has negative net present value under the NPV method. However, while evaluating mutually exclusive investment proposals, these methods may give different rankings. Example 10.10 presents such a case.

Example 10.10

Year	Project A	Project B
0	(₹50,000)	(₹35,000)
1	40,000	30,000
2	40,000	30,000
Present value of cash inflow (0.10)	69,440	52,080
NPV	19,440	17,080
PI	$69,440/50,000 = 1.39$	$52,080/35,000 = 1.49$

Thus, project A is acceptable under the NPV method, while project B under the PI method. Which project should the firm accept? The NPV technique is superior and so project A should be accepted. The reasons for the superiority of NPV method are the same as given in comparing NPV and IRR techniques. The best project is the one which adds the most, among available alternatives, to the shareholders' wealth. The NPV method, by its very definition, will always select such projects. Therefore, the NPV method gives a better mutually exclusive choice than PI. The NPV method guarantees the choice of the best alternative.

LO 10.2 PROJECT SELECTION UNDER CAPITAL RATIONING

The **capital rationing situation** refers to the choice of investment proposals under financial constraints in terms of a given size of capital expenditure budget. The objective to select the combination of projects would be the maximisation of the total NPV. The project selection under capital rationing involves two stages: (i) identification of the acceptable projects. (ii) selection of the combination of projects. The acceptability of projects can be based either on profitability index or IRR.

Capital rationing implies the choice of investment proposals under financial constraints of capital expenditure budget.

Capital rationing can be of two types, namely, **soft rationing** and **hard rationing**. While hard rationing refers to the situation when a business firm cannot raise required finances to execute all potential available profitable investment projects, the soft rationing is internal to the firms in that different divisions/units of a firm are allocated a fixed amount of capital budget each year.⁹

Soft rationing is primarily used, as a means of control on the capital spending of divisional managers. It does not imply that the firm, as a whole, has paucity of funds. In other words, the firm can raise required funds, if it so desires.

The fallout of soft rationing is that the firm eventually is deprived of the profitable investment projects (in case divisions happen to have such projects). As a result, the imposition of soft rationing is in conflict with the basic goal of the firm of maximisation of the wealth/value.

The method of selecting investment projects under capital rationing situation will depend upon whether the projects are **indivisible** or **divisible**. In case the project is to be accepted/rejected in its entirety, it is called an indivisible project; a divisible project, on the other hand, can be accepted/rejected in part. These are illustrated in Examples 10.11 and 10.12 respectively.

Example 10.11 (Divisible Project)

A company has ₹7 crore available for investment. It has evaluated its options and has found that only 4 investment projects given below have positive NPV. All these investments are divisible. Advise the management which investment(s)/projects it should select.

Project	Initial investment (₹ crore)	NPV (₹ crore)	PI
X	3.00	0.60	1.20
Y	2.00	0.50	1.25
Z	2.50	1.50	1.60
W	6.00	1.80	1.30

Solution

Ranking of the Projects in Descending Order of Profitability Index

Project and (rank)	Investment outlay (₹ crore)	Profitability index	NPV (₹ crore)
Z (1)	2.50	1.60	1.50
W (2)	6.00	1.30	1.80
Y (3)	2.00	1.25	0.50
X (4)	3.00	1.20	0.60

Accept Project Z in *full* and W in part (₹4,50,000) as it will maximise the NPV.

Example 10.12 (Indivisible Project)

A company working against a self-imposed capital budgeting constraint of ₹70 crore is trying to decide which of the following investment proposals should be undertaken by it. All these investment proposals are indivisible as well as independent. The list of investments along with the investment required and the NPV of the projected cash flows are given as below:

Project	Initial investment (₹ crore)	NPV (₹ crore)
A	10	6
B	24	18
C	32	20
D	22	30
E	18	20

Which investment should be acquired by the company?

Solution

NPV from investments D, E and B is ₹68 crore with ₹64 crore utilised leaving ₹6 crore to be invested in some other investment outlet. No other investment package would yield an NPV higher than this amount. The company is advised to invest in D, E and B projects.

- **Indivisible project**
- is a project which
- can be accepted/
- rejected in its
- entirety.

- **Divisible project**
- is a project which
- can be accepted in
- parts.

Trial and error process is an integral part of selecting optimal investment packages/set in capital rationing situation. Consider Example 10.13.

Example 10.13

Sound Limited has a financial resource constraint of a maximum of ₹65 lakh in the current year. It has evaluated a large number of investment projects but has discarded all except those listed below. All the listed investment proposals are independent. The selected list of investments provide investment outlays, gross present value, NPV and present value index.

Project	Investment outlay	NPV	Gross present value	Present value index
A	₹21,85,000	₹15,07,500	₹36,92,500	1.69
B	19,10,000	10,70,000	29,80,000	1.56
C	15,50,000	2,15,000	17,65,000	1.14
D	13,00,000	2,75,000	15,75,000	1.21
E	11,45,000	15,80,000	27,25,000	2.38
F	9,40,000	4,25,000	13,65,000	1.45
G	6,75,000	6,20,000	12,95,000	1.92
H	5,35,000	3,90,000	9,25,000	1.73
I	4,65,000	6,10,000	10,75,000	2.31
J	4,30,000	4,77,500	9,07,500	2.11
K	4,10,000	2,95,000	7,05,000	1.72
L	3,50,000	3,05,000	6,55,000	1.87
M	2,75,000	1,07,500	3,82,500	1.39
N	2,45,000	2,05,000	4,50,000	1.84
O	1,90,000	3,00,000	4,90,000	2.58
	1,26,05,000	83,82,500	2,09,87,500	

Which investments should be acquired by Sound Limited?

Solution First, we should arrange the investment projects in descending order of present value (PI) index. The optimal investment portfolio/set will be one which yields the maximum NPV. The investment projects are accordingly listed below.

Project	PI	Investment outlays of		NPV of	
		Project	Cumulative	Project	Cumulative
O	2.58	₹1,90,000	₹1,90,000	₹3,00,000	₹3,00,000
E	2.38	11,45,000	13,35,000	15,80,000	18,80,000
I	2.31	4,65,000	18,00,000	6,10,000	24,90,000
J	2.11	4,30,000	22,30,000	4,77,500	29,67,500
G	1.92	6,75,000	29,05,000	6,20,000	35,87,500
L	1.87	3,50,000	32,55,000	3,05,000	38,92,500
N	1.84	2,45,000	35,00,000	2,05,000	40,97,500
H	1.73	5,35,000	40,35,000	3,90,000	44,87,500
K	1.72	4,10,000	44,45,000	2,95,000	47,82,500
A	1.69	21,85,000	66,30,000 ¹	15,07,500	—
B	1.56	19,10,000	63,55,000	10,70,000	58,52,500 ²
F	1.45	9,40,000		4,25,000	
M	1.39	2,75,000		1,07,500	
D	1.21	13,00,000		2,75,000	
C	1.14	15,50,000		2,15,000	

¹Not feasible at this stage; cumulative investment outlays exceed ₹65 lakh.

²Investment outlay as well as NPV consist of projects (from O to H) plus project B.

In case the company is guided simply by the PI index, then it selects the first nine projects (numbered from O through K) plus project B. This investment package yields an NPV of ₹58,52,500.

However, this is not the optimal investment package as it does not provide the highest possible NPV. By dropping Project K (₹4,10,000) and B (₹19,10,000) from the proposed investment package and substituting projects A (₹21,85,000) and M (₹2,75,000), the firm generates a higher NPV of ₹61,02,500, as shown below.

Project	Investment outlays of		NPV of	
	Project (s)	Cumulative	Project (s)	Cumulative
O to H	—	₹40,35,000	—	₹44,87,500
A	₹21,85,000	62,20,000	₹15,07,500	59,95,000
M	2,75,000	64,95,000	1,07,500	61,02,500

Such a substitution exercise involves a trial and error approach. Thus, the optimal investment package consists of 10 projects (O, E, I, J, G, L, N, H, A and M) requiring a total investment outlay of ₹64.95 lakh, yielding a total NPV of ₹61,02,500.

Fallout of Capital Rationing

Capital rationing limits the amount to be spent on capital expenditure decisions. The firm may impose such a limit primarily for two reasons: **(i)** there may be a paucity of funds and **(ii)** corporate managers/owners may be conservative and may not like to invest more than a specified/stated sum in capital projects at one point of time; they may like to accept projects with a greater margin of safety, measured by NPV.

Whatever might be the reasons for capital rationing, it usually results in an investment policy that is *less than optimal*. The reason is that capital rationing does not allow the business firm to accept all profitable investment projects which could add to net present value and, thus, add to the wealth of shareholders. In other words, capital rationing inflicts opportunity cost to the extent of NPV foregone on account of non-acceptance of otherwise acceptable (profitable) investment projects.

Another notable consequence is that capital rationing may lead to the acceptance of several small investment projects (promising higher return per rupee of investment) rather than a few large investment projects. Acceptance of such a package of investment projects is likely to have a bearing on the risk complexion of the business firm (perhaps it may decrease).

Finally, selection criterion of investment projects under capital rationing (based on one-period analysis) does not reckon intermediate cash inflows expected to be provided by an investment project. However, some investment projects may yield relatively higher CFAT in the initial/early years compared to other projects. Obviously, availability of such funds in the early years tends to reduce capital budgeting constraints of the early/future years as they can be used to finance profitable investment projects. For this reason, the management should consider more than one period in the allocation of limited capital for investment projects¹⁰.

LO 10.3 INFLATION AND CAPITAL BUDGETING

The capital budgeting results would be unrealistic if the impact of inflation is not correctly factored in the analysis. The cash flow estimates will not reflect the real purchasing power. In other words, cash flows would be shown at inflated sums and, to that extent, cause distortion in capital budgeting decisions. Therefore, cash flows should be adjusted to accommodate the inflation factor so that the capital budgeting decisions reflect the 'true' picture. The discussion that follows on the procedure for adjusting data for inflation. Consider Example 10.14.

The first part of the document discusses the importance of maintaining accurate records. It emphasizes that every detail matters and that consistency is key. The text is organized into several sections, each with a clear heading.

In the second section, the author provides a detailed analysis of the data collected. This involves comparing different sets of information and identifying trends. The analysis is thorough and covers various aspects of the data.

The third section focuses on the practical application of the findings. It offers suggestions for how the information can be used to improve processes and make better decisions. The author also discusses potential challenges and how to overcome them.

Finally, the document concludes with a summary of the key points. It reiterates the importance of the work and expresses confidence in the results. The overall tone is professional and informative.

The second part of the document continues the discussion on the importance of data. It highlights the need for regular updates and the role of technology in data management. The text is well-structured and easy to read.

The author also discusses the ethical implications of data collection and use. It is important to ensure that data is handled responsibly and that privacy is protected. The document provides guidelines for ethical data practices.

In the final section, the author looks to the future. They discuss emerging trends in data science and how they might impact the field. The author expresses optimism about the future of data and its potential to solve complex problems.

The document is a comprehensive overview of the current state of data and its future. It is a valuable resource for anyone interested in the field. The author's expertise is evident throughout the text.

Example 10.14

Proposal X requires an initial capital outlay of ₹2,00,000, with no salvage value, and will be depreciated on a straight line basis for tax purposes. The earnings before depreciation and taxes (EBDT) during its 5 year life are:

Year	1	2	3	4	5
EBDT	₹70,000	₹76,000	₹80,000	₹60,000	₹52,000

The corporate tax rate is 35 per cent and the company evaluates its capital budgeting projects at 12 per cent cost of capital. Advise the company whether the project should be accepted. (i) when there is no inflation and (ii) when there is inflation at the rate of 15 per cent per annum, and the stated gross earnings are also expected to grow at this rate of inflation.

Solution**Determination of NPV (When There is No Inflation)***(Amount in thousand rupees)*

Year	EBDT	Depreciation (200 ÷ 5)	Taxable income	EAT (Col. 4 × 0.65)	CFAT (Col. 5 + 3) (Col. 2 - 3)	PV factor	Total PV (Col. 6 × 7)	
1	2	3	4	5	6	7	8	
1	70	40	30	19.5	59.5	0.893	53.13	
2	76	40	36	23.4	63.4	0.797	50.53	
3	80	40	40	26.0	66.0	0.712	46.99	
4	60	40	20	13.0	53.0	0.636	33.71	
5	52	40	12	7.8	47.8	0.567	27.10	
Gross present value								211.46
Less: Cash outflows								<u>200.00</u>
Net present value								11.46

Since the net present value is positive, the project is worth accepting in a non-inflationary scenario.

In an inflationary situation, EBDT are expected to grow at 15 per cent. As per Table A-1 (showing compound sum of one rupee), EBDT can be determined (reflecting 15 per cent compound rate of growth). As amount of depreciation remains unchanged, taxable profits as well as taxes would go up as exhibited below:

Determination of CFAT in Inflationary Situation*(Amount in thousand rupees)*

Year	EBDT	Compound factor at 0.15	Revised EBDT (Col. 2 × 3)	Depreciation	Taxable income (Col. 4 - 5)	EAT (Col. 6 × 0.65)	CFAT (Col. 7 + 5)
1	2	3	4	5	6	7	8
1	70	1.150	80.50	40	40.50	26.32	66.32
2	76	1.322	100.47	40	60.47	39.31	79.31
3	80	1.521	121.68	40	81.68	53.09	93.09
4	60	1.749	104.94	40	64.94	42.21	82.21
5	52	2.011	104.57	40	64.57	41.97	81.97

Since CFAT are inflated sums, they are to be deflated at the rate of inflation (15 per cent) to determine real cash flows. The relevant calculations are as follows:

Determination of Real Cash Flows

(Amount in thousand rupees)

Year	CFAT	Discount/deflated factor at 0.15 as per Table A - 3	Real cash inflows (CFAT) (Col. 2 × 3)
1	2	3	4
1	66.32	$1/1.15 = 0.870$	57.70
2	79.31	$1/(1.15)^2 = 0.756$	59.96
3	93.09	$1/(1.15)^3 = 0.658$	61.25
4	82.21	$1/(1.15)^4 = 0.572$	47.02
5	81.97	$1/(1.15)^5 = 0.497$	40.74

The **real cash flows** are substantially lower than nominal cash flows. This is due to the fact that increased income (as depreciation charges do not change) is subject to higher amount of taxes. The corporate tax rate is more than twice (35 per cent) the inflation rate (15 per cent). The NPV and real cash inflows are shown in the following tables.

- Real cash flows
- are cash flows
- discounted/deflated
- to reflect effect of
- inflation on nominal
- cash flows.

NPV of Real CFAT

(Amount in ₹ thousands)

Year	Real CFAT	PV factor at 12%	Total PV (Col. 2 × 3)
1	2	3	4
1	57.70	0.893	51.53
2	59.96	0.797	47.79
3	61.25	0.712	43.61
4	47.02	0.636	29.90
5	40.74	0.567	23.10
Gross present value			195.93
Less: Cash outflows			200.00
Net present value			(4.07)

IRR of Real CFAT

(Amount in ₹ thousands)

Year	Real CFAT	PV factor at 11%	Total PV (Col. 2 × 3)
1	2	3	4
1	57.70	0.901	51.99
2	59.96	0.812	48.69
3	61.25	0.731	44.77
4	47.02	0.659	30.99
5	40.74	0.593	24.16
Gross present value			200.60
IRR (%)			11.00

Since the NPV is negative under inflationary situations, the investment proposal is not acceptable. Similar conclusions follow based on the internal rate of return method. The IRR based on real CFAT is 11 per cent—lower than the cost of capital (12 per cent).

Thus, inflation results both in lower cash flows and lower real rates of return. Example 10.14 highlights that firms (conscious of protecting the real purchasing power of their owners) may go for unprofitable investment projects, affecting the shareholders wealth adversely. It underlines the significance of incorporating the inflation factor in evaluating capital budgeting decisions, in particular for business firms interested in real returns.

Consistency warrants that the **real cost of capital** should be used to discount real cash inflows after taxes and the nominal cost of capital should be employed for nominal CFAT. This point is illustrated in Example 10.15.

Real cost of capital is cost of capital adjusted for inflation effect.

Example 10.15 The investment data of Prudent Company Ltd launching a new product and with 12 per cent cost of capital, is as follows:

Particulars	Amount
Investment	₹7,00,000
CFAT: Year 1	5,00,000
2	4,00,000
3	2,00,000
4	1,00,000
5	1,00,000

Assuming an inflation rate of 5 per cent, determine NPV of the project by using both the nominal rate of discount and the real rate of discount.

Solution

NPV Using Nominal Rate of Discount

Year	CFAT	PV factor at 0.12	Total PV
1	₹5,00,000	0.893	₹4,46,500
2	4,00,000	0.797	3,18,800
3	2,00,000	0.712	1,42,400
4	1,00,000	0.636	63,600
5	1,00,000	0.567	56,700
Total present value			10,28,000
Less: Cash outflows			7,00,000
Net present value			3,28,000

The nominal rate of discount (n) is obtained by compounding the real rate (r) and inflation rate (i).¹¹ In equations terms, it is

$$(1 + n) = (1 + r)(1 + i) \quad (10.3)$$

or $(1 + r) = (1 + n)/(1 + i) \quad (10.4)$

Substituting the values,

$$(1 + r) = 1.12/1.05 = 1.0667$$

or $r = 0.0667$ or 6.67 per cent.

Since the discount rate now to be used is the real discount rate, the CFAT should also be adjusted for inflation so that they too are expressed in real terms. In operational terms, CFAT will be deflated by the inflation rate (5 per cent). While Table 10.1 shows real/deflated CFAT, NPV of real CFAT is provided in Table 10.2.

TABLE 10.1 Real Cash Flows

Year	CFAT	Deflation factor at 0.05	Real CFAT
1	₹5,00,000	$1/(1.05) = 0.952$	₹4,76,000
2	4,00,000	$1/(1.05)^2 = 0.907$	3,62,800
3	2,00,000	$1/(1.05)^3 = 0.864$	1,72,800
4	1,00,000	$1/(1.05)^4 = 0.823$	82,300
5	1,00,000	$1/(1.05)^5 = 0.784$	78,400

TABLE 10.2 NPV Using Real Rate of Discount

Year	Real CFAT	PV factor at 6.67% ^a	Total PV
1	₹4,76,000	0.938	₹4,46,488
2	3,62,800	0.879	3,18,901
3	1,72,800	0.824	1,42,387
4	82,300	0.772	63,536
5	78,400	0.724	56,761
Total present value			10,28,073
Less: Cash outflows			7,00,000
Net present value			3,28,073 ^b

a Based on interpolation as per Table A – 3.

b Difference in NPV of ₹73 (₹3,28,073 – ₹3,28,000) between the two discount rates (nominal and real) is on account of rounding off the values. Both the approaches provide the same answer.

It is important to note that 'real' cash flows discounted at the 'real' discount rate yield an identical amount of NPV that is obtained by discounting 'nominal' cash flows by the 'nominal' discount rate. When estimates of CFAT and cost of capital include inflation, they are said to be expressed in nominal terms; when such estimates exclude the impact of inflation, they are said to be shown in real terms. For correct analysis, these estimates should either be stated in nominal or real terms. It implies that capital budgeting decisions should either reckon the inflation factor in CFAT, as well as the cost of capital, or exclude it completely.

SUMMARY

In case of independent investment proposals, all the discounted cash flow (DCF) methods provide consistent results in terms of acceptance or rejection of capital budgeting proposal(s). The independent proposals refer to investment projects, the acceptance of which does not preclude the acceptance of other profitable proposal (s).

The reason is that all the DCF methods are based on cash flows and take into account total benefits as well as time value of money. The data inputs in terms of cash outflows, CFAT, cost of capital and so on is the same for all these methods. As a result, the investment projects which have positive NPV will also have (i) an IRR > required rate of return, (k) and (ii) a present value index > one

In the case of mutually exclusive proposals, the DCF methods may provide conflicting rankings. The reason is while the NPV method is based on the *total* yield/earnings/NPV, the other two methods (IRR and PI) are concerned with the *rate* of return/earnings on investment.

While IRR and PI methods are not compatible with the objective of financial decision making of the firm, that is, maximising shareholders' wealth, the recommendation of NPV method is consistent with the goal of the firm of maximising shareholders' wealth.

The IRR and PI methods can be modified (by adopting the incremental approach) to give results identical to the NPV method. The logic behind the incremental approach is that the firm would get the profits promised by the smaller outlay investment project plus the profit on the incremental investments required in the project involving larger outlay.

The conflict between the NPV and IRR methods is mainly ascribed to the different reinvestment rate assumptions of intermediate cash inflows accruing from projects. The IRR method implicitly assumes that the cash flows generated from the projects are subject to reinvestment at IRR. In contrast, the reinvestment rate assumption under the NPV method is the cost of capital. The assumption of the NPV method is conceptually superior to that of the IRR as the former has the virtue of having a uniform rate which can consistently be applied to all investment proposals.

The IRR can be modified (to overcome the deficiency of the reinvestment rate assumption) assuming the cost of capital to be the reinvestment rate.

The IRR method is beset with computational and other operational difficulties. In the case of mixed-stream of cash flows, it involves a trial-and-error procedure. When cash flows are non-conventional, its value is either indeterminate or it has multiple values. In contrast, the NPV calculations do not present any such problems.

The NPV method continues to be the best alternative under capital rationing situations. For these reasons, therefore, the NPV emerges as a theoretically correct and better technique for evaluation of capital projects.

LO 10.1

There are two approaches to deal with investment projects of unequal/varying lives: (i) common time horizon approach and (ii) equivalent annual value, (EANPV)/cost approach (EAC). The first approach requires that the projects must be compared over the same period of time (by taking the LCM of the lives of the capital projects). The implicit assumption of this approach is that the investment which is being replaced will produce cash flows of a similar pattern in future as it has done in the past. Therefore, the approach lacks realism and presents operational difficulties to be used in the real business world.

The EANPV/EAC is a better approach. The EANPV is determined dividing the NPV of cash flows of the project by the annuity factor corresponding to the life of the project at the given cost of capital. The EAC is obtained dividing the total PV of cash outflows by the relevant annuity factor. While the maximisation of EANPV is the decision-criterion in the case of revenue-expanding proposals, the minimisation of EAC is the guiding criterion for cost reduction proposals.

LO 10.2

Capital rationing involves the choice of combination of available projects maximise the total NPV, given the capital budget constraints. The ranking of investment projects can be done either on the basis of present value index or the IRR. The procedure to select the package of investment projects will relate to whether the project is divisible or indivisible, the objective being the maximisation of total NPV by exhausting the capital budget as far as possible.

Cash flows of the project should be adjusted for the inflation factor so that they reflect the real purchasing power. The nominal CFAT should be deflated at the rate of inflation. The deflated CFAT are real cash flows. The real CFAT are then discounted at the real rate of discount.

LO 10.3

The nominal rate of discount (n) is obtained by compounding the real rate (r) and inflation rate (i). In equation terms, $(1 + n) = (1 + r) / (1 + i)$.

From this equation the following real rate of discount (r) can be obtained: $(1 + r) = (1 + n) / (1 + i)$. The decision criterion is to accept the investment project if it has positive NPV of the real CFAT, discounted at the real rate.

Alternatively, the nominal CFAT (not adjusted for inflation), are to be discounted at the nominal rate of discount. Both these approaches provide an identical amount of NPV. Therefore, the capital budgeting decisions should either reckon the inflation factor in CFAT as well as cost of capital or exclude it completely.

SOLVED PROBLEMS

P.10.1 Northern Chemicals Ltd owns a machine with the following characteristics:

Book value	₹1,10,000
Current market value	80,000
Expected salvage value at the end of 5 years remaining useful life	Nil
Annual cash operating costs	36,000

The firm's cost of capital is 15 per cent; its tax rate is 35 per cent. The company follows the straight line method of depreciation and the same is accepted for tax purposes.

The management of the company is considering selling the machine. If it does so, the total cash operating costs to perform the work now done by the machine will increase by ₹40,000 per year to ₹76,000 per year. Advise whether the machine should be sold.

LO 10.1 LOD
M

Solution

Cash inflows (if machine is sold)

Selling price of the old machine	₹80,000
Add tax savings ($0.35 \times ₹30,000$, short-term capital loss)	10,500
	90,500

Present value of cash outflows saved if machine is not sold (PV of keeping machine)

Particulars	Amount before tax	Amount after tax
Annual cash operating costs saved ($₹76,000 - ₹36,000$)	₹40,000	₹26,000
Plus: Tax savings on depreciation ($₹1,10,000 \div 5$)	22,000	14,300
Net annual cash flows		40,300
(x) PVIFA _{15,5}		(x) 3.352
PV of keeping machine		1,35,086
PV of selling machine		90,500
Difference favouring keeping the machine		44,586

Recommendation The machine should not be sold.

P.10.2 Avon Ltd is investigating the feasibility of manufacturing one of the components needed for its finished product rather than purchasing it from an outside supplier. Its present supplier has just announced that he intends to increase the price from ₹100 to ₹125 per unit.

LO 10.1 LOD
D

The equipment needed to make this product can be purchased for ₹10 lakh, and is expected to have salvage value of ₹2,00,000 after the expiry of the fifth year. Additional fixed costs (excluding depreciation) are estimated to increase by ₹1,00,000 per year. The variable costs of manufacturing each component will be ₹30 per unit. The company is subject to a 35 per cent tax rate and 15 per cent is the appropriate cost of capital for this project. The company projects annual needs at 7,500 units per year for the 6-year period. The tax relevant rate of depreciation is 25 per cent and there are no other assets in the 25 per cent block.

Advise the company whether it should continue buying from outside suppliers, or start manufacturing on its own. Will your answer be different if the requirement of the company is only 6,000 units per year? Assume the firm would have sufficient short-term capital gains in year 6.

Solution Cash outflows:

(i)	Cash inflows (CFAT)		₹10,00,000
	Particulars	7,500 units	6,000 units
	Buy costs @ ₹125 per unit	₹9,37,500	₹7,50,000
	Less: Manufacturing costs:		
	Variable cost @ ₹30 per unit	2,25,000	1,80,000
	Fixed cost	1,00,000	1,00,000
	Cost saving (profit) before taxes	6,12,500	4,70,000
	Less: Taxes	<u>2,14,375</u>	<u>1,64,500</u>
	Cash flows after taxes	3,98,125	3,05,500
	(×) PV factor of annuity for 5 years	(×) 3.352	(×) 3.352
	Total PV	13,34,515	10,24,036

(ii) Present value of tax shield due to depreciation				
Year	Depreciation	Tax shield	PV factor	Total PV
1	₹2,50,000	₹87,500	0.870	₹76,125
2	1,87,500	65,625	0.756	49,612
3	1,40,625	49,219	0.658	32,386
4	1,05,469	36,914	0.572	21,115
5	79,101	27,685	0.497	13,752
				<u>1,92,997</u>

(iii) Present value of salvage value $(₹2,00,000 \times 0.497) = ₹99,400$.

(iv) PV of tax shield on short-term capital loss: $[0.35 \times (₹2,37,305 - ₹2,00,000 \text{ salvage value}) \times 0.497] = ₹6,489$.

(v) Determination of NPV		
Particulars	7,500 units	6,000 units
PV of cash savings	₹13,34,515	₹10,24,036
PV of tax shield (depreciation)	1,92,997	1,92,997
PV of salvage value	99,400	99,400
PV of short-term capital loss	6,489	6,489
Total PV	16,33,401	13,22,922
Less: Cash outflows	10,00,000	10,00,000
NPV	6,33,401	3,22,922

Recommendation The company is advised to start manufacturing on its own, irrespective of the fact whether the required units are 7,500 or 6,000 as the NPV is positive in both the situations.

P.10.3 Avon Chemical Company Ltd is presently paying an outside firm ₹1 per gallon to dispose of the waste material resulting from its manufacturing operations. At normal operating capacity the waste is about 40,000 gallons per year.

LO 10.1 

After spending ₹40,000 on research, the company discovered that the waste could be sold for ₹15 per gallon if it was processed further. Additional processing would, however, require an investment of ₹6,00,000 in new equipment, which would have an estimated life of 5 years and no salvage value. Depreciation would be computed by the reducing balance method @ 25 per cent. There are no other assets in the 25 per cent block.

Except for the costs incurred in advertising ₹20,000 per year, no change in the present selling and administrative expenses is expected if the new product is sold. The details of additional processing costs are as follows: variable—₹5 per gallon of waste put into process; fixed (excluding depreciation)—₹30,000 per year.

In costing the new product, general factory overheads will be allocated at the rate of ₹1 per gallon.

There will be no losses in processing, and it is assumed that all of the waste processed in a given year will be sold in that very year. Waste that is not processed further will have to be disposed off at the present rate of ₹1 per gallon. Estimates indicate that 30,000 gallons of the new product could be sold each year.

The management, confronted with the choice of disposing off the waste, or processing it further and selling it, seeks your advice. Which alternative would you recommend? Assume that the firm's cost of capital is 15 per cent and it pays, on an average, 35 per cent tax on its income. Assume the firm would have sufficient short-term, capital gains in year 5.

Solution Cash outflows:

Cost of additional investment ₹6,00,000

(i) Present value of cash inflows (excluding depreciation), $t = 1 - 5$

Particulars	Amount
Increase in sales revenue (30,000 × ₹15)	₹4,50,000
Cost saving: reduction in disposal costs (30,000 × ₹1)	30,000
Less: Incremental costs:	4,80,000
Variable (30,000 × ₹5)	₹1,50,000
Fixed, manufacturing or processing	30,000
Advertising	20,000
Earnings before taxes	2,80,000
Less: Taxes	98,000
CFAT	1,82,000
× PVIFA	(×)3.352
Total present value	6,10,064

(ii) PV of tax shield due to depreciation

Year	Depreciation	Tax advantage	PV factor	Total PV
1	₹1,50,000	₹52,500	0.870	₹45,675
2	1,12,500	39,375	0.756	29,767
3	84,375	29,531	0.658	19,431
4	63,281	22,148	0.572	12,669
				1,07,542

(iii) PV of tax advantage due to short-term capital loss: $[0.35 \times (\text{₹}1,89,844) \times 0.497] = \text{₹}33,023$.

(iv) Determination of NPV

Gross present value [(i) + (ii) + (iii)]	₹7,50,629
Less: Cost of additional investment	6,00,000
NPV	1,50,629

Note: ₹40,000 spent on research is irrelevant cost and so is the allocated share of factory overheads.

Recommendation Since the NPV is positive, the company is advised to purchase new equipment.

P.10.4 The North South Airlines (NSA) is considering two proposals to expand its current operations in a big way. At present, it has a fleet of two Boeing 737-200 jets and four Dornier aircrafts. The B-737s were leased from Wright Airways Inc. of USA. The profits of NSA on a revenue of ₹92 crore are ₹21 crore.

LO 10.1

The Director (Operations) of NSA favours the induction of two additional latest model B737-400 aircrafts. With four jets, the NSA would get the airlines status while its present status is that of Air Taxi Operator (ATO). As a result of achieving the airlines status, the NSA would have to fly on unprofitable routes also. It is suggested that the existing B737-200 models would serve the unprofitable routes. Moreover, Fly-By-Wire Airways (FBWA) is ready to buy one Dornier aircraft for ₹12 crore whose book value is ₹10 crore with remaining useful life of 8 years.

According to an alternative proposal, NSA should acquire an one Airbus-320 (A-320) which has a capacity of 180 passengers compared to 120 of the B737. The NSA would not be required to fly on uneconomical routes with a total fleet of three aircrafts.

1. The first part of the report discusses the general situation of the country and the progress of the work. It is noted that the work has been carried out in accordance with the plan and that the results are satisfactory.

2. The second part of the report deals with the specific results of the work. It is shown that the work has been carried out in accordance with the plan and that the results are satisfactory.

3. The third part of the report discusses the conclusions of the work. It is concluded that the work has been carried out in accordance with the plan and that the results are satisfactory.

4. The fourth part of the report discusses the conclusions of the work. It is concluded that the work has been carried out in accordance with the plan and that the results are satisfactory.

5. The fifth part of the report discusses the conclusions of the work. It is concluded that the work has been carried out in accordance with the plan and that the results are satisfactory.

6. The sixth part of the report discusses the conclusions of the work. It is concluded that the work has been carried out in accordance with the plan and that the results are satisfactory.

On a reference from the managing director of the NSA, the finance manager has worked out the financial parameters as detailed below.

(Amount in ₹ crore)

Particulars	Option 1 (Buy 737-400 and sell Dornier)	Option 2 (Buy A-320)
Cost of aircraft	150	120
Staff training	2	—
Recurring costs:		
Fuel (5 per cent annual increase)	20	12
Maintenance	10	8
Salary/wages	5	3
Insurance premium	5	6
Overheads (airport charges)	5	3
Sale of Dornier	12	—
Recurring revenues:		
Profitable routes (10 per cent annual increase)	70	55
Unprofitable routes (constant)	5	—
Salvage value (after 8 years)	30	40

The fuel costs are expected to increase 5 per cent annually, while the likely annual increase in salary, wages and overheads would be 10 per cent. The projected recurring revenues are based on the assumption of average occupancy of 70 per cent on profitable routes and 20 per cent on uneconomical routes.

Assuming 35 per cent tax rate, 10 per cent required rate of return and straight line method of depreciation for tax purposes, how do you evaluate the financial viability of the two proposals? Which one would you recommend and why? Ignore tax shield on staff training costs.

Solution

Financial evaluation of options I and II

Option I (to sell 1 Dornier and buy B-737) (amount in crore of rupees):

Cash outflows:

Cost of aircraft	150
Add: Cost of staff training	2
Less: Sale proceeds of Dornier	(12)
Add: Tax payment on sale of Dornier (₹12 crore – ₹10 crore) × 0.35	0.7
	140.7

Determination of CFAT and NPV (amount in crore of rupees)

Year	Net cash inflow*	Incremental depreciation**	EBT	EAT (EBT × 0.65)	CFAT	PV factor (at 0.10)	Total PV
1	30	13.75	16.25	10.56	24.31	0.909	22.10
2	35	13.75	21.25	13.81	27.56	0.826	22.76
3	40.55	13.75	26.80	17.42	31.17	0.751	23.41
4	46.72	13.75	32.97	21.43	35.18	0.683	24.03
5	53.54	13.75	39.79	25.86	39.61	0.621	24.60
6	61.11	13.75	47.36	30.78	44.53	0.564	25.11
7	69.49	13.75	55.74	36.23	49.98	0.513	25.64
8	78.79	13.75	65.04	42.28	56.03	0.467	26.17
8 Salvage value					30.00	0.467	14.01
Less: Cash outflows							(140.7)
NPV							67.13

*Working note 1

**Working note 2

Working Notes

1. Determination of net cash inflows (amount in crore of rupees)

Year	Gross revenues			Costs					Total	Net cash inflows
	PR	UR	Total	Fuel	Maint- enance	Salary and IP	OH wages			
1	70	5	75	20	10	5	5	5	45	30
2	77	5	82	21	10	5.5	5	5.5	47	35
3	84.7	5	89.7	22.05	10	6.05	5	6.05	49.15	40.55
4	93.17	5	98.17	23.15	10	6.65	5	6.65	51.45	46.72
5	102.49	5	107.49	24.31	10	7.32	5	7.32	53.95	53.54
6	112.74	5	117.74	25.53	10	8.05	5	8.05	56.63	61.11
7	124.01	5	129.01	26.80	10	8.86	5	8.86	59.52	69.49
8	136.41	5	141.41	28.14	10	9.74	5	9.74	62.62	78.79

PR = Profitable routes, UR = Unprofitable routes, IP = Insurance premium, OH = Overhead and airport charges

2. Incremental depreciation (₹ crore)

Depreciation (new base) (₹150 crore – ₹30 crore)/8 years	₹15
Less: Depreciation (Dornier) ₹10 crore/8 years	1.25
Incremental depreciation	13.75

Option II (buy A-320):

Cash outflows:

Cost of aircraft

₹120 crore

Determination of CFAT and NPV (amount in crore of rupees)

Year	Net cash inflow*	Depreciation**	EBT	EAT#	CFAT	PV factor	Total PV
1	23	10	13	8.45	18.45	0.909	16.77
2	27.3	10	17.3	11.24	21.24	0.826	17.54

8 Salvage value					40.00	0.467	18.68
Less: Cash outflows							(120.00)
NPV							51.95

* Working note 3

** (₹120 crore – ₹40 crore)/8 years = ₹10 crore

(EBT × 0.65)

Recommendation Option I is recommended for NSA as it has higher NPV.

The first part of the report deals with the general situation of the country and the progress of the war. It is followed by a detailed account of the operations of the army and the navy. The report concludes with a summary of the results of the campaign and a list of the names of the officers and men who have distinguished themselves in the service of their country.

The second part of the report deals with the general situation of the country and the progress of the war. It is followed by a detailed account of the operations of the army and the navy. The report concludes with a summary of the results of the campaign and a list of the names of the officers and men who have distinguished themselves in the service of their country.

Working Notes

3. Determination of net cash inflows (amount in crore of rupees)

Year	Revenues	Costs					Total	Net cash inflows
		Fuel	Maintenance	Salary and wages	IP	OH		
1	55	12	8	3	6	3	32	23
2	60.5	12.6	8	3.3	6	3.3	33.2	27.3
3	66.55	13.23	8	3.63	6	3.63	34.49	32.06
4	73.21	13.89	8	3.99	6	3.99	35.87	37.34
5	80.53	14.59	8	4.39	6	4.39	37.37	43.16
6	88.58	15.32	8	4.83	6	4.83	38.98	49.60
7	97.44	16.08	8	5.31	6	5.31	40.70	56.74
8	107.18	16.89	8	5.84	6	5.84	42.57	64.61

P.10.5 XYZ Ltd is considering a proposal to replace an existing piece of equipment by a new one. The new equipment is operationally efficient and will result in savings in operating costs estimated at ₹1,50,000 annually.

LO 10.1 LOD M

It will cost ₹3,00,000 and will be purchased at the beginning of the year. The equipment dealer states that most companies use a 4-year life while depreciating equipment with no salvage value. As the equipment will be operational during the second quarter of the year, only 60 per cent of the estimated annual savings would be obtained in the first year. The company will incur a one-time expense of ₹30,000 in transferring production activities from the old equipment to the new one.

The equipment currently being used has a book value of ₹20,000. A review of its condition reveals that it can be used for an additional 4 years. The firm would receive ₹5,000 net of removal costs if it is disposed off now. However, it will have no salvage value after 4 years.

The company uses the declining balance method of depreciation. The equipment is subject to 25 per cent depreciation together with other assets in the block. Assuming that the full year's depreciation is taken into account in the first year, and the corporate tax rate and required rate of return are 35 per cent and 15 per cent respectively, what action should XYZ Ltd's management take? Assume further that shifting expenses are allowed as a deductible item of expense for tax purposes in the year in which they are incurred.

Solution

Cash outflows

Cost of new equipment		₹3,00,000
Add: Shifting expenses	₹30,000	
Less: Tax benefit	10,500	19,500
Less: Sale proceeds of sold equipment		(5,000)
Incremental cash outflows		3,14,500

Determination of CFAT and NPV

Particulars	Year 1	Year 2	Year 3	Year 4
Cash operating savings	₹90,000	₹1,50,000	₹1,50,000	₹1,50,000
Less: Incremental depreciation	73,750	55,312	41,484	31,113
Taxable earnings (incremental)	16,250	94,688	1,08,516	1,18,887
Less: Taxes (0.35)	5,687	33,141	37,981	41,610
Earnings after taxes (EAT)	10,563	61,547	70,535	77,277
CFAT (EAT + Depreciation)	84,313	1,16,859	1,12,019	1,08,390
× PVIF (0.15)	0.870	0.756	0.658	0.572
PV	73,352	88,345	73,709	61,999
Total present value				2,97,405
Less: Cash outflows				3,14,500
NPV			(17,095)	

Recommendation The company should reject the proposal as the NPV is negative.

Working Notes

Depreciation base of new equipment:

WDV of existing equipment	₹20,000
Add: Cost of new equipment	3,00,000
Less: Sale proceeds of existing equipment	5,000
Amount of equipment on which depreciation will be charged	3,15,000
Less: WDV of existing equipment	20,000
Base of incremental depreciation	2,95,000

P.10.6 Batch & Company Ltd is producing product 'A' and is presently commanding a market share of 15 per cent. The cost and profit margin for one unit of product 'A' is as under:

LO 10.1 LOO M

Sale price	₹100
Variable costs:	
Material	₹40
Labour	20
Overhead	10
Contribution	30
Less: Fixed cost	20
Profit	10

The sale of the product is 15,000 units at 15 per cent market share in the current year.

It has now been estimated that the market share can be increased up to 25 per cent from next year if the following promotional expenses are incurred in the previous year:

For year 1	₹1,00,000
2	75,000
3	50,000

There will also be an increase in fixed cost by ₹30,000, if production has to be increased from present level.

The company wants to achieve a 15 per cent return and would apply DCF rate.

You are required to find out the effect when (i) Market share is increased to 25 per cent, (ii) Market share is increased to 20, and (iii) Market share is increased to 19 and also recommend action to be taken by the company. Ignore taxes.

Solution

Present value of promotional expenses incurred

Year	Promotional expenses	PV factor	Total PV
1	₹1,00,000	1.000	₹1,00,000
2	75,000	0.870	65,250
3	50,000	0.756	37,800
			2,03,050

NPV of increased market share (25, 20 and 19 per cent)

Particulars	Increased market shares (Years 1 - 3)		
	25 per cent	20 per cent	19 per cent
Incremental sales revenue	₹10,00,000	₹5,00,000	₹4,00,000
Less: Variable costs (0.70)	7,00,000	3,50,000	2,80,000
Less: Incremental fixed costs	30,000	30,000	30,000

(Contd.)

(Contd.)

Incremental profit	2,70,000	1,20,000	90,000
(×) PV factor annuity (0.15) for 3 years	2.283	2.283	2.283
PV of incremental profit	6,16,410	2,73,960	2,05,470
Less: PV of cash outflows	2,03,050	2,03,050	2,03,050
NPV	4,13,360	70,910	2,420

Recommendation It will be worthwhile to incur promotional expenses even if it is expected that market share will increase to 19 per cent.

P.10.7 An educational institute is planning to install air conditioners for its new computer centre. It has received proposals from 2 manufacturers. The first proposal is for the installation of 6 window air conditioners @ ₹25,000 each. The other is for the installation of split air conditioners of an equal capacity costing ₹2,00,000. The useful life of window air conditioners is 6 years and that of split air conditioners is 10 years. The cash operating costs associated with each proposal are given below:

LO 10.1 LOD E

Year	Proposal 1	Proposal 2
1	₹20,000	₹18,000
2	20,000	18,000
3	20,000	18,000
4	25,000	22,000
5	25,000	22,000
6	25,000	22,000
7		26,000
8		26,000
9		26,000
10		26,000

The salvage value of the window air conditioners at the end of 6 years is expected to be ₹10,000 and that of the split air conditioners ₹15,000. Advise the educational institute which proposal should be selected by it if its opportunity cost of funds is 10 per cent.

Solution Equivalent Annual Cost

Particulars	Year	Proposal 1		
		Cost	PV factor (at 10%)	PV
Purchase cost	0	₹1,50,000	1.000	₹1,50,000
Operating costs	1	20,000	0.909	18,180
	2	20,000	0.826	16,520
	3	20,000	0.751	15,020
	4	25,000	0.683	17,075
	5	25,000	0.621	15,525
	6	25,000	0.564	14,100
Salvage value	6	(10,000)	0.564	(5,640)
Total PV				₹2,40,780

Equivalent Annual Cost (EAC)

$$= \frac{\text{Total present value of the project}}{\text{PV of annuity corresponding to the life of the project at the given cost of capital}}$$

$$₹2,40,780/4.355 = ₹55,288.17$$

Proposal 2				
Particulars	Year	Cost	PV factor (at 10%)	PV
Purchase cost	0	₹2,00,000	1.000	₹2,00,000
Operating costs	1	18,000	0.909	16,362
	2	18,000	0.826	14,868
	3	18,000	0.751	13,518
	4	22,000	0.683	15,026
	5	22,000	0.621	13,662
	6	22,000	0.564	12,408
	7	26,000	0.513	13,338
	8	26,000	0.467	12,142
	9	26,000	0.424	11,024
	10	26,000	0.386	10,036
Salvage Value	10	(15,000)	0.386	(5,790)
Total PV				₹3,38,174

Equivalent Annual Cost (EAC) = ₹3,32,384/6.145 = ₹55,032.38

Recommendation The educational institution should go for split air conditioners as their equivalent annual cost is lower.

P.10.8 A large profit making company is considering the installation of a machine to process the waste produced by one of its existing manufacturing process and convert it into a marketable product. At present, the waste is being removed, for disposal by a contractor against payment of ₹50 lakh per annum. This arrangement will continue for the next four years. The contract can be terminated upon installation of the aforesaid machine, on payment of a compensation of ₹30 lakh before the processing operation starts. This compensation is not allowed as deduction for tax purposes.

LO 10.1 LOD D

The machine required for carrying out the processing, costing ₹200 lakh will be financed by a loan repayable in 4 equal installments, commencing from the end of year 1. The interest rate is 16 per cent per annum. At the end of the 4th year, the machine can be sold for ₹20 lakh and the cost of dismantling and removal will be ₹15 lakh.

Sales and direct costs of the product emerging from waste processing, for 4 years, are estimated as under:

Year	[₹ (lakh)]			
	1	2	3	4
Sales	322	322	418	418
Material consumption	30	40	85	85
Wages	75	75	85	100
Other expenses	40	45	54	70
Factory overheads	55	60	110	145
Depreciation (as per income-tax rules)	50	38	28	21

Initial stock of materials required before commencement of the processing operations is ₹20 lakh at the start of year 1. The stock levels of materials to be maintained at the end of year 1, 2 and 3 will be ₹55 lakh and the stocks at the end of year 4 will be nil. The storage of materials will utilize space which would otherwise have been rented out at ₹10 lakh per annum. Labour costs include wages of 40 workers, whose transfer to this process will reduce idle time payments of ₹15 lakh in year 1 and ₹10 lakh in year 2. Factory overheads include apportionment of general factory overheads, except to the extent of insurance charges of ₹30 lacs per annum, payable on this venture. The company's tax rate is 50 per cent.

Present value factors for 4 years are as under:

Year	1	2	3	4
Present value factors at 15%	0.870	0.756	0.658	0.572

Advise the management on the desirability of installing the machine for processing the waste. All calculations should form part of the answer.

Solution

Determination of cash outflows

(Amount in ₹ lakh)

Particulars	Time	
	Year 0	1
Cost of new machine	200	—
Compensation for cancellation of contract	30	—
Working capital required (in terms of carrying stock of materials)	20	35
	250	35
Multiply by PVIF at 15 per cent	1.000	0.870
PV of cash outflows	250.00	30.45
Total cash outflows at $t = 0$	280.45	

Determination of CFAT and NPV

(Amount in ₹ lakh)

Particulars	Year			
	1	2	3	4
Sales	322	322	418	418
Add: Cost savings (reduction in waste disposal costs)	50	50	50	50
	372	372	468	468
Less: Incremental costs:				
Material consumption	30	40	85	85
Wages (net of idle time)	60	65	85	100
Other expenses	40	45	54	70
Insurance charges	30	30	30	30
Loss of rent	10	10	10	10
Depreciation	50	38	28	21
	220	228	292	316
Earnings before taxes	152	144	176	152
Less: Taxes	76	72	88	76
Earnings after taxes	76	72	88	76
CFAT 126	110	116	97	
Salvage value (net of removal costs)	—	—	—	5
Release of working capital				55
PV factor at 15%	0.870	0.756	0.658	0.572
Present value	109.62	83.16	76.33	89.80
Total present value				358.91
Less: Present value of cash outflows				280.45
Net present value				78.46

Notes:

- Interest has not been treated as expenses as CFAT are to be discounted at cost of capital (which includes after-tax cost of debt).
- Since the cost of machine has been shown as cash outflow at $t = 0$, repayment of instalment has not been shown as cash outflow.

(iii) As the question has specifically stated depreciation as per income-tax rules, no tax treatment has been made in terminating year 4 due to unabsorbed depreciation.

Recommendation The company is advised to buy the machine for processing waste (since NPV is positive).

P.10.9 XYZ Ltd, an infrastructure company, is evaluating a proposal to build, operate and transfer a section of 35 kms of road at a project cost of ₹200 crore, to be financed as follows:

Equity share capital ₹50 crore, ₹150 crore loan at the rate of interest of 15 per cent per annum from financial institutions. The project, after completion will be opened to traffic and a toll will be collected, from the vehicles using the road, for a period of 15 years. The company is also required to maintain the road during the 15 years and after the completion of that period, it will be handed over to the highway authorities at zero value. It is estimated that the toll revenue will be ₹50 crore per annum and the annual toll collection expenses including maintenance of the roads will amount to 5 per cent of the project cost. The company considers to write off the total cost of the project in 15 years on a straight-line basis. For corporate income tax purposes the company is allowed to take depreciation @ 10 per cent on WDV basis. Financial institutions are agreeable to the repayment of the loan in 15 equal annual installments—consisting of principal and interest.

LO 10.1 LOD D

Calculate project IRR and equity IRR. Ignore corporate taxation.

Solution

(i) Determination of project IRR

(₹ crore)

Cash outflow/project cost:	₹200
Cash inflows (t = 1 – 15 years):	
Toll revenue	50
Less: Toll collection expenses, maintenance of the roads, etc (₹200 crore × 0.05)	10
Net cash inflows	40

$$CO_0 = \sum_{t=1}^{15} \frac{CI_t}{(1+r)^t}; ₹200 \text{ crore} = \frac{₹40 \text{ crore}}{(1+r)^{15}}$$

To determine IRR, payback is determined i.e., 5 years (₹200 crore/₹40 crore). Then PV table of annuity is referred to, to look for a PV factor which is equal to or closest to the payback period, corresponding to the life of the project (15 years). As per the PV table, the two closest figures are 5.092 (at 18 per cent) and 4.876 (at 19 per cent); evidently, the IRR is likely to be between the range of 18–19 per cent. Its value is 18% + (0.092 ÷ 0.216) = 18.43 per cent.

(ii) Determination of Equity IRR: It may be defined as a rate of discount which discounts future cash inflows available to equityholders in such a way that the PV of these cash inflows is equal to the equity owners' investment. Accordingly, the relevant values are:

(a) Equity share capital is ₹50 crore and (b) cash inflows available to equity holders are ₹14.35 crore as shown below

	(₹ crore)
Net cash inflow of the project	₹40
Less: Equated instalment of the project (₹150 crore / PVIF at 15% for 15 years i.e., 5.847)	25.65
Cash inflows for equityholders	14.35

$$₹50 \text{ crore} = \frac{₹14.35 \text{ crore}}{(1+r)^{15}}$$

Payback period is ₹50 crore/₹14.35 crore = 3.484

The PV factor closest to 3.484 (as per PV annuity table corresponding to 15 years) is 3.483, at 28 per cent rate of discount. In other words, 28 per cent is equity IRR.

Note: Depreciation is considered in capital budgeting decisions as it yields tax savings (depreciation per se does not cause cash outflows). Since taxes are to be ignored in the present question, therefore, depreciation is also not taken into account.

P.10.10 The capital budgeting department of a company has suggested 3 investment proposals. The after-tax cash flows for each are tabulated below. If the cost of capital is 12 per cent, rank them on the basis of the profitability index. **LO 10.2** LOO E

Year	After-tax cash flows		
	Project A	Project B	Project C
0	₹20,000	₹60,000	₹36,000
1	5,600	12,000	13,000
2	6,000	20,000	13,000
3	8,000	24,000	13,000
4	8,000	32,000	13,000

Solution

Determination of present value

Year	CFAT			PV factor	Total PV		
	A	B	C		A	B	C
1	₹5,600	₹12,000	₹13,000	0.893	₹5,001	₹10,716	₹11,609
2	6,000	20,000	13,000	0.797	4,782	15,940	10,361
3	8,000	24,000	13,000	0.712	5,696	17,088	9,256
4	8,000	32,000	13,000	0.636	5,088	20,352	8,268
					20,567	64,096	39,494

Profitability index = PV of cash inflows/PV of cash outflows

$$PI_{(A)} = ₹20,567/₹20,000 = 1.028$$

$$PI_{(B)} = ₹64,096/₹60,000 = 1.068$$

$$PI_{(C)} = ₹39,494/₹36,000 = 1.097$$

The projects in descending order of profitability are: C, B and A.

P.10.11 A textile company has ₹20 lakh available for investment. It has evaluated its options and found that only four investments (W, X, Y and Z) have positive net present values. All these investments are entirely independent of one other. However, they have an equal life period of 5 years. The risk-free interest rate is 5 per cent per annum. The cost of capital to the company is 10 per cent. The relevant data for the selected investments are: **LO 10.2** LOO E

Investment	Initial outlay	Present value of future cash inflows from the investment
W	₹8,00,000	₹10,00,000
X	6,00,000	10,00,000
Y	7,00,000	11,40,000
Z	6,00,000	12,00,000

Which investment(s) should the firm adopt? Would your answer be different if the present value of future cash flows of project W were ₹12,50,000 instead of ₹10,00,000?

Solution

NPVs of investment projects

Investment	Initial outlay	PV of future cash flows	NPV
W	₹8,00,000	₹10,00,000	₹2,00,000
X	6,00,000	10,00,000	4,00,000
Y	7,00,000	11,40,000	4,40,000
Z	6,00,000	12,00,000	6,00,000

(i) NPV from investments Z, X and W = ₹12,00,000 (with full capital budget amount utilised).

(ii) NPV from investments X, Y and Z = ₹14,40,000 (with ₹19,00,000 utilised, leaving ₹1,00,000 to be invested elsewhere). ₹1,00,000 can be invested for a period of 5 years at 5 per cent. The compound sum of ₹1,00,000 would be ₹1,27,600 [$₹1,00,000 \times 1.276$ (the sum of rupee one at 5 per cent in 5 years as per Table A-1)].

The NPV of ₹1,27,600 received at the end of the fifth year would be ₹79,240 [$(₹1,27,600 \times 0.621)$, that is, the present value of rupee one at 10 per cent rate of discount to be received in 5 years from now as per Table A-3]. Thus, the total NPV is ₹14,40,000 + ₹79,240 = ₹15,19,240.

Therefore, the firm should adopt X, Y, and Z investment proposals.

(b) No. It is because the NPV from investments Z, X and W would still be lower than the package of investments as outlined in (a) (ii). The new NPV from investments Z, X and W would be ₹14,50,000, while from X, Y and Z, it is ₹15,19,240.

P.10.12 Alpha Limited is considering 5 capital projects for the years 1 and 2. The company is financed by equity entirely and its cost of capital is 12 per cent. The expected cash flows of the projects are as detailed below:

LO 10.2 LOP M

Project	Year and cashflows			
	1	2	3	4
A	(70)	35	35	20
B	(40)	(30)	45	55
C	(50)	(60)	70	80
D	—	(90)	55	65
E	(60)	20	40	50

(Figures in brackets represent cash outflows.)

All projects are divisible, that is, size of investment can be reduced, if necessary, in relation to availability of funds. None of the projects can be delayed or undertaken more than once.

Calculate which project should Alpha Ltd undertake if the capital available for investment is limited to ₹1,10,000 in year 1 and with no limitation in subsequent years. For your analysis use the following present value factors:

Year	1	2	3	4
Factor	1.00	0.89	0.80	0.71

Solution

Determination of gross present value, NPV and PI of projects A to E

(Amount in ₹ '000)

Year	Projects				
	A	B	C	D	E
1	(70)	(40)	(50)	—	(60)
2	(35 × 0.89) = 31.15	(30 × 0.89) = 26.7	(60 × 0.89) = 53.4	(90 × 0.89) = 80.1	20 × 0.89 = 17.8
3	(35 × 0.80) = 28	(45 × 0.8) = 36	(70 × 0.8) = 56	(55 × 0.8) = 44	(40 × 0.8) = 32
4	(20 × 0.71) = 14.2	(55 × 0.71) = 39.05	(80 × 0.71) = 56.8	(65 × 0.71) = 46.15	(50 × 0.71) = 35.5
Gross present value	73.35	75.05	112.8	90.15	85.3
NPV	3.35	8.35	9.4	10.05	25.3
Profitability index (PI)	1.048	1.125	1.091	1.125	1.422
Ranking (on the basis of PI)	5	3	4	2	1

Recommendation Since project D is not subject to capital rationing (as it is to be undertaken in year 2) and it promises positive NPV, the project is worth accepting. For other projects (A, B, C and E), the requirement is ₹2,20,000 against the available sum of ₹1,10,000. Based on ranking (descending order of PI), projects E and B will be accepted in full and a part of project C as shown below:

Project and rank	Amount of investment
E(1)	₹60,000
B(3)	40,000
C(4) (limited to)	10,000

P.10.13 A company (profile summarised below) with a 12 per cent cost of funds and limited investment funds of ₹4,00,000 is evaluating the desirability of several investment proposals.

LO 10.2 LOD M

Project	Initial investment	Life (in years)	Year-end cash inflow
A	₹3,00,000	2	₹1,87,600
B	2,00,000	5	66,000
C	2,00,000	3	1,00,000
D	1,00,000	9	20,000
E	3,00,000	10	66,000

- Rank the projects according to the profitability index, and NPV methods.
- Determine the optimal investment package.
- Which projects should be selected, if the company has ₹5,00,000 as the size of its capital budget?
- Determine the optimal investment package in the above situations, assuming that the projects are divisible.

Solution

(i) Determination of NPV and PI for all projects

Project	Life in years	Year-end CFAT	PV factor at 0.12 corresponding to life of the project	Total PV of CFAT	Initial investment	NPV	PI	Ranking 1 to 5 in order of preference NPV PI	
A	2	₹1,87,600	1.690	₹3,17,044	₹3,00,000	₹17,044	1.057	4	5
B	5	66,000	3.605	2,37,930	2,00,000	37,930	1.189	3	3
C	3	1,00,000	2.402	2,40,200	2,00,000	40,200	1.200	2	2
D	9	20,000	5.328	1,06,560	1,00,000	6,560	1.066	5	4
E	10	66,000	5.650	3,72,900	3,00,000	72,900	1.243	1	1

(ii) Optimal investment package when capital budget is ₹4,00,000

Project	Investment	NPV
E	₹3,00,000	₹72,900
D	1,00,000	6,560
		<u>79,460</u>

(iii) Capital budget is ₹5,00,000

E	3,00,000	72,900
C	2,00,000	40,200
		<u>1,13,100</u>

(iv) (a) Capital budget is ₹4,00,000

Project	Investment	PI	NPV
E	₹3,00,000	1.243	72,900
C (0.50)	1,00,000 (0.50 × ₹2,00,000)	1.200	20,100
			<u>93,000</u>

(b) Capital budget is ₹5,00,000

E	3,00,000	1.243	72,900
C	2,00,000	1.200	40,200
			<u>1,13,100</u>

P.10.14 S Ltd has ₹10,00,000 allocated for capital budgeting purposes. The following proposals and associated profitability indexes have been determined:

LO 10.2 LOD M

Project	Amount	Profitability Index
1	₹3,00,000	1.22
2	1,50,000	0.95
3	3,50,000	1.20
4	4,50,000	1.18
5	2,00,000	1.20
6	4,00,000	1.05

Which of the above investments should be undertaken? Assume that the projects are indivisible and there is no alternative use of the money allocated for capital budgeting.

The first part of the document
 discusses the general principles
 of the system and the
 various methods of
 calculation. It is
 divided into several
 sections, each dealing
 with a different aspect
 of the problem. The
 first section is
 devoted to the
 theory of the
 system, and the
 second to the
 practical application
 of the same. The
 third section
 contains the
 results of the
 calculations, and
 the fourth the
 conclusions drawn
 from them.

The following table
 shows the results of
 the calculations for
 the various cases
 considered. The
 first column
 contains the
 values of the
 variables, and the
 second column
 the corresponding
 results. The
 third column
 contains the
 errors, and the
 fourth the
 remarks.

The results of the
 calculations show
 that the system
 is very accurate
 and that the
 errors are very
 small. This
 is due to the
 fact that the
 system is based
 on a very
 simple principle
 and that the
 calculations are
 very easy to
 perform. The
 system is therefore
 very suitable
 for use in
 practice.

The second part of the document
 discusses the various
 methods of calculation
 and the results of the
 calculations. It is
 divided into several
 sections, each dealing
 with a different aspect
 of the problem. The
 first section is
 devoted to the
 theory of the
 system, and the

Solution

Statement showing ranking of projects (in descending order of profitability index) and their NPV

Projects	Initial investment	Profitability index	Gross present value (Col. 2 × Col. 3)	Net present value (Col. 4 – Col. 2)
1	2	3	4	5
1	₹3,00,000	1.22	₹3,66,000	₹66,000
3	3,50,000	1.20	4,20,000	70,000
5	2,00,000	1.20	2,40,000	40,000
4	4,50,000	1.18	5,31,000	81,000
6	4,00,000	1.05	4,20,000	20,000

Notes: (i) Project 2 has been excluded in view of its profitability index being less than one, implying negative NPV. (ii) Since project 3 has a higher profitability index, it has been assigned a higher rank than project 5.

S Ltd. is advised to undertake projects 4, 3 and 5 as this package holds potentials of yielding the maximum NPV of ₹1,91,000 (₹81,000 + ₹70,000 + ₹40,000).

P.10.15 Owing to the ongoing recession in the world market, Strong company's bottom line suffered yet it managed to have just ₹65 lakh remaining for investment after paying off the dividends to the shareholders. The company is not willing to raise additional funds either through debt or equity, given the present state of business scenario. The finance department lists the following profitable projects (along with other necessary details like NPV, PVI, etc.) where the funds can be invested. You are required to evaluate these projects to help the company make the best investment decision possible under the current scenario. Assume all given investment proposals are independent and divisible.

LO 10.2 LOD

Project	Investment outlay	NPV	Gross present value	Present value index
P1	₹21,85,000	₹10,92,500	₹32,77,500	1.50
P2	20,80,000	10,19,200	30,99,200	1.49
P3	2,25,000	92,250	3,17,250	1.41
P4	2,40,000	1,00,800	3,40,800	1.42
P5	11,50,000	15,41,000	26,91,000	2.34
P6	9,40,000	4,25,000	13,65,000	1.45
P7	8,55,000	7,95,150	16,50,150	1.93
P8	4,95,000	3,41,550	8,36,550	1.69
P9	6,05,250	7,38,405	13,43,655	2.22
P10	3,90,000	4,48,500	8,38,500	2.15
P11	4,00,000	2,08,000	6,08,000	1.52
P12	3,15,000	2,83,500	5,98,500	1.90
P13	1,55,000	73,800	2,28,800	1.48
P14	3,70,500	2,92,695	6,63,195	1.79
P15	280,500	4,80,968	7,61,468	2.71
Total	1,06,86,250	79,33,318	1,86,19,568	

Solution

First, arrange all the investment projects in descending order of present value index (PI). The optimal investment portfolio/ set will be one that yields the maximum NPV. The investment projects are accordingly listed below.

Project	PI	Investment outlays		NPV	
		Project	Cumulative	Project	Cumulative
P15	2.71	₹2,80,500	₹2,80,500	₹4,80,968	₹4,80,968
P5	2.34	11,50,000	14,30,500	15,41,000	20,21,968
P9	2.22	6,05,250	20,35,750	7,38,405	27,60,373
P10	2.15	3,90,000	24,25,750	4,48,500	32,08,873
P7	1.93	8,55,000	32,80,750	7,95,150	40,04,023
P12	1.90	3,15,000	35,95,750	2,83,500	42,87,523
P14	1.79	3,70,500	39,66,250	2,92,695	45,80,218
P8	1.69	4,95,000	44,61,250	3,41,550	49,21,768
P11	1.52	4,00,000	48,61,250	2,08,000	51,29,768
P1	1.50	21,85,000	70,46,250 ^a	10,92,500	62,22,268
P1	1.50	16,38,750	65,00,000	8,19,375 ^b	59,49,143

^aNot feasible as cumulative investment outlays exceed ₹65 lakh.

^bProject P1 can be undertaken to the extent of 75 per cent (₹16,38,750 amount short of ₹65,00,000/₹21,85,000, cost of project 1). Accordingly, NPV accruing from truncated project would be $0.75 \times ₹10,92,500 = ₹8,19,375$.

Recommendation Strong company is advised to select projects P15 to P11 (shown in solution table) in their entirety and 75 per cent of P1, utilising all available funds (₹65 lakh) and yielding a (maximum possible) NPV of ₹59,49,143.

P.10.16 A corporate firm's management policy is to earn a real rate of return (r) of 10 per cent on new projects. It is expected that the inflation rate (i) during the proposed project's life is 6 per cent per year. Determine the nominal discount rate (n) which should be used by the firm to determine the present value of the project.

LO 10.3 LOD E

Solution

$$\begin{aligned} \text{Nominal rate } (n) &= (1 + r)(1 + i) - 1 \\ &= (1 + 0.10)(1 + 0.06) - 1 \\ &= (1.1)(1.06) - 1 = 1.166 - 1 = 0.166 = 16.6 \text{ per cent} \end{aligned}$$

P.10.17 Sagar Industries employs 15 per cent as nominal required rate of return to evaluate its new investment projects. In the recent meeting of its board of directors, it has been decided to protect the interest of shareholders against purchasing power loss due to inflation. The expected inflation rate in the economy is 6 per cent. Determine the real discount rate to be employed now by Sagar Industries.

LO 10.3 LOD E

Solution

$$\begin{aligned} \text{Real rate } (r) &= (1 + n)/(1 + i) - 1 \\ &= (1 + 0.15)/(1 + 0.06) - 1 \\ &= (1.15/1.06) - 1 = 1.0849 - 1 = 0.0849 = 8.49 \text{ per cent} \end{aligned}$$

P.10.18 A new machine is expected to generate the following set of incremental CFAT during its 5 year economic useful life:

LO 10.3 LOD M

Year	CFAT
1	₹10,00,000
2	12,00,000
3	15,00,000
4	8,00,000
5	5,00,000

The rate of inflation during the period is expected to be 8 per cent and the project's cost of capital in real terms would be 10 per cent. Should the machine be purchased if it costs ₹25 lakh?

Solution

Determination of real CFAT

Year	CFAT	Deflation factor at 0.08*	Real CFAT
1	₹10,00,000	$1/(1.08) = 0.926$	₹9,26,000
2	12,00,000	$1/(1.08)^2 = 0.857$	10,28,400
3	15,00,000	$1/(1.08)^3 = 0.794$	11,91,000
4	8,00,000	$1/(1.08)^4 = 0.735$	5,88,000
5	5,00,000	$1/(1.08)^5 = 0.681$	3,40,500

*As per Table A-3.

Determination of NPV using real rate of discount

Year	Real CFAT	Discount factor at 0.10	Total PV
1	₹9,26,000	0.909	₹8,41,734
2	10,28,400	0.826	8,49,458
3	11,91,000	0.751	8,94,441
4	5,88,000	0.683	4,01,604
5	3,40,500	0.621	2,11,450
Total present value			31,98,687
Less: Cash outflows			25,00,000
Net present value			6,98,687

Recommendation The machine should be purchased as the NPV is positive.**P.10.19** Assume the data given in **P10.18** remains unchanged. Determine the NPV of machine in nominal terms. Does your answer change?LO 10.3 LOD
M**Solution**

$$\begin{aligned} \text{Nominal rate } (n) &= (1 + r) (1 + i) - 1 \\ &= (1 + 0.10) (1 + 0.08) - 1 \\ &= (1.1) (1.08) - 1 = 1.188 - 1 = 0.188 = 18.8 \text{ per cent} \end{aligned}$$

Determination of NPV in nominal terms requires discounting nominal CFAT by nominal rate of discount (18.8 %).

Determination of NPV using nominal rate of discount

Year	CFAT	PV factor at 18.8%*	Total PV
1	₹10,00,000	0.841	₹8,41,000
2	12,00,000	0.709	8,50,800
3	15,00,000	0.596	8,94,000
4	8,00,000	0.502	4,01,600
5	5,00,000	0.423	2,11,500
Total present value			31,98,900
Less: Cash outflows			25,00,000
Net present value			6,98,900

* Based on interpolation as per Table A-3.

Recommendation The machine should be purchased, the answer does not change. The reason is that nominal CFAT are discounted at nominal discount rate; earlier real CFAT were discounted at real discount rate. Consistency is critical for a consistent answer.

P.10.20 Royal Industries is contemplating on buying a new moulding machine at ₹50 lakh, with an additional working capital requirement of ₹10 lakh. The machine is expected to have an economic useful life of 5 years, with no salvage value. The firm follows the straight-line method of depreciation and the same is accepted for tax purposes. The machine is expected to generate an incremental increase in the before tax cash operating income of ₹20 lakh (in real terms) per year for a period of 5 years. The relevant tax rate is 35 per cent. Inflation is expected to be 6 per cent per year and the firm's cost of capital in real terms is 10 per cent. Advise the company whether the machine should be purchased. Show your NPV calculation in real terms. Assume the working capital requirement will remain unchanged throughout the period, in spite of inflation.

LO 10.3 LOD M

Solution

(i) Cash outflows	
Cost of moulding machine	₹50,00,000
Additional working capital	10,00,000
	<u>60,00,000</u>

(ii) CFAT and present value	
(a) Incremental cash operating income	20,00,000
Less: Taxes (0.35)	7,00,000
CFAT ($t = 1 - 5$)	13,00,000
(X) PV factor of annuity for 5 years (0.10)	(×) 3.791
Present value	<u>49,28,300</u>
(b) Tax savings due to depreciation	
Depreciation (₹50 lakh/5 years) per year	10,00,000
(X) Tax rate (0.35)	(×) 0.35
Tax savings per year for 5 years	<u>3,50,000</u>

(c) Present value of tax shield due to depreciation					
Year	Tax savings (Nominal CFAT)	Discount/Deflated at 0.06 rate of inflation*	CFAT (Real)	PVF at 0.10	Total PV
1	₹3,50,000	0.943	₹3,30,050	0.909	₹3,00,015
2	3,50,000	0.890	3,11,500	0.826	2,57,299
3	3,50,000	0.840	2,94,000	0.751	2,20,794
4	3,50,000	0.792	2,77,200	0.683	1,89,328
5	3,50,000	0.747	2,61,450	0.621	<u>1,62,360</u>
Present value					<u>11,29,796</u>

*As per Table A-3

(d) Release of working capital (at year-end 5)	₹10,00,000
(X) Discount factor at 0.06 (at year-end 5)	(×) 0.747
Cash inflows (real)	<u>7,47,000</u>
(X) Discount factor at 0.10 (at year-end 5)	(×) 0.621
Present value	<u>4,63,887</u>
(iii) Total present value	
(a) ₹49,28,300 + (c) ₹11,29,796 + (d) ₹4,63,887	<u>65,21,983</u>
(iv) Net present value (₹65,21,983 - ₹60,00,000)	<u>5,21,983</u>

Recommendation The company should purchase the machine as the NPV of real cash flows is positive.

P.10.21 Assume everything to be the same as contained in P10.20, except that the firm follows written down value method of depreciation at the rate of 25 per cent. Assume further that the company does not have any other asset in the block of 25 per cent and the machine is expected to have salvage value of ₹5 lakh at year-end 5. Does your answer change? You are to compute NPV in real terms. Also assume that the firm would have sufficient short-term capital gains in year 5.

LO 10.3 LOO M

Solution There will be a change in PV of tax savings due to depreciation in view of change in the method of depreciation; there will be tax savings due to short-term capital loss at year-end 5 also.

Tax savings (CFAT) in nominal and real terms due to depreciation

Year	Depreciation	Tax savings/Nominal CFAT, (Depreciation × 0.35)	Discount factor at 0.06	CFAT, (real)
1	₹12,50,000	₹4,37,500	0.943	₹4,12,562
2	9,37,500	3,28,125	0.890	2,92,031
3	7,03,125	2,46,094	0.840	2,06,719
4*	5,27,344	1,84,570	0.792	1,46,179

* Since the block ceases to exist in the 5th year, no depreciation is charged in year 5.

Present value of tax shield, salvage value and short-term capital loss

Year	Real CFAT	PV factor 0.10	Total PV
1	₹4,12,562	0.909	₹3,75,019
2	2,92,031	0.826	2,41,218
3	2,06,719	0.751	1,55,246
4	1,46,179	0.683	99,840
(i) Present value of tax shield due to depreciation			8,71,323
Salvage value (at year-end 5)			5,00,000
(X) Deflated/discount factor at 0.06 (at year-end 5)		(×) 0.747	
Real Cash inflows			3,73,500
(X) Discount factor (at year-end 5) at 0.10		(×) 0.621	
(ii) Present value of salvage value			2,31,943
Short-term capital loss (at year-end 5)			50,00,000
Cost of machine			34,17,969
Less: Accumulated depreciation in 4 years			15,82,031
Book value of machine in year 5			5,00,000
Less: Sale value			10,82,031
Short-term capital loss (STCL)			3,78,711
Tax savings (₹10,82,031 × 0.35) on STCL/CFAT, nominal		(×) 0.747	
(X) Deflation factor at 0.06 (at year-end 5)			2,82,897
Real CFAT		(×) 0.621	
(X) Discount factor (at year-end 5) at 0.10			1,75,679
(iii) Present value of STCL			12,78,945
Total present value (₹8,71,323 + ₹2,31,943 + ₹1,75,679)			

NPV of machine

Present value of operating CFAT	₹49,28,300
Present value of release of working capital	4,63,887
Present value of tax shield due to depreciation, salvage value and short-term capital loss	12,78,945
Total present value	66,71,132
Less: Present value of cash outflows	60,00,000
Net present value	6,71,132

Recommendation Since NPV is positive, the firm should accept the project. The answer regarding acceptance of the project remains unchanged.

P.10.22 XYZ Ltd wants to purchase a plant for its expanding operations. The desired plant is available at ₹10 lakh. The expected earnings before depreciation and taxes (EBDT) during its 5 years economic useful life are as shown in table.

LO 10.3 **LO D**

Year	EBDT
1	₹3,50,000
2	3,80,000
3	4,00,000
4	3,25,000
5	2,50,000

The rate of inflation during the period is expected to be 8 per cent and the stated EBDT are also expected to grow at this rate of inflation. The management policy of the firm is to evaluate its capital budgeting proposal by using cost of capital in real terms at 10 per cent.

The firm follows the written down value method of depreciation at the rate of 25 per cent on this machine. There are several machines in this block. The machine is expected to a yield salvage value of ₹1,00,000 at year-end 5. The relevant tax rate is 35 per cent.

Advise the company whether the proposed machine should be purchased. Show your calculations in real terms.

Solution

Determination of CFAT in inflationary situation

Year	EBDT	Compound factor at 0.08 as per Table A-1	Revised EBDT (Col. 2 × 3)	Depreciation @ 0.25 on WDV	Taxable income	EAT (Col. 6 × 0.65) (Col. 4 - 5)	CFAT (Col. 7 + 5)
1	2	3	4	5	6	7	8
1	₹3,50,000	1.080	₹3,78,000	₹2,50,000	₹1,28,000	₹83,200	₹3,33,200
2	3,80,000	1.166	4,43,080	1,87,500	2,55,580	1,66,127	3,53,627
3	4,00,000	1.260	5,04,000	1,40,625	3,63,375	2,36,194	3,76,819
4	3,25,000	1.360	4,42,000	1,05,469	3,36,531	2,18,745	3,24,214
5	2,50,000	1.469	3,67,250	54,101*	3,13,149	2,03,547	2,57,648

* (₹2,16,406 × 0.25)

Determination of real CFAT and NPV

Year	CFAT	Deflated factor at 0.08 as per Table A-3	Real CFAT	PV factor at 0.10	Total PV
1	₹3,33,200	0.926	₹3,08,543	0.909	₹2,80,466
2	3,53,627	0.857	3,03,058	0.826	2,50,326
3	3,76,819	0.794	2,99,194	0.751	2,24,695
4	3,24,214	0.735	2,38,297	0.683	1,62,757
5	2,57,648	0.681	1,75,458	0.621	1,08,960
5	1,00,000**	0.681	68,100	0.621	42,290
Total present value					10,69,494
Less: Cash outflows					10,00,000
Net present value					69,494

** Salvage value

Recommendation Since NPV is positive, the company is advised to buy the plant.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be clearly documented and supported by appropriate evidence. The text also touches upon the need for transparency and accountability in financial reporting.

In the second section, the author delves into the complexities of tax regulations and how they impact various aspects of business operations. It provides a detailed analysis of current tax trends and offers practical advice on how to navigate these challenges effectively. The discussion highlights the importance of staying up-to-date with legislative changes and seeking professional guidance when necessary.

The third part of the document focuses on the role of technology in modern accounting and finance. It explores how digital tools and software solutions have revolutionized the way businesses manage their financial data. The text discusses the benefits of automation, such as increased efficiency and reduced risk of human error, while also addressing potential security concerns and the need for robust data protection measures.

Finally, the document concludes with a discussion on the future of the financial industry. It examines emerging trends such as artificial intelligence, blockchain, and sustainable finance, and discusses their potential implications for businesses and investors. The author encourages a forward-thinking approach and suggests ways in which organizations can prepare themselves for the challenges and opportunities of the future.

MINI CASES

10.C.1 In-house Vs Outsourcing Computea Ltd is an IT Company based in Delhi. It is into outsourcing IT consulting and systems integration. Setup as a startup company three years ago by five entrepreneurs, the headcount of the company is presently 100, with an annual turnover of ₹80 lakh. As an employee-friendly organisation and to ensure good working environment, Computea Ltd arranges tea/coffee to each of its employees thrice a day. About half of the employees prefer tea and the remaining half prefer coffee.

Tea and coffee are presently supplied by a vendor who is paid on a monthly basis. The cost of a cup of tea is ₹3. The cost of coffee is ₹5 per cup. Labour charges amount to ₹500 per month.

The HR manager, K V Prasad, has proposed to the CEO, Vineet Barnwal, to install a coffee/tea vending machine in the premises of Computea Ltd. A vending machine is available from Good Serve Ltd for ₹2,00,000, having a useful life of five years with no salvage value. The machine would require an annual maintenance cost of ₹30,000 (i.e. ₹2,500 per month) in addition to spare parts amounting to ₹10,000. The operation of the vending machine would consume electricity at ₹500 per month. The other associated operating costs would be as estimated below:

- 2 packets of coffee beans per day at ₹30 per packet
- 2 packets of 1 kg tea powder per day at ₹20 per packet
- 7,500 plastic cups per month at ₹0.25 per cup
- 200 litres of milk per month (A litre of milk costs ₹14).
- 60 kgs of sugar per month (The price of sugar is ₹15 per kg).
- Labour charges would amount to ₹1,500 per month
- Electricity charges, ₹500 per month

The number of working days in month is 23. Computea Ltd would use straight-line method of depreciation and its cost of capital is 10 per cent. As a financial consultant, would you advise the CEO of Computea Ltd to install the vending machine? Why?

Solution

Financial Analysis to Instal Vending Machine

Savings in cost per annum

(i) Cost of tea and coffee from the vendor:			
Tea ($3 \times ₹3 \times 50 \times 23 \text{ days} \times 12$)	₹1,24,200		
Coffee ($3 \times ₹5 \times 50 \times 23 \text{ days} \times 12$)	2,07,000	₹3,31,200	
Labour charges (₹500 × 12)		6,000	₹3,37,200
(ii) Vending machine costs:			
Annual maintenance cost (₹2,500 × 12)	30,000		
Spares	10,000		
Coffee beans packets ($₹30 \times 2 \times 23 \times 12$)	16,560		
Plastic cups ($₹0.25 \times 7,500 \times 12$)	22,500		
Milk ($₹14 \times 200 \times 12$)	33,600		
Sugar ($₹15 \times 60 \times 12$)	10,800		
Tea powder ($₹20 \times 2 \times 23 \times 12$)	11,040		
Labour charges (₹1,500 × 12)	18,000		
Electricity charges (₹500 × 12)	6,000		
Depreciation ($₹2,00,000 \div 5$)	40,000		1,98,500
Less taxes (0.35)			1,38,700
Earnings after taxes			48,545
			90,155
Add depreciation			40,000
CFAT			1,30,155
PVIFA _{5,10}			3.791
Total PV			4,93,418
Less cash outflows			2,00,000
NPV			2,93,418

Recommendation The proposal is viable. Computea Ltd should buy the vending machine.

10.C.2 Replacement Situation Gurgaon Chemicals supplies chemicals and dyes to various units in and around NCR Delhi. The onsite delivery of chemicals and dyes every month is 2,000 units. The unit sale price is ₹100. The cost per unit is ₹50. It is using a tempo which can carry a maximum of 80 units. The total distance covered in one trip is 400 kms. The cost of diesel in the NCR Delhi is ₹25.5 per litre. The average consumption of diesel is 8 kms per litre.

Due to increase in demand for dyes for industrial use, Gurgaon Chemicals has an opportunity to make and deliver 2,500 units per month. To cater to the increased demand, the company is contemplating buying a mini truck with a capacity to carry 165 units. The required mini truck is available from Eicher for ₹14,00,000. The tempo being currently used has a book value of ₹6,00,000. It can be sold for ₹4,00,000. The annual salary of the tempo driver is ₹6,000 per month. If the mini truck is acquired, Gurgaon Chemicals would have to increase his monthly salary to ₹8,000. The consumption of diesel by the truck would average 5 kms per litre. The annual maintenance cost of the mini truck would be ₹8,500 compared to ₹6,200 maintenance cost of the tempo. Gurgaon Chemical uses straightline method of depreciation for tax purposes. The tempo has a remaining useful life of 5 years. The mini could truck serve the need of the Gurgaon Chemicals for the next 5 years. The applicable tax rate is 35 per cent. Assume that loss on sale of existing machine can be claimed as short-term capital loss in the current year itself.

Nitin Jain, the CEO of Gurgaon Chemicals, has asked the CFO, Rahul Joshi, to examine the financial viability of the proposal to replace the tempo by the mini truck and make appropriate recommendation in this regard. Assume a required rate of return of 14 per cent.

Solution

Financial Analysis of Replacement of Tempo by Mini Truck

(A) Incremental cashoutflow ($t = 0$)			
Cost of mini truck		₹14,00,000	
Less sale value of tempo		(4,00,000)	
Less tax advantage on loss on sale of tempo:			
• Current book value	₹6,00,000		
• Sale value	4,00,000		
• Loss on sale	2,00,000		
• Tax advantage	× 0.35	(70,000)	₹9,30,000
(B) Incremental cash inflows ($t = 1 - 5$)			
Incremental revenue ¹ (500 units × 12 months × ₹100)		6,00,000	
Less incremental costs:			
• Cost of additional units ²	3,00,000		
• Diesel charges ³	(15,300)		
• Maintenance cost ⁴	2,300		
• Driver's salary ⁵	24,000		
• Depreciation ⁶	1,60,000	4,71,000	
Earnings before taxes		1,29,000	
Less taxes (0.35)		45,150	
EAT		83,850	
Add depreciation		1,60,000	
CFAT ($t = 1 - 5$ years)		2,43,850	
PVIFA _{5, 14}		× 3.433	
Total PV			8,37,137
NPV (B - A)			(92,863)

¹ [500 units (2,500 units - 2,000 units) × 12 months × ₹100]

² (500 units × 12 × ₹50)

³ Diesel charges

2011-2012

Handwritten notes at the top of the left page, including a header and several lines of text.

Table with multiple columns and rows of handwritten data, possibly a ledger or record book.

Vertical handwritten text at the bottom right of the left page.

Main body of handwritten notes on the right page, continuing from the left page.

Table with multiple columns and rows of handwritten data, similar to the table on the left page.

Vertical handwritten text at the bottom right of the right page.

(Contd.)

	Truck	Tempo
Mileage km/lit	5	8
Kms per trip	400	400
Trips/month (2,500 units ÷ 165 units per trip)	15	—
(2,000 units ÷ 80 units per trip)	—	25
Kms annually (12 months × 15 × 400)	72,000	—
(12 months × 25 × 400)	—	1,20,000
Diesel consumed (72,000 ÷ 5)	14,400	—
(1,20,000 ÷ 8)	—	15,000
Total cost (14,400 × ₹25.5)	₹3,67,700	—
(15,000 × ₹25.5)	—	₹3,82,000
Savings in diesel cost (₹3,82,500 – ₹3,67,200) =	(₹15,300)	
⁴ Maintenance cost (₹8,500 – ₹6,200)		
⁵ Drivers salary [(₹8,000 – ₹6,000) × 12 months]		
⁶ Depreciation (incremental):		
Depreciation on truck (₹14,00,000 ÷ 5)	₹2,80,000	
Depreciation on tempo (₹6,00,000 ÷ 5)	1,20,000	
	1,60,000	

Recommendation The proposal to acquire the mini truck and dispose off the tempo is not financially viable. The CEO may not approve it.

10.C.3 Equivalent Annual Value (EAV) The Iridium Jewellery Company produces and sells jewellery in its showrooms in the country. Iridium's Jewellery is always in much demand due to fine workmanship, reasonable prices and helpful and polite behaviour of its sales persons.

Iridium has recently entered into an arrangement with the Sale Well Gems of England for distribution of its products in the United Kingdom. Iridium expects yearly additional revenue to the tune of ₹75 lakh from its sales to Sale Well Gems. To meet the increased demand, it would have to replace its existing machine. The book value of the machine being currently used is ₹30 lakh with remaining usefulness of 6 years and salvage value of ₹6 lakh. It can be sold for ₹15 lakh. The choice of the machinery is between an imported Finesse machine from Amsterdam and a Work Horse machine available locally.

The cost of Finesse is ₹50 lakh. The freight and insurance costs associated with its import would amount to 40 per cent of the cost of the machine. The expected salvage value at the end of its 5-year life is ₹15 lakh. The enlarged operation would require ₹10 lakh as additional working capital. Iridium's cost of capital may be assumed to be 15 per cent.

Work Horse locally available would cost ₹35 lakh with no salvage value after 7 years of its useful life. The additional working capital requirement would be ₹5 lakh. The required rate of return for the 7-year period would be 16 per cent.

Finesse machine is technologically advanced and automated. Work Horse would require supervision for usage and would cost ₹3 lakh in training.

The operation of the new machine(s) would involve additional fixed costs and variable costs amounting to ₹2 lakh and ₹8 lakh respectively.

The CEO of Iridium, Anupam Saha, seeks your advice, as a financial consultant, on the course of action. Would you advise him to import Finesse or acquire Work Horse? You may assume 35 per cent tax, straightline method of depreciation for tax purposes, and the existing machine constitutes a separate block for depreciation purposes. Also assume that the firm would have sufficient short-term capital gains in year 5.

Solution**Financial Analysis of Imported Machine vs Local Machinery**

(A) Import of finesse machine:		
Cost of machine		₹50,00,000
+ Freight and insurance cost (0.40 × ₹50 lakh)		20,00,000
+ Additional working capital		10,00,000
- Sale value of existing machine		(15,00,000)
- Tax advantage on short-term capital loss on sale of existing machine		
• Current book value	₹30,00,000	
• Less sale value	(15,00,000)	
• Loss	15,00,000	
• Tax advantage (0.35 × ₹15,00,000)		(5,25,000)
(a) Net cash outflows		<u>59,75,000</u>
Additional sales		75,00,000
Less: Additional fixed costs		(2,00,000)
Less: Additional variable costs		(8,00,000)
Incremental depreciation:		
• Depreciation on new machine (₹70 lakh – ₹15 lakh) ÷ 5	₹11,00,000	
• Depreciation on existing machine (₹30 lakh – ₹6 lakh) ÷ 6	<u>4,00,000</u>	(7,00,000)
Earnings before taxes		<u>58,00,000</u>
Less taxes (0.35)		20,30,000
Earnings after taxes		<u>37,70,000</u>
Add incremental depreciation		7,00,000
(b) CFAT ($t = 1 - 4$)		<u>44,70,000</u>
CFAT ($t = 5$) [₹44,70,000 + ₹10,00,000, WC + ₹15,00,000, SV]		<u>69,70,000</u>
(c) Net present value		
$t = 1 - 4$ ₹44,70,000 × 2.855 (PVIFA _{4,15})		1,27,61,850
$t = 5$ 69,70,000 × 0.497 (PVIF _{5,15})		<u>34,64,090</u>
Total PV		1,62,25,940
Less cash outflow		(59,75,000)
NPV		<u>1,02,49,060</u>
EAV (PVIFA _{5,15})		÷ 3.353
		<u>30,56,684</u>
(B) Purchase of Work Horse:		
Cost of machine		₹35,00,000
- Sale value of machine		(15,00,000)
+ Working capital		5,00,000
+ Training costs		3,00,000
- Tax advantage on short term capital loss on sale of existing machine as in (A) above		<u>(5,25,000)</u>
(a) Net cash outflows		22,75,000
Incremental sales		75,00,000
Less : Additional fixed costs		(2,00,000)
: Additional variable costs		(8,00,000)
: Incremental depreciation:		
Depreciation on new machine [₹35 lakh ÷ 7]	₹5,00,000	
Depreciation on existing machine [₹30 lakh – ₹6 lakh] ÷ 6	<u>4,00,000</u>	(1,00,000)
Earnings before taxes		<u>64,00,000</u>
Less taxes (0.35)		22,40,000
Earnings after taxes		41,60,000
Add incremental depreciation		1,00,000
(b) CFAT ($t = 1 - 6$)		<u>42,60,000</u>
CFAT ($t = 7$) (₹42,60,000 + ₹5,00,000, WC)		<u>47,60,000</u>

(Contd.)

1917
[Faint, illegible text, possibly a list or index]

[Faint, illegible text, possibly a list or index]

[Faint, illegible text, possibly a list or index]

Vertical text on the right margin, possibly a page number or title.

(Contd.)

(c) Net present value

$t = 1 - 6$	$\text{₹}42,60,000 \times 3.685$ (PVIFA _{6,16})	1,56,98,100
7	$47,60,000 \times 0.354$ (PVIFA _{7,16})	16,85,040
Total PV		1,73,83,140
Less cash outflow		22,75,000
NPV		1,51,08,140
EAV (Equivalent annual value) (PVIFA _{7,16})		$\div 4.039$
		37,40,564

Recommendation Based on EAV, I would recommend to the CEO of Iridium to buy the Work Horse.

10.C.4 Gas Pipeline Extension A proposal to extend the ABC Gas Company Ltd's gas distribution network to the NOIDA industrial cluster, about 40 kms east of Delhi, at a distance of about 20 kms from the ABC's existing transmission line, is under the consideration of its CEO, Prerna Goyal. The NOIDA industrial cluster is dominated by the textile industry including texturising, weaving, spinning and yarn units with over 2,500 small and medium-sized units. The potential of gas consumption in these industries is mainly on account of captive power. Power constitutes 40 – 65 per cent of the production costs in the key target sectors for gas supply. The units in the cluster have been considering reduction of power costs by moving away from the expensive grid supply to captive power generation. The total estimated potential of captive power presently is 45 MW which corresponds to 0.30 million standard cubic meters per day (MSCMD) of gas. The proposed project is essentially an extension of the distribution network in the existing Delhi distribution zone.

A market survey of potential customers to assess the gas demand potential in the region has identified over 40 customers with a combined gas demand of 0.25 MSCMD for captive power. Negotiations for gas supply have also been initiated with them. ABC Gas Ltd has received expression of interest for over 0.075 MSCMD. However, timing of gas supply is the key since alternative fuel options such as solid and liquid fuels and wind energy are available. The expression of interest would fall through if gas is not supplied by mid-2008.

Amit Kumar, an engineering consultant, is hired by Prerna Goyal to identify the most feasible and economical route for laying down the gas pipeline. A preliminary site survey is followed by reconnaissance survey by Amit. After conducting Quantified Risk Assessment and evaluating several pipeline options, the consultant has proposed a 12 inch, 150 class low pressure (19 bar) pipeline for a total length of 30 kms from the ABC's transmission pipeline. The capacity of the proposed pipeline will be 0.75 MSCMD.

The base investment/capital expenditure is estimated to be ₹24 crore consisting of the following heads: (i) engineering, ₹0.50 crore (ii) project clearance, ₹1.2 crore (iii) material costs, ₹13.2 crore (iv) contracts, ₹7.7 crore, (v) commissioning ₹0.10 crore and (vi) contingency and insurance, ₹1.3 crore. The pipeline is expected to have a life of 10 years.

The other parameters of the projects have been identified by the consultant as listed below:

1. Volumes build up (in MSCMD)

Year	Volume	Year	Volume
1	0.075	6	0.121
2	0.083	7	0.133
3	0.091	8	0.146
4	0.100	9	0.161
5	0.110	10	0.177

2. Sales price of gas, ₹8.90 per standard cubic meter (SCM) with an increase of 3 per cent every year.

3. Purchase price of gas, ₹7 per standard cubic meter with an increase of 3 per cent every year.

4. Variable costs are assumed to be constant throughout the 10-year life of the pipeline at ₹28 lakh per annum (consisting of pigging of pipeline, ₹20 lakh; cathodic protection of pipeline, ₹2 lakh supervision cost, ₹3 lakh; pipeline surveys, ₹2 lakh; and electricity charges, ₹1 lakh).

Assuming straight-line method of depreciation of material cost of initial capital investment for tax purposes and 12 per cent required rate of return, analyse, as a financial consultant, the financial viability of the proposal and make a recommendation to the CEO of the ABC Gas Ltd.

Solution

Financial Analysis of Extension of Gas Pipeline by ABC Gas Ltd (₹crore)

Year	CFAT ^{@@}	PV Factor(0.12)	Present value
2008	4.04	0.893	₹3.61
2009	4.51	0.797	3.59
2010	5.01	0.712	3.57
2011	5.58	0.636	3.55
2012	6.23	0.567	3.53

[⊙] ₹24 crore ÷ 10 = ₹2.4 crore

10.C.5 Unabsorbed Depreciation The Cements India Limited, a private sector company established in 1985, is a leading producer of cement in India. It has grown into the most trusted cement company in India. It presently has four manufacturing plants in India located at Raipur, Paradeep, Guntur and Amravati.

The company has observed that its existing production capacity is likely to fall short to meet the increased demand for cement. Therefore, Mr. Divyansh, CEO of Cements India Limited, decides to increase the capacity of its Raipur plant to meet the anticipated rise in demand for cement. The company decides to replace the grinder machine at Raipur plant, which was installed in 2013 (and at present is 5 years old) at a cost of ₹25,00,000. The machine has a current salvage value of ₹3,00,000 and has economic useful life of 7 more years. The machine is a part of a block of assets which is being depreciated at a rate of 20% using written down value approach.

The new machine is an integrated unit, which will lead to increase in sales of cement by ₹15,90,000. The fixed cost will remain unchanged and variable cost to volume ratio for the integrated unit is 30%. The machine will cost ₹41,00,000 and has an expected salvage value of ₹1,45,000 at the end of its economic useful life of 7 years. The new machine too is a part of the same block of assets as the existing machine is. The new machine will require additional working capital of ₹4,00,000 for uninterrupted operations throughout the period. The corporate tax rate is 30%.

Mr. Divyansh has asked the CFO of the company to assess the financial feasibility of replacement of old machine and make relevant recommendations in this regard. Assume a minimum required rate of return to be 14%.

Solution:

The CFO carries out the assigned task as per the following aspects:

I. Written Down Value of the existing machine in the beginning of 2018 (Year 6)

Initial Cost of grinder machine in 2013	₹25,00,000
Less: Depreciation @ 20% in Year 1	₹5,00,000
WDV at the beginning of 2014 (Year 2)	₹20,00,000
Less: Depreciation @ 20% in Year 2	₹4,00,000
WDV at the beginning of 2015 (Year 3)	₹16,00,000
Less: Depreciation @ 20% in Year 3	₹3,20,000
WDV at the beginning of 2016 (Year 4)	₹12,80,000
Less: Depreciation @ 20% in Year 4	₹2,56,000
WDV at the beginning of 2017 (Year 5)	₹10,24,000
Less: Depreciation @ 20% in Year 5	₹2,04,800
WDV at the beginning of 2018 (Year 6)	₹8,19,200

II. Depreciation base with new integrated machine

Written down value of grinder machine	₹8,19,200
Add: purchase price of the integrated unit	41,00,000
Less: salvage value of grinding machine	(3,00,000)
Depreciation Base	₹46,19,200

III. Base for incremental depreciation

Depreciation base of new integrated unit	₹46,19,200
Less: depreciation base of grinding machine	₹8,19,200
Base for incremental depreciation	₹38,00,000

IV. Incremental depreciation from 2018 to 2024 (Years 1-7)

Year	Incremental Base	Depreciation @ 20% on Written Down Value
1	₹38,00,000	₹7,60,000
2	₹30,40,000	₹6,08,000
3	₹24,32,000	₹4,86,400
4	₹19,45,600	₹3,89,120
5	₹15,56,480	₹3,11,296
6	₹12,45,184	₹2,49,037
7	₹9,96,147	₹1,70,230 [⊗]

⊗ 0.20 (₹9,96,147 – ₹1,45,000 salvage value)

V. Incremental cash outflows

Cost of integrated unit	₹41,00,000
Additional working capital requirement	₹4,00,000
Less: salvage value of grinding machine	₹(3,00,000)
Incremental cash outflows	<u>₹42,00,000</u>

VI. Incremental cash inflows after taxes

The new machine is expected to increase sales of cement by ₹15,90,000. Since the fixed costs remain unchanged and variable costs to volume ratio is 30%:

Net incremental contribution = Incremental Sales – Variable Cost

$$= ₹15,90,000 - (0.3 \times ₹15,90,000) = ₹11,13,000$$

Determination of CFAT for years (2018-2024)

Year	Incremental Contribution (a)	Incremental Depreciation Base (b)	Taxable Income (a)-(b) = (c)	Tax @ 30% (c)*0.3 = (d)	EAT (c)-(d) = (e)	CFAT (b) + (e)
2018	₹11,13,000	₹7,60,000	₹3,53,000	₹1,05,900	₹2,47,100	₹10,07,100
2019	11,13,000	6,08,000	5,05,000	1,51,500	3,53,500	9,61,500
2020	11,13,000	4,86,400	6,26,600	1,87,980	4,38,620	9,25,020
2021	11,13,000	3,89,120	7,23,880	2,17,164	5,06,716	8,95,836
2022	11,13,000	3,11,296	8,01,704	2,40,511	5,61,193	8,72,489
2023	11,13,000	2,49,037	8,63,963	2,59,189	6,04,774	8,53,811
2024	11,13,000	1,70,230	9,42,770	2,82,831	6,59,939	8,30,169

VII. Calculation of NPV

Year	CFAT (in ₹)	PV factor @ 14%	Present value (in ₹)
2018	10,07,100	0.877	8,83,227
2019	9,61,500	0.769	7,39,394
2020	9,25,020	0.675	6,24,389

The first of these is the fact that the
 population of the country has increased
 since the year 1800. This increase has
 been the result of a number of causes,
 the most important of which are the
 following:

1. The increase in the number of
 children born to each family.
 2. The decrease in the number of
 deaths from various causes.
 3. The immigration of people from
 other countries.

The second of these is the fact that the
 population of the country has increased
 since the year 1800. This increase has
 been the result of a number of causes,
 the most important of which are the
 following:

Population in 1800	1,000,000
Population in 1810	1,200,000
Population in 1820	1,500,000
Population in 1830	2,000,000
Population in 1840	2,500,000
Population in 1850	3,000,000
Population in 1860	3,500,000
Population in 1870	4,000,000
Population in 1880	4,500,000
Population in 1890	5,000,000
Population in 1900	5,500,000
Population in 1910	6,000,000
Population in 1920	6,500,000
Population in 1930	7,000,000
Population in 1940	7,500,000
Population in 1950	8,000,000
Population in 1960	8,500,000
Population in 1970	9,000,000
Population in 1980	9,500,000
Population in 1990	10,000,000
Population in 2000	10,500,000
Population in 2010	11,000,000
Population in 2020	11,500,000

The third of these is the fact that the
 population of the country has increased
 since the year 1800. This increase has
 been the result of a number of causes,
 the most important of which are the
 following:

Population in 1800	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Population in 1810	1,200,000	1,200,000	1,200,000	1,200,000	1,200,000
Population in 1820	1,500,000	1,500,000	1,500,000	1,500,000	1,500,000
Population in 1830	2,000,000	2,000,000	2,000,000	2,000,000	2,000,000
Population in 1840	2,500,000	2,500,000	2,500,000	2,500,000	2,500,000
Population in 1850	3,000,000	3,000,000	3,000,000	3,000,000	3,000,000
Population in 1860	3,500,000	3,500,000	3,500,000	3,500,000	3,500,000
Population in 1870	4,000,000	4,000,000	4,000,000	4,000,000	4,000,000
Population in 1880	4,500,000	4,500,000	4,500,000	4,500,000	4,500,000
Population in 1890	5,000,000	5,000,000	5,000,000	5,000,000	5,000,000
Population in 1900	5,500,000	5,500,000	5,500,000	5,500,000	5,500,000
Population in 1910	6,000,000	6,000,000	6,000,000	6,000,000	6,000,000
Population in 1920	6,500,000	6,500,000	6,500,000	6,500,000	6,500,000
Population in 1930	7,000,000	7,000,000	7,000,000	7,000,000	7,000,000
Population in 1940	7,500,000	7,500,000	7,500,000	7,500,000	7,500,000
Population in 1950	8,000,000	8,000,000	8,000,000	8,000,000	8,000,000
Population in 1960	8,500,000	8,500,000	8,500,000	8,500,000	8,500,000
Population in 1970	9,000,000	9,000,000	9,000,000	9,000,000	9,000,000
Population in 1980	9,500,000	9,500,000	9,500,000	9,500,000	9,500,000
Population in 1990	10,000,000	10,000,000	10,000,000	10,000,000	10,000,000
Population in 2000	10,500,000	10,500,000	10,500,000	10,500,000	10,500,000
Population in 2010	11,000,000	11,000,000	11,000,000	11,000,000	11,000,000
Population in 2020	11,500,000	11,500,000	11,500,000	11,500,000	11,500,000

2021	8,95,836	0.592	5,30,335
2022	8,72,489	0.519	4,52,822
2023	8,53,811	0.456	3,89,338
2024	8,30,169	0.400	3,32,068
2024 - Salvage Value	1,45,000	0.400	58,000
2024 - Recovery of WC	4,00,000	0.400	1,60,000
Gross Present Value			41,69,571
Less: cash outflow			(42,00,000)
Net Present Value			(30,429)

Therefore, the CFO suggests non-acceptance of the replacement proposal. This makes the CEO sad. He has started exploring the ways by which the project can become profitable. During the process, he recapitulates the concept of unabsorbed depreciation. He immediately calls the CFO. He discusses the concept with him; the CFO realizes his mistake and recalls that the tax advantage is available on unabsorbed depreciation even after the sale of machine. Accordingly, he carries out the following two steps to complete the analysis:

VIII. The unabsorbed depreciation of the machine

Depreciation base in terminal year (2024) – depreciation in 2024 – salvage value of integrated unit

$$\text{Unabsorbed depreciation} = (\text{₹}9,96,147 - \text{₹}1,70,230 - \text{₹}1,45,000) = \text{₹}6,80,917$$

The company will get tax advantage on unabsorbed depreciation of the machine.

IX. Calculation of tax advantage on unabsorbed depreciation for years (2025 -2031) after sale of machine

Year	Unabsorbed De- preciation (in ₹)	Depreciation @20% (in ₹)	Tax advantage @30% (in ₹)	PVF @14%	Total PV (in ₹)
2025	6,80,917	1,36,183	40,855	0.351	14,340
2026	5,44,734	1,08,947	32,684	0.308	10,067
2027	4,35,787	87,157	26,147	0.27	7,060
2028	3,48,630	69,726	20,918	0.237	4,958
2029	2,78,904	55,781	16,734	0.208	3,481
2030	2,23,123	44,625	13,387		2,437
2031	1,78,498	35,700	10,710		1,714
Total					44,055*

Recommendation NPV is positive (₹44,055 – ₹30,429 = ₹ 3,626) after reckoning tax advantage on unabsorbed depreciation. Therefore, it is recommended that the existing machine should be replaced.

*The amount would be higher as tax advantage would be available on ₹1,42,798 (₹1,78,498 – ₹35,700) in subsequent years.

Scan the QR Code given at the end of chapter to access comprehensive cases.

REVIEW QUESTIONS**LOD: Easy**

RQ. 10.1 Fill in the following blanks:

[LO 10.1,2,3]

- (i) _____ method is the most appropriate measure for cost reduction investment projects with unequal lives.
- (ii) _____ is an appropriate method for revenue-expanding investment proposals with unequal lives.
- (iii) Intermediate cash inflows are assumed to have been reinvested at the rate of _____ under IRR method.
- (iv) Intermediate cash inflows are assumed to be reinvested at _____ under NPV method.
- (v) _____ method is an appropriate measure in projects selection (when they are divisible) under capital rationing.
- (vi) _____ cash flows are substantially lower than _____ cashflows, when adjusted for inflation factor.
- (vii) _____ should be used to discount real cashflows in selecting investment projects requiring adjustment for inflation.
- (viii) Capital budgeting decisions should either reckon the inflation factor in _____ as well as in cost of capital or exclude it completely.
- (ix) Real cost of capital is obtained dividing nominal cost of capital by _____.
- (x) CFAT will be deflated by _____ to determine real CFAT.

Answers: (i) Equivalent annual cost (ii) Equivalent annual NPV (iii) IRR (iv) Cost of capital (v) Present value index (vi) Real, nominal (vii) Real cost of capital (viii) cash inflows after taxes (ix) (1 + Inflation rate) (x) inflation rate.

RQ. 10.2 What is the criterion for judging the worth of investments in the capital budgeting technique based on the profitability index? What is its value, when its NPV is (a) zero, (b) negative and (c) positive? Also indicate the relationship between IRR and cost of capital in these situations.

RQ. 10.3 ABC Ltd is considering to install a machine, either X or Y which are mutually exclusive. The details of their purchase price and operating costs are:

[LO 10.1]

Particulars	Year	Machine X	Machine Y
Purchase cost	0	₹10,000	₹8,000
Operating costs	1	2,000	2,500
	2	2,000	2,500
	3	2,000	2,500
	4	2,500	3,800
	5	2,500	3,800
	6	2,500	3,800
	7	3,000	
	8	3,000	
	9	3,000	
	10	3,000	

Machine X will recover a salvage value of ₹1,500 in the year 10 while machine Y will recover ₹1,000 in the year 6. Determine which is cheaper at the 10 per cent cost of capital, assuming that both the machines operate at the same efficiency?

LOD: Medium

- RQ. 10.4** Contrast the IRR and the NPV methods. Under what circumstance may they lead to (a) comparable recommendations, and (b) give conflicting recommendations? In circumstances in which they give contradictory results, which criteria should be used to select the project and why? [LO 10.1]
- RQ. 10.5** What are the critical factors to be observed while making capital budgeting decisions under capital rationing? [LO 10.2]
- RQ. 10.6** Discuss the problems of ranking projects with varying economic lives, sizes and patterns of cash outflows and inflows. [LO 10.1]
- RQ. 10.7** What is the relationship between the desired real rate of return, inflation rate and the rate used to discount project cash flows under conditions of inflation. [LO 10.2]
- RQ. 10.8** The nominal cost of capital is not equivalent to the sum of the real cost of capital and the expected inflation rate. Elucidate with an appropriate example. [LO 10.3]
- RQ. 10.9** Company X is forced to choose between two machines A and B. The two machines are designed differently, but have identical capacity and do exactly the same job. Machine A costs ₹1,50,000 and will last for 3 years. It costs ₹40,000 per year to run. Machine B is an 'economy' model costing only ₹1,00,000, but will last only for 2 years, and cost ₹60,000 per year to run. These are real cash flows. The costs are forecasted in rupees of constant purchasing power. Ignore tax. Opportunity cost of capital is 10 per cent. Which machine company X should buy? [LO 10.1]
- RQ. 10.10** A machine purchased four years ago has been depreciated to its current book value of ₹50,000. The machine originally had a projected life of 10 years and zero salvage value.
A new machine will cost ₹80,000. Its installation cost estimated by the technician is ₹20,000. The technician also estimates that the installation of the new machine will result in a reduced operating cost of ₹30,000 per year for the next 6 years. The old machine would be sold for ₹20,000. The new machine will have a 6-year life with no salvage value. The company's income is taxed at 35. Assuming the cost of capital at 10 per cent, determine whether the existing machine should be replaced. Make your own assumption regarding depreciation of the machine. [LO 10.1]
- RQ. 10.11** A company working against a self-imposed capital budgeting constraints of ₹3,50,000, is trying to decide which investment proposals should be undertaken by it. All the investments are mutually independent (do not affect one another's cash flows). The list of investments along with the investment required and the net present value of the projected cash flows are as follows:

<i>Investments</i>	<i>Outlays</i>	<i>NPV</i>
A	₹50,000	₹30,000
B	1,20,000	90,000
C	1,60,000	1,00,000
D	1,60,000	1,50,000
E	90,000	1,00,000

Which investments should be acquired by the company? [LO 10.2]

- RQ. 10.12** Strong Company wants to launch a new product, suggested by its marketing department. For this purpose a new machine is to be purchased. The relevant data processed in this regard is as follows: [LO 10.3]

Cost of new machine	₹20,00,000
CFAT: year 1	6,00,000
2	7,00,000
3	8,00,000
4	5,00,000
5	4,00,000

The company uses 13 per cent as required cost of capital (nominal) to evaluate new projects. The rate of inflation during the period is expected to be 6 per cent. Determine NPV of the machine using both the nominal as well as real rate of discount, and comment on the results.

LOD: Difficult

RQ. 10.13 'For most investment decisions that the firm faces, net present value is either a superior decision criterion, or is at least as good as the competing techniques.' In what investment situation is the profitability index better than the net present value? [LO 10.1.2]

RQ. 10.14 Royal Industries is considering to buy a moulding machine. The machine (having capital cost of ₹20 lakh) is expected to have 4 years economic useful life with no salvage value; the company follows the straight line method of depreciation and the same is accepted for tax purposes. The expected CFAT (with corporate tax rate of 35 per cent) during its 4 years economic useful life are as follows: [LO 10.3]

Year 1	2	3	4
CFAT ₹8 lakh	₹10 lakh	₹7 lakh	₹5 lakh

Inflation is expected to be 8 per cent per year and the machine's cost of capital in real terms would be 10 per cent. Compute the NPV of purchasing this machine.

ANSWERS

- 10.3 Machine X is cheaper due to lower EAC (₹3,976.50). EAC of Y is ₹4,764.20.
 10.9 Company X should buy Machine A due to its lower EAC of ₹1,00,297.55. EAC of Machine B is 1,17,569.12.
 10.10 NPV is ₹25,698. Machine should be replaced.
 10.11 D, E and B.
 10.12 Real discount rate 6.6 per cent. NPV is ₹1,57,092.
 10.14 Nominal rate of discount: 18.8 per cent. NPV: ₹50,800.

CHAPTER

11

Concept and Measurement of Cost of Capital

LEARNING OBJECTIVES

LO 11.1	Understand importance, the basic assumptions, relationships, concepts and specific sources of capital underlying the cost of capital
LO 11.2	Determine the cost of long-term debt using calculations and an approximation (short-cut) technique
LO 11.3	Compute the cost of preference shares
LO 11.4	Calculate the cost of equity shares using (i) dividend valuation approach, (ii) capital asset pricing model (CAPM) approach and (iii) debt-yield plus risk premium approach
LO 11.5	Determine the cost of retained earnings
LO 11.6	Find the weighted average/overall cost of capital and discuss the alternative weighting schemes—historical (book values as well as market values) and marginal
LO 11.7	Outline cost of capital practices followed by corporates in India

INTRODUCTION

The discussions in Chapters 9 and 10 relating to capital budgeting have shown the relevance of a certain required rate of return as a decision criterion. Such a rate is the cost of capital of a firm. Apart from its usefulness as an operational criterion to accept/reject an investment proposal, cost of capital is also an important factor in designing capital structure. The relationship of cost of capital and capital structure of the firm is explored in part four. This Chapter is devoted to a discussion of the concept and measurement of cost of capital. It first covers the importance of, and elaborates on the concept of, cost of capital. The measurement of the specific cost of capital is examined subsequently. The measurement of overall cost of capital and the related issues of determining the relative weights are also examined. While the corporate practices followed in India are outlined, the major points are summarised by way of recapitulation.

CHAPTER

Concept and Measurement of Cost of Capital

PART A MCQs

- Q1. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q2. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q3. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q4. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q5. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q6. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.

MCQs

- Q1. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q2. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q3. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q4. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q5. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.
- Q6. The cost of capital is the rate of return that a firm must earn on its investments to satisfy its investors.

LO 11.1 IMPORTANCE AND CONCEPT

Importance

As mentioned above, the cost of capital is an important element, as a basic input information, in capital investment decisions. In the present value method of discounted cash flow technique, the cost of capital is used as the discount rate to calculate the NPV. The profitability index or benefit-cost ratio method similarly employs it to determine the present value of future cash inflows. When the internal rate of return method is used, the computed IRR is compared with the cost of capital. The cost of capital, thus, constitutes an integral part of investment decisions. It provides a yardstick to measure the worth of investment proposal and, thus, performs the role of accept-reject criterion. This underlines the crucial significance of cost of capital. It is also referred to as *cut-off rate*, *target rate*, *burdle rate*, *minimum required rate of return*, *standard return* and so on.

The cost of capital, as an operational criterion, is related to the firms' objective of wealth maximisation. The accept-reject rules require that a firm should avail of only such investment opportunities as promise a rate of return higher than the cost of capital. Conversely, the firm would be well advised to reject proposals whose rates of return are less than the cost of capital. If the firm accepts a proposal having a rate of return higher than the cost of capital, it implies that the proposal yields returns higher than the minimum required by the investors and the prices of shares will increase and, thus, the shareholders' wealth. By virtue of the same logic, the shareholders' wealth will decline on the acceptance of a proposal in which the actual return is less than the cost of capital. The cost of capital, thus, provides a rational mechanism for making optimum investment decisions. In brief, *the cost of capital is important because of its practical utility as an acceptance-rejection decision criterion.*

The considerable significance of cost of capital in terms of its practical utility notwithstanding, it is probably the most controversial topic in financial management. There are varying opinions as to how this can be computed. In view of the crucial operational significance of this concept, our focus is on the general framework for the computation of cost of capital. We first define the term cost of capital in general terms. This is followed by a detailed account of the measurement of cost of capital—both specific as well as overall—of different sources of financing.

Definition

In operational terms, **cost of capital** refers to the discount rate that is used in determining the present value of the estimated future cash proceeds and eventually deciding whether the project is

Cost of capital is the rate of return that a firm must earn on its project/ investments to maintain its market value and attract funds.

worth undertaking or not. In this sense, it is defined as the *minimum rate of return that a firm must earn on its investment for the market value of the firm to remain unchanged.*

The cost of capital is visualised as being composed of several elements. These elements are the cost of each component of capital. The term 'component' means the different sources from which funds are raised by a firm. Obviously, each source of funds or each component of capital has its cost. For example, equity capital has a cost, so also preference share capital and so on. The cost of each source or component is called **specific cost** of capital. When these specific costs are combined to arrive at overall cost of capital, it is referred to as the **weighted cost of capital**. The terms, *cost of capital*, *weighted cost of capital*, *composite cost of capital* and *combined cost of capital* are used interchangeably in this book. In other words, the term, cost of capital, as the acceptance criterion for investment proposals, is used in the sense of the combined cost of all sources of financing. This is mainly because our focus is on the valuation of the firm as a whole.¹

Assumptions

The theory of cost of capital is based on certain assumptions. A basic assumption of traditional cost of capital analysis is that the firm's business and financial risks are unaffected by the acceptance and financing of projects.² **Business risk** measures the variability in operating profits [earnings before interest and taxes (EBIT)] due to change in sales. If a firm accepts a project that is considerably more risky than the average, the suppliers of the funds are quite likely to increase the cost of funds as there is an increased probability of committing default on the part of the firm in making payments of their money. A debenture-holder will charge a higher rate of interest to compensate for increased risk. There is similarly an increased uncertainty from the point of equity holders of getting dividend from the firm. Therefore, they will also require a higher return as a compensation for the increased risk. In analysing the cost of capital in this chapter, we assume that there would be no change whatsoever in the business risk complexion of the firm as a result of acceptance of new investment proposals.

- **Business risk**
- is the risk to the firm of being unable to cover fixed operating costs.

The capital budgeting decision determines the business risk complexion of the firm. The financing decision determines its **financial risk**. In general, the greater the proportion of long-term debt in the capital structure of the firm, the greater is the financial risk because there is a need for a larger amount of periodic interest payment and principal repayment at the time of maturity. In such a situation, obviously, the firm requires higher operating profits to cover these charges. If it fails to earn adequate operating profits to cover such financial charges, it may be forced into cash insolvency. Thus, with the increase in the proportion of debt commitments and preference shares in its capital structure, fixed charges increase. All other things being the same, the probability that the firm will be unable to meet these fixed charges also increases. As the firm continues to lever itself, the probability of cash insolvency, which may lead to legal bankruptcy, increases.³ Clearly, therefore, as a firm's financial structure shifts towards a more highly levered position, the increased financial risk associated with the firm is recognised by the suppliers of funds. They compensate for this increased risk by charging higher rates of interest or requiring greater returns. In short, they react in much the same way as they would in the case of increasing business risks.⁴ In the analysis of the cost of capital in this Chapter, however, the firm's financial structure is assumed to remain fixed. In the absence of such an assumption, it would be quite difficult to find its cost of capital, as the selection of a particular source of financing would change the cost of other sources of financing. In operational terms, the assumption of a constant capital structure implies that the additional funds required to finance the new project are to be raised in the same proportion as the firm's existing financing.

- **Financial risk**
- is the risk of being unable to cover required financial obligations such as interest and preference dividends.

For the purpose of capital budgeting decisions, benefits from undertaking a proposed project are evaluated on an after-tax basis. In fact, only the cost of debt requires tax adjustment as interest paid on debt is deductible expense from the point of view of determining taxable income whereas dividends paid either to preference shareholders or to equity-holders are not eligible items as a source of deduction to determine taxable income.

To sum up, it may be said that cost of capital (k) consists of the following three components:

- (i) the riskless cost of the particular type of financing, r_j ;
- (ii) the business risk premium, b ; and
- (iii) the financial risk premium, f

$$\text{Or } k = r_j + b + f$$

[Illegible text]

Since the business and financial risks are assumed to be constant, the changing cost of each type of capital, j , over time should be affected by the change in the supply of, and demand for, each type of funds.

Explicit and Implicit Costs

The cost of capital can be either **explicit or implicit**. The distinction between explicit and implicit costs is important from the point of view of the computation of the cost of capital.

The explicit cost of any source of capital is the discount rate that equates the present value of the cash inflows that are incremental to the taking of the financing opportunity with the present value of its incremental cash outflows.⁵

When firms raise funds from different sources, there is a series of cash flows. Initially, there is cash inflow to the extent of the amount raised. This is followed by a series of cash outflows in respect of interest payments, repayment of principal, or payment of dividends. For example, a firm raises ₹5,00,000 through the sale of 10 per cent perpetual debentures. There will be a cash inflow of ₹5,00,000 followed by an annual cash outflow of ₹50,000. The rate of return that equates the present value of cash inflows (₹5,00,000) with the present value of cash outflows (₹50,000) would be the explicit cost.

The determination of the explicit cost of capital is similar to the determination of the IRR, with one difference. While in the computation of the IRR, the cash outflows (assuming conventional flows) are involved in the beginning, followed by cash inflows subsequently, it is exactly opposite with the explicit cost of capital. Here, as shown above, the cash flows take place only once and there is a series of cash outflows subsequently.

The general formula for the explicit cost of capital of any source of raising finance would be as follows:

$$CI_0 = \sum_{i=1}^n \frac{CO_i}{(1+C)^i} \quad (11.1)$$

Where CI_0 = initial cash inflow, that is, net cash proceeds received by the firm from the capital source at time 0, $CO_1 + CO_2 \dots + CO_{n-1}$ = cash outflows at times 1, 2 ... $n-1$, that is, cash payment from the firm to the capital source. If CI_0 is received in instalments, then, CI_0

$$\begin{aligned} CI_0 + \frac{CI_1}{(1+C)^1} + \frac{CI_2}{(1+C)^2} + \frac{CI_3}{(1+C)^3} + \dots + \frac{CI_{n-1}}{(1+C)^n} \\ = \frac{CO_1}{(1+C)^1} + \frac{CO_2}{(1+C)^2} + \frac{CO}{(1+C)^3} + \dots + \frac{CO}{(1+C)} \end{aligned} \quad (11.2)$$

It is evident from the above mathematical formulation that the **explicit cost** of capital is the 'rate of return of the cash flows of the financing opportunity'.⁶ In other words, it is the internal rate of return that the firm pays to procure financing. On the basis of the above formula, we can easily find out that the explicit cost of an interest-free loan is zero per cent because the discount rate that equates the present value of a future sum with an equivalent sum received today is zero. The explicit cost of capital of a loan bearing interest is that discount rate which equates the present value of the future cash outflows with

Explicit cost is the rate that the firm pays to procure financing.

the net amount of funds initially provided by the loan. The explicit cost of capital of a gift is minus 100 per cent. The explicit cost of capital derived from the sale of an asset is a discount rate that equates the present value of the future cash flows foregone by the asset's sale with the net proceeds to the firm resulting from its liquidation. The explicit cost of funds supplied by increases in certain liabilities such as accounts payable and accrued taxes is zero per cent unless, of course, penalties are incurred or discounts lost owing to the increase in these liabilities.⁷

The explicit cost of capital is concerned with the incremental cash flows that result directly from raising funds. Retained earnings used in the firm involve no future cash flows to, or from, the firm. Therefore, the explicit cost of retained earnings is minus 100 per cent. There are no future interest or principal payments imposed by the retention of earnings. There are no additional shares created and sold to outsiders on which dividends will be paid. From this, it should, however, not be concluded that retained earnings have no cost. (In fact, they also have costs like other sources of raising finance have). The retained earnings are undistributed profits of the company belonging to the shareholders. Given the ultimate objective of the firm to maximise the wealth of shareholders, the cost of retained earnings would be equivalent to the **opportunity cost** of earning by investing elsewhere by the shareholders themselves or by the company itself. **Opportunity costs** are technically referred to as **implicit cost of capital**. The **implicit cost of capital** of funds raised and invested by the firm may, therefore, be defined as 'the rate of return associated with the best investment opportunity for the firm and its shareholders that would be foregone, if the projects presently under consideration by the firm were accepted.'⁸ The cost of retained earnings is an opportunity cost or implicit capital cost, in the sense that it is the rate of return at which the shareholders could have invested these funds had they been distributed to them.⁹ However, other forms of financing also have implicit cost once they are invested. The explicit cost arises when funds are *raised*, whereas the implicit costs arise when funds are *used*. Viewed in this perspective, implicit costs are ubiquitous. They arise whenever funds are used no matter what the source.

- **Implicit cost**
- is the rate of return
- associated with the
- best investment
- opportunity
- foregone.

The term cost of capital, as a decision criterion, is the overall cost. This is the combined cost of the specific costs associated with specific sources of financing. The cost of the different sources of financing represents the components of the combined cost. The computation of the cost of capital, therefore, involves two steps: **(i)** the computation of the different elements of the cost in terms of the cost of the different sources of finance (specific costs), and **(ii)** the calculation of the overall cost by combining the specific costs into a composite cost.

The first step in the measurement of the cost of capital of the firm is the calculation of the cost of individual sources of raising funds. Apart from its relevance to the measurement of the combined cost, the specific cost will also indicate the relative cost of pursuing one line of financing rather than another. From the viewpoint of capital budgeting decision, the long-term sources of funds are relevant as they constitute the major sources of financing of fixed assets. In calculating the cost of capital, therefore, the focus is on long-term funds. In other words, the specific costs have to be calculated for **(i)** long-term debt (including debentures); **(ii)** preference shares; **(iii)** equity capital; and **(iv)** retained earnings.

LO 11.2 COST OF DEBT

The calculation of the **cost of debt** is relatively easy. The cost of funds raised through debt in the form of debentures or loan from financial institutions can be determined from Eq. 11.1. To apply the formulation of explicit cost of debt, we need data

- **Cost of debt**
- is the after tax cost
- of long-term funds
- through borrowing.

regarding: (i) the **net cash proceeds**/inflows (the issue price of debentures/amount of loan minus all **floatation costs**) from specific source of debt, and (ii) the net cash outflows in terms of the

Net cash proceeds are the funds actually received from the sale of security.

amount of periodic interest payment and repayment of principal in instalments or in lump sum on maturity. The interest payments made by the firm on debt issues qualify for tax deduction in determining net taxable income. Therefore, the effective cash outflows is less than the actual payment of interest made by the firm to the debt holders by the amount of tax shield on interest payment.¹⁰ The debt can be either perpetual/irredeemable or redeemable.

Floatation cost is the total cost of issuing and selling securities.

Cost of Perpetual Debt The measurement of the cost of perpetual debt is conceptually relatively easy. It is the rate of return which the lenders expect. The debt carries a certain rate of interest. The coupon interest rate or the market yield on debt can be said to represent an approximation of the cost of debt. The nominal/coupon rate of interest on debt is the before-tax cost of debt. Since the effective cost of debt is the tax-adjusted rate of interest, the before-tax cost of debt should

be adjusted for the tax effect. Finally, the bonds and debentures (debt) can be issued at (i) par, (ii) discount, and (iii) premium. The coupon rate of interest will require adjustment to find out the true cost of debt. Symbolically,

$$k_i = \frac{I}{SV} \quad (11.3)$$

$$k_d = \frac{I}{SV}(1-t) \quad (11.4)$$

k_i = Before-tax cost of debt

k_d = Tax-adjusted cost of debt

I = Annual interest payment

SV = Sale proceeds of the bond/debenture

t = Tax rate

The calculation is illustrated in Example 11.1.

Example 11.1

A company has 10 per cent perpetual debt of ₹1,00,000. The tax rate is 35 per cent. Determine the cost of capital (before tax as well as after tax) assuming the debt is issued at (i) par, (ii) 10 per cent discount, and (iii) 10 per cent premium.

Solution

(i) Debt issued at par

$$\text{Before-tax cost, } k_i = \frac{₹ 10,000}{1,00,000} = 10 \text{ per cent}$$

$$\text{After-tax cost, } k_d = k_i (1 - t) = 10\% (1 - 0.35) = 6.5 \text{ per cent}$$

(ii) Issued at discount

$$\text{Before-tax cost, } k_i = \frac{₹ 10,000}{90,000} = 11.11 \text{ per cent}$$

$$\text{After-tax cost, } k_d = 11.11\% (1 - 0.35) = 7.22 \text{ per cent}$$

(iii) Issued at premium

$$\text{Before-tax cost, } k_i = \frac{₹ 10,000}{1,10,000} = 9.09 \text{ per cent}$$

$$\text{After-tax cost, } k_d = 9.09\% (1 - 0.35) = 5.91 \text{ per cent}$$

Cost of Redeemable Debt In the case of calculation of cost of redeemable debt, account has to be taken, in addition to interest payments, of the repayment of the principal. When the amount of principal is repaid in one lump sum at the time of maturity, the cost of debt would be given by solving Eq. 11.5. If, however, the repayments are in a number of instalments, the cost of debt can be calculated on the basis of Eq. 11.6.

$$CI_0 = \sum_{t=1}^n \frac{COI_t}{(1+k_d)^t} + \frac{COP_n}{(1+k_d)^n} \quad (11.5)$$

where CI_0 = Net cash proceeds from issue of debentures or from raising debt
 $COI_1 + COI_2 + \dots + COI_n$ = Cash outflow on interest payments in time period 1,2 and so on up to the year of maturity *after adjusting tax savings on interest payment*.

COP_n = Principal repayment in the year of maturity

k_d = Cost of debt.

If the repayment of debt is in a number of instalments instead of one lump sum payment, the equation would be:

$$CI_0 = \sum_{t=1}^n \frac{COI_t + COP_t}{(1+k_d)^t} \quad (11.6)$$

Example 11.2

A company issues a new 10 per cent debentures of ₹1,000 face value to be redeemed after 10 years. The debenture is expected to be sold at 5 per cent discount. It will also involve flotation costs of 5 per cent of face value. The company's tax rate is 35 per cent. What would the cost of debt be? Illustrate the computations using (i) trial and error approach and (ii) shortcut method.

Solution

(i) Trial and Error/Long Approach

Cash Flow Pattern of the Debentures

Years	Cash flow
0	+ ₹900 (₹1,000 - ₹100, that is, par value less flotation cost less discount)
1 - 10	- ₹100 (interest outgo)
10	- ₹1,000 (repayment of principal at maturity).

We are to determine the value of k_d in the following equation:

$$₹900 = \sum_{t=1}^{10} \frac{₹65}{(1+k_d)^t} + \frac{₹1,000}{(1+k_d)^{10}}$$

The value of k_d for this equation would be the cost of debt. The value of k_d can be obtained, as in the case of IRR, by trial and error.

Determination of PV at 7% and 8% Rates of Interest

Year(s)	Cash outflows	PV factor at		Total PV at	
		7%	8%	7%	8%
1-10	₹65	7.024	6.710	₹456.56	₹436.15
			(Table A-4)		
10	1,000	0.508	0.463	508.00	463.00
			(Table A-3)		
				964.56	899.15

The value of k_d would be 8 per cent.

Let x and y be two numbers such that $x + y = 10$ and $x - y = 2$. Find the values of x and y .

$x + y = 10$ (1)
 $x - y = 2$ (2)

Adding (1) and (2):
 $2x = 12$
 $x = 6$

Substituting $x = 6$ into (1):
 $6 + y = 10$
 $y = 4$

Let x and y be two numbers such that $x + y = 15$ and $x - y = 3$. Find the values of x and y .

$x + y = 15$ (1)
 $x - y = 3$ (2)

Adding (1) and (2):
 $2x = 18$
 $x = 9$

Substituting $x = 9$ into (1):
 $9 + y = 15$
 $y = 6$

Let x and y be two numbers such that $x + y = 20$ and $x - y = 4$. Find the values of x and y .

$x + y = 20$ (1)
 $x - y = 4$ (2)

Adding (1) and (2):
 $2x = 24$
 $x = 12$

Substituting $x = 12$ into (1):
 $12 + y = 20$
 $y = 8$

- 1. Solve for x and y if $x + y = 12$ and $x - y = 6$.
- 2. Solve for x and y if $x + y = 18$ and $x - y = 8$.
- 3. Solve for x and y if $x + y = 22$ and $x - y = 10$.

Let x and y be two numbers such that $x + y = 25$ and $x - y = 5$. Find the values of x and y .

$x + y = 25$ (1)
 $x - y = 5$ (2)

Adding (1) and (2):
 $2x = 30$
 $x = 15$

Substituting $x = 15$ into (1):
 $15 + y = 25$
 $y = 10$

- 4. Solve for x and y if $x + y = 30$ and $x - y = 12$.
- 5. Solve for x and y if $x + y = 35$ and $x - y = 15$.
- 6. Solve for x and y if $x + y = 40$ and $x - y = 18$.

Let x and y be two numbers such that $x + y = 30$ and $x - y = 10$. Find the values of x and y .

$x + y = 30$ (1)
 $x - y = 10$ (2)

Adding (1) and (2):
 $2x = 40$
 $x = 20$

Substituting $x = 20$ into (1):
 $20 + y = 30$
 $y = 10$

Let x and y be two numbers such that $x + y = 35$ and $x - y = 12$. Find the values of x and y .

$x + y = 35$ (1)
 $x - y = 12$ (2)

Adding (1) and (2):
 $2x = 47$
 $x = 23.5$

Substituting $x = 23.5$ into (1):
 $23.5 + y = 35$
 $y = 11.5$

Let x and y be two numbers such that $x + y = 40$ and $x - y = 14$. Find the values of x and y .

$x + y = 40$ (1)
 $x - y = 14$ (2)

Adding (1) and (2):
 $2x = 54$
 $x = 27$

Substituting $x = 27$ into (1):
 $27 + y = 40$
 $y = 13$

Let x and y be two numbers such that $x + y = 45$ and $x - y = 16$. Find the values of x and y .

$x + y = 45$ (1)
 $x - y = 16$ (2)

Adding (1) and (2):
 $2x = 61$
 $x = 30.5$

Substituting $x = 30.5$ into (1):
 $30.5 + y = 45$
 $y = 14.5$

Let x and y be two numbers such that $x + y = 50$ and $x - y = 18$. Find the values of x and y .

$x + y = 50$ (1)
 $x - y = 18$ (2)

Adding (1) and (2):
 $2x = 68$
 $x = 34$

Substituting $x = 34$ into (1):
 $34 + y = 50$
 $y = 16$

Let x and y be two numbers such that $x + y = 55$ and $x - y = 20$. Find the values of x and y .

$x + y = 55$ (1)
 $x - y = 20$ (2)

Adding (1) and (2):
 $2x = 75$
 $x = 37.5$

Substituting $x = 37.5$ into (1):
 $37.5 + y = 55$
 $y = 17.5$

Let x and y be two numbers such that $x + y = 60$ and $x - y = 22$. Find the values of x and y .

$x + y = 60$ (1)
 $x - y = 22$ (2)

Adding (1) and (2):
 $2x = 82$
 $x = 41$

Substituting $x = 41$ into (1):
 $41 + y = 60$
 $y = 19$

Equation	x	y
$x + y = 10, x - y = 2$	6	4
$x + y = 15, x - y = 3$	9	6
$x + y = 20, x - y = 4$	12	8
$x + y = 25, x - y = 5$	15	10
$x + y = 30, x - y = 6$	18	12
$x + y = 35, x - y = 7$	21	14
$x + y = 40, x - y = 8$	24	16
$x + y = 45, x - y = 9$	27	18
$x + y = 50, x - y = 10$	30	20
$x + y = 55, x - y = 11$	33	22
$x + y = 60, x - y = 12$	36	24

(ii) **Shortcut Method:** The formula for approximating the effective cost of debt can, as a shortcut, be shown in the Equation (11.7):

$$k_d = \frac{I(1-t) + (f + d + pr - pi) / N_m}{(RV + SV) / 2} \quad (11.7)$$

where I = Annual interest payment

RV = Redeemable value of debentures/debt

SV = Net sales proceeds from the issue of debenture/debt (face value of debt minus issue expenses)

N_m = Term of debt

f = Flotation cost

d = Discount on issue of debentures

pi = Premium on issue of debentures

pr = Premium on redemption of debentures

t = Tax rate

$$k_d = \frac{\text{₹}100(1 - 0.35) + (\text{₹}50 + \text{₹}50)/10}{(\text{₹}900 + \text{₹}1,000)/2} = 7.9 \text{ per cent}$$

Example 11.3

A company issues 11 per cent debentures of ₹100 for an amount aggregating ₹1,00,000 at 10 per cent premium, redeemable at par after five years. The company's tax rate is 35 per cent. Determine the cost of debt, using the shortcut method.

Solution

$$k_d = \frac{[\text{₹}11(1 - 0.35) - \text{₹}(10/5)]}{(\text{₹}110 + \text{₹}100)/2} = 4.9 \text{ per cent}$$

The shortcut, however, cannot be applied when the principal is repaid in a number of instalments in lieu of one lump sum repayment. We can compute the value of k_d with the help of Eq. 11.6.

Example 11.4

A company has issued 10 per cent debentures aggregating ₹1,00,000. The flotation cost is 4 per cent. The company has agreed to repay the debentures at par in 5 equal annual instalments starting at the end of year 1. The company's rate of tax is 35 per cent. Find the cost of debt.

Solution

Net proceeds from the sale of debenture = ₹96,000.

Since the cash outflows are higher in the initial years than the average (₹24,500), let us try to determine PV at 7 per cent and 8 per cent.

Cash outflows	PV factor at		Total PV at	
	7%	8%	7%	8%
26,500 [@]	0.935	0.926	₹24,777	₹24,539
25,200	0.873	0.857	22,000	21,596
23,900	0.816	0.794	19,502	18,977
22,600	0.763	0.735	17,244	16,611
21,300	0.713	0.681	15,187	14,505
			98,710	96,228

[@]₹20,000 principal + ₹10,000 interest (1 - 0.35)

The value of k_d = 8 per cent.

To conclude, conceptually speaking, the calculation of the cost of debt is relatively easy. Moreover, debt is the cheapest source of long-term funds from the point of view of the company. In the first place, it is the safest form of investment from the point of view of the creditors because they are the first claimants on the company's assets at the time of its liquidation. Likewise, they are the first to be paid their interest before any dividend is paid to preference and equity shareholders. In fact, they are to be paid the interest even if the company incurs losses. Therefore, the suppliers' required rate of return on debt instruments is lower *vis-a-vis* other financial instruments, and, hence, lower cost of debt to the firm. Another, and more important, reason for debt having the lowest cost is the tax-deductibility of interest payments. The tax benefit would, however, be available only when the firm is profitable and pay taxes. A firm which suffers losses would not be required to pay any tax and its cost of debt would be before-tax cost (k_p) and not after-tax cost (k_p).

In practice, the corporates are normally likely to have multiple debt issues most likely subject to different interest rates. To determine the overall cost of debt, cost of each debt issue is to be separately computed. The weighted average of costs of all debt issues would be the cost of debt of the firm as a whole.

LO 11.3 COST OF PREFERENCE SHARES

The computation of the cost of preference shares is conceptually difficult as compared to the cost of debt. In the case of debt, as shown above, the interest rate is the basis of calculating cost, as payment of a specific amount of interest is legal commitment on the part of the firm. There is no such obligation in regard to preference dividend. It is true that a fixed dividend rate is stipulated on preference shares. It is also true that holders of such shares have a preferential right as regards payments of dividend as well as return of principal, as compared to the ordinary shareholders. But, unlike debt, there is no risk of legal bankruptcy if the firm does not pay the dividends due to the holders of such shares. Nevertheless, firms can be expected to pay the stipulated dividend, if there are sufficient profits, for a number of reasons. First, the preference shareholders, as already observed, carry a prior right to receive dividends over the equity shareholders. Unless, therefore, the firm pays out the dividend to its preference shareholders, it will not be able to pay anything to its ordinary shareholders. Moreover, the preference shares are usually cumulative which means that preference dividend will get accumulated till it is paid. As long as it remains in arrears, nothing can be paid to the equity holders. Further, non-payment of preference dividend may entitle their holders to participate in the management of the firm as voting rights are conferred on them in such cases. Above all, the firm may encounter difficulty in raising further equity capital mainly because the non-payment of preference dividend adversely affects the prospects of ordinary shareholders. Therefore, the stipulated dividend on preference shares, like the interest on debt, constitutes the basis for the calculation of the cost of preference shares. The **cost of preference capital** may be defined as the dividend expected by the preference shareholders.

However, unlike interest payments on debt, dividend payable on preference shares is not tax-deductible because preference dividend is not a charge on earnings or an item of expenditure; it is an appropriation of earnings. In other words, they are paid out of after-tax earnings of the company. Therefore, no adjustment is required for taxes while computing the cost of preference capital.

There are two types of preference shares: (i) **irredeemable**, and (ii) **redeemable**. The first category is a kind of perpetual security in that the principal is not to be returned for a long time or is likely to be available till the life of the company. The redeemable preference shares are issued with a maturity date so that the principal will be repaid at some future date. Accordingly, the cost of preference is calculated separately for these situations.

- **Cost of preference share capital**
- is the annual preference share dividend divided by the net proceeds from the sale of preference shares.

Perpetual Security The cost of preference shares which has no specific maturity date is given by Eq. (11.8) and Eq. (11.8A):

$$k_p = \frac{D_p}{P_0(1-f)} \tag{11.8}$$

$$k_p = \frac{D_p(1+D_t)}{P_0(1-f)} \tag{11.8A}$$

- where k_p = Cost of preference capital
 D_p = Constant annual dividend payment
 P_0 = Expected sales price of preference shares
 f = Flotation costs as a percentage of sales price
 D_t = Tax on preference dividend

Example 11.5

A company issues 11 per cent irredeemable preference shares of the face value of ₹100 each. Flotation costs are estimated at 5 per cent of the expected sale price. (a) What is the k_p if preference shares are issued at (i) par value, (ii) 10 per cent premium, and (iii) 5 per cent discount? (b) Also, compute k_p in these situations assuming 13.125 per cent dividend tax.

Solution

(a) (i) Issued at par

$$k_p = \frac{₹11}{₹100(1-0.05)} = 11.6 \text{ per cent}$$

(ii) Issued at premium

$$k_p = \frac{₹11}{₹110(1-0.05)} = 10.5 \text{ per cent}$$

(iii) Issued at discount

$$k_p = \frac{₹11}{₹95(1-0.05)} = 12.2 \text{ per cent}$$

(b) (i) Issued at par

$$k_p = \frac{₹11(1.13125)}{₹95} = 13.1 \text{ per cent}$$

(ii) Issued at premium

$$k_p = \frac{₹12.44}{₹104.5} = 11.9 \text{ per cent}$$

(iii) Issued at discount

$$k_p = \frac{₹12.44}{₹90.25} = 13.8 \text{ per cent}$$

Cost of Redeemable Preference Capital The explicit cost of preference shares in such a situation is the discount rate that equates the net proceeds of the sale of preference shares with the present value of the future dividends and principal repayments. The appropriate formula to calculate cost is given by Eq. (11.9).

$$P_0(1-f) = \frac{D_{p_1}}{(1+k_p)^1} + \frac{D_{p_2}}{(1+k_p)^2} + \dots + \frac{D_{p_n}}{(1+k_p)^n} + \frac{P_n}{(1+k_p)^n}$$

$$P_0(1-f) = \sum_{t=1}^n \frac{D_{p_t}}{(1+k_p)^t} + \frac{P_n}{(1+k_p)^n} \tag{11.9}$$

- where P_0 = Expected sale price of preference shares
 f = Flotation cost as percentage of P_0
 D_p = Dividends paid on preference shares
 P_n = Repayment of preference capital amount

Example 11.6

ABC Ltd has issued 11 per cent preference shares of the face value of ₹100 each to be redeemed after 10 years. Flotation cost is expected to be 5 per cent. Determine the cost of preference shares (k_p).

Solution

$$₹ 95 = \sum_{t=1}^{10} \frac{₹ 11}{(1 + k_p)^t} + \frac{₹ 100}{(1 + k_p)^{10}}$$

The value of k_p is likely to be between 11 and 12 per cent as the rate of dividend is 11 per cent.

Determination of the PV at 11 Per Cent and 12 Per Cent

Year	Cash outflows	PV factor at		Total PV at	
		11%	12%	11%	12%
1-10	₹11	5.889	5.65	₹64.78	₹62.15
10	100	0.352	0.322	35.15	32.20
				99.93	94.35

$k_p = 11.9$ per cent

LO 11.4 COST OF EQUITY CAPITAL

The cost of equity capital is by far, conceptually speaking, the most difficult and controversial cost to measure. It has been shown in the preceding discussions that the coupon rate of interest which forms the basis of calculation of cost of debt can be estimated with a high degree of accuracy since interest payments as well as the return of the principal are contractual obligations. The return on preference shares, although not a contractual obligation, can also be estimated fairly accurately as they are fixed in terms of the stipulations governing the issue of such shares. In contrast, the return to the equity-holders solely depends upon the discretion of the company management. Apart from the absence of any definite commitment to receive dividend, the equity shareholders rank at the bottom as claimants on the assets of the company at the time of its liquidation. It may, therefore, *prima facie*, appear that equity capital does not carry any cost. But this is not true. Equity capital, like other sources of funds, does certainly involve a cost to the firm. It may be recalled that the objective of financial management is to maximise shareholders' wealth and the maximisation of market price of shares is the operational substitute for wealth maximisation. When equity-holders invest their funds they also expect returns in the form of dividends. The market value of shares is a function of the return that the shareholders expect and get. If the company does not meet the requirements of its shareholders and pay dividends, it will have an adverse effect on the market price of shares. A policy of not paying dividends by a firm would be in conflict, in other words, with its basic objective, namely, net present value maximisation. The equity shares, thus, implicitly involve a return in terms of the dividend expected by the investors and, therefore, carry a cost. In fact, the cost of equity capital is relatively the highest among all the sources of funds. The investors purchase the shares, as already mentioned, in the expectation of a certain rate of return. The quantum of the rate of return, depends, *inter-alia*, on the business risk and financial risk of a company. The equity shares involve the highest degree of financial risk since they are entitled to receive dividend and return of principal after all other obligations of the firm are met. As a compensation to the higher risk exposure, holders of such securities expect a higher return and, therefore, higher cost is associated with them.

Therefore, one simple approach suggested to determine cost of equity is to add a judgmental risk premium of 3 to 5 percentage points to the interest rate paid by the firm on its own long-term debt. Such a method may be referred to as **debt-yield plus risk premium approach**.¹¹ Although this method does not ensure a precise cost of equity, it gets us into the right ballpark.¹² There is no direct basis of knowing the return the firm's equity investors require on their investments. Therefore, it is to be estimated.¹³

- **Cost of equity capital**
- is the rate at which investors discount the expected dividends of the firm to determine its share value.

Conceptually, the **cost of equity capital**, k_e , may be defined as *the minimum rate of return that a firm must earn on the equity-financed portion of an investment project in order to leave unchanged the market price of the shares.*¹⁴ To illustrate, suppose the required rate of return on equity (ordinary) shares of a firm is 12 per cent and the cost of debt is 8 per cent. Further assume that the policy of the firm is to use equity and debt respectively in the proportion of 75 : 25. The required rate of return for the project as a whole would be 11 per cent:

$$\begin{array}{r} 0.75 \times 0.12 = 9 \text{ per cent} \\ 0.25 \times 0.08 = 2 \\ \hline 11 \end{array}$$

In other words, if the firm accepts an investment project involving an outlay of ₹1,000 that was expected to continuously earn ₹110 per year, the project would provide a return just sufficient to leave unchanged the market price of its shares. With the assumption of no taxes, the rate of return on the equity-financed portion would be:

Total return	₹110.00
Less: Interest on debt (0.08 × ₹250)	20.00
Amount available to equity holders	<u>90.00</u>
Rate of return on equity (₹90 ÷ ₹750)	12 per cent

Thus, the expected rate of return on equity shares is just equal to the required rate of return of investors. If the project earns less than ₹110 yearly, it would give a return on the equity-financed portion less than that required by the investors so that the market price of shares would decline. This rate of return is the cost of equity capital in theory.¹⁵

The measurement of the above required rate of return is the measurement of the cost of equity capital. There are two possible approaches that can be employed to calculate the cost of equity capital: (i) dividend approach, and (ii) capital asset pricing model approach.

Dividend Approach One approach to calculate the cost of equity capital is based on the **dividend valuation model**. According to this approach, the cost of equity capital is calculated on

Dividend valuation model assumes that the value of a share equals the present value of all future dividends that it is expected to provide over an indefinite period.

the basis of a required rate of return in terms of the future dividends to be paid on the shares. The cost of equity capital, k_e , is, accordingly, defined as *the discount rate that equates the present value of all expected future dividends per share with the net proceeds of the sale (or the current market price) of a share.*

The process of determining k_e is similar to that used in calculating the explicit before-tax cost of debt (k_d) and cost of preference capital (k_p). The two elements of the calculation of k_e on the basis of the dividend approach are (i) net proceeds from the sale of a share/current market price of a share, and (ii) dividends and capital gains expected on the share. In arriving at the first, that is, the sale proceeds/current price, adjustments for flotation cost and discount/premium are necessary. In the case

of dividends, the investors expect a rate of dividend which will not be constant over the years but will grow. The growth in expected dividends in future may be either at a uniform normal rate perpetually or it may vary so that for a few years it may be at level higher than in subsequent years after which it will increase at a normal rate. While calculating the cost of equity capital, therefore, the dividend approach takes into account expected dividends under different growth assumptions.

The cost of equity capital can be measured with the following equations:

(A) When dividends are expected to grow at a uniform rate perpetually:

$$P_0(1 - f) = \frac{D_0(1+g)^1}{(1+k_e)^1} + \frac{D_0(1+g)^2}{(1+k_e)^2} + \dots + \frac{D_0(1+g)^n}{(1+k_e)^n} = \sum_{t=1}^n \frac{D_0(1+g)^t - 1}{(1+k_e)^t} \quad (11.10)$$

k_e in Eq. 11.10 is the rate of return (discount rate) which equates the two sides of the equation. Simplifying Eq. 11.10, we get

$$P_0 = \frac{D_1}{k_e - g} \quad (11.11)$$

$$k_e = \frac{D_1}{P_0} + g \quad (11.12)$$

where D_1 = Expected dividend per share
 P_0 = Net proceeds per share/current market price
 g = Growth in expected dividends

The calculation of k_e on the basis of Eq. 11.12 is based on certain assumptions with respect to the behaviour of investors and their ability to forecast future values:

- the market value of shares depends upon the expected dividends;
- investors can formulate subjective probability distribution of dividends per share expected to be paid in various future periods;
- the initial dividend, D_0 , is greater than zero ($D_0 > 0$);
- the dividend pay-out ratio is constant;
- investors can accurately measure the riskiness of the firm so as to agree on the rate at which to discount the dividends.

Note: Under the provisions of Section 115(O), of the Income Tax Act, 1961, a domestic company is liable to pay tax at a flat rate of 15 per cent (plus surcharge) on dividends declared/distributed/paid on/after April 1, 2010. With effect from April 1, 2018, the effective dividend distribution tax (including surcharge and cess) has been increased to 20.36 per cent. The payment of the dividend tax will reduce the growth (g) in dividends:

$$g = b \cdot r, \text{ where } b = \text{retention rate, } r = \text{rate of return.}$$

$$b = 1 - \left[\frac{DPS (1 + Dt)}{EPS} \right] = \left[\frac{EPS - DPS (1 + Dt)}{EPS} \right]$$

where Dt = Dividend distribution tax
 $r = EPS/P_0$

$$\therefore g = b \cdot r = \frac{EPS}{P_0} \times \frac{EPS - [DPS (1 + Dt)]}{EPS} = \left[\frac{EPS - DPS (1 + Dt)}{P_0} \right] \quad (11.12A)$$

Obviously, g without Dt would be higher.

(B) Under different growth assumptions of dividends over the years:

Equation 11.12 will have to be modified to take into account two (or more, if necessary) growth rates. The solution in the following Equation (11.13) for k_e would give the cost of equity capital:

$$P_0 = \sum_{t=1}^n \frac{D_0 (1 + g_b)^{t-1}}{(1 + k_e)^t} + \sum_{t=n+1}^{\infty} \frac{D_n (1 + g_c)^{t-1}}{(1 + k_e)^t} \quad (11.13)$$

where g_b = Rate of growth in earlier years
 g_c = Constant growth in later years

Example 11.7

Suppose that dividend per share of a firm is expected to be ₹1 per share next year and is expected to grow at 6 per cent per year perpetually. Determine the cost of equity capital, assuming the market price per share is ₹25.

Solution

This is a case of constant growth of expected dividends. The k_e can be calculated by using Equation 11.12. Thus,

$$k_e = \frac{D_1}{P_0} + g = \frac{\text{₹}1}{\text{₹}25} + 0.06 = 10 \text{ per cent}$$

The dividend approach can be used to determine the expected market value of a share in different years. The expected value of a share of the hypothetical firm in Example 11.7 at the end of years 1 and 2 would be as follows, applying Eq. 11.12.

$$(i) \text{ Price at the end of the first year } (P_1) = \frac{D_2}{k_e - g} = \frac{\text{₹}1.06}{0.10 - 0.06} = \text{₹}26.50$$

$$(ii) P_2 = \frac{D_3}{k_e - g} = \frac{\text{₹}1.124}{0.10 - 0.06} = \text{₹}28$$

In case company's past growth rate has been abnormally high or low, either due to its own unique situation or due to general economic fluctuations, historic growth rates (**g**) may not be reliable. In such situations, dividend growth forecasts should be based on factors such as projected sales, profit margins and competitive factors.¹⁶ Accordingly, k_e would be as follows:

$$k_e = \frac{D_1}{P_0} + \text{Growth rate as projected} \quad (11.13-A)$$

Another method for estimating **g** can be conceived in terms of the company's projected retention rate and its expected future rate of return on equity. More profitable firms retain a large proportion of their earnings for reinvestment and will, therefore, tend to have higher growth rate compared to less profitable firms which distribute a large proportion of their earnings as dividends.¹⁷

In brief, careful analysis and sound judgments are essential and play more important role in determining the k_e vis-à-vis the k_d and the k_p .

However, the dividend growth model approach is beset with a number of practical problems and drawbacks. The major ones are: **(1)** It is applicable only to those corporates which pay dividends. Its results are really applicable to cases where a reasonably steady growth is likely to occur; **(2)** Cost of equity is very sensitive to the estimated growth. As explained earlier, it is not easy to estimate its value; **(3)** The approach does not explicitly reckon risk factor. There is no allowance for the degree of risk associated with the estimated growth rate for dividends.¹⁸

Example 11.8

From the undermentioned facts determine the cost of equity shares of company X:

- (i) Current market price of a share = ₹150.
- (ii) Cost of floatation per share on new shares, ₹3.
- (iii) Dividend paid on the outstanding shares over the past five years:

Year	Dividend per share
1	₹10.50
2	11.02
3	11.58
4	12.16
5	12.76
6	13.40

- (iv) Assume a fixed dividend pay out ratio.
- (v) Expected dividend on the new shares at the end of the current year is ₹14.10 per share.

Solution

As a first step, we have to estimate the growth rate in dividends. Using the compound interest table (Table A-1), the annual growth rate of dividends would be approximately 5 per cent. (During the five years the dividends have increased from ₹10.50 to ₹13.40, giving a compound factor of 1.276, that is, ₹13.40/₹10.50. The sum of ₹1 would accumulate to ₹1.276 in five years @ 5 per cent interest).

$$k_e = \frac{₹14.10}{₹147 (₹150 - ₹3)} + 5\% = 14.6 \text{ per cent}$$

Example 11.9

Z Ltd is foreseeing a growth rate of 12 per cent per annum in the next 2 years. The growth rate is likely to fall to 10 per cent for the third year and the fourth year. After that, the growth rate is expected to stabilise at 8 per cent per annum. If the last dividend was ₹1.50 per share and the investors' required rate of return is 16 per cent, find out the intrinsic value per share of Z Ltd as of date.

Solution

Intrinsic value of Z Ltd = the sum of: (i) PV of dividends payments during 1-4 years and (ii) PV of expected market price at the end of the fourth year based on a constant growth of 8 per cent.

Present value of dividends, year 1-4

Years	Dividend	PVIF (0.16)	Total PV
1	₹1.68	0.862	₹1.45
2	1.88	0.743	1.40
3	2.07	0.641	1.33
4	2.28	0.552	1.26
			5.44

$$P_4 = D_5 / (k_e - g) = \frac{₹2.28 (1.08)}{16\% - 8\%} = ₹30.78$$

PV of ₹30.78 = ₹30.78 × 0.552 = ₹16.99

Intrinsic value of share = ₹5.44 + ₹16.99 = ₹22.43

Capital Asset Pricing Model Approach Another technique that can be used to estimate the cost of equity is the capital asset pricing model (CAPM) approach. We first discuss the CAPM.¹⁹ As an approach to measure the cost of equity capital, it is described subsequently.

The CAPM explains the behaviour of security prices and provides a mechanism whereby investors could assess the impact of proposed security investment on their overall portfolio risk and return. In other words, it formally describes the risk-return trade-off for securities. It is based on certain assumptions. The basic assumptions of CAPM are related to (a) the efficiency of the security markets and (b) investor preferences.

The efficient market assumption implies that (i) all investors have common (homogeneous) expectations regarding the expected returns, variances and correlation of returns among all securities; (ii) all investors have the same information about securities; (iii) there are no restrictions on investments; (iv) there are no taxes; (v) there are no transaction costs; and (vi) no single investor can affect market price significantly.

The implication of investors' preference assumption is that all investors prefer the security that provides the highest return for a given level of risk or the lowest amount of risk for a given level of return, that is, the investors are risk averse.

The risk to which security investment is exposed falls into two groups: (i) **diversifiable/unsystematic**, and (ii) **non-diversifiable/systematic**. The first represents that portion of the total risk of an investment that can be eliminated/minimised through diversification. The events/factors that cause such risks vary from firm to firm. The sources of such risks include management capabilities and decisions, strikes, unique government regulations, availability or otherwise of raw materials, competition, level of operating and financial leverage of the firm, and so on.

The systematic/**non-diversifiable risk** is attributable to factors that affect all firms. Illustrative sources of such risks are interest rate changes, inflation or purchasing power change, changes in

- **Diversifiable/unsystematic risk**
- is the portion of a security's risk that is attributable to firm-specific random causes; can be eliminated through diversification.
- **Non-diversifiable risk**
- is the relevant portion of a security's risk that is attributable to market factors that affect all firms; cannot be eliminated through diversification.

investor expectations about the overall performance of the economy and political changes, and so on. As unsystematic risk can be eliminated by an investor through diversification, the systematic risk is the only relevant risk. Therefore, an investor (firm) should be concerned, according to CAPM, solely with the non-diversifiable (systematic) risk.

Capital asset pricing model (CAPM) describes the relationship between the required return or cost of equity capital and the non-diversifiable risk of a firm measured by beta coefficient. *b*.

Systematic risk can be measured in relation to the risk of a diversified portfolio which is commonly referred to as the **market portfolio** or **the market**. According to CAPM, the non-diversifiable risk of an investment/security/ asset is assessed in terms of the *beta* coefficient. *Beta* is a measure of the volatility of a security's return relative to the returns of a broad-based market portfolio. Alternatively, it is an index of the degree of responsiveness or *co-movement* of return on an investment with the market return. The beta for the market portfolio as measured by the broad-based market index equals one. Beta coefficient of 1 would imply that the risk of the specified security is equal to the market; the interpretation of zero coefficient is that there is no market-related risk to the investment. A negative coefficient would indicate a relationship

in the opposite direction. The 'going' required rate of return in the market for a given amount of systematic risk is called the Security Market Line (SML).

With reference to the cost of capital perspective, the **CAPM** describes the relationship between the required rate of return, or the cost of equity capital, and the non-diversifiable or relevant risk, of the firm as reflected in its index of non-diversifiable risk, that is, beta. Symbolically,

$$K_e = R_f + b(K_m - R_f) \quad (11.14)$$

Where

K_e = cost of equity capital

R_f = the rate of return required on a risk-free asset/security/investment

K_m = the required rate of return on the market portfolio of assets that can be viewed as the average rate of return on all assets.

b = the beta coefficient

The computation of the cost of equity capital using the CAPM approach is shown in Example 11.10.

Example 11.10

The Hypothetical Ltd wishes to calculate its cost of equity capital using the capital asset pricing model approach. From the information provided to the firm by its investment advisors along with the firms' own analysis, it is found that the risk-free rate of return equals 10 per cent; the firm's beta equals 1.50 and the return on the market portfolio equals 12.5 per cent. Compute the cost of equity capital.

Solution

Substituting the values in Eq. 11.14

$$K_e = 10\% + [1.5 \times (12.5\% - 10\%)] = 13.75 \text{ per cent}$$

Example 11.11

As an investment manager you are given the following information

Investment in equity shares of	Initial price	Dividends	Year-end market price	Beta risk factor
A Cement Ltd	₹25	₹2	₹50	0.80
Steel Ltd	35	2	60	0.70
Liquor Ltd	45	2	135	0.50
B Government of India Bonds	1,000	140	1,005	0.99
Risk-free return, 8 per cent				

You are required to calculate (i) expected rate of returns of market portfolio, and (ii) expected return in each security, using capital asset pricing model.

Solution**(i) Expected Returns on Market Portfolio**

Security	Return			Investment
	Dividends	Capital appreciation	Total	
A Cement Ltd	₹2	₹25	₹27	₹25
Steel Ltd	2	25	27	35
Liquor Ltd	2	90	92	45
B Government of India Bonds	140	5	145	1,000
	146	145	291	1,105

Rate of return (expected) on market portfolio = ₹291/₹1,105 = 26.33 per cent

(ii) Expected Returns on Individual Security (in per cent)

$k_e = R_f + b(k_m - R_f)$	
Cement Ltd = 8% + 0.8 (26.33% - 8%)	22.66
Steel Ltd = 8% + 0.7 (26.33% - 8%)	20.83
Liquor Ltd = 8% + 0.5 (26.33% - 8%)	17.16
Government of India Bonds = 8% + 0.99 (26.33% - 8%)	26.15

The capital assets pricing model (CAPM) approach to calculate the cost of equity capital is different from the dividend valuation approach in some respects. In the first place, the CAPM approach directly considers the risk as reflected in beta in order to determine the K_e . The valuation model does not consider the risk; it rather uses the market price as a reflection of the expected risk-return preference of investors in the market. Secondly, the dividend model can be adjusted for flotation cost to estimate the cost of the new equity shares. The CAPM approach is incapable of such adjustment as the model does not include the market price which has to be adjusted. However, its big virtue is that it can be used to determine cost of equity for corporates which either do not pay dividends or are not subject to steady growth rate.

Both the dividend and CAPM approaches are theoretically sound. But major problems are encountered in the practical application of the CAPM approach in collecting data—which may not be readily available or in a country like India may be altogether absent—regarding expected future returns, the most appropriate estimate of the risk-free rate and the best estimates of the security's *beta*. Moreover, beta measure of risk considers only the systematic risk. Poorly diversified investors may be more interested in total risk rather than in systematic risk only. In such cases the CAPM may tend to underestimate the required rate of such investor. For these reasons, the use of the dividend approach would appear to be more appropriate to measure the cost of equity capital.

In brief, various methods of estimating k_e are most likely to provide different amounts because each method relies on different assumptions. There are two ways to deal with the situation: (1) Each estimate of k_e should be looked at to ascertain that its value is neither too high nor too low. It should intuitively appear to be reasonable; (2) Average the various estimates of k_e (as suggested by Ross, et al).²⁰

LO 11.5 COST OF RETAINED EARNINGS

Retained earnings, as a source of finance for investment proposals, differ from other sources like debt, preference shares and equities. The use of debt is associated with a contractual obligation to pay a fixed rate of interest to the suppliers of funds and, often, repayment of principal at some predetermined date. An almost similar kind of stipulation applies to the use of preference shares also. In the case of ordinary shares, although there is no provision for any predetermined payment to the shareholders, yet a certain expected rate of dividend provides a starting point for the computation of cost of equity capital. That retained earnings do not involve any formal arrangement to

become a source of funds is obvious. In other words, there is no obligation, formal or implied, on a firm to pay a return on retained earnings. Apparently, retained earnings may appear to carry no cost since they represent funds which have not been raised from outside. The contention that retained earnings are free of cost, however, is not correct. On the contrary, they do involve cost like any other source.

It is true that a firm is not obliged to pay a return (dividend or interest) on retained earnings. But retention of earnings does have implications for the shareholders of the firm. If earnings were not retained, they would have been paid out to the ordinary shareholders as dividends. In other words, retention of earnings implies withholding of dividends from holders of ordinary shares. When earnings are, thus, retained, shareholders are forced to forego dividends. The dividends foregone by the equity-holders are, in fact, an opportunity cost. Thus, retained earnings involve opportunity cost. In other words, the firm is implicitly required to earn on the retained earnings at least equal to the rate that would have been earned by the shareholders if they were distributed to them. This is the cost of retained earnings. Therefore, the cost of retained earnings may be defined as *opportunity cost in terms of dividends foregone by/withheld from the equity shareholders*.

The alternative use of retained earnings is based on 'external-yield criterion'.²¹ According to this approach, the alternative to retained earnings is external investment of funds by the firm itself. In other words the opportunity cost of retention of earnings is the rate of return that could be earned by investing the funds in another enterprise by the firm instead of what would be obtained by the shareholders on other investments. The firm should estimate the yield it can earn from external investment opportunities by investing its retained earnings there. While doing so, the firm should bear in mind that it selects such investment opportunities as have the same degree of risk as that of the firm itself. The rate of return that could be thus earned constitutes the opportunity cost of retained earnings. Such a return would give the cost of retained earnings, k_r . The k_r under the assumption of external-yield criterion would be approximately k_e . The merits of this approach are obvious. The k_r here is simply the return on direct investment by the firm itself. Since the investments of funds are assumed to be made by the firm itself, the return would not be affected by the tax brackets in which the various shareholders of the firm are. The approach, in other words, can be consistently applied. The external-yield criterion, therefore, represents an economically justifiable opportunity cost.

In brief, the **cost of retained earnings** represents an opportunity cost in terms of the return on their investment in another enterprise by the firm whose cost of retained earnings is being considered. The opportunity cost given by the external-yield criterion which can be consistently applied can be said to measure the k_r , which is likely to be equal to the k_e . Therefore, k_e should be used as k_r , but the latter would be lower than the former due to differences in flotation cost and due to dividend payment tax.

LO 11.6 COMPUTATION OF OVERALL COST OF CAPITAL

The calculations of the cost of specific sources, namely, debt, preference shares, equity shares and retained earnings have been shown in the preceding discussions. In this section we propose to dwell on the computation of the overall cost of capital. The term cost of capital means the overall composite cost of capital defined as **weighted average of the cost of each specific type of fund**. The use of *weighted average* and not the *simple average* is warranted by the fact that the proportions of various sources of funds in the capital structure of a firm are different. To be representative, therefore, the overall cost of capital should take into account the relative proportions of different sources and hence the *weighted average*.

Cost of retained earnings

is the same as the cost of an equivalent fully subscribed issue of additional shares, which is measured by the cost of equity capital.

Weighted average cost of capital

is the expected average future cost of funds over the long run found by weighting the cost of each specific type of capital by its proportion in the firm's capital structure.

The computation of the overall cost of capital (represented symbolically by k_o) involves the following steps:

1. Assigning weights to specific costs.
2. Multiplying the cost of each of the sources by the appropriate weights.
3. Dividing the total weighted cost by the total weights.

The crucial part of the exercise is the decision regarding appropriate weights and the related aspects. We first illustrate the relevant aspects of the choice of the weights. This is followed by the mechanics of computation of k_o which is relatively simple.

Assignment of Weights

The aspects relevant to the selection of appropriate weights are (i) Historical weights versus Marginal weights; (ii) Historical weights can be—(a) Book value weights or (b) Market value weights.

Historical versus Marginal Weights The first aspect of the decision regarding the selection of appropriate weights for computing the overall cost of capital is: which system of weighting—marginal or historical—is preferable? The critical assumption in any weighting system is that *the firm will raise capital in the specified proportions*.

Marginal Weights The use of **marginal weights** involves weighting the specific costs by the proportion of each type of fund to the total funds to be raised. The marginal weights represent the percentage share of different financing sources the firm intends to raise/employ. The basis of assigning relative weights is, therefore, new/additional/incremental issue of funds and, hence, marginal weights.

In using marginal weights, we are concerned with the actual amounts of each type of financing used in raising additional funds to finance new projects by the company. In fact, the use of marginal weights is more attuned to the actual process of financing projects. Another merit of marginal weights is that their use also reflects the fact that the firm does not have a great deal of control over the amount of financing obtained through retained earnings or other sources which are influenced by several factors, such as, temper of the market, investors' preference and so on.

- **Marginal weights**
- use proportion of
- each type of capital
- to the total capital
- to be raised.

What is the relative suitability of marginal weights to compute the overall cost of capital? The composite cost of capital is computed, it would be recalled, to be used as an investment criterion. The capital budgeting decision is concerned with the selection of new investment proposals. As already mentioned, the cost of capital, conceptually speaking, which is relevant is the cost of the new capital to be raised to finance the current capital expenditure decision, that is, marginal cost. It is, therefore, argued that the weights must correspond to the proportions of financing inputs the firm intends to employ, that is, the combined cost of capital should be calculated by employing marginal weights. If marginal weights are not used, the implication is that new capital is raised in proportions other than those used to calculate this cost. As a result,²² the real overall cost of capital will be different from that calculated and used for asset-selection decision. There is obviously a bias in the exercise. If the real cost is more than the calculated one, certain investment proposals will be accepted that will have the effect of leaving the investor worse off than before because the potential profitability has been overestimated. On the other hand, if the real cost is less than the measured cost, projects that could increase the shareholders' wealth would be rejected. Finally, the problem of choosing between book-value weights and market value weights does not arise in the case of marginal weights.

However, the marginal weighting system suffers from serious limitations. One major criticism²³ of the use of marginal weights is that this approach does not consider the long-term implications of the firm's current financing. Since capital expenditure decisions are long-term investments of the firm, attention should be given to the long-term implications of any financing strategy. Using cheaper

sources of funds to finance a given project may place the firm in a position where more expensive equity financing will have to be raised to finance a future project. For example, a firm may be able to sell debt at an after-tax cost of 9 per cent. If the best investment project has currently available returns of 10 per cent and the weighted average cost of capital based on marginal weights is used as a decision criterion, the project will be accepted. If next year, the firm must raise equity at a cost of 16 per cent, it will have to reject a project, returning 15 per cent. Thus, **the fact that today's financing affects tomorrow's cost is not considered in using marginal weights.**²⁴ In other words, the interrelationship among the various methods of financing is ignored if marginal weights are used to calculate the cost of capital.

Historic weights are based on actual capital structure proportion to calculate weights. **Historical Weights** The alternative to the use of marginal weights is to use **historical weights**. Here, the relative proportions of various sources to the existing capital structure are used to assign weights. In other words, the basis of the weighting system is the funds already employed by the firm. The use of the historical weights is based on the assumption that the firm's existing capital structure is optimal and, therefore, should be maintained in the future. That is, the firm should raise additional funds for financing investments in the same proportion as they are in the existing capital structure. In other words, the existing proportion of various sources of long-term funds will be followed whenever the firm raises additional long-term funds to finance new investment projects. For instance, if the present capital structure of firm has 30 per cent debts, 20 per cent preference shares, 40 per cent equity capital and 10 per cent retained earnings, the company will be assumed to raise incremental funds in the same proportion as it has done in the past. Assume further, that the firm requires additional funds amounting to ₹1,00,000 to finance a new project. It should be expected, according to the historical weighting system, to raise this sum from different sources in the proportion of 30 per cent (debt), 20 per cent (preference shares), 40 per cent (ordinary shares) and 10 per cent (retained earnings). The break-up of the amount source-wise would be: debt, ₹30,000; preference capital, ₹20,000; equity capital, ₹40,000 and retained earnings, ₹10,000.

The problem with historical weighting is that the validity of the assumptions on which it is based is open to question. That firms should raise additional funds from different sources in the same proportion in which they are in the existing capital structure implies that there are no constraints on raising funds from these sources. This is not correct. For instance, the amount of retained earnings may actually fall short of its required share in financing new projects because firms cannot have control over the retained earnings. Similarly, raising funds from the capital market depends on several factors such as the state of the economy, requirements of investors, temper of the market and so on, over which the firms have obviously no control. There are, thus, practical difficulties in applying historical weights. Yet another problem with the application of the historical weights is that a choice has to be made between the book value weights and market value weights.

As against the above limitations, the system of assigning weights on the basis of the existing capital structure has one outstanding merit. As a decision criterion, the weighted cost of capital based on historical weights takes into account a long-term view. If the cost thus calculated is 12 per cent, using it as a decision-criterion for capital budgeting decision, a project returning 13 per cent next year will be accepted. While it is true that firms actually raise funds in lump sum amounts from one or two sources at a time instead of all the available sources, the use of historical weights to calculate the overall weighted average cost of capital is more consistent with the firm's long-term goal of maximising the owner's wealth. Therefore, the use of historical weights is much more likely to lead to an optimal selection of capital investment projects in the long run.²⁵ It is probably for this reason that historical weights are commonly used to calculate the weighted cost of capital, and are treated as superior to marginal weights, which, as already indicated, ignore the long-term implications of the firm's current financing.

Book Value and Market Value Weights The second aspect of assigning weights to various sources of finance in calculating the composite cost of capital relates to the choice between book value weights and market value weights. This problem will arise only in the case of historical weights.

Both these methods have their own merits. In theory, the use of **market value weights** for calculating the cost of capital is more appealing than the use of book value weights because: (i) market values of securities closely approximate the actual amount to be received from their sale; (ii) the costs of the specific sources of finance which constitute the capital structure of the firm are calculated using prevailing market prices. However, there are practical difficulties in its use as calculating the market value of securities may present difficulties, particularly the market values of retained earnings. Moreover, weights based on market values are likely to fluctuate widely.

On the other hand, the merits of **book value weights** are operational in nature. For one thing, book values are readily available from the published records of the firm. Also, firms set their capital structure targets in terms of book values rather than market values. Finally, the analysis of capital structure in terms of debt-equity ratio is based on book value.

In brief, the alternatives—book values and market values of securities—have their own commendable features. While the book value is operationally convenient, the market value basis is theoretically consistent and sound, and therefore a better indicator of a firm's true capital structure.

- **Market value weights**
- use market values to measure the proportion of each type of capital to calculate weighted average cost of capital.

- **Book value weights**
- use accounting (book) values to measure the proportion of each type of capital to calculate the weighted average cost of capital.

Mechanics of Computation

Example 11.12 (Book Value Weights)

We now illustrate the mechanics of computation of the weighted average cost of capital.

- (a) A firm's after-tax cost of capital of the specific sources is as follows:
- | | | |
|--|----|----------|
| Cost of debt | 8 | per cent |
| Cost of preference shares (including dividend tax) | 14 | |
| Cost of equity funds | 17 | |

- (b) The following is the capital structure:

Source	Amount
Debt	₹3,00,000
Preference capital	2,00,000
Equity capital	5,00,000
	10,00,000

- (c) Calculate the weighted average cost of capital, k_0 , using book value weights.

Solution

TABLE 11.1 Computation of Weighted Average Cost of Capital (Book Value Weights)

Source of funds	Amount	Proportion	Cost (%)	Weighted cost (3 × 4)
(1)	(2)	(3)	(4)	(5)
Debt	₹3,00,000	0.3 (30)	0.08	0.024
Preference capital	2,00,000	0.2 (20)	0.14	0.028
Equity capital	5,00,000	0.5 (50)	0.17	0.085
	10,00,000	1.00 (100)		0.137
Weighted average cost of capital = 13.7 per cent				

An alternative method of determining the k_0 is to compute, as shown in Table 11.2, the total cost of capital and then divide this figure by the total capital. This procedure obviously avoids fractional calculations.

TABLE 11.2 Computation of Weighted Average Cost of Capital (Alternative Method)

Sources	Amount	Cost (%)	Total cost (2 × 3)
(1)	(2)	(3)	(4)
Debt	₹3,00,000	8	₹24,000
Preference capital	2,00,000	14	28,000
Equity capital	5,00,000	17	85,000
Total	10,00,000		1,37,000

Weighted average cost of capital = $\frac{₹1,37,000}{₹10,00,000} \times 100 = 13.7$ per cent

Example 11.13 (Market Value Weights)

From the information contained in Example 11.12, calculate the weighted average cost of capital, assuming that the market values of different sources of funds are as follows:

Source	Market value
Debt	₹2,70,000
Preference shares	2,30,000
Equity and retained earnings	7,50,000
Total	12,50,000

Solution

(1) The determination of the market value of retained earnings presents operational difficulties. The market value of retained earnings can be indirectly estimated. A possible criterion has been suggested by Gitman,²⁶ according to which, since retained earnings are treated as equity capital for purpose of calculation of cost of specific source of funds, the market value of the ordinary shares may be taken to represent the combined market value of equity shares and retained earnings. The separate market values of retained earnings and ordinary shares may be found by allocating to each of these a percentage of the total market value equal to their percentage share of the total based on book values.

On the basis of the foregoing criterion, the sum of ₹7,50,000 in Example 11.13 is allocated between equity capital and retained earnings as follows:

Source of funds	Book value	Per cent of book value	Market value
(1)	(2)	(3)	(4)
Equity shares	₹4,00,000	80	₹6,00,000*
Retained earnings	1,00,000	20	1,50,000**

* $(0.8 \times ₹7,50,000)$

** $(0.20 \times ₹7,50,000)$

(2) After the determination of market value, k_0 is calculated as shown in Table 11.3.

TABLE 11.3 Computation of Weighted Average Cost of Capital (Market Value Weights)

Sources	Market value	Cost (per cent)	Total cost (3 × 2)
(1)	(2)	(3)	(4)
Debt	₹2,70,000	8	₹21,600
Preference shares	2,30,000	14	32,200
Equity capital	6,00,000	17	1,02,000
Retained earnings	1,50,000	17	25,500
Total	12,50,000		1,81,300

$$k_0 = (\₹1,81,300 / ₹12,50,000) \times 100 = 14.5 \text{ per cent}$$

One notable point that emerges from the computation of the weighted average cost of capital based respectively on book value weights and market value weights is that the k_0 with market value weights is higher. This is mainly due to the fact that equity shares have market values considerably greater than their book values. Since these sources of long-term funds have higher specific costs, the overall cost increases.

In operational terms, if book value weighted average cost of capital is used, some projects would be accepted that would not be acceptable based on the market value approach. The results given by the market value based weights are obviously better as a decision criterion.

Example 11.14 (Marginal Weights)

The firm of Example 11.12 wishes to raise ₹5,00,000 for expansion of its plant. It estimates that ₹1,00,000 will be available as retained earnings and the balance of the additional funds will be raised as follows:

Long-term debt	₹3,00,000
Preference shares	1,00,000

Using marginal weights, compute the weighted average cost of capital.

Solution The computation is illustrated in Table 11.4.

TABLE 11.4 Weighted Average Cost of Capital (Marginal Weights)

Sources of funds	Amount	Proportion	Cost (%)	Total cost (2 × 4)
(1)	(2)	(3)	(4)	(5)
Debt	₹3,00,000	0.60 (60)	8	₹24,000
Preference shares	1,00,000	0.20 (20)	14	14,000
Retained earnings	1,00,000	0.20 (20)	17	17,000
	5,00,000	1.00 (100)		55,000

Weighted average cost of capital = (₹55,000/₹5,00,000) × 100 = 11 per cent

This cost is substantially lower than the weighted cost calculated using either book values or market values of historical weights. This is because debt finance has been used in large amount. Since only a limited amount of debt financing can be raised for a given equity base, it is quite likely that the firm will have to use primarily expensive equity financing for future projects. Obviously, this is not a happy situation because a project which gives a return of, say, 12 per cent this year will be accepted as the k_0 is only 11 per cent but next year another project which may give a higher return might have to be rejected because equity financing will imply/entail a higher k_0 . The use of historical market value weights in calculating k_0 is much more likely to lead to an optimal selection of capital investment projects in the long run and, therefore, it should be preferred as the basis of assigning weights to calculate the composite cost of capital.

LO 11.7

COST OF CAPITAL PRACTICES IN INDIA

The main features of the cost of capital practices followed by the corporates in India are as follows:

- The most frequently used (67 per cent of cases) discount rate (i.e., minimum acceptable/required rate of return) to evaluate capital budgeting decision is based on the overall cost (WACC) of the corporate. There is a preference for the use of market weights over book value weights by a vast majority of the sample companies.

- Depending on the risk characteristics of the project, multiple risk-adjusted discount rates are used by about one-fifth of the corporate enterprises.
- The specific cost of capital used to finance the project (i.e. if the discount rate for a project that will be financed entirely with retained earnings is the cost of retained funds) is used by one-fourth of the sample corporates.
- The CAPM is the most popular method of estimating the cost of equity capital (54 per cent). The Gordon's dividend model is equally popular method to compute the cost of equity capital (52 per cent). The earnings yield approach is used by one-third of the sample corporates to estimate the cost of equity capital. The use of the multi-factor model is used by very few corporates (7 per cent).
- A significant feature of the methods used to estimate the cost of equity capital is that while the CAPM is significantly used by the large corporates, the Gordon's discount model is more popular with small firms. Moreover, the highly profitable corporate (based on ROCE and EAV) give significantly low importance to dividend yield and earnings yield to compute the cost of equity capital than the less profitable corporates.
- The Government of India (GOI) 10-year bonds are the most widely used risk-free rate to compute the cost of capital using the CAPM approach. The industry average beta is the most popular measure of the systematic risk used by the corporates. Each of the published sources of beta and the self-calculated beta are also used by about one-fifth of the corporates respectively.
- The self-calculated beta is more popularly used by the large and/highly profitable corporates. The small and low profitable corporates rely more on the published sources of beta.
- The majority of corporates (two-thirds) considers the last 5-year monthly share price data to estimate the equity beta. The highly profitable firms use weekly share price data for the purpose.
- The average market risk premium (9-10 per cent) is the most widely used measure by the corporates. The average of historical return and the implied return on the market portfolio are also fairly popular as an input while using the CAPM.
- As regards the cost of debt, the most widely used method is the interest tax shield (i.e., tax advantage of interest on debt).
- While the majority of the corporates revise their estimates of cost of capital annually, some of the sample corporates continuously revise it with every investment.
- Apart from project choice criterion, the cost of capital is also used widely for (a) divisional performance measurement, (b) EVA computation and (c) CVA computations.
- Majority of the sample companies adopt theoretically sound and conceptually correct basis of determining the cost of capital, namely, the weighted average cost of long-term sources of finance. However, there is no systematic procedure followed to compute it. It is more likely to be subjective in nature. The Indian corporates use mix of the WACC, marginal cost of capital of additional funds and management judgment in this regard.
- There is wide divergence in the corporate practices as regards the computation of the cost of equity capital. About one-tenth of the corporates do not attach any cost to equity capital. Another one-tenth treat the cost of equity capital as equivalent to primary rate of return available on securities of balanced mutual funds and debentures issued by blue chip companies.
- However, the vast majority of companies (two-thirds of the sample) follow the conceptually sound methods (i.e. primary rate of return plus risk premium, dividend valuation model and CAPM) of determining the cost of equity capital.
- About one-fifth of the sample corporates consider retained earnings as a cost-free source of finance. However, a sizeable proportion of the sample companies (75 per cent) regard cost of retained earnings either as equivalent to opportunity cost of using these funds by the corporate/equity-holders or equal to the cost of equity capital.

SUMMARY

The cost of capital is an integral part of investment decisions as it is used to measure the worth of investment proposal. It is used as a discount rate in determining the present value of future cash flows associated with capital projects. Conceptually, it is the minimum rate of return that a firm must earn on its investments so as to leave market price of its shares unchanged. It is also referred to as cut-off rate, target rate, hurdle rate, required rate of return and so on.

In operational terms, it is defined as the weighted average cost of capital (k_0) of all long-term sources of finance. The major long-term sources of funds are (i) debt, (ii) preference shares, (iii) equity capital, and (iv) retained earnings. Thus, it comprises of several components in terms of specific cost of each source of finance. When these specific costs are combined, it results in the weighted average cost of capital.

LO 11.1

The cost of capital can be explicit or implicit. The explicit cost of capital is associated with the raising of funds (from debt, preference shares and equity). The explicit cost of any source of capital (C) is the discount rate that equates the present value of the cash inflows (CI_t) that are incremental to the taking of financing opportunity with the present value of its incremental cash outflows (CO_t). Symbolically,

$$CI_0 = \sum_{t=1}^n \frac{CO_t}{(1+C)^t}$$

Its determination is similar to the determination of the internal rate of return (IRR). It is the internal rate of return that the firm pays to procure financing.

Retained earnings involve no future cash flows to, or from, the firm. Therefore, the retained earnings do not have explicit cost. However, they carry implicit cost in terms of the opportunity cost of the foregone alternative (s) in terms of the rate of return at which the shareholders could have invested these funds had they been distributed to them/or not retained by the firm.

There are four types of specific costs, namely, cost of debt (k_d), cost of preference shares (k_p), cost of equity capital (k_e) and cost of retained earnings (k_r).

The debt carries a certain rate of interest. Interest qualifies for tax deduction in determining tax liability. Therefore, the effective cost of debt is less than the actual interest payment made by the firm by the amount of tax shield it provides. The debt can be either perpetual or redeemable.

In the case of perpetual debt, it is computed dividing effective interest payment, i.e., $I(1-t)$ by the

amount of debt/sale proceeds of debentures or bonds (SV). Symbolically, $K_d = \frac{I(1-t)}{SV}$

In the case of redeemable debt, the repayment of debt principal (COP) either in instalments or in lump sum (besides interest, COI) is also taken into account. k_d is computed based on the following equations:

LO 11.2

$$CI_0 = \sum_{t=1}^n \frac{COI_t}{(1+k_d)^t} (1-t) + \frac{COP_n}{(1+k_d)^n} \quad (\text{When principal is paid in lump sum})$$

$$\text{Alternatively, } K_d = \frac{I(1-t) + (\text{Redeemable value, } RV - SV/N)}{(RV + SV)/2}$$

$$CI_0 = \sum_{t=1}^n \frac{COI_t}{(1+k_d)^t} (1-t) + \frac{COP_t}{(1+k_d)^t} \quad (\text{When debt is paid in instalments})$$

The cost of debt is generally the lowest among all sources partly because the risk involved is low but mainly because interest paid on debt is tax deductible.

The cost of preference share (k_p) is akin to k_d . However, unlike interest payment on debt, dividend payable on preference shares is not tax deductible from the point of view assessing tax liability. On the contrary, tax (Df) may be required to be paid on the payment of preference dividend.

The k_p in the case of irredeemable preference shares is based on dividends payable on them and the sale proceeds obtained by issuing such preference shares, $P_0(1-f)$. In terms of equation:

$$K_p = \frac{D_p(1+Dt)}{P_0(1-f)}$$

LO 11.3

The k_p for redeemable preference shares requiring lump sum repayment (P) is determined on the basis of the following equation:

$$P_0(1-f) = \sum_{t=1}^n \frac{D_p(1+Dt)}{(1+k_p)^t} + \frac{P_n}{(1+k_p)^n}$$

In the case of repayment required in instalments:

$$P_0(1-f) = \sum_{t=1}^n \frac{D_p(1+Dt)}{(1+k_p)^t} + \frac{P_t}{(1+k_p)^t}$$

Cost of preference shares would be higher due to dividend distribution tax (with effect from April 1, 2018, the rate is 20.36 per cent).

The computation of cost of equity capital (k_e) is conceptually more difficult as the return to the equity-holders solely depends upon the discretion of the company management. It is defined as the minimum rate of return that a corporate must earn on the equity-financed portion of an investment project in order to leave unchanged the market price of the shares.

There are three approaches to measure k_e : (i) the dividend valuation model approach, (ii) capital asset pricing model (CAPM) approach and (iii) debt-yield plus risk premium approach.

As per the dividend approach, k_e is defined as the discount rate that equates the present value of all expected future dividends per share with the net proceeds of the sale (or the current market price) of a share. In equation terms,

$$P_0(1-f) = \sum_{t=1}^n \frac{D_1(1+g)^{t-1}}{(1+k_e)^t} \quad \text{Or, } k_e = \frac{D_1}{P_0(1-f)} + g$$

LO 11.4

The CAPM describes the relationship between the required rate of return or the cost of equity capital and the non-diversifiable or relevant risk of the firm as reflected in its index of non-diversifiable risk, that is, beta. Symbolically,

$$K_e = R_f + b(K_m - R_f),$$

R_f = Required rate of return on risk-free investment

b = Beta coefficient**, and

K_m = Required rate of return on market portfolio, that is, the average rate or return on all assets

$$** = \frac{\sum MJ - N\bar{M}\bar{J}}{\sum M^2 - N\bar{M}^2}, \text{ where}$$

M = Excess in market return over risk-free rate,

J = Excess in security returns over risk-free rate,

MJ = Cross product of M and J and

N = Number of years

As per debt-yield plus risk premium approach, cost of equity is equal to judgemental risk premium of 3 to 5 percentage points + interest rate paid by the firm on its own long-term debt.

LO 11.5

The cost of retained earning (k_r) is equally difficult to calculate in theoretical terms. Since retained earnings essentially involves use of funds, it is associated with an opportunity/implicit cost. The alternative to retained earnings is the investment of the funds by the firm itself in a homogeneous outside investment. Therefore, k_r is equal to k_e . However, it might be slightly lower than k_e in the case of new equity issue due to flotation costs.

LO 11.6

The measurement of the weighted average/overall cost of capital (k_0) involves the choice of appropriate weights. The two systems of assigning weights, namely, historical and marginal, have their own suitability but historical weights appear to be superior to marginal weights as the former take into account the long-term implications of the firm's current financing. With historical weights, a choice is to be made between book value and market value weights. While the book value weights are operationally convenient, the market value basis is theoretically consistent and sound, and therefore, a better indicator of firm's capital structure.

The k_0 is computed based on the following equation:

$$K_0 = K_d W_d + K_p W_p + K_e W_e + K_r W_r$$

W_d = Percentage of debt to total capital,

W_p = Percentage of preference shares to total capital,

W_e = Percentage of external equity to total capital and

W_r = Percentage of retained earnings to total capital

10. This apart, there may be additional tax advantage on account of amortisation of flotation costs. For instance, Sec. 35D of the Indian Income Tax Act provides that the aggregate amount of qualifying expenditure under the head of preliminary expenses (of which flotation cost is only one part) is available for amortisation in 10 equal instalments over a period of 10 years, subject to the limit 2.5 per cent of the cost of the project or capital employed. To keep the discussion simple, we have ignored these adjustments. However, in practice, cost of capital should be calculated after providing for the tax benefits accruing out of amortisation of flotation costs.

SOLVED PROBLEMS

P.11.1 Calculate the explicit cost of debt for each of the following situations:

LO 11.2 LOD
M

- (a) Debentures are sold at par and flotation costs are 5 per cent.
 (b) Debentures are sold at premium of 10 per cent and flotation costs are 5 per cent of issue price.
 (c) Debentures are sold at discount of 5 per cent and flotation costs are 5 per cent of issue price.

Assume: (i) coupon rate of interest on debentures is 10 per cent; (ii) face value of debentures is ₹100; (iii) maturity period is 10 years; and (iv) tax rate is 35 per cent.

Solution

$$(a) \quad k_d = \frac{I(1-t) + (RV - SV)/N}{(RV + SV)/2} = \frac{₹10(1-0.35) + (₹100 - ₹95)/10}{(₹100 + 95)/2} = 7.18 \text{ per cent}$$

$$\text{Alternatively, } CI_o = \sum_{t=1}^n \frac{COI_t}{(1+k_d)^t} + \frac{COP_n}{(1+k_d)^n}$$

$$₹95 = \sum_{t=1}^{10} \frac{₹10(1-0.35)}{(1+k_d)^t} + \frac{₹100}{(1+k_d)^{10}}$$

Year	CO	PVIFA at		Total PV at	
		7%	8%	7%	8%
1-10	₹6.5	7.024	6.710	₹45.66	₹43.61
10	100	0.508	0.463	50.80	46.30
				96.46	89.91

By interpolation, $k_d = 7\% + (₹1.46/6.55 = 0.22) = 7.22$ per cent

$$(b) \quad k_d = \frac{₹6.5 + (₹100 - ₹104.50)/10}{(₹100 + 104.50)/2} = 5.92 \text{ per cent}$$

$$\text{Alternatively, } ₹104.50 = \sum_{t=1}^n \frac{₹6.5}{(1+k_d)^t} + \frac{₹100}{(1+k_d)^{10}}$$

Year	CO	PVIFA at		Total PV at	
		5%	6%	5%	6%
1-10	₹6.5	7.722	7.360	₹50.19	₹47.84
10	100	0.614	0.558	61.40	55.80
				111.59	103.64

By interpolation, $k_d = 6\% - (₹0.86/7.95 = 0.11) = 5.89$ per cent

$$(c) \quad k_d = \frac{₹6.5 + (₹100 - ₹90.25)/10}{(₹100 + 90.25)/2} = 7.86 \text{ per cent}$$

$$\text{Alternatively, } ₹90.25 = \sum_{t=1}^{10} \frac{₹6.5}{(1+k_d)^t} + \frac{₹100}{(1+k_d)^{10}}$$

Year	CO	PVIFA at		Total PV at	
		7%	8%	7%	8%
1-10	₹6.5	7.024	6.710	₹45.66	₹43.61
10	100	0.508	0.463	50.80	46.30
				96.46	89.91

$k_d = 8\% - (\₹0.34/6.55 = 0.05) = 7.95$ per cent

P.11.2 Assume everything to be the same in P.11.1 (a) and (b) except that debentures are to be repaid in 10 equal annual instalments commencing from the year-end 1. Determine the cost of debt.

LO 11.2 LOD M

Solution

(i) $\₹95 = \sum_{t=1}^{10} \frac{COI_t + COP_t}{(1 + k_d)^t}$

Year	Cash outflows	PVIFA at		Total PV at	
		7%	8%	7%	8%
1	₹16.5 [⊙]	0.935	0.926	₹15.43	₹15.28
2	15.85 ^{⊙⊙}	0.873	0.857	13.84	13.58
3	15.20	0.816	0.794	12.40	12.07
4	14.55	0.763	0.735	11.10	10.69
5	13.90	0.713	0.681	9.91	9.47
6	13.25	0.666	0.630	8.82	8.35
7	12.60	0.623	0.583	7.85	7.35
8	11.95	0.582	0.540	6.95	6.45
9	11.30	0.544	0.500	6.15	5.65
10	10.65	0.508	0.463	5.41	4.93
				97.86	93.82

Cost of debt = 7% + (₹2.86/4.04 = 0.71) = 7.71 per cent

[⊙]₹100 ÷ 10 years = ₹10 + ₹10 interest (1 - 0.35) on ₹100 = ₹16.5

^{⊙⊙}₹10 + ₹9 interest (1 - 0.35) on ₹90 = ₹15.85

(ii) $\₹104.50 = \sum_{t=1}^{10} \frac{COI_t + COP_t}{(1 + k_d)^t}$

Year	Cash outflows	PVIFA at		Total PV at	
		5%	6%	5%	6%
1	₹16.50	0.952	0.943	₹15.71	₹15.56
2	15.85	0.907	0.890	14.38	14.11
3	15.20	0.864	0.840	13.13	12.77
4	14.55	0.823	0.792	11.97	11.52
5	13.90	0.784	0.747	10.89	10.38
6	13.25	0.746	0.705	9.88	9.34
7	12.60	0.711	0.665	8.38	8.38
8	11.95	0.677	0.627	8.09	7.49
9	11.30	0.645	0.592	7.29	6.69
10	10.65	0.614	0.558	6.54	5.94
				106.26	102.18

$k_d = 5\% + (\₹1.76/4.08 = 0.43) = 5.43$ per cent

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author details the various methods used to collect and analyze the data. This includes both manual and automated processes. The manual process involves reviewing each entry individually, while the automated process uses software to identify patterns and anomalies.

The third section describes the results of the analysis. It shows that there are several areas where the data is inconsistent or incomplete. These areas are highlighted in the accompanying tables, which provide a detailed breakdown of the findings.

Finally, the document concludes with a series of recommendations for improving the data collection and analysis process. These include implementing more rigorous controls, using more advanced software tools, and providing additional training for the staff involved.

The following table provides a summary of the data collected during the analysis. It shows the number of entries for each category and the total amount involved.

Category	Number of Entries	Total Amount
Category A	15	\$1,200.00
Category B	20	\$1,500.00
Category C	10	\$800.00
Category D	5	\$400.00
Category E	3	\$250.00
Total	53	\$4,150.00

The second table provides a more detailed breakdown of the data, showing the number of entries and the total amount for each sub-category.

Sub-Category	Number of Entries	Total Amount
Sub-Category A.1	8	\$600.00
Sub-Category A.2	7	\$600.00
Sub-Category B.1	10	\$750.00
Sub-Category B.2	10	\$750.00
Sub-Category C.1	5	\$400.00
Sub-Category C.2	5	\$400.00
Sub-Category D.1	3	\$250.00
Sub-Category D.2	2	\$150.00
Total	53	\$4,150.00

The final section of the document discusses the implications of the findings. It notes that the inconsistencies identified in the data could lead to significant errors in financial reporting if not addressed. Therefore, it is crucial that the recommended improvements are implemented as soon as possible.

P.11.3 (a) A company's debentures of the face value of ₹100 bear an 8 per cent coupon rate. Debentures of this type currently yield 10 per cent. What is the market price of debentures of the company?

LO 11.2 **LOD M**

(b) What would happen to the market price of the debentures if interest rises to (i) 16 per cent, and (ii) drops to 12 per cent?

(c) What would be the market price of the debentures in situation (a) if it is assumed that debentures were originally having a 15 year maturity period and the maturity period is 4 years away from now?

(d) Would you pay ₹90 to purchase debentures specified in situation (c)? Explain.

Solution

(a) The market price of the debenture, $V_d = \frac{\text{Interest on debentures } (I)}{\text{Current interest rate } (k_t)} = \frac{₹8}{0.10} = ₹80$.

(b) (i) $V_d = \frac{₹8}{0.16} = ₹50$, (ii) $V_d = \frac{₹8}{0.12} = ₹66.67$

(c) Determine the PV of (i) interest to be received on these debentures for a period of 4 years and (ii) principal repayment of ₹100 at the end of the fourth year using the current interest rate, that is, 10 per cent as discount rate.

Year	Cash outflows before taxes	PV factor at 10%	Total PV
1-4	₹8	3.170 (Table A-4)	₹25.36
4	100	0.683 (Table A-3)	68.30
			<u>93.66</u>

The market price of the debentures = ₹93.66.

(d) Yes, we would pay ₹90 for the purchase of debentures because its current worth (₹93.66) is more than the purchase price.

P.11.4 The Elu Ltd is contemplating a debenture issue on the following terms:

LO 11.2 **LOD D**

Face value	:	₹100 per debenture
Term of maturity	:	7 years
Yearly coupon rate of interest		
Years 1 - 2	:	9 per cent
3 - 4	:	10
5 - 7	:	11

The current market rate on similar debentures is 11 per cent per annum. The company proposes to price the issue so as to yield a (compounded) return of 12 per cent per annum to the investors. Determine the issue price. Assume redemption at a premium of 5 per cent on face value.

Solution

The issue price of debenture will be the sum of (i) PV of interest payments during 1-7 years and (ii) PV of maturity value of debenture in the seventh year:

Year	Cash outflows	PVIF at 12%	Total PV
1	₹9	0.893	₹8.037
2	9	0.797	7.173
3	10	0.712	7.120
4	10	0.636	6.360
5	11	0.567	6.237
6	11	0.507	5.577
7	116*	0.452	52.432
			<u>92.936</u>

*Inclusive of ₹105 maturity value of debentures.

Issue price of debenture should be ₹93.

P.11.5 A company is considering raising ₹100 lakh by one of the two alternative methods, viz. 14 per cent institutional term loan and 13 per cent non-convertible debentures. The term loan option would attract no major incidental cost. The debentures would have to be issued at a discount of 2.5 per cent and would involve ₹1 lakh as cost of issue.

LO 11.2 LOD E

Advise the company as to the better option based on the effective cost of capital in each case. Assume a tax rate of 35 per cent.

Solution

(i) Cost of 14 per cent institutional term loan: ₹14 lakh (1 - 0.35)/₹100 lakh = 9.1 per cent

(ii) Cost of 13 per cent non-convertible debentures: ₹13 lakh (1 - 0.35)/₹96.50 lakh* = 8.76 per cent
 (*₹100 lakhs - ₹2.5 lakh discount - ₹1 lakh cost of issue).

Recommendation Raising of funds through non-convertible debentures is a better option.

P.11.6 ABC Ltd. has issued 14% Preference shares of face value of ₹100 each at a premium of 10% to be redeemed after 6 years at a premium of 3 per cent. Flotation cost is expected to be ₹1 per share. Determine cost of preference shares by both the methods. Out of the two costs, which do you consider more precise? Ignore dividend payment tax.

LO 11.3 LOD M

Solution

$$(i) K_p = \frac{D_p + [RV - (SV - f)]/N}{[RV + (SV - f)]/2}$$

$$= \frac{₹14 + [₹103 - (₹110 - ₹1)]/6}{[₹103 + (110 - 1)]/2} = \frac{₹14 - ₹21}{₹106} = 12.26\%$$

Cost of preference share is 12.26 per cent.

$$(ii) k_p = \sum_{t=1}^6 \frac{COD_t}{(1 + k_p)^t} + \frac{COP_6}{(1 + k_p)^6}$$

$$₹109 = \sum_{t=1}^6 \frac{₹14_t}{(1 + k_p)^t} + \frac{₹103}{(1 + k_p)^6}$$

Year	COAT	PVIFA at		Total PV at	
		12%	13%	12%	13%
1-6	₹14	4.111	3.998	57.55	55.97
6	103	0.507	0.480	52.22	49.44
				109.77	105.41

$$k_p = 12\% + (0.77/109.77 - 105.41 = 4.36) = 12\% + 0.18\% = 12.18\%$$

Cost of preference share at 12.18 per cent is more precise/accurate.

P.11.7 XYZ company is planning for an issue of 13% Preference shares of ₹100 each redeemable at 8 per cent premium after 8 years. They are expected to be sold at premium of 2 per cent. The likely flotation cost is ₹2 per share. Determine cost of preference share capital assuming dividend payment tax of 17 per cent, using both the methods.

LO 11.3 LOD M

Solution

$$(i) k_p = \frac{D_p(1 + DPr) + [RV - (SV - f)]/N}{[RV + (SV - f)]/2}$$

$$= \frac{₹13(1.17) + [₹108 - (₹102 - ₹2)]/8}{(₹108 + ₹100)/2}$$

$$\frac{₹15.21 + ₹1}{104} = \frac{₹16.21}{104} = 15.58 \text{ per cent}$$

1. The first part of the report deals with the general situation of the country and the progress of the work during the year. It is followed by a detailed account of the various projects and the results achieved.

2. The second part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

Project	Progress	Results
Project A	Completed	100%
Project B	In Progress	75%
Project C	Not Started	0%

3. The third part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

4. The fourth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

Project	Progress	Results
Project A	Completed	100%
Project B	In Progress	75%
Project C	Not Started	0%

5. The fifth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

6. The sixth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

7. The seventh part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

Project	Progress	Results
Project A	Completed	100%
Project B	In Progress	75%

8. The eighth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

9. The ninth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

Project	Progress	Results
Project A	Completed	100%
Project B	In Progress	75%
Project C	Not Started	0%

10. The tenth part of the report is devoted to a detailed description of the various projects and the results achieved. It is followed by a detailed account of the various projects and the results achieved.

$$(ii) k_p = \sum_{t=1}^8 \frac{COD_t}{(1+k_p)^t} + \frac{COP_B}{(1+k_p)^8}$$

$$₹100 = \sum_{t=1}^8 \frac{₹115.21_t}{(1+k_p)^t} + \frac{₹108}{(1+k_p)^8}$$

Year	COAT	PVIFA at		Total PV at	
		15%	16%	15%	16%
1-8	₹15.21	4.487	4.344	₹68.25	₹66.07
8	108	0.327	0.305	35.32	32.94
				103.57	99.01

$$k_p = 15\% + (3.57 / 103.57 - 99.01 = 4.56) = 15\% + 0.78\% = 15.78\%$$

P.11.8 From the following information, determine the cost of equity capital using the CAPM approach.

- Required rate of return on risk-free security, 8 per cent.
- Required rate of return on market portfolio of investment is 13 per cent.
- The firm's beta is 1.6.

LO 11.4 **LOD E**

Solution $k_e = R_f + b(K_m - R_f)$

$$= 0.08 + 1.6(0.13 - 0.08) = 16.0 \text{ per cent}$$

P.11.9 The beta coefficient of Target Ltd is 1.4. The company has been maintaining 8 per cent rate of growth in dividends and earnings. The last dividend paid was ₹4 per share. The return on government securities is 10 per cent while the return on market portfolio is 15 per cent. The current market price of one share of Target Ltd. is ₹36.

LO 11.4 **LOD M**

- What will be the equilibrium price per share of Target Ltd?
- Would you advise purchasing the share?

Solution

(a) The required rate of return (k_e) = $R_f + b(k_m - R_f) = 10\% + 1.4(15\% - 10\%) = 17$ per cent

$$\text{Equilibrium price per share } (P_e) = \frac{D_1}{k_e - g} = \frac{₹4(1.08)}{17\% - 8\%} = ₹48$$

(b) The share of Target Ltd is worth buying as it is undervalued.

P.11.10 Consider the following figures pertaining to risk free rate, market rate and return rate of a security of A Ltd during the last 6 years.

LO 11.4 **LOD M**

Year	Risk-free rate (R_f)	Market rate (R_m)	Security return (R_j)
1	0.06	0.14	0.08
2	0.05	0.03	0.11
3	0.07	0.21	0.29
4	0.08	0.26	0.25
5	0.09	0.03	0.07
6	0.07	0.11	0.04

On the basis of the above information, you are required to determine the cost of equity capital in the context of CAPM. Past data may be taken as proxy for the future.

Solution

Determination of various required values under CAPM approach

Year	Risk-free rate (R_f)	Market return (K_m)	Excess in market returns (M) [col.3 - col.2]	(M) ²	Security return (R_j)	Excess in security return (J) [col.6 - col.5]	Cross product (MJ) [col.4 × col.7]
1	2	3	4	5	6	7	8
1	0.06	0.14	0.08	0.0064	0.08	0.02	0.0016
2	0.05	0.03	(0.02)	0.0004	0.11	0.06	(0.0012)
3	0.07	0.21	0.14	0.0196	0.29	0.22	0.0308
4	0.08	0.26	0.18	0.0324	0.25	0.17	0.0306
5	0.09	0.03	(0.06)	0.0036	0.07	(0.02)	0.0012
6	0.07	0.11	0.04	0.0016	0.04	(0.03)	(0.0012)
Total	0.42	0.78	0.36	0.0640		0.42	0.0618
Average return	0.07	0.13	0.06	—		0.07	—

Figures in brackets represent negative returns.

$$b = \frac{\sum MJ - N\bar{M}\bar{J}}{\sum M^2 - N\bar{M}^2} = \frac{0.0618 - 6(0.06 \times 0.07)}{0.0640 - 6 \times (0.06)^2} = \frac{0.0366}{0.0424} = 0.863$$

$$k_e = R_f + b(k_m - R_f) = 0.07 + 0.863(0.13 - 0.07) = 12.18 \text{ per cent}$$

P.11.11 Investors require a 12 per cent rate of return on equity shares of company Y. What would be the market price of the shares if the previous dividend (D_0) was ₹2 and investors expect dividends to grow at a constant rate of (a) 4% (b) 0% (c) -4% (d) 11% (e) 12% and (f) 14%?

LO 11.4 **LOD M**

Solution

$$(a) P_0 = \frac{₹ 2.08}{12\% - 4\%} = ₹ 26,$$

$$(d) = \frac{₹ 2.22}{12\% - 11\%} = 222,$$

$$(b) = \frac{₹ 2.00}{12\%} = 16.67,$$

$$(e) = \frac{₹ 2.24}{12\% - 12\%} = \text{Undefined and}$$

$$(c) = \frac{₹ 1.92}{12\% - (-4\%)} = 12,$$

$$(f) = \frac{₹ 2.28}{12\% - 14\%} = (114), \text{ which is ridiculous (price cannot be negative).}$$

The results in situation (e) and (f) show that the formula does not make sense if k_e is less than or equal to the growth rate.

P.11.12 A mining company's iron ore reserves are being depleted, and its cost of recovering a declining quantity of iron ore are rising each year. As a consequence, the company's earnings and dividends are declining, at a rate of 8 per cent per year. If the previous year's dividend was ₹10 and the required rate of return is 15 per cent, what would be the current price of the equity share of the company?

LO 11.4 **LOD E**

Solution

$$P_0 = \frac{₹ 9.20}{15\% + 8\%} = ₹ 40$$

The current price of the equity shares of the mining company would be ₹40.

P.11.13 The Chemicals and Fertilisers Ltd. has been growing at a rate of 18 per cent per year in recent years. This abnormal growth rate is expected to continue for another 4 years; then it is likely to grow at the normal rate (g_n) of 6 per cent. The required rate of return on the shares by the investment

LO 11.4 **LOD D**

community is 12 per cent, and the dividend paid per share last year was ₹3 ($D_0 = ₹3$). At what price, would you, as an investor, be ready to buy the shares of this company now ($t = 0$), and at the end of years 1, 2, 3 and 4, respectively? Will there be any extra advantage by buying at $t = 0$, or in any of the subsequent four years, assuming all other things remain unchanged?

Solution

Year	$D_0(1 + g)^t = D_t$	PV factor (0.12)	Total PV
1	₹3(1 + 0.18) ¹ = ₹3.54	0.893	₹3.161
2	3(1 + 0.18) ² = 4.176	0.797	3.328
3	3(1 + 0.18) ³ = 4.929	0.712	3.509
4	3(1 + 0.18) ⁴ = 5.817	0.636	3.700
Total PV of dividends			13.7

$$P_4 = D_4 / (K_e - g) = D_4(1 + g_n) / 0.06 = ₹5.817(1.06) / 0.06 = ₹102.76.$$

PV of ₹102.76 would be ₹102.76 × 0.636 (PV factor at 0.12 for four years) = ₹65.36

$$P_0 = ₹65.36 + ₹13.7 = ₹79$$

I, as an investor, would be prepared to buy the shares of this company at a price less than ₹79 at $t = 0$.

$$P_1 = PVD_2 + PVD_3 + PVD_4 + PVP_4$$

Year	Dividends	PV factor (0.12)	Total PV
2	$D_2 = ₹4.176$	0.893	₹3.729
3	$D_3 = 4.929$	0.797	3.928
4	$D_4 = 5.817$	0.712	4.142
Total PV of dividends			11.80

PV of share at the end of year 1 would be: ₹102.76 × 0.712 (PV factor for 3 years) = ₹73.17.

$$P_1 = ₹11.80 + ₹73.17 = ₹84.97$$

$$P_2 = PVD_3 + PVD_4 + PVP_4$$

Year	Dividends	PV factor (0.12)	Total PV
3	$D_3 = ₹4.929$	0.893	₹4.402
4	$D_4 = 5.817$	0.797	4.636
Total PV of dividends			9.04

PV of share at the end of year 2 would be = ₹102.76 × 0.797 (PV factor for 2 years) = ₹81.90.

$$P_2 = ₹81.90 + ₹9.04 = 90.94$$

$$P_3 = PVD_4 + PVP_4$$

Year	Cash flows	PV factor (0.12)	Total PV
3	$D_4 = ₹5.817$	0.893	₹5.195
4	$P_4 = 102.76$	0.893	91.764
	$P_3 =$		96.96
	$P_4 =$		102.76

There will be no extra advantage by buying shares in any of the subsequent 4 years.

P.11.14 The shares of a chemical company are selling at ₹20 per share. The firm had paid dividend @ ₹2 per share last year. The estimated growth of the company is approximately 5 per cent per year.

(a) Determine the cost of equity capital of the company.

(b) Determine the estimated market price of the equity shares if the anticipated growth rate of the firm

(i) rises to 8 per cent, and (ii) falls to 3 per cent.

LO 11.4 **LOD E**

Solution (a) $k_e = (D_1/P_0) + g = (\text{₹}2.10/\text{₹}20) + 0.05 = 15.5$ per cent

(b) (i) $P_0 = D/(k_e - g) = \text{₹}2.16/0.075 = \text{₹}28.80$

(ii) $P_0 = \text{₹}1.94/0.185 = \text{₹}10.49$

P.11.15 An investor has invested in a company which is growing at an above average rate, translated to an annual increase in dividends of 20 per cent for 15 years. Thereafter, dividend growth returns to an average rate of 7 per cent. The capitalisation rate of the company is 9 per cent and the current dividend per equity share is ₹1 per share. Determine the value of the equity shares. LO 11.4 LOD M

Solution The value of the equity shares will be the sum of: (i) PV of dividend payments during 1-15 years and (ii) PV of expected market price at the end of the fifteenth year, based on a constant growth of 7 per cent. Present value of dividends, years 1-15

Years	Dividend	PVIF (0.09)	Total PV
1	₹1.20	0.917	₹1.100
2	1.44	0.842	1.212
3	1.728	0.772	1.334
4	2.074	0.708	1.468
5	2.488	0.650	1.617
6	2.986	0.596	1.780
7	3.583	0.547	1.960
8	4.300	0.502	2.159
9	5.160	0.460	2.374
10	6.192	0.422	2.613
11	7.430	0.388	2.883
12	8.916	0.356	3.174
13	10.700	0.326	3.488
14	12.839	0.299	3.839
15	15.407	0.275	4.237
			35.238

$$P_{15} = D_{16}/(k_e - g) = \frac{\text{₹}15.407(1.07)}{9\% - 7\%} = \text{₹}824.25$$

PV of ₹824.25 at $t = 0 = \text{₹}824.25 \times 0.275 = \text{₹}226.67$

Value of equity shares = ₹35.24 + ₹226.67 = ₹261.91.

P.11.16 Analyst X is looking for including common stock of ABC Ltd in his client portfolio. The current price of its common stock is ₹16. So he gathered the following information in order to calculate cost of equity of ABC Ltd. LO 11.4 LOD D

Balance sheet as on 31st March 2014

Liabilities	Amount(₹)	Assets	Amount(₹)
Equity capital (₹15 per share)	15,00,000	Net fixed assets	22,00,000
10% Debt	6,00,000	Current assets	11,00,000
Retained earnings	10,00,000		
Current liabilities	2,00,000		
33,00,000		33,00,000	

In the current year, company sold 24,000 units each at a price of ₹50, which includes 10% variable cost. Total fixed costs incurred by company during the year is ₹6,80,000. Corporate tax rate is 35% and dividend payout ratio is 40%. He then gathered following figures pertaining to risk free rate and market return during the last six years.

Year	1	2	3	4	5	6
Risk free rate (R_f)	6%	5	7	8	7	9
Market rate (R_m)	14%	10	16	17	9	18

Debt yield on long term Government bond having maturity greater than 10 years is 7.5% and risk premium for such a company is 4%. Assuming β for this company is 0.85, calculate cost of equity for ABC Ltd using various approaches. Determine K_e based on the average of all approaches.

Solution

Income Statement for the Current Year Ending March, 2014

Sales (24,000 × ₹50)	₹12,00,000
Less Variable cost(10% of sales)	1,20,000
Less Fixed Cost	6,80,000
EBIT	4,00,000
Less interest (10% of ₹6,00,000)	60,000
EBT	3,40,000
Less Taxes (35%)	1,19,000
EAT	2,21,000
Number of equity shares	1,00,000
EPS	₹2.21
Dividend Per Share (0.40 × EPS)	0.88
ROE (EAT/Total Equity) × 100	8.84%

Business Risk (B_r) = Degree of operating leverage = $(\text{Sales} - \text{VC})/(\text{Sales} - \text{VC} - \text{FC})$
 $= (\text{₹}12,00,000 - 1,20,000)/(\text{₹}12,00,000 - \text{₹}1,20,000 - \text{₹}6,80,000) = 2.7$

Financial Risk (F_r) = Degree of Financial leverage = $\text{EBIT}/(\text{EBIT} - \text{I}) = \text{₹}4,00,000/(\text{₹}4,00,000 - \text{₹}60,000) = 1.76$
 Determination of cost of equity (K_e)

- Calculating K_e using first approach

$K_e = R_f + B_r + F_r$ (Risk Free Rate + Business risk premium equivalent to DOL + Financial risk premium equivalent to DFL)
 $= 7\% + 2.7\% + 1.18 = 10.88\%$

- Calculating K_e using second approach

$K_e = \text{Debt yield on long-term bonds} + \text{Risk premium}$
 $= 7.5\% + 4\% = 11.5\%$

- Calculating K_e using third approach (CAPM)

Year	1	2	3	4	5	6	Average
Risk free rate (R_f)	6%	5	7	8	7	9	7
Market rate (R_m)	14%	10	16	17	9	18	14

$K_e = R_f + \beta(R_m - R_f)$
 $= 7\% + 0.85\% (14\% - 7\%) = 12.95\%$

- Calculating K_e using fourth approach (Dividend discount model)

$$K_e = \frac{D_1}{P_0} + g$$

$$g = \text{RR} \times \text{ROE}$$

$$\text{RR} = 1 - \text{Dividend payout ratio}$$

$$= 1 - 0.4 = 0.6$$

$$ROE = 8.84\%$$

$$g = 0.6 \times 0.0884 = 5.30\%$$

$$D_1 = 0.88 \times (1 + 0.053) = 0.92$$

$$K_e = \frac{0.92}{16} + 0.053 = 11.05\%$$

K_e based on average of K_e of all 4 approaches

$$K_e = (10.88\% + 11.5\% + 12.95\% + 11.05\%)/4 = 11.60\%$$

P.11.17 A company has on its books the following amounts and specific costs of each type of capital.

Type of capital	Book value	Market value	Specific costs (%)
Debt	₹4,00,000	₹3,80,000	5
Preference	1,00,000	1,10,000	8
Equity	6,00,000		15
Retained earnings	2,00,000	12,00,000	13
	13,00,000	16,90,000	

Determine the weighted average cost of capital using (a) Book value weights and, (b) Market value weights. How are they different? Can you think of a situation where the weighted average cost of capital would be the same using either of the weights?

Solution

(a) Determination of weighted average cost of capital using book value weights:

Source of capital	Amount of book value (BV)	Specific cost (%)	Total costs
		(k)	BV (×) k
Debt	₹4,00,000	5	₹20,000
Preference	1,00,000	8	8,000
Equity	6,00,000	15	90,000
Retained earnings	2,00,000	13	26,000
	13,00,000		1,44,000

$$k_0 = \frac{\text{Total cost (₹1,44,000)}}{\text{Total amount of capital (₹13,00,000)}} \times 100 = 11.1 \text{ per cent}$$

(b) Determination of weighted average cost of capital using market value weights

Source of capital	Market value (MV)	Specific cost (%)	Total costs
		(k)	MV (×) k
Debt	₹3,80,000	5	₹19,000
Preference	1,10,000	8	8,800
Equity	9,00,000 ^a	15	1,35,000
Retained earnings	3,00,000 ^a	13	39,000
	16,90,000		2,01,800

$$k_0 = \frac{₹2,01,800}{₹16,90,000} \times 100 = 11.9 \text{ per cent}$$

^a The total market value of equity shares and retained earnings is apportioned three-fourths and one-four respectively on the basis of their book values.

The k_0 based upon market value is greater than k_0 based upon book value because the market value of equity funds is considerably larger than their book value and since these sources of long-term funds have higher specific costs, the overall cost of capital increases.

The weighted average cost of capital would be the same with both the book value weights and market value weights when there is no difference between the book value and the market value of securities used in raising the capital.

P.11.18 Aries Limited wishes to raise additional finance of ₹10 lakh for meeting its investment plans. It has ₹2,10,000 in the form of retained earnings available for investment purposes. The following are the further details:

LO 11.5 **LOO D**

1. Debt-equity mix, 30:70
2. Cost of debt: Upto ₹1,80,000, 10 per cent (before tax); Beyond ₹1,80,000, 12 per cent (before tax)
3. Earnings per share, ₹4
4. Dividend payout, 50 per cent of earnings
5. Expected growth rate in dividend, 10 per cent
6. Current market price per share, ₹44
7. Tax rate, 35 per cent

You are required:

- (a) To determine the pattern for raising the additional finance, assuming the firm intends to maintain existing debt/equity mix.
- (b) To determine the post-tax average cost of additional debt.
- (c) To determine the cost of retained earnings and cost of equity.
- (d) Compute the overall weighted average after tax cost of additional finance.

Solution

- (a) Pattern for raising additional finance:

$$\text{Debt} = 0.30 \times ₹10 \text{ lakh} = ₹3 \text{ lakh,}$$

$$\text{Equity Funds} = 0.70 \times ₹10 \text{ lakh} = ₹7 \text{ lakh}$$

Retained earnings	₹2,10,000	
Equity share capital (additional)	4,90,000	₹7,00,000
Debt funds (₹3,00,000)		
10% Debt	1,80,000	
12% Debt	1,20,000	3,00,000
		<u>10,00,000</u>

- (b) $k_d = \text{Total interest } (1 - t)/₹3,00,000 = ₹18,000 + ₹14,400 = ₹32,400 (1 - 0.35)/₹3,00,000 = 7.02 \text{ per cent}$

(c) (i) $k_e = \frac{D_t}{P_0} + g, \frac{₹4(50\%) + 10\%}{₹44} + 10\% = 15 \text{ per cent}$

(ii) $k_r = k_e = 15 \text{ per cent}$

- (d) Overall cost of capital (k_0) of additional finance

Source	Amount	After-tax cost	Total cost
Equity share capital	₹4,90,000	0.15	₹73,500
Retained earnings	2,10,000	0.15	31,500
Debt	3,00,000	0.0702	21,060
			<u>1,26,060</u>

$$k_0 = ₹1,26,060/₹10,00,000 = 12.61 \text{ per cent}$$

P.11.19 Three companies A, B and C are in the same business and hence have similar operating risks. However, the capital structure of each of them is different. The following are the details:

LO 11.4 LOD M

	A	B	C
Equity share capital (₹) (Face value ₹10 per share)	4,00,000	2,50,000	5,00,000
Market value per share (₹)	15	20	12
Dividend per share (₹)	2.70	4	2.88
Debentures (₹)	Nil	1,00,000	2,50,000
Market value (MV) per debenture (₹)		125	80
Interest rate		10	8

Assume the current levels of dividends are generally expected to continue indefinitely and the income-tax rate is 35 per cent. You are required to compute the weighted average cost of capital (k_0) of each company.

Solution

Cost of debentures:	A	B	C
$(1 - t)/MV$ of debentures (%)	—	₹6.5/₹125 = 5.2	₹5.2/₹80 = 6.5
Cost of equity:			
D_1/P_0 (%)	₹2.7/₹15 = 18	₹4/₹20 = 20	₹2.88/₹12 = 24

 Weighted average cost of capital (k_0)

Source	Amount	After-tax cost (%)	Total cost
Company A:			
Equity	₹6,00,000	18	₹1,08,000
Debentures	Nil	—	—
	6,00,000	18	1,08,000
Company B:			
Equity	5,00,000	20	1,00,000
Debentures (1,000 × ₹125)	1,25,000	5.2	6,500
	6,25,000	17.04	1,06,500
Company C:			
Equity	6,00,000	24	1,44,000
Debentures (2,500 × ₹80)	2,00,000	6.5	13,000
	8,00,000	19.625	1,57,000

Overall cost of capital: 0.18 (A), 0.17 (B) and 0.196 (C).

P.11.20 As a financial analyst of a large electronics company, you are required to determine the weighted average cost of capital of the company using (a) book value weights and (b) market value weights. The following information is available for your perusal.

LO 11.6 LOD M

The company's present book value capital structure is:

Debentures (₹100 per debenture)	₹8,00,000
Preference shares (₹100 per share)	2,00,000
Equity shares (₹10 per share)	10,00,000
Retained earnings	8,00,000
	28,00,000

All these securities are traded in the capital markets. Recent prices are:

Debentures, ₹110 per debenture, Preference shares, ₹120 per share, and Equity shares, ₹22.5 per share
Anticipated external financing opportunities are:

- (i) ₹100 per debenture redeemable at par; 10 year maturity, 11 per cent coupon rate, 4 per cent flotation costs, sale price, ₹100.
- (ii) ₹100 preference share redeemable at par; 10 year maturity, 12 per cent dividend rate, 5 per cent flotation costs, sale price, ₹100.
- (iii) Equity shares: ₹0.5 per share flotation costs, sale price = ₹22.5.

In addition, the dividend expected on the equity share at the end of the year is ₹2.20 per share; the anticipated growth rate in dividends is 7 per cent and the firm has the practice of paying all its earnings in the form of dividends. The corporate tax rate is 35 per cent. Cost of retained earnings is 15 per cent.

Solution

Determination of specific costs:

- (i) Cost of debt, (k_d) = $\frac{I(1-t) + (f + N_m)}{(RV + SV) + 2} = \frac{₹11(0.35) + (₹4 + 10)}{(₹100 + ₹96) + 2} \times 100 = 7.7$ per cent
- (ii) Cost of preference shares (k_p) = $\frac{D + (f + N_m)}{(RV + SV) + 2} = \frac{₹12 + (₹5 + 10)}{(₹100 + ₹95) + 2} \times 100 = 12.8$ per cent
- (iii) Cost of equity shares (k_e) = $\frac{D_1}{P_0(1-f)} + g = \frac{₹2.20}{₹22} + 0.07 = 17$ per cent

Using these specific costs we can calculate the book value and market value weights as follows:

(a) k_0 based on book value weights

Source of capital	Book value (BV)	Specific cost (k) (%)	Total costs [BV (×) k]
Debentures	₹8,00,000	7.7	₹61,600
Preference shares	2,00,000	12.8	25,600
Equity shares	10,00,000	17.0	1,70,000
Retained earnings	8,00,000	15.0	1,20,000
	<u>28,00,000</u>		<u>3,77,200</u>

$$k_0 = ₹3,77,200/₹28,00,000 = 13.47 \text{ per cent}$$

(b) k_0 based on market value weights

Source of capital	Market value (MV)	Specific cost (k) (%)	Total costs [MV (×) k]
Debentures	₹8,80,000	7.7	₹67,760
Preference shares	2,40,000	12.8	30,720
Equity shares	12,50,000*	17.0	2,12,500
Retained earnings	10,00,000**	15.0	1,50,000
Total capital	<u>33,70,000</u>		<u>4,60,980</u>

$$k_0 = ₹4,60,980/₹33,70,000 = 13.68 \text{ per cent}$$

*Market value of equity shares (₹22,50,000 × 10/18) = ₹12,50,000.

**Market value of retained earnings (₹22,50,000 × 8/18) = ₹10,00,000.

P.11.21 From the following capital structure of XYZ Ltd. determine appropriate weighted average cost of capital.

Equity shares (1,00,000)	₹38,00,000
Preference shares	8,00,000
Debentures	50,00,000
Bank loan (long-term)	18,00,000
Bank loan (short-term)	14,00,000
Trade creditors	6,00,000

Additional information:

- (i) Equity shares include the existing 60,000 shares having current market value of ₹40 per share and the balance is net proceeds from the new issue in the current year (issue price of the share, ₹40; flotation cost per share, ₹5). The projected EPS and DPS for the current year are ₹8 and ₹5 respectively.
- (ii) Dividend indicated on preference shares is 12 per cent
- (iii) Pre-tax cost of debentures—11 per cent
- (iv) Interest on bank loan—12 per cent (long-term) and 11.5 per cent (short-term).
- (v) Corporate tax: 35 per cent. Dividend tax: 10 per cent
- (vi) Market value of preference shares is ₹8,50,000.

Solution

Determination of cost of specific sources:

- (i) Equity existing; $g = [EPS - DPS (1 + t)]/P_0 = [₹8 - ₹5(1 + 0.1)]/₹40 = 6.25$ per cent
 $k_e = (D_1/P_0) + g = (₹5/40) + 0.0625 = 18.75$ per cent
 Equity (new issue) = $(₹5/35) + 0.0625 = 20.54$ per cent
- (ii) Cost of debentures = $0.11 (1 - 0.35) = 7.15$ per cent
- (iii) Cost of bank loan = $0.12 (1 - 0.35) = 7.8$ per cent
- (iv) Cost of preference shares = $(\text{Total dividends on preference shares} + \text{Dividend tax}) / \text{Market value of preference shares} = (₹96,000 + ₹10,000)/₹8,50,000 = 12.47$ per cent

Determination of overall cost of capital (based on market value, MV weights)

Sources of capital	MV (1)	Cost (per cent) (2)	Total cost [1×2] (3)
Equity capital (existing)	₹24,00,000	0.1875	₹4,50,000
Equity capital (new)	14,00,000	0.2054	2,87,560
Preference shares	8,50,000	0.1247	1,05,995
Debentures	50,00,000	0.715	3,57,500
Long-term bank loan	18,00,000	0.078	1,40,400
	<u>1,14,50,000</u>		<u>13,41,455</u>

$K_0 = ₹13,41,455/1,14,50,000 = 11.72$ per cent.

P.11.22(a) XYZ Ltd., has the following book value capital structure:

	(₹ crore)
Equity capital (in shares of ₹10 each, fully paid up—at par)	₹15
12% Preference capital (in shares of ₹100 each, fully paid up—at par)	1
Retained earnings	20
11.5% Debentures (of ₹100 each)	10
11% Term loans	12.5

The next expected dividend on equity shares per share is ₹3.60; the dividend per share is expected to grow at the rate of 7 per cent. The market price per share is ₹40.

Preference stock, redeemable after ten years, is currently selling at ₹75 per share.

Debentures, redeemable after six years, are selling at ₹80 per debenture.

The Income- tax rate for the company is 40 per cent.

(i) Required:

Calculate the weighted average cost of capital using:

- (a) Book value proportions; and
- (b) Market value proportions.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice to ensure transparency and accountability.

2. The second part outlines the specific procedures for recording income and expenses. It details how to categorize different types of transactions and provides examples of how to format entries in the ledger.

3. The third part addresses the process of reconciling the accounts. It explains how to compare the ledger balances with bank statements and identify any discrepancies that may arise.

4. Finally, the document concludes with a summary of the key principles of sound financial management, including regular review and timely reporting of financial data.

Date	Description	Debit	Credit	Balance
1/1/20	Opening Balance			1000.00
1/5/20	Income from Sales		500.00	1500.00
1/10/20	Expenses - Rent	200.00		1300.00
1/15/20	Expenses - Utilities	100.00		1200.00
1/20/20	Income from Services		300.00	1500.00
1/25/20	Expenses - Salaries	400.00		1100.00
1/31/20	Closing Balance			1100.00

The following table provides a detailed breakdown of the income and expense categories used in the ledger above.

Category	Amount
Income from Sales	500.00
Income from Services	300.00
Expenses - Rent	200.00
Expenses - Utilities	100.00
Expenses - Salaries	400.00
Opening Balance	1000.00
Closing Balance	1100.00

This document is intended to serve as a guide for individuals and businesses seeking to improve their financial record-keeping practices. It is not a substitute for professional accounting advice.

The second part of the document focuses on the practical aspects of managing cash flow. It discusses the importance of forecasting future income and expenses to ensure that there is always enough liquidity to cover obligations.

It also covers strategies for reducing costs and increasing revenue, such as negotiating better terms with suppliers and offering discounts to loyal customers.

The third part of this section addresses the role of technology in financial management. It highlights the benefits of using accounting software to automate data entry and generate reports, which can save time and reduce the risk of errors.

Finally, the document emphasizes the importance of seeking professional help when needed. It suggests consulting with an accountant or financial advisor to ensure that all financial matters are handled correctly and in compliance with applicable laws and regulations.

Item	Quantity	Unit Price	Total Price
Office Supplies	50	2.00	100.00
Printing Services	100	1.50	150.00
Software Licenses	5	30.00	150.00
Professional Fees	1	100.00	100.00
Travel Expenses	20	5.00	100.00
Marketing Costs	10	10.00	100.00
Utilities	1	100.00	100.00
Rent	1	200.00	200.00
Salaries	1	400.00	400.00
Income from Sales	1	500.00	500.00
Income from Services	1	300.00	300.00

The following table summarizes the key financial metrics for the business over the period shown.

Metric	Value
Total Revenue	800.00
Total Expenses	1400.00
Net Profit/Loss	(600.00)
Operating Ratio	0.57
Current Ratio	1.20
Debt to Equity Ratio	0.80

These metrics provide a snapshot of the business's financial health and performance. Regular monitoring of these indicators is essential for identifying trends and making informed decisions.

Solution(a) Statement showing determination of K_0 (using book value proportions)

Source of finance	Amount	Proportion	After-tax cost (%)	Total cost (%)
Equity capital	₹15,00,00,000	0.256	16 ¹	4.096
12% Preference capital	1,00,00,000	0.017	16.57 ²	0.282
Retained earnings	20,00,00,000	0.342	16 ³	5.472
11.5% Debentures	10,00,00,000	0.171	11.37 ⁴	1.944
11% Term loans	12,50,00,000	0.214	6.6 ⁵	1.412
	<u>58,50,00,000</u>			<u>13.206</u>

Overall cost of capital is 13.21 per cent approximately

$$^1 k_e = (\text{₹}3.60/\text{₹}40) + 7\% = 16 \text{ per cent}$$

$$^2 k_p = \left(D_p + \frac{RV - MV}{N} \right) / (RV + MV) + 2 = \left(\text{₹}12 + \frac{\text{₹}100 - 75}{10 \text{ years}} \right) / \text{₹}87.5 = 16.57 \text{ per cent}$$

³ Cost of retained earnings is equal to K_e

$$^4 K_d = \left(I(1 - t) + \frac{RV - MV}{N} \right) / (RV + MV) + 2$$

$$= \left(\text{₹}11.5(1 - 0.4) + \frac{\text{₹}20}{6} \right) / \text{₹}90 = (\text{₹}6.9 + \text{₹}3.33) / \text{₹}90 = 11.37 \text{ per cent}$$

⁵ Cost of term loan = 11% (1 - 0.4) = 6.6 per cent
(b) Statement showing determination of K_0 (using market value proportions)

(amount in ₹ crore)

Source of finance	Amount	Proportion	After-tax cost (%)	Total cost (%)
Equity capital	₹25.71	0.316	16	5.056
12% Preference capital	0.75	0.009	16.57	0.149
Retained earnings	34.29	0.422	16.0	6.752
11.5% Debentures	8.00	0.098	11.37	1.114
11% Term loans	12.50	0.154	6.6	1.016
	<u>81.25</u>			<u>14.087</u>

Overall cost of capital is 14.09 per cent approximately

Note: The total market value of equity shares ₹60 crore (1.5 crore shares × ₹40) is apportioned between equity capital and retained earnings in the ratio of 15 : 20 based on their book values.

P11.22(b) Determine the weighted marginal cost of capital schedule for the above company, if it raises ₹10 crore next year, given the following information:

LO 11.6 LOD D

- The amount will be raised by equity and debt in equal proportions;
- The company expects to retain ₹1.5 crore earnings next year;
- The additional issue of equity shares will result in the net price per share being fixed at ₹32;
- The debt capital raised by way of term loans will cost 12 per cent for the first ₹2.5 crore and 13 per cent for the next ₹2.5 crore.

Solution

Statement showing weighted marginal cost of capital of ₹10 crore funds

Source of finance	Weight	After-tax cost (%)	Total cost (%)
Equity:			
Retained earnings	0.15 ¹	16.0 ²	2.4
Equity share capital	0.35 ³	18.25 ⁴	6.39
Debt:			
12% Loan	0.25	7.2 ⁵	1.80
13% Loan	0.25	7.8 ⁶	1.95
			<u>12.54</u>

Weighted marginal cost of capital = 12.54 per cent

¹ ₹1.5 crore/₹10 crore = 0.15

² Cost of retained earnings is equivalent to existing cost of equity.

³ ₹3.5 crore external equity share capital to be raised/₹10 crore total funds = 0.35

⁴ $K_e = (\text{₹}3.60/\text{₹}32) + 7\% = 18.25$ per cent

⁵ Cost of 12% Loan = $12\%(1 - 0.4) = 7.2$ per cent

⁶ Cost of 13% Loan = $13\%(1 - 0.4) = 7.8$ per cent

P.11.23 Malaysian Paints (India) Limited has paid a dividend of 30 per cent on its shares of ₹10 each in the current financial year. In the opinion of Choksi, finance director, the dividend is expected to grow @ 5 per cent annum. The required rate of return of the company is 15 per cent.

LO 11.4 **LOD D**

Malaysian Paints is facing tough competition in the market because a large number of multinational companies have started their operations in India in the same line of business. Therefore, the management of the company is seriously thinking of diversifying the activities of the company. In a quarterly meeting of the Board, a special executive committee consisting of finance director, marketing director and production director was formed. The special committee was chaired by the CMD of the company.

The special executive committee had a brain-storming session and a series of meetings. It suggested the following alternative courses of action for the consideration of the Board:

- (i) To increase the dividend growth rate to 6 per cent, and lower the required rate of return to 14 per cent.
- (ii) To increase the dividend growth rate to 7 per cent and raise the required rate of return to 17 per cent.
- (iii) To raise the required rate of return to 16 per cent and reduce the growth rate of dividend to 4 per cent.
- (iv) To increase the dividend growth rate to 8 per cent and increase the required rate of return to 17 per cent.

You are the finance manager of the company. The Board of Directors has confidence in your abilities because, in the past, you have helped the Board in making such decisions. The Board has requested you to suggest, with calculations, the most suitable course of action for the company (assuming the firm has an objective of maximising its shareholders wealth). State your assumptions if any.

Solution As a finance manager, I will prefer a course of action which maximises the price of shares as the pursuance of such a policy is consistent with the objective of optimal financial decision making. Keeping this perspective in mind, the five courses of action (emerged in brain-storming session) are analysed.

$$(i) P_0 = \frac{D_1}{K_e - g} = \frac{\text{₹}3.15}{15\% - 5\%} = \frac{\text{₹}3.15}{10\%} = \text{₹}31.50$$

$$(ii) P_0 = \frac{\text{₹}3.18}{14\% - 6\%} = \frac{\text{₹}3.18}{8\%} = \text{₹}39.75$$

$$(iii) P_0 = \frac{\text{₹}3.21}{17\% - 7\%} = \frac{\text{₹}3.21}{10\%} = \text{₹}32.10$$

$$(iv) P_0 = \frac{\text{₹} 3.12}{16\% - 4\%} = \frac{\text{₹} 3.12}{12\%} = \text{₹} 26$$

$$(v) P_0 = \frac{\text{₹} 3.24}{17\% - 8\%} = \frac{\text{₹} 3.24}{9\%} = \text{₹} 36$$

Recommendation Alternative second to increase the dividend growth rate to six per cent and lower the required rate of return to 14 per cent is the most suitable course of action as such an action is likely to fetch the maximum price of equity shares.

MINI CASES

11.C.1 Mr Aggarwal recently attended an investor's meet in Mumbai wherein he came across some brokers who advised him to measure the systematic risk of shares using beta before finally investing money in the same. Mr. Aggarwal picked the old financial newspapers and prepared the following table containing the data of equity share prices of Infotech Limited, Cantaxy Limited and S&P CNX Nifty, collected on the last trading day of the month for the last thirteen months.

Date	Share price of Infotech Ltd	Share price of Cantaxy Ltd	S&P CNX Nifty
February 28	₹115	₹28	976
March 29	125	26	985
April 30	140	21	991
May 31	167	20	1035
June 28	189	20	1049
July 31	177	15	989
August 30	142	19	977
September 30	121	21	965
October 31	102	32	956
November 29	94	29	951
December 31	102	31	957
January 31	126	28	962
February 28	149	39	975

Calculate beta for Infotech Limited and Cantaxy Limited. Use S&P CNX Nifty data as a proxy for market portfolio and comment.

Solution

$$\text{BETA} = \frac{N \sum XY - (\sum X)(\sum Y)}{N \sum X^2 - (\sum X)^2}$$

Y = Return on security

X = Return on market portfolio (index)

N = Total number of observations

X = (Market index level on last trading day of 't' month – Market index level on last trading day of 't – 1' month) × 100 / Market index level on last trading day of 't – 1' month.

Y = Price of share on last trading day of 't' month – Price of share on last trading day of 't – 1' month) × 100 / Price of share on last trading day of 't – 1' month.

Determination of beta in respect of equity shares of Infotech Limited

Date	Infotech limited	S&P CNX Nifty	Return on Infotech limited Y	X	Return on Nifty index X × Y	X ²
February 28	115	976				
March 29	125	985	8.70	0.92	8.02	0.85
April 30	140	991	12.00	0.61	7.31	0.37
May 31	167	1035	19.29	4.44	85.63	19.71
June 28	189	1049	13.17	1.35	17.82	1.83
July 31	177	989	-6.35	-5.72	36.32	32.72
August 30	142	977	-19.77	-1.21	23.99	1.47
September 30	121	965	-14.79	-1.23	18.16	1.51
October 31	102	956	-15.70	-0.93	14.64	0.87
November 29	94	951	-7.84	-0.52	4.10	0.27
December 31	102	957	8.51	0.63	5.37	0.40
January 31	126	962	23.53	0.52	12.29	0.27
February 28	149	975	18.25	1.35	24.67	1.83
Sum			38.99	0.21	258.33	62.10
Average			3.25	0.02		
Observations (N)			12			

$$\text{BETA} = 12 \times 258.33 - (0.21 \times 38.99)/12 \times 62.10 - (0.21 \times 0.21) = 4.15$$

Determination of beta in respect of equity shares of Cantaxy Limited

Date	Cantaxy limited	S&P CNX Nifty	Return on Infotech limited Y	X	Return on Nifty index X × Y	X ²
February 28	28	976				
March 29	26	985	-7.14	0.92	-6.59	0.85
April 30	21	991	-19.23	0.61	-11.71	0.37
May 31	20	1035	-4.76	4.44	-21.14	19.71
June 28	20	1049	-0.00	1.35	0.00	1.83
July 31	15	989	-25.00	-5.72	142.99	32.72
August 30	19	977	26.67	-1.21	-32.36	1.47
September 30	21	965	10.53	-1.23	-12.93	1.51
October 31	32	956	52.38	-0.93	-48.85	0.87
November 29	29	951	-9.38	-0.52	4.90	0.27
December 31	31	957	6.90	0.63	4.35	0.40
January 31	28	962	-9.68	0.52	-5.06	0.27
February 28	39	975	39.29	1.35	53.09	1.83
Sum			60.57	0.21	66.70	62.10
Average			5.05	0.02		
Observations (N)			12			

$$\text{BETA} = 12 \times 66.70 - (0.21 \times 60.57)/12 \times 62.10 - (0.21 \times 0.21) = 1.06$$

Comment: Since the beta of Infotech Limited is substantially higher (4.15) than that of Cantaxy Limited (1.06), the equity shares of Infotech Limited are evidently more risky compared to those of Cantaxy Limited.

11.C.2 NTPC, India's largest power company, was set up in 1975 with a vision "A world class integrated power major, powering India's growth, with increasing global presence" to accelerate power development in India. It has emerged as an Integrated Power Major, with a significant presence in the entire value chain of power generation business.

NTPC ranked 317th in the 2011, Forbes Global 2000 ranking of the World's biggest companies. With a current generating capacity of above 34,000 MW, NTPC has embarked on plans to become a 75,000 MW company by 2017. (For details refer to [websitewww.ntpcindia.com](http://www.ntpcindia.com)).

The company intends to determine its weighted average cost of capital for year 2012.

Solution

Calculation of cost of capital:

Weighted average cost of capital has been calculated as on 31st March 2012 using the data inputs from its annual reports for the financial years ended March 31, 2011 and 2012.

Calculation of cost of equity:

Using CAPM approach: $K_e = R_f + \beta e \times (R_m - R_f)$

Where: R_f = Risk-free Return (Obtained from 10 year G- sec benchmark)

R_m = Average market return

βe = Systematic risk factor (Equity Beta)

Calculation of equity beta of NTPC:

The beta has been calculated using daily returns of NTPC Stock prices and NIFTY returns for five years 2006-2011; by using regression approach.

$$R_{NTPC} = a + \beta e \times R_{NIFTY}$$

Where: R_{NTPC} = Returns given by NTPC stock.

R_{NIFTY} = Returns given by Nifty.

The output for the regression analysis is

Regression Statistics

Multiple R	0.668
R Square	0.446
Adjusted R Square	0.444
Standard Error	0.032
Observations	257

ANOVA

	df	SS	MS	F	Significance F
Regression	1	0.213	0.213	205.082	0.000
Residual	255	0.265	0.001		
Total	256	0.478			

	Coefficients	Standard error	t Stat	P-value	Lower 95%	Upper 95%	Lower 95%	Upper 95%
Intercept	0.002	0.002	0.771	0.441	0.002	0.006	0.002	0.006
X Variable	0.700	0.049	14.321	0.000	0.604	0.796	0.604	0.796

$$\beta e = 0.7$$

The value of beta is 0.700. This implies that NTPC stock is low risk stock. The coefficient of correlation of 0.668 between NIFTY returns and NTPC returns shows moderate positive relationship. This implies the movement in NTPC follows the movement of NIFTY.

Calculation of risk-free rate of return:

The 10 year Govt.- sec. benchmark rate has been taken as the risk-free rate of return. The Govt.-Sec. rate is 8.79%. Therefore, risk-free rate of return is taken as 8.79%. (Source: <http://www.fimmda.org>)

$$R_f = 8.79\%$$

Calculation of market risk premium:

It is the excess of market return over the risk-free return. The market return has been computed using NIFTY returns for 5 years 2006-11. The market return is 20.48%. (Source: <http://www.nseindia.com>).

$$R_m = 20.48\% \text{ (Market Nifty Return)}$$

Calculation of cost of equity:

$$K_e = R_f + \beta e \times (R_m - R_f)$$

$$K_e = 8.79 + 0.7 \times (20.48 - 8.79) = 16.97\%$$

Calculation of cost of debt:

$$K_d = (\text{Interest on loan funds during the year} / \text{Long Term Loans}) \times 100$$

$$K_d = (\text{₹}28507 \text{ million} / \text{₹}404926 \text{ million}) \times 100 = 7.04\% \text{ (before tax; based on average long-term loans)}$$

$$K_d = 7.04\% (1 - 0.33) = 4.72\%$$

Calculation of cost of retained earnings:

Assuming flotation cost of 5%, cost of retained earnings (k_r) would be:

$K_r = 16.97\% (1 - 0.05) = 16.12\%$. The main difference between the cost of equity and cost of retained earnings is the flotation costs.

Calculation of weighted average cost of capital:

Source of funds	Cost of funds	Capital (in ₹ million)	Total cost (in ₹ million)
Debt	4.72%	₹404926	₹19,112.51
Share capital	16.97	82455	13,992.61
Retained earnings	16.12	573415	92,434.50
Total		1060796	1,25,539.61

$$K_o = (\text{₹}125539.61 \text{ million} / \text{₹}1060796 \text{ million}) \times 100 = 11.84 \text{ per cent}$$

11.C.3 ITC is one of India's foremost private sector companies with a market capitalization of US \$ 35 billion and a turnover of US \$ 7 billion. It has a diversified presence in FMCG, Hotels, Paperboards and Specialty Papers, Packaging, Agri-Business, and Information Technology. While ITC is an outstanding market leader in its traditional businesses of Cigarettes, Hotels, Paperboards, Packaging and Agri-Exports, it is rapidly gaining market share even in its nascent businesses of Packaged Foods and Confectionery, Branded Apparel, Personal Care and Stationery.

Estimate the cost of equity capital for ITC Ltd using the following methods:

1. Dividend approach
2. Capital asset pricing model approach
3. Debt-yield plus risk premium approach

... ..
... ..

...
...
...
...

... ..
... ..
... ..

... ..
... ..
... ..

4. Risk free rate plus risk premium approach
5. Average approach (as per Ross et. al)

1. Dividend approach

$$k_e = \frac{D_1}{P_0} + g$$

The dividend history (2004 – 2013) of ITC Ltd is as follows:

Year	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Ordinary dividend per share	₹5.25	4.50	2.80	2.25	1.84	1.74	1.54	1.31	1.02	0.66

Source: <http://www.itcportal.com/about-itc/shareholder-value/annual-reports/itc-annual-report-2013/pdf/ITC-Ten-years-at-glance.pdf>

Based on the ten-year dividend history, the dividend growth rate can be estimated as:

$$g = \left(\frac{5.25}{0.66} \right)^{\frac{1}{10}} - 1 = 23.04 \text{ per cent per annum}$$

and the expected dividend per share for next year (2014) would be ₹5.25 × (1 + 23.04%) = ₹6.46 per share. Further, the market price per share as on 31 March 2013 was: ₹309.1

$$k_e = (\text{₹6.46}/\text{₹309.1}) + 23.04\% = 25.13\%$$

Therefore, the cost of equity as per dividend approach is 25.13 per cent.

2. Capital asset pricing model approach

$$k_e = R_f + \beta \cdot (k_m - R_f)$$

The risk-free rate of return was computed based on the yield to maturity on government securities for a period of 30 years (Reserve Bank of India Bulletin). This value was found to be 8.5 per cent (http://www.rbi.org.in/scripts/BS_ViewBulletin.aspx?Id=13790).

The market portfolio was chosen as the BSE Sensex. BSE SENSEX is a widely reported/accepted index in both domestic and international markets.

Base value of index in 1979: 100

Value of index in March 2013: 18835.77

Number of years: 34

$$\text{Market rate of return} = \left(\frac{18835.77}{100} \right)^{\frac{1}{34}} - 1 = 16.66\%$$

The beta value was obtained as

$$\beta = \frac{\text{Co var}(r_a, r_m)}{\text{Var}(r_m)}$$

Through regression of the monthly data, the beta value was calculated as follows:

$$\beta = \frac{\text{Co var}(r_{ITC}, r_m)}{\text{Var}(r_m)} = \frac{0.002313411}{0.005739118} = 0.403$$

(For details refer to www.mhhe.com/khanjainfm8e)

$$k_e = R_f + \beta \cdot (k_m - R_f)$$

$$k_e = 8.5\% + 0.403 \cdot (16.66\% - 8.5\%)$$

$$k_e = 11.79\%$$

Therefore, the cost of equity through the CAPM approach is estimated to be 11.79 per cent.

3. Debt-yield plus risk premium approach

The debt-yield approach determines cost of equity by adding a judgmental risk premium of 3 to 5 percentage points to the interest paid by the firm on its long-term debt.

ITC Ltd has a very low debt-equity ratio. Long-term borrowings form only 0.2% of the total liabilities of the company. As per the annual report for FY 2012-13, term loans from banks are repayable in equated periodic instalments up to a 5 year period from the date of respective loan. These are repayable by 2014-15 and carry an interest of 11.25 per cent p.a.

(Source: <http://www.itcportal.com/about-itc/shareholder-value/annual-reports/itc-annual-report-2013/pdf/ITC-Notes-Financial-Statements.pdf> Page 92).

ITC Ltd is a well-established company and is well-positioned in the market.

Hence, we can estimate the cost of equity using the debt-yield plus risk premium of 3 per cent.

$$k_e = 11.25\% + 3\% = 14.25\%$$

4. Risk free rate plus risk premium approach

In this approach

$$k_e = R_f + b_r + f_r$$

The degree of operating leverage is calculated as follows:

$$DOL = \frac{SR - VC}{SR - VC - FC}$$

In the absence of data about variable costs and fixed costs of the company, it is difficult to estimate the degree of operating leverage.

$$DFL = \frac{EBIT}{EBIT - I}$$

As per the data in Annual Report for FY 2012-13:

(Source: <http://www.itcportal.com/about-itc/shareholder-value/annual-reports/itc-annual-report-2013/pdf/ITC-Profit-Loss.pdf>)

$$DFL = \frac{10790.09}{10790.09 - 105.91} = 1.0099$$

The degree of financial leverage is very close to one and hence the financial risk is virtually negligible, warranting no/insignificant premium.

However, since the company is working in the areas of FMCG, Hotels, Paperboards & Specialty Papers, Packaging, Agri-Business, and Information Technology, it is reasonable to assume that the operating fixed costs would constitute a significant component of the cost structure and hence the company is likely to have a significant business risk. 4 per cent business risk premium has been assumed/considered adequate to compensate for such a substantial business risk.

Therefore, $k_e = 8.5\% + 4\% = 12.5\%$

Cost of equity is computed using the average of k_e determined by 4 approaches (as suggested by Ross et.al).

Approach	Cost of equity
Dividend approach	25.13%
Capital asset pricing model approach	11.79
Debt-yield plus risk premium approach	14.25
Risk free rate plus risk premium approach	12.50
Average from four approaches (63.67%/4)	15.92

Cost of equity of ITC has been estimated as 15.92 per cent.

REVIEW QUESTIONS

LOD: Easy

RQ. 11.1 Indicate whether the following statements are true or false. [LO 11.2, 3, 4, 5, 6]

- (i) Cost of capital is cost of borrowing funds.
- (ii) Equity capital does not carry any cost as a company is under no legal obligation to pay dividends.
- (iii) Like equity capital, retained earnings also do not cause any cost to the company.
- (iv) Weighted average cost of capital takes into consideration cost of long-term sources of finance.
- (v) Retained earnings do not have explicit cost. They carry implicit cost.
- (vi) Overall cost of capital decreases on payment of entire long-term debt.
- (vii) Cost of retained earning is less then cost of equity.
- (viii) Beta is a measure of unsystematic risk.
- (ix) Cost of additional equity share capital is the same as that of existing equity share capital.
- (x) The higher is the corporate tax rate, the higher is the cost of debt.
- (xi) Beta is a measure of systematic risk.
- (xii) Cost of debt is higher than cost of equity.
- (xiii) Cost of preference share capital is higher than cost of debt.
- (xiv) Cost of preference share capital is higher that cost of equity share capital.
- (xv) Among all long-term sources of finance, equity capital carries maximum cost.

[Answers: (i) False (ii) False (iii) False (iv) True (v) True (vi) False (vii) True (viii) False (ix) False (x) False (xi) True (xii) False (xiii) True (xiv) False (xv) True]

RQ. 11.2 Discuss how the cost of capital enters into the process of evaluating capital budgeting proposals? Particularly, how is it related to the various discounted cash flow techniques for determining a project's acceptability? [LO 11.1]

LOD: Medium

RQ. 11.3 What is financial risk? Is it necessary to assume that firm's financial structure remains unchanged when evaluating the firm's cost of capital? Why is this assumption impractical? [LO 11.1]

RQ. 11.4 Explain why: [LO 11.2,3,4,5]

- (a) Debt is usually considered the cheapest source of financing available to the firm.
- (b) The cost of preference shares is less than the cost of equity.
- (c) The cost of retained earnings is less than the cost of new equity.
- (d) The cost of equity and retained earnings is not zero.
- (e) The cost of capital is dependent only on the cost of long-term funds.
- (f) The cost of capital is a hurdle for new investment projects.
- (g) The cost of capital is most appropriately measured on an after-tax basis.

RQ. 11.5 Explain the problems faced in determining the cost of capital. How is the cost of capital relevant in capital budgeting decisions? [LO 11.1,4]

RQ. 11.6 Examine critically the different approaches to the calculation of cost of equity capital. [LO 11.4]

RQ. 11.7 Explain the CAPM approach for computing the cost of equity. Discuss the merits and demerits of the approach. [LO 11.4]

RQ. 11.8 State briefly the assumptions on which the Gordon (valuation) Model for the cost of equity is based. What does each component of the equation represent? [LO 11.4]

RQ. 11.9 Discuss the approach to determine the cost of retained earnings. Also explain the rationale behind treating retained earnings as a fully subscribed issue of equity shares. [LO 11.5]

- RQ. 11.10** Other things being equal, explain how the following events would affect the company's weighted average cost of capital: [LO 11.6]
- (a) The corporate income tax rate is increased/ decreased.
 - (b) The company has started making substantial new investments in assets that are considerably riskier than the company's presently owned assets.
 - (c) The company begins to make use of substantial amounts of debt to finance its new projects.
 - (d) The company has repaid its long-term debts.
 - (e) Flotation costs of issuing new securities increase/decrease.
- RQ. 11.11** What is the weighted average cost of capital? Examine the rationale behind the use of weighted average cost of capital. [LO 11.6]
- RQ. 11.12** The weighted average cost of capital (k_0) may be determined using 'book' or 'market' weights. Compare the pros and cons of using market value weights rather than book value weights in calculating the value of k_0 . [LO 11.6]
- RQ. 11.13** ABC company sold ₹1,000, 6 per cent debentures carrying no maturity date to the public a decade earlier. Interest rates since have risen so that debentures of the quality represented by this company are now selling at 9 per cent yield basis. [LO 11.2]
- (a) Determine the current indicated market price of the debentures. Would you buy the debentures for ₹700? Explain your answer.
 - (b) Assuming that debentures of the company are selling at ₹850, and if the debentures have 8 years to run to maturity, compute the approximate effective yield an investor would earn on his investment?
- RQ. 11.14** Assuming a corporate tax rate of 35 per cent, compute the after-tax cost of the capital in the following situations: [LO 11.2, 3, 4]
- (a) A perpetual 15 per cent debentures of ₹1,000, sold at the premium of 10 per cent with no flotation costs.
 - (b) A ten year 14 per cent debenture of ₹2,000, redeemable at par, with 5 per cent flotation costs.
 - (c) A ten year 14 per cent preference share of ₹100, redeemable at premium of 5 per cent, with 5 per cent flotation costs.
 - (d) An equity share selling at ₹50 and paying a dividend of ₹6 per share, which is expected to be continued indefinitely.
 - (e) The same equity share (that is, described in situation (d), if dividends are expected to grow at the rate of 5 per cent.
 - (f) An equity share, selling at ₹120 per share, of a company that engages only in equity financing. The earning per share is ₹20 of which 50 per cent is paid in dividends. The shareholders expect the company to earn a constant after-tax rate of 10 per cent on its investment of retained earnings.
- RQ. 11.15** From the following information supplied to you, determine the appropriate weighted average cost of capital, relevant for evaluating long-term investment projects of the company: [LO 11.6]

Cost of equity	12 per cent
After-tax cost of long-term debt	7
After-tax cost of short-term loans	4

Source of capital	Book value	Market value
Equity	₹5,00,000	₹7,50,000
Long-term debt	4,00,000	3,75,000
Short-term debt	1,00,000	1,00,000
	10,00,000	12,25,000

LOD: Difficult

- RQ. 11.16** The determination of any explicit cost of capital requires two things: (i) the net proceeds the firm will receive from the particular capital source and (ii) the expected future payments the firm will make to the investors. In spite of the similarity of estimation problems, it is recognised that the cost of equity (both internal and external) is the most difficult cost to estimate. Briefly explain why this is so. [LO 11.1,4,5]
- RQ. 11.17** Compare the advantages and disadvantages of using marginal as opposed to historical weights for calculating the weighted average cost of capital. Which of the weights are more consistent with the company's goal of wealth maximisation? [LO 11.6]
- RQ. 11.18** The shares of a textile company are selling at ₹20 per share. The firm had paid ₹2 per share dividend last year. The estimated growth of the company is approximately 5 per cent per year. [LO 11.4]
- (a) Determine the cost of equity capital of the company.
- (b) Determine the estimated market price of the equity shares if the anticipated growth rate of the firm (i) rises to 8 per cent (ii) falls to 3 per cent.
- (c) Determine the market price of the company assuming a growth rate of 20 per cent. Are you satisfied with your calculations?
- RQ. 11.19** A paper company has the following specific cost of capital along with the indicated book and market value weights. [LO 11.2,3,4,5,6]

Type of capital	Cost (%)	Book value weights (%)	Market value weights (%)
Long-term debt	5	30	25
Preference shares	10	20	17
Equity shares	12	40	46
Retained earnings	12	10	12
		100	100

- (a) Calculate the weighted average cost of capital using book value and market value weights. Which of them do you consider better and why?
- (b) Calculate the weighted average cost of capital using material weights if the company intends to raise the needed funds using 50 per cent long-term debt, 35 per cent preference shares and 15 per cent retained earnings.

ANSWERS

11.13(a) ₹666.67. No. Its current worth is only ₹666.67; (b) 8.69%.

11.14(a) 8.86%, (b) 9.85%, (c) 15%, (d) 12%, (e) 17%, (f) 13.33%

11.15 10.33%.

11.18(a) Cost of equity, 15.5%, (b) (i) ₹28.8, (ii) ₹15.43, (c) (₹53.33) (ridiculous). The reason is $k_e > g$.

11.19(a) k_0 based on book value weights 9.5%, k_0 based on market value weights 9.9% (b) 7.8%.

CHAPTER

12

Analysis of Risk and Uncertainty

LEARNING OBJECTIVES

LO 12.1	Discuss the basic risk concept and its precise expression—sensitivity analysis, scenario analysis and simulation
LO 12.2	Describe two precise measures of risk measurement—standard deviation as an absolute measure and coefficient of variation as a relative measure of risk
LO 12.3	Explain and illustrate the main risk evaluation approaches, namely, risk adjusted discount rate (RADR), certainty-equivalent (CE), Probability distribution and Decision tree
LO 12.4	Discuss risk and real options and their types
LO 12.5	Outline the features relating to the methodology followed by Indian corporates to assess project risk and the relative significance assigned to different risk assessment techniques

INTRODUCTION

This Chapter discusses the risk and uncertainty associated with capital budgeting. The importance of the risk dimension in capital budgeting can hardly be overstressed. In fact, profitability and risk are closely related. It is very likely that a project which is potentially very profitable may also increase the perceived risk of the firm. This trade-off between risk and profitability would have a bearing on the investors' perception of the firm before and after the acceptance of a specific proposal. If the acceptance of a proposal, for instance, makes a firm more risky, the investors would not look to it with favour. This may have an adverse implication for the market price of shares, total valuation of the firm and its goal. It is, therefore, necessary to incorporate the risk factor in the analysis of capital budgeting. The present Chapter is concerned with methods for doing this. The effect on the risk of the firm as a whole has not been covered here; the focus is on the project risk. The Chapter explores first the basic risk concepts. The discussion of the various methods for incorporating the risk factor into the capital budgeting decisions for an individual investment proposal

EXAMPLE 1

Let X and Y be independent random variables with probability density functions $f_X(x)$ and $f_Y(y)$ respectively. Show that the joint probability density function of (X, Y) is $f_X(x)f_Y(y)$.

SOLUTION Let A and B be any two events in the sample space S . Then

$$P(A \cap B) = P(A)P(B) \quad \text{since } X \text{ and } Y \text{ are independent.}$$

Let $A = \{X \in A\}$ and $B = \{Y \in B\}$. Then

$$P(A \cap B) = \int_{A \times B} f_{X,Y}(x,y) dx dy = P(A)P(B) = \left(\int_A f_X(x) dx \right) \left(\int_B f_Y(y) dy \right)$$

$$= \int_A \int_B f_X(x)f_Y(y) dx dy = \int_{A \times B} f_X(x)f_Y(y) dx dy$$

$$= \int_{A \times B} f_{X,Y}(x,y) dx dy \quad \text{since } f_{X,Y}(x,y) = f_X(x)f_Y(y)$$

Since A and B are arbitrary, it follows that $f_{X,Y}(x,y) = f_X(x)f_Y(y)$.

EXAMPLE 2 Let X and Y be independent random variables with probability density functions $f_X(x)$ and $f_Y(y)$ respectively. Show that the joint probability density function of (X, Y) is $f_X(x)f_Y(y)$.

SOLUTION Let A and B be any two events in the sample space S . Then

$$P(A \cap B) = P(A)P(B) \quad \text{since } X \text{ and } Y \text{ are independent.}$$

$$P(A \cap B) = \int_{A \times B} f_{X,Y}(x,y) dx dy = P(A)P(B) = \left(\int_A f_X(x) dx \right) \left(\int_B f_Y(y) dy \right)$$

$$= \int_A \int_B f_X(x)f_Y(y) dx dy = \int_{A \times B} f_X(x)f_Y(y) dx dy$$

$$= \int_{A \times B} f_{X,Y}(x,y) dx dy \quad \text{since } f_{X,Y}(x,y) = f_X(x)f_Y(y)$$

Since A and B are arbitrary, it follows that $f_{X,Y}(x,y) = f_X(x)f_Y(y)$.

EXAMPLE 3 Let X and Y be independent random variables with probability density functions $f_X(x)$ and $f_Y(y)$ respectively. Show that the joint probability density function of (X, Y) is $f_X(x)f_Y(y)$.

SOLUTION Let A and B be any two events in the sample space S . Then

$$P(A \cap B) = P(A)P(B) \quad \text{since } X \text{ and } Y \text{ are independent.}$$

$$P(A \cap B) = \int_{A \times B} f_{X,Y}(x,y) dx dy = P(A)P(B) = \left(\int_A f_X(x) dx \right) \left(\int_B f_Y(y) dy \right)$$

$$= \int_A \int_B f_X(x)f_Y(y) dx dy = \int_{A \times B} f_X(x)f_Y(y) dx dy$$

$$= \int_{A \times B} f_{X,Y}(x,y) dx dy \quad \text{since } f_{X,Y}(x,y) = f_X(x)f_Y(y)$$

Since A and B are arbitrary, it follows that $f_{X,Y}(x,y) = f_X(x)f_Y(y)$.

CHAPTER

12

Analysis of Risk and Uncertainty

12.1

Let X and Y be independent random variables with probability density functions $f_X(x)$ and $f_Y(y)$ respectively. Show that the joint probability density function of (X, Y) is $f_X(x)f_Y(y)$.

SOLUTION Let A and B be any two events in the sample space S . Then

$$P(A \cap B) = P(A)P(B) \quad \text{since } X \text{ and } Y \text{ are independent.}$$

$$P(A \cap B) = \int_{A \times B} f_{X,Y}(x,y) dx dy = P(A)P(B) = \left(\int_A f_X(x) dx \right) \left(\int_B f_Y(y) dy \right)$$

$$= \int_A \int_B f_X(x)f_Y(y) dx dy = \int_{A \times B} f_X(x)f_Y(y) dx dy$$

$$= \int_{A \times B} f_{X,Y}(x,y) dx dy \quad \text{since } f_{X,Y}(x,y) = f_X(x)f_Y(y)$$

Since A and B are arbitrary, it follows that $f_{X,Y}(x,y) = f_X(x)f_Y(y)$.

12.2

Let X and Y be independent random variables with probability density functions $f_X(x)$ and $f_Y(y)$ respectively. Show that the joint probability density function of (X, Y) is $f_X(x)f_Y(y)$.

SOLUTION Let A and B be any two events in the sample space S . Then

$$P(A \cap B) = P(A)P(B) \quad \text{since } X \text{ and } Y \text{ are independent.}$$

$$P(A \cap B) = \int_{A \times B} f_{X,Y}(x,y) dx dy = P(A)P(B) = \left(\int_A f_X(x) dx \right) \left(\int_B f_Y(y) dy \right)$$

$$= \int_A \int_B f_X(x)f_Y(y) dx dy = \int_{A \times B} f_X(x)f_Y(y) dx dy$$

$$= \int_{A \times B} f_{X,Y}(x,y) dx dy \quad \text{since } f_{X,Y}(x,y) = f_X(x)f_Y(y)$$

Since A and B are arbitrary, it follows that $f_{X,Y}(x,y) = f_X(x)f_Y(y)$.

is the theme of the subsequent discussions. The chapter also examines risk and real options. The main points are summarised by way of recapitulation.

LO 12.1 DESCRIPTION AND MEASUREMENT OF RISK

Definition of Risk

As already observed, risk analysis should be incorporated in the capital budgeting exercise. In general, other things being equal, a firm would be well advised to accept a project which is less risky and reject those that involve more risk. This recommendation is consistent with the assumption that the management is averse to risk.

The capital budgeting decision is based on the benefits derived from the project. These benefits are measured in terms of cash flows. As shown in Chapter 9, these cash flows are estimates. The estimation of future returns is done on the basis of various assumptions. The actual returns in terms of cash inflows depend, in other words, on a variety of factors such as price, sales volume, effectiveness of the advertising campaign, competition, cost of raw materials, manufacturing costs and so on. Each of these, in turn, depends on other variables like the state of economy, the rate of inflation, and so on. The accuracy of the estimates of future returns and, therefore, the reliability of the investment decision would largely depend upon the precision with which these factors are forecast.

There are strong reasons to believe that howsoever carefully the factors having a bearing on future returns emanating from the project are forecast, the actual returns will not precisely correspond to the estimate. In other words, the actual returns will vary from the estimate. This is technically referred to as risk. The term **risk** with reference to capital budgeting/investment decision may, therefore, be defined as the variability in the actual returns emanating from a project over its working life, in relation to the estimated return as forecast at the time of the initial capital budgeting decision.

Risk is the variability in the actual returns in relation to the estimated returns.

The decision situations with reference to risk analysis in capital budgeting decisions can be broken up into three types¹: **(i)** uncertainty, **(ii)** risk, and **(iii)** certainty. The risk situation is one in which the probabilities of occurrence of a particular event are known. These probabilities are not known under the uncertainty situation. The difference between risk and uncertainty, therefore, lies in the fact that variability is less in risk than in uncertainty. In other words, in a strict mathematical sense, there is a distinction between the two:

Risk refers to a set of unique outcomes for a given event which can be assigned probabilities, while uncertainty refers to the outcomes of a given event which are too unsure to be assigned probabilities.²

That is, risk exists when the decision maker is in a position to assign probabilities to various outcomes (i.e. probability distribution is known to him). This happens when the decision maker has some historical data on the basis of which he assigns probabilities to other projects of the same type. Uncertainty exists when the decision maker has no historical data from which to develop a probability distribution, and must make intelligent guesses in order to develop a subjective probability distribution. For example, if the proposed project is completely new to the firm, the decision maker, through research and consultation with others, may be able to subjectively assign probabilities to various outcomes.³ Throughout this chapter, however, the terms **risk** and **uncertainty** will be used interchangeably to refer to an uncertain decision making situation.

It is, then, obvious that if the future returns are certain, that is, if they could be forecast accurately, there would be no risk involved in such situations. The less accurately they are forecast, the more likely would be the risk involved in the investment decision. The variability of returns and, hence, risk would vary with the type of project. For instance, lease-purchase capital budgeting will, according to this criterion, have no risk since no variability is associated with the returns. This is because the firm purchases the asset to give it on lease for a specified number of annual lease payments. The return, in other words, is absolutely certain. Another example of risk-free investment is the various types of government and government-guaranteed securities. Excepting these few cases, the investment decision is faced with the problem of uncertain returns, which vary widely depending on the nature and purpose of the decision. Thus, the capital budgeting decision for starting a new product will have more uncertain returns than the one involving expansion of an existing one. Further, the estimates of returns from cost-reduction type of capital budgeting will be subject to a lower degree of risk, than the revenue-expanding capital budgeting project.

In brief, risk, with reference to capital budgeting, results from the variation between the estimated and the actual returns. The greater the variability between the two, the more risky is the project. In the discussions that follow, we will discuss the measures to quantify risk in more precise terms.

Sensitivity Analysis

One measure which expresses risk in more precise terms is **sensitivity analysis**. It provides information as to how sensitive the estimated project parameters, namely, the expected cash flow, the discount rate and the project life are to estimation errors. The analysis on these lines is important as the future is always uncertain and there will always be estimation errors. Sensitivity analysis takes care of estimation errors by using a number of possible outcomes in evaluating a project. The method adopted under sensitivity analysis is to evaluate a project using a number of estimated cash flows to provide to the decision maker an insight into the variability of the outcomes.

- **Sensitivity analysis**
- is a behavioural approach that
- uses a number of possible values for a given variable to assess its impact on a firm's returns.

Sensitivity analysis provides different cash flow estimates under three assumptions: (i) the worst (i.e. the most pessimistic), (ii) the expected (i.e. the most likely), and (iii) the best (i.e. the most optimistic) outcomes associated with the project. This is illustrated in Example 12.1.

Example 12.1

From the undermentioned facts, compute the net present values (NPVs) of the two projects for each of the possible cash flows, using sensitivity analysis.

<i>Particulars</i>	<i>Project X ('000)</i>	<i>Project Y ('000)</i>
Initial cash outlays ($t = 0$)	₹40	₹40
Cash inflow estimates ($t = 1 - 15$)		
Worst	6	0
Most-likely	8	8
Best	10	16
Required rate of return	0.10	0.10
Economic life (years)	15	15

Solution

The NPV of each project, assuming a 10 per cent required rate of return, can be calculated for each of the possible cash flows. Table A-4 indicates that the present value interest factor annuity (PVIFA) of ₹1 for 15 years at 10 per cent discount is 7.606. Multiplying each possible cash flow by PVIFA, we get, (Table 12.1):

TABLE 12.1 Determination of NPV

Expected cash inflows	Project X		Project Y	
	PV	NPV	PV	NPV
Worst	₹45,636	₹5,636	Nil	(₹40,000)
Most likely	60,848	20,848	₹60,848	20,848
Best	76,060	36,060	1,21,696	81,696

Table 12.1 demonstrates that sensitivity analysis can produce some very useful information about projects that appear equally desirable on the basis of the most likely estimates of their cash flows. Project X is less risky than Project Y. The actual selection of the project (assuming that the projects are mutually exclusive) will depend on the decision maker's attitude towards risk. If the decision maker is conservative, he will select Project X as there is no possibility of suffering losses. On the other hand, if he is willing to take risks, he will choose Project Y as it has the possibility of paying a very high return as compared to project X. Sensitivity analysis, in spite of being crude, does provide the decision maker with more than one estimate of the project's outcome and, thus, an insight into the variability of the returns.

Assigning Probability It has been shown above that sensitivity analysis provides more than one estimate of the future return of a project. It is, therefore, superior to single-figure forecast as it gives a more precise idea regarding the variability of the returns. But it has a limitation in that it does not disclose the chances of occurrence of these variations. To remedy this shortcoming of sensitivity analysis so as to provide a more accurate forecast, the probability of the occurring variations should also be given. Probability assignment to expected cash flows, therefore, would provide a more precise measure of the variability of cashflows. The concept of probability is helpful as it indicates the percentage chance of occurrence of each possible cash flow. For instance, if some expected cash flow has 0.6 probability of occurrence, it means that the given cash flow is likely to be obtained in 6 out of 10 times (i.e. 60 per cent). Likewise, if a cash flow has a probability of 1, it is certain to occur (as in the case of purchase-lease capital budgeting decision that is, the chances of its occurrence are 100 per cent). With zero probability, the cash flow estimate will never materialise. Thus, probability of obtaining particular cash flow estimates would be between zero and one.

The quantification of variability of returns involves two steps. First, depending on the chance of occurrence of a particular cash flow estimate, probabilities are assigned. The assignment of probabilities can be *objective* or *subjective*. Objective probability refers to the assignment of a probability which is based on a large number of observations, under independent and identical situations, on the basis of the experience of happening or not happening of the event. However, objective probability is not of much use in capital budgeting situations because they do not satisfy the requirement of independent observations repeated over time. They are rather based on single event. Probability assignments which are not based on objective evidence of a large number of trials of identical events are called subjective or personal probability assignments. The assignment of probabilities to cash flow estimates is subjective.

The second step is to estimate the expected return on the project. The returns are expressed in terms of expected monetary values. The expected value of a project is a weighted average return,

where the weights are the probabilities assigned to the various expected events, that is, the expected monetary values of the estimated cash flows multiplied by the probabilities.

The procedure for assigning probabilities and determining the expected value is illustrated in Table 12.2 by using the NPVs for projects X and Y of Example 12.1.

TABLE 12.2 Calculation of Expected Values

Possible NPV	Probability of the NPV occurrence	NPV (×) Probability
Project X		
₹5,636	0.25	₹1,409
20,848	0.50	10,424
36,060	0.25	9,015
	1.00	Expected NPV 20,848
Project Y		
(40,000)	0.25	(10,000)
20,848	0.50	10,424
81,696	0.25	20,424
	1.00	Expected NPV 20,848

The mechanism for calculating the expected monetary value and the NPV of these estimates is further illustrated in Example 12.2.

Example 12.2

The following information is available regarding the expected cash flows generated, and their probability for company X. What is the expected return on the project? Assuming 10 per cent as the discount rate, find out the present values of the expected monetary values.

Year 1		Year 2		Year 3	
Cash flows	Probability	Cash flows	Probability	Cash flows	Probability
₹3,000	0.25	₹3,000	0.50	₹3,000	0.25
6,000	0.50	6,000	0.25	6,000	0.25
8,000	0.25	8,000	0.25	8,000	0.50

Solution

TABLE 12.3 (i) Calculation of Expected Monetary Values

Year 1			Year 2			Year 3		
Cash flows	Probability	Monetary values	Cash flows	Probability	Monetary values	Cash flows	Probability	Monetary values

(ii) Calculation of Present Values

Year 1	₹5,750 × 0.909	= ₹5,226.75
Year 2	5,000 × 0.826	4,130.00
Year 3	6,250 × 0.751	4,693.75
Total		14,050.50

The first part of the paper is devoted to a general discussion of the problem. It is shown that the problem is equivalent to the problem of finding the minimum of a certain functional. This functional is defined as follows:

$$J(u) = \int_{\Omega} |\nabla u|^2 dx + \int_{\Omega} u^2 dx - \int_{\Omega} f u dx$$

where Ω is the domain of interest, ∇ is the gradient operator, and f is a given function. The minimum of this functional is attained at the solution of the problem.

The second part of the paper is devoted to the construction of a numerical algorithm for the solution of the problem. It is shown that the problem can be solved by the method of steepest descent. The algorithm is described in detail.

The third part of the paper is devoted to the analysis of the convergence of the algorithm. It is shown that the algorithm converges to the minimum of the functional. The rate of convergence is also analyzed.

The fourth part of the paper is devoted to the numerical results. It is shown that the algorithm is efficient and accurate. The results are compared with the exact solution.

The fifth part of the paper is devoted to the conclusion. It is shown that the problem is solved. The results are summarized.

APPENDIX I

Year	Amount	Percentage
1950	100	100
1951	110	110
1952	120	120
1953	130	130

1980	400	400

Sensitivity analysis can also be used to ascertain how change in key variables (say, sales volume, sales price, variable costs, operating fixed costs, cost of capital and so on) affect the expected outcome (measured in terms of NPV) of the proposed investment project. For the purpose of analysis, only one variable is considered, holding the effect of other variables constant, at a point of time.

Assume a manufacturing company determines a positive NPV of ₹5 lakh for a new investment project requiring a cash outlay of ₹25 lakh. Its management may find it useful to know the impact of change in sales price (± 5 per cent) on the NPV of the project. Assume further that the sensitivity analysis indicating a drop in selling price by 5 per cent will cause NPV to be negative. Evidently, it signals that the project is highly risky. On the contrary, if it is found that the NPV continues to be positive even with 25 per cent drop in sales, the project can be viewed as one which has low risk.

Likewise, the management may carry out sensitivity exercises in relation to increase in variable costs. Assuming that 5 per cent increase in variable costs converts the status of positive NPV to negative NPV, the project will be designated as a risky one. In this way, sensitivity analysis can be carried out with respect to identified critical variables to the base NPV. The project is said to be highly sensitive if the small change brings out a magnified change in NPV. These examples eloquently demonstrate the usefulness of sensitivity analysis as a technique of assessing the risks associated with the proposed project.

It will be equally useful to have a graphic presentation to assess the impact of change in key variables on the NPV; the more steep the curve is, the more sensitive/risky the project is, a flatter curve is the manifestation of the low risk.

Thus, the primary objective of sensitivity analysis is to determine how sensitive the NPV is to changes in any of the key variables and to identify which variable has the most significant impact on the NPV. Clearly, sensitivity analysis brings a good insight/feel to the decision maker about the riskiness of the project.

Scenario Analysis

Scenario analysis is akin to sensitivity analysis but is broader in scope. Unlike sensitivity analysis which analyses the impact of only one variable at a time, the scenario analysis evaluates the impact on the project's profitability of simultaneous changes in more than one variable at a time, such as cash inflows, cash outflows and cost of capital.⁴ The decision-maker begins with the base case (most likely scenario). Then, he asks operating managers (production sales, personnel and so on) to specify the worst-case (most pessimistic) scenario in terms of high fixed costs, high variable costs, low selling price, low sales volume, higher cost of capital, and so on and the best-case (most optimistic) scenario (in terms of high sales price, higher sales volume, low variable costs, low fixed costs, lower cost of capital, and so on).⁵ Each scenario will affect the firm's cash inflows, cash outflows, cost of capital and NPV. The values of NPV can be used by the decision-maker to assess the risk involved in the project.

In reality, there is an incredibly remote possibility of either of the two scenarios (the best and the worst) to take place. However, their computation is useful. For instance, in the worst scenario, if NPV remains positive, it indicates that the project has very low risk and is worth accepting. In contrast, if the project shows moderate NPV in the best scenario, the project may be considered highly risky and may not be worth accepting.

Thus, the scenario analysis provides a useful insight into the risk complexion of the proposed project. However, its usefulness is limited in that it considers only a few discreet outcomes (e.g., NPVs). In practice, there are infinite number of other possibilities. Simulation analysis (**discussed below**) is a more comprehensive method of assessing the project's risk. The excel application has greatly enhanced the use of these techniques in project risk assessment.

Simulation

Simulation is a statistical technique employed to have an insight into risk in a capital budgeting decisions. This technique applies predetermined probability distributions and random numbers to estimate risky outcomes.

A simulation model is akin to sensitivity analysis as it attempts to answer 'what if' questions. However, the advantage of simulation is that it is a more comprehensive than sensitivity analysis. Instead of showing the impact on the NPV for change in one key variable (say, change in sales price or cost of capital) at one point of time in sensitivity analysis, simulation enables the distribution of probable values (of NPV), for change in all the key variables, in one iteration/run only. Being so, it provides more information and better understanding about the risk associated with investment decisions to the finance manager.

To be effective, simulation requires a sophisticated computing package as it then enables to try out a large number of outcomes with much ease.

The first step in any simulation exercise is to develop the precise model of the investment project to be used by the computer. Once the model is developed, the computer calculates a random value of project returns (say, in terms of NPV) for each variable identified for the model. From each set/iteration/run of random values (consisting of all the variables listed in the model), a new series of cash flows (cash inflows and cash outflows) is generated and so also of NPV. The important variables in any typical capital budgeting project (most often used in the model) are market size and its growth rate, market share the proposed project is likely to capture, sales price, unit variable cost, total fixed costs, salvage value of the asset, economic useful life span of the project, cost of capital, working capital requirement, tax rate and so on.

This process of generating a random set of values is repeated numerous times (perhaps as many as a thousand times or even more for very large and complex investment projects). This iteration exercise enables the decision maker to develop a probability distribution of the net present value of the proposed investment project; this probability distribution is then used to compute the project's expected mean value of NPV and its standard deviation. The value of standard deviation 'then' can be used to assess the level of risk associated with the project.

It is evident from the above that the probability distribution so developed (through the simulation process) is not only more credible, but it also enables the decision maker/finance manager to view a **continuum of possible outcomes** rather than a single point estimate.⁶

Given the complex nature of a full simulation exercise, it is beyond the scope of the present volume. We have taken a simple example to illustrate the *modus-operandi* of the simulation exercise.

Example 12.3

Let us assume that the marketing department of Hypothetical Ltd has developed the following two tables (one for sale price and another for sales volume) for its new product, containing probability and assigned random numbers.

- **Simulation**

TABLE 12.4 Probability assessment and Assigned random numbers at various sale prices

<i>Sale price</i>	<i>Probability</i>	<i>Random numbers</i>
₹10	0.04	1–10
11	0.06	11–20
12	0.07	21–30
13	0.08	31–40
14	0.10	41–50
15	0.15	51–60
16	0.18	61–70
17	0.17	71–80
18	0.09	81–90
19	0.06	91–100

TABLE 12.5 Probability Assessment and Assigned random numbers at various sales Volumes

<i>Sale volume (units)</i>	<i>Probability</i>	<i>Random numbers</i>
10,000	0.04	1–6
15,000	0.05	7–15
20,000	0.06	16–28
25,000	0.09	29–40
30,000	0.11	41–50
35,000	0.23	51–64
40,000	0.22	65–80
45,000	0.12	81–88
50,000	0.05	89–96
60,000	0.03	97–100

On the first run of a model, the computer will generate two numbers—one for sale price and another for sales volume. Suppose, the random numbers generated are ₹15 (price) and 30,000 (volume). Based on these two numbers, the total sales value for the model will be ₹4,50,000 (₹15 × 30,000 units). This value is to be placed with all other key variables (say, unit variable cost and fixed costs) to generate the first set of NPV. The data for all the other key variables will be also in the form of a table containing probability assessment and assigned random numbers. As stated earlier, this process will be repeated many times to develop probability distribution of expected NPVs. From the distribution so generated, mean and standard deviation values can be determined.

Evidently, the simulation exercise is more comprehensive. It enables the decision maker to have a deeper and thorough understanding of the proposed investment project; he has a better feel of its risk dimension. Besides, the simulation exercise can cope with both independence and dependence among variables.⁷

However, simulation suffers from certain limitations that render this technique inappropriate/infeasible to be used to assess risk profile of a capital budgeting proposal in real life situations. In fact, the model often becomes so complex (and so quickly) that the decision maker loses interest and finds it difficult to go along with the model.

The other problem associated with using simulation is that probability assessments of the key variables (required for model) are most often subjective and difficult to estimate in practice (for example probability values assigned to sale price and sales volume are subjective in nature). Finally, the simulation exercise is both costly and time consuming. Therefore, this exercise has restricted application in that it is likely to be used only in analysing very complex and large investment projects, involving substantial funds.

LO 12.2 PRECISE MEASURES OF RISK: STANDARD DEVIATION AND COEFFICIENT OF VARIATION

Assigning probabilities to cash flow estimates, as a measure of variability of future returns, represents a further improvement over sensitivity analysis, which, as already mentioned, was itself superior to the method which involved the estimation of future cash flows in the form of a single figure. The assignment of probabilities and the calculation of expected values, without doubt, takes into account the risk in terms of variability in explicit terms in investment decisions. But it suffers from a limitation to the extent that it does not provide the decision maker with a concrete value indicative of variability and, therefore, of risk. In other words, for a more meaningful incorporation of risk into the capital budgeting analysis, a more precise statistical measure is called for. The standard deviation (σ) and the coefficient of variation (V) are two such measures which tell us about the variability associated with the expected cash flow in terms of degree of risk. Standard deviation is an absolute measure which can be applied when the projects involve the same outlay. If the projects to be compared involve different outlays, the coefficient of variation is the correct choice, being a relative measure.

Standard Deviation: Absolute Measure of Risk In statistical terms, **standard deviation** is defined as the square root of the mean of the squared deviation, where deviation is the difference between an outcome and the expected mean value of all outcomes. Further, to calculate the value of standard deviation, we provide weights to the square of each deviation by its probability of occurrence.

Assume there are n possible levels of cash flows which are signified as CF_1, CF_2, \dots, CF_n . The mean of these cash flows equals \overline{CF} . The probability of any CF_i is signified as P_i , for example, the probability of CF_4 is signified as P_4 and so on. The formula to calculate the standard deviation (σ) is as follows:

$$\sigma = \sqrt{P_1 (CF_1 - \overline{CF})^2 + P_2 (CF_2 - \overline{CF})^2 + \dots + P_n (CF_n - \overline{CF})^2}$$

$$\sigma = \sqrt{\sum_{i=1}^n P_i (CF_i - \overline{CF})^2} \quad (12.1)$$

- **Standard deviation**
- is the square root of the mean of the squared deviation; the deviation being the difference between an outcome and the expected mean value of all outcomes.

The greater the standard deviation of a probability distribution, the greater is the dispersion of outcomes around the expected value. Standard deviation is a measure that indicates the degree of uncertainty (or dispersion) of cash flow and is one precise measure of risk.

If two projects have the same expected value (mean), then one which has a greater σ will be said to have higher degree of uncertainty or risk. Table 12.6 presents the calculations of the standard deviation for Projects X and Y based on the data presented in our Example 12.1 (Table 12.1).

TABLE 12.6 Calculation of Standard Deviation

CF_i	\bar{CF}	$(CF_i - \bar{CF})$	$(CF_i - \bar{CF})^2$	P_i	$(CF_i - \bar{CF})^2 P_i$
Project X					
₹5,636	₹20,848	₹(15,212)	₹23,14,04,944	0.25	₹5,78,51,236
20,848	20,848	Nil	Nil	0.50	Nil
36,060	20,848	15,212	23,14,04,944	0.25	5,78,51,236
				$\Sigma (CF_i - \bar{CF})^2 P_i$	= 11,57,02,472
Project Y					
(40,000)	20,848	(60,848)	3,70,24,79,104	0.25	92,56,19,776
20,848	20,848	Nil	Nil	0.50	Nil
81,696	20,848	60,848	3,70,24,79,104	0.25	92,56,19,776
				$\Sigma (CF_i - \bar{CF})^2 P_i$	= 1,85,12,39,552
				$\sigma X = \sqrt{11,57,02,472}$	= 10,756.4
				$\sigma Y = \sqrt{1,85,12,39,552}$	= 43,026

The standard deviation of project X is smaller than that of project Y. Therefore, it can be concluded that project X is less risky than project Y.

The conclusion regarding the superiority of project X over project Y would hold because both the projects have an equal outlay. However, if the sizes of the projects' outlay differ, the decision maker should make use of the coefficient of variation to judge the riskiness of the projects.

Coefficient of Variation: A Relative Measure of Risk Standard deviation can be misleading in comparing the uncertainty of alternative projects, if they differ in size. The coefficient of variation (V) is a correct technique in such cases. It is calculated as follows:

$$V = \frac{\text{Standard deviation}}{\text{Expected cash flow}} \quad \text{or} \quad \frac{\sigma}{CF} \quad (12.2)$$

The coefficient of variation for projects X and Y are 0.516 ($\frac{₹10,756.4}{₹20,848}$) and 2.06 ($\frac{₹43,026}{₹20,848}$). The higher the coefficient, the more risky is the project. Project Y, therefore, is more risky than project X. Thus, we find that V is not providing any additional information. However, the real utility of V is apparent when we compare the projects having differing expected values. The following example (Example 12.4) demonstrates the point further.

Example 12.4

A company is considering selecting one of the two mutually exclusive projects, A and B. The relevant information required to evaluate the riskiness of the project is given below:

Data pertaining to NPV	Project A	Project B
(A) Expected value (CF)	₹36,000	₹50,000
(B) Standard deviation (σ)	27,000	32,000
(C) Coefficient of variation (V)	0.75	0.64

On the basis of standard deviation alone, project B would be labelled as a more risky project than A since B has larger standard deviation (32,000) than A (27,000). But on the basis of V , project B would be considered less risky than project A since it has V lower than that of A (0.64 vs 0.75).

We can, therefore, conclude that the coefficient of variation is a better measure of the uncertainty of cash flow returns than the standard deviation. This is because the coefficient of variation adjusts for the size of the cash flow, whereas the standard deviation does not.

LO 12.3 RISK EVALUATION APPROACHES

Once the nature of risk is understood and its quantum estimated, it is to be incorporated within the decision-making framework. This section examines the popular techniques to handle risk. They are:

1. Risk-adjusted Discount Rate Approach
2. Certainty-Equivalent Approach
3. Probability Distribution Approach
4. Decision-tree Approach.

Risk-adjusted Discount Rate Approach

The Risk-adjusted Discount Rate (RAD) Approach is one of the simplest and the most widely used methods for incorporating risk into the capital budgeting decision. Under this method, the amount of risk inherent in a project is incorporated in the discount rate employed in the present value calculations. Relatively risky projects would have relatively high discount rates and relatively safer projects would have relatively lower discount rates. For example, we would use a very low RAD if we intend to purchase a risk-free asset such as treasury bills. On the other hand, a much higher RAD would be used if we intend to invest in a new project which introduces a new product into an untried market. In fact, in practice, the companies may be using different RADs for different types of projects. For instance, RAD may be, say, 10 per cent for projects involving expansion programmes, 15 per cent for new projects and a still higher rate, say, 20 per cent if the project is concerned with introducing a new product to new types of customers.

Risk adjusted discount rate is a method to incorporate risk in the discount rate employed in computing the present values.

The risk-adjusted discount rates presumably represent the differential risk in different classes of investments. The rationale for using different RADs for different projects is as follows. The rate of discount or the cost of capital (k) is the minimum acceptable required rate of return. It is the rate which the investors demand in providing capital to the firm for an investment having a specified risk since such rate is available elsewhere in the economy on assets of similar risk. Therefore, if the project earns less than the rates earned in the economy for that risk, the shareholders will be earning less than the prevailing rate for that risk level, and the market value of the company's shares will fall. The cost of capital, therefore, represents the investors' time preference for money for a typical investment project. Thus, the cost of capital is equivalent to the prevailing rate in the market on that risk class of investment. A well-accepted economic premise is that the required rate of return should increase as risk increases. Therefore, the greater the riskiness of the project, the greater should be the discount rate and *vice versa*. The risk-adjusted discount rate is the discount rate which combines time as well as risk preference of investors.

The use of a single rate of discount without considering the differing risk of various projects would be logically inconsistent with the firm's goal of shareholders' wealth maximisation. Figure 12.1 portrays the relationship between the amount of risk and the required k . It indicates that cash flows of project X with no risk will be discounted at the lowest rate (6 per cent). But as the risk (measured in terms of coefficient of variation) increases, the cash flows of other Projects (Y, Z and W) have to be discounted at progressively higher rates, viz. 10 per cent, 14 per cent and 18 per cents respectively.

Year	Jan	Feb	Mar	Apr	May	June	July	Aug	Sept	Oct	Nov	Dec
1929	100	100	100	100	100	100	100	100	100	100	100	100
1930	100	100	100	100	100	100	100	100	100	100	100	100
1931	100	100	100	100	100	100	100	100	100	100	100	100

The following table shows the percentage of the population in each of the five largest cities in the United States, based on the 1930 census. The cities are New York, Chicago, Philadelphia, Los Angeles, and San Francisco. The percentages are as follows:

City	Percentage of Population
New York	13.1%
Chicago	11.2%
Philadelphia	7.8%
Los Angeles	5.4%
San Francisco	4.2%

The above table shows that New York is the most densely populated city in the United States, with over 13% of the population living in the city. Chicago is the second most densely populated city, with over 11% of the population living in the city. Philadelphia, Los Angeles, and San Francisco are the third, fourth, and fifth most densely populated cities, respectively.

THE UNITED STATES

The following table shows the percentage of the population in each of the five largest cities in the United States, based on the 1930 census. The cities are New York, Chicago, Philadelphia, Los Angeles, and San Francisco. The percentages are as follows:

City	Percentage of Population
New York	13.1%
Chicago	11.2%
Philadelphia	7.8%
Los Angeles	5.4%
San Francisco	4.2%

The above table shows that New York is the most densely populated city in the United States, with over 13% of the population living in the city. Chicago is the second most densely populated city, with over 11% of the population living in the city. Philadelphia, Los Angeles, and San Francisco are the third, fourth, and fifth most densely populated cities, respectively.

The following table shows the percentage of the population in each of the five largest cities in the United States, based on the 1930 census. The cities are New York, Chicago, Philadelphia, Los Angeles, and San Francisco. The percentages are as follows:

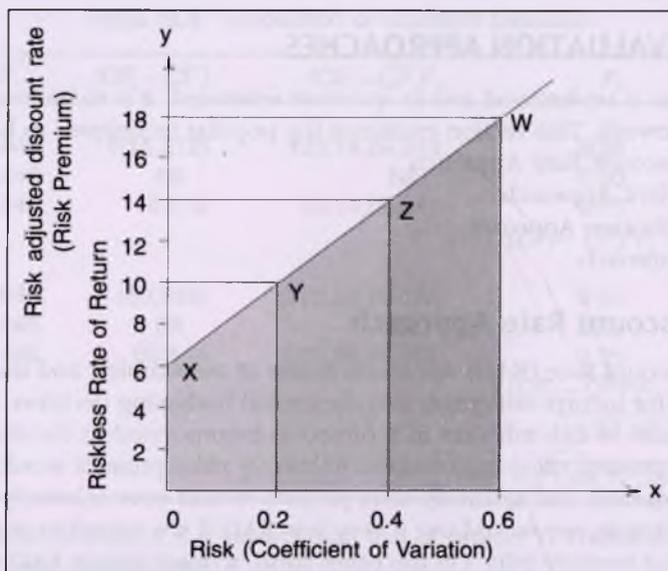

FIGURE 12.1 Risk and Required Return

Accept-reject Decision The Risk-adjusted Discount Rate Approach can be used with both the NPV and the IRR. If the NPV method is used to evaluate capital expenditure decision, NPV would be calculated using the risk-adjusted rate. If the NPV is positive, the proposal would qualify for acceptance. A negative NPV would signify that the project should be rejected. In case of the IRR as a decision criterion, the internal rate of return (r) would be compared with the risk-adjusted required rate of return. If the r exceeds the risk-adjusted rate, the proposal would be accepted, otherwise not.

The risk associated with future returns has two dimensions. First, as already mentioned, the degree of risk of different projects may be different at a particular point of time because of the nature of the proposals such as expansion or new products and so on. The risk may also be different in the case of the same project over time. That is to say, the return at the end of the second year may be more risky than that at the end of the first year and so on. We have illustrated below the calculations of the NPV in both types of situations.

We shall be using the following equation for the purpose of determining NPV under the RAD method.

$$NPV = \sum_{t=1}^n \frac{CFAT_t}{(1 + K_r)^t} - CO \quad (12.3)$$

where $CFAT_t$ = expected CFAT in year t , K_r = risk-adjusted discount rate, CO = cash outflows

Thus, projects are evaluated on the basis of future cash flow projections and an appropriate discount rate. Example 12.5 clarifies how the K_r can be used to evaluate capital budgeting projects.

Example 12.5	Cash outlays	(₹1,00,000)
	CFAT Year 1	50,000
	Year 2	60,000
	Year 3	40,000

Riskless rate of return = 6 per cent

Risk-adjusted rate of return for the current project = 20 per cent

Solution

$$\text{NPV} = (\text{₹}1,00,000) + \frac{\text{₹}50,000}{(1 + .20)} + \frac{\text{₹}60,000}{(1 + .20)^2} + \frac{\text{₹}40,000}{(1 + .20)^3} = (\text{₹}1,00,000) + [\text{₹}50,000 (0.833)] + [\text{₹}60,000 (0.694)] + [\text{₹}40,000 (0.579)] = \text{₹}6,410$$

Given the expected cash flows and estimated risk-adjusted discount rate (K_r), the project's expected NPV is positive and the project should be accepted.

If the risk-adjusted discount rate is 28 per cent, the NPV will be negative (₹5,550). Then, the project will have to be rejected. If the riskiness of the return from the same project differs for future periods, different rates of discount for different future periods can be used. Thus, in Example 12.5, if it is felt that the cash flow is riskier for the second and the third year compared to the first year, a higher discount rate would be used for the return in the second year than that for the first year and so on. Let the rate of discount be 20 per cent, 22 per cent and 25 per cent for the returns for the years 1, 2 and 3 respectively. Then $\text{NPV} = (\text{₹}1,00,000) + \text{₹}50,000 (0.833) + \text{₹}60,000 (0.672) + \text{₹}40,000 (0.512) = \text{₹}2,450$.

Evaluation The Risk-adjusted Discount Rate Approach to incorporate risk in the capital budgeting analysis has certain virtues. First, it is simple to calculate and easy to understand. Moreover, companies in actual practice apply different standards of cost of capital for different projects. It has, therefore, the merit of operational feasibility.

However, it is beset with certain operational and conceptual difficulties. The principal operational difficulty of this approach to the incorporation of risk relates to the determination of the risk-adjusted discount rate. While it is logical to assume that projects which involve more risk should be discounted at a higher rate and *vice-versa*, the difficulty encountered is how to precisely express a higher risk in terms of a higher discount rate. In other words, determining an appropriate discount rate in consonance with differing degrees of risks of various projects or, over the years for the same project, is bound to be arbitrary and, therefore, inconsistent in application. It is doubtful if the exercise would give objective results.

The second criticism of this approach is that it does not make direct use of the information available from the probability distribution of expected future cash.⁸ Moreover, conceptually, this approach adjusts the wrong element. It is the future cash flow of a project which is subject to risk. What is needed is that the cash flow should be adjusted and not the required rate of return.

Finally, the process of adding the risk premium to the discount rate leads to a compounding of risk over time. This is not a theoretically desirable practice. It is because the discounting process should only take into account time value considerations and not risk considerations. In other words, this method implies that risk necessarily increases with time and, therefore, proposals in which risk does not necessarily increase with time may not be properly evaluated by this method.

In brief, this approach can at best be described as a crude method of incorporating risk into capital budgeting analysis.

Certainty-Equivalent Approach

The certainty-equivalent approach (CEA), as an alternative to the risk-adjusted rate method, overcomes some of the weaknesses of the latter method. Under the former approach, the riskiness of the project is taken into consideration by adjusting the expected cash flows and not the discount rate. This method eliminates the problem arising out of the inclusion of risk premium in the discounting process.

- **Certainty equivalents**
- are risk adjusted factors that represent the per cent of estimated cash inflow that investors would be satisfied to receive for certain rather than the cash inflows that are possible/uncertain for each year.

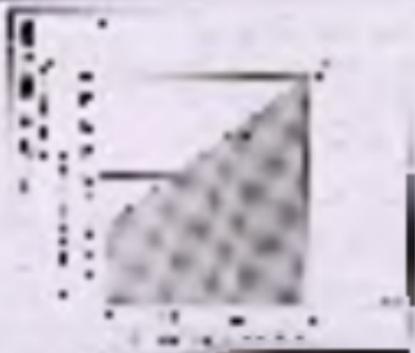

FIG. 1. Scatter plot showing a positive correlation between variables X and Y.

The following table shows the results of the regression analysis for the data in Figure 1. The regression equation is $Y = 1.5X + 2.5$. The coefficient of determination is $R^2 = 0.85$, indicating a strong positive linear relationship between the variables. The standard error of the estimate is 1.2, and the confidence interval for the regression line is shown in the shaded area of the plot.

Steps Involved The incorporation of risk in the investment decision on the basis of the certainty-equivalent approach involves the following steps.

Comparable Riskless Flow As already observed, the incorporation of risk in capital budgeting analysis is done, according to this approach, by modifying the expected cash inflows. The first step, therefore, involves the determination of the basis for modifying the cash flows to adjust for risk. The risk adjustment factor is expressed in terms of a certainty-equivalent coefficient. The certainty-equivalent coefficient represents the relationship between certain (riskless) cash flows and uncertain (risky) cash flows. Thus, the coefficient is equal to:

$$\frac{\text{Riskless cash flow}}{\text{Risky cash flow}} \quad (12.4)$$

Investment decisions are associated with risk as the future returns are uncertain in the sense that the actual returns are likely to vary from the estimates. If the returns could be made certain, there would be no element of risk. It can reasonably be expected that investors would prefer a relatively smaller but certain cash flows rather than an uncertain, though slightly larger cash flow. How much less they would accept would depend on their perception or utility preference with respect to risk. Therefore, depending on the perception, the first step in the use of the certainty-equivalent approach is to ascertain riskless cash flows comparable to the expected cash flows streams from the project.

Suppose a project is expected to generate a cash flow amounting to ₹20,000. Since this involves risk, a smaller but certain cash flow would be as acceptable to the firm as this one. Let us assume that, on the basis of the utility preference of the management with respect to risk, the firm would rank a certain cash flow of ₹12,000 as equal to an uncertain cash flow of ₹20,000. In other words, the certainty-equivalent of ₹20,000 is ₹12,000. Or, the comparable risky flow for the riskless flow of ₹12,000 is ₹20,000. Thus, the certainty equivalent coefficient is $0.60 (\text{₹}12,000 \div \text{₹}20,000)$. This coefficient, when multiplied by the risky cash flow, would generate the riskless cash flows, that is, $0.6 \times \text{₹}20,000 = \text{₹}12,000$.

The coefficient is a fractional amount which can assume a value between 0 and 1. There is an inverse relationship between the degree of risk and the value of the coefficient; the higher the risk associated with the projected cash flow, the lower is the coefficient.

Present Value Calculations After the expected cash flows have been converted into certainty-equivalents, the second step under this approach is to calculate their present values. The rate of discount used for the purpose is the *risk-free rate* or the rate which appropriately reflects the time value of money. It is the same discount rate which is used for computing the present values in the normal course of evaluating capital expenditure. This rate differs from the rate used in the risk-adjusted discount method in that the latter is a modified version of the former.

Accept-Reject Rule The decision-criterion here can either be the NPV method or the IRR method. Using the NPV method, the proposal would be accepted if the NPV of the certainty-equivalent cash flow is positive, otherwise it would be rejected. If the IRR method is employed, the internal rate of return (r), that equates the present value of certainty-equivalent cash inflows with the present value of the cash outflows, would be compared with the risk-free discount rate. As is the practice with this method, if r exceeds the risk-free rate, the investment project would be accepted. If not, it would be rejected.

The mathematical formulation to give the NPV would be:

$$\begin{aligned} \text{NPV} &= \frac{a_1 \text{CFAT}_1}{(1+i)^1} + \frac{a_2 \text{CFAT}_2}{(1+i)^2} + \frac{a_3 \text{CFAT}_3}{(1+i)^3} + \dots + \frac{a_n \text{CFAT}_n}{(1+i)^n} - \text{CO} \\ &= \sum_{t=1}^n \frac{a_t \text{CFAT}_t}{(1+i)^t} - \text{CO} \end{aligned} \quad (12.5)$$

where a_t = certainty-equivalent coefficient for year t , i = riskless interest rate, CO = Cash outflow
We illustrate below the certainty-equivalent approach to adjust risk to capital budgeting analysis on the basis of Example 12.5.

Let us further assume that the certainty-equivalent coefficients for future cash inflows in different years are:

Year	Coefficient
1	0.90
2	0.70
3	0.60

The certainty-equivalent cash inflows would be as follows:

- Year 1 = ₹45,000 (coefficient 0.9 × ₹50,000, the expected cash inflows)
Year 2 = ₹42,000 (0.70 × ₹60,000)
Year 3 = ₹24,000 (0.60 × ₹40,000)

This would be discounted by the riskless rate of return, which is, 6 per cent. Substituting the value in Equation (12.5), $\text{NPV} = \frac{₹45,000}{(1+0.06)^1} + \frac{₹42,000}{(1+0.06)^2} + \frac{₹24,000}{(1+0.06)^3} - ₹1,00,000$
 $= ₹45,000 (0.943) + ₹42,000 (0.890) + ₹24,000 (0.840) - ₹1,00,000 = .(₹25)$

Since the NPV is negative, the project should be rejected. This decision is in conflict with the decision using the risk-adjusted discount rate where $K = 20$ per cent. Thus, both these methods may not yield identical results.

Evaluation The certainty-equivalent approach has the merit of being simple to calculate. Another merit of this approach is that it incorporates risk by modifying the cash flows which are subject to risk. It is, therefore, conceptually superior to the time-adjusted discount rate approach.

Its weaknesses arise out of the practical problems of implementation. The crucial element in the application of this approach is the certainty-equivalent coefficient. It depends upon the utility preferences of the management and the perception of the investors. Being a subjective estimate, it cannot be objective, precise and consistent. The conclusions based on such an estimate would be open to question. Another weakness of this method is that it does not directly use the probability distribution of possible cash flows. Moreover, it is not as intuitively appealing as the risk-adjusted discount rate approach and is more difficult to calculate as well as understand.

However, despite these shortcomings, the certainty-equivalent approach is theoretically superior to the risk-adjusted discount rate approach.⁹ The reasons, in brief, are as follows.¹⁰ The risk-adjusted discount rate method implies increasing risk over time when the discount rate, K , is constant. It may well be the case that this assumption is appropriate. However, management is unable to consider increasing risk explicitly with this approach and make serious errors in measuring risk over time. For many projects, risk does increase with the length of time in future. As a result, the assumption

implicit in the risk-adjusted discount rate approach may well be valid. However, all projects do not necessarily conform to this pattern. For example, an investment proposal may be more risky in the initial years, but when established it may not be that risky, for instance, a tree plantation. In such circumstances, the assumption of risk increasing with the length of time is not valid. This project would be penalised by the risk-adjusted discount rate approach. With the certainty-equivalent approach, management is able to specify directly the degree of risk for a particular future period and then discount the cash flow back to the present value, employing the time value of money. For this reason, the certainty-equivalent approach is superior to the risk-adjusted discounted rate method.

We have discussed so far two common techniques of handling risk in capital budgeting. They are at best crude attempts to incorporate risk. Their major shortcoming is that specifying the appropriate degree of risk for an investment project is beset with serious operational problems. Another common weakness of both these methods is that they cannot be consistently applied to various projects and over time. A method to incorporate risk in the capital budgeting analysis should possess two attributes: (a) it should be able to specify in precise terms the appropriate degree of risk, and (b) these specifications should be consistently applied. **The methods that satisfy these two requirements of a satisfactory approach are: (i) Probability Distribution Approach and (ii) Decision-tree Approach.**

Probability Distribution Approach

Dependent cash flows are cash flows in a period which depend upon the cash flows in the preceding periods.

In the earlier part of this chapter dealing with basic risk concepts, we had introduced the use of the concept of probability for incorporating risk in evaluating capital budgeting proposals. As already observed, the probability distribution of cash flows over time provides valuable information about the expected value of return and the dispersion of the probability distribution of possible returns. On the basis of this information an accept-reject decision can be taken. We discuss the application of probability theory to capital budgeting in this section.

Independent cash flows are cash flows not affected by cash flows in the preceding or following years.

The application of this theory in analysing risk in capital budgeting depends upon the behaviour of the cash flows, from the point of view of behavioural cash flows being (i) independent, or (ii) dependent. The assumption that cash flows are independent over time signifies that future cash flows are not affected by the cash flows in the preceding or following years. Thus, cash flows in year 3 are not dependent on cash flows in year 2 and so on. When cash flows in one period depend upon the cash flows in previous periods, they are referred to as dependent cash flows.

Independent Cash Flows Over Time The mathematical formulation to determine the expected values of the probability distribution of NPV for any project is:

$$NPV = \sum_{t=1}^n \frac{\overline{CF}_t}{(1+i)^t} - CO \quad (12.6)$$

where \overline{CF}_t is the expected value of net CFAT in period t and i is the riskless rate of interest. The standard deviation of the probability distribution of NPV is equal to

$$\sigma (NPV) = \sqrt{\sum_{t=1}^n \frac{\sigma_t^2}{(1+i)^{2t}}} \quad (12.7)$$

where σ_t is the standard deviation of the probability distribution of expected cash flows for period t , σ_t would be calculated as follows:

$$\sigma_t = \sqrt{\sum_{j=1}^m (CF_{jt} - \overline{CF}_t)^2 \cdot P_{jt}} \tag{12.8}$$

The above calculations of the standard deviation and the NPV will produce significant volume of information for evaluating the risk of the investment proposal. The calculations are illustrated in Example 12.6.

Example 12.6

Suppose there is a project which involves initial cost of ₹20,000 (cost at $t = 0$). It is expected to generate net cash flows during the first 3 years with the probability as shown in Table 12.7. Risk free rate of return is 10 per cent.

TABLE 12.7 Expected Cash Flows

Year 1		Year 2		Year 3	
Probability	Net cash flows	Probability	Net cash flows	Probability	Net cash flows
0.10	₹6,000	0.10	₹4,000	0.10	₹2,000
0.25	8,000	0.25	6,000	0.25	4,000
0.30	10,000	0.30	8,000	0.30	6,000
0.25	12,000	0.25	10,000	0.25	8,000
0.10	14,000	0.10	12,000	0.10	10,000

Solution

- (i) Expected Values: For the calculation of standard deviation for different periods, the expected values are to be calculated first. These are calculated in Table 12.8.
- (ii) The standard deviation of possible net cash flows is:

$$\sigma_t = \sqrt{\sum_{j=1}^m (CF_{jt} - \overline{CF}_t)^2 \cdot P_{jt}}$$

Thus, the standard deviation for period 1 is:

$$\sigma_1 = \sqrt{[0.10(6,000 - 10,000)^2 + 0.25(8,000 - 10,000)^2 + 0.30(10,000 - 10,000)^2 + 0.25(12,000 - 10,000)^2 + 0.10(14,000 - 10,000)^2]} = ₹2,280$$

When calculated on similar lines the standard deviations for periods 2 and 3 (σ_2 and σ_3) also work out to ₹2,280.

- (iii) NPV = ₹10,000 (0.909) + ₹8,000 (0.826) + ₹6,000 (0.751) - ₹20,000 = ₹204.

TABLE 12.8 Calculation of Expected Values of Each Period

Time period	Probability	Net cash flow	Expected value (1×2)
	(1)	(2)	(3)
Year 1	0.10	₹6,000 8,000 10,000 12,000 14,000	₹600
	0.25		2,000
	0.30		3,000
	0.25		3,000
	0.10		1,400
			$\overline{CF}_1 = 10,000$

(Contd.)

(Contd.)

	0.10	}	4,000	400
Year 2	0.25		6,000	1,500
	0.30		8,000	2,400
	0.25		10,000	2,500
	0.10		12,000	1,200
			$\overline{CF}_2 =$	8,000
	0.10	}	2,000	200
Year 3	0.25		4,000	1,000
	0.30		6,000	1,800
	0.25		8,000	2,000
	0.10		10,000	1,000
			$\overline{CF}_3 =$	6,000

(iv) The standard deviation under the assumption of independence of cash flows over time:

$$\sigma = \sqrt{\sum_{t=1}^n \frac{\sigma_t^2}{(1+i)^{2t}}} = \sqrt{\frac{\text{₹}(2,280)^2}{(1.10)^2} + \frac{\text{₹}(2,280)^2}{(1.10)^4} + \frac{\text{₹}(2,280)^2}{(1.10)^6}} = \text{₹}3,283$$

Normal Probability Distribution We can make use of the normal probability distribution to further analyse the element of risk in capital budgeting. The use of the normal probability distribution will enable the decision maker to have an idea of the probability of different expected values of NPV, that is, the probability of NPV having the value of zero or less; greater than zero and within the range of two values, say, ₹1,000 and ₹1,500 and so on. If the probability of having NPV of zero or less is considerably low, say, .01, it implies that the risk in the project is negligible. Thus, the normal probability distribution is an important statistical technique in the hands of decision makers for evaluating the riskiness of a project.

The normal probability distribution as shown in Fig. 12.2 has a number of useful properties.

The area under the normal curve, representing the normal probability distribution, is equal to 1 (0.5 on either side of the mean). The curve has its maximum height at its expected value (mean). The distribution (curve) theoretically runs from minus infinity to plus infinity. The probability of occurrence beyond $3\sigma_s$ is very near zero (0.26 per cent).

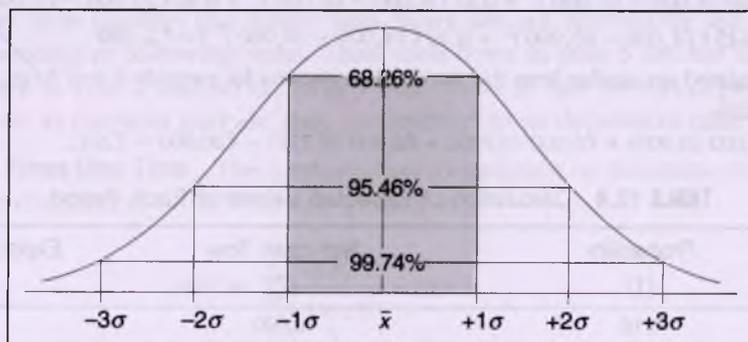

FIGURE 12.2 Normal Curve

For any normal distribution, the probability of an outcome falling within plus or minus 1σ from the mean is 0.6826 or 68.26 per cent. If we take the range within $2\sigma_s$ ($X \pm 2\sigma$), the probability of

an occurrence within this range is 95.46 and 99.74 per cent of all outcomes and lie within 3σ of the \bar{X} .

Example 12.7

Assume that a project has a mean of ₹40 and standard deviation of ₹20. The management wants to determine the probability of the NPV under the following ranges: (i) Zero or less, (ii) Greater than zero, (iii) Between the range of ₹25 and ₹45, (iv) Between the range of ₹15 and ₹30.

Solution

(i) Zero or less: The first step is to determine the difference between the expected outcome X and the expected net present value \bar{X} . The second step is to standardise the difference (as obtained in the first step) by the standard deviation of the possible net present values. Then, the resultant quotient is to be seen in statistical tables of the area under the normal curve. Such a table (Table Z) is given at the end of the book. The table contains values for various standard normal distribution functions. Z is the value which we obtain through the first two steps, that is:

$$Z = \frac{0 - ₹40}{₹20} = -2.0$$

This is also illustrated in Fig. 12.3.

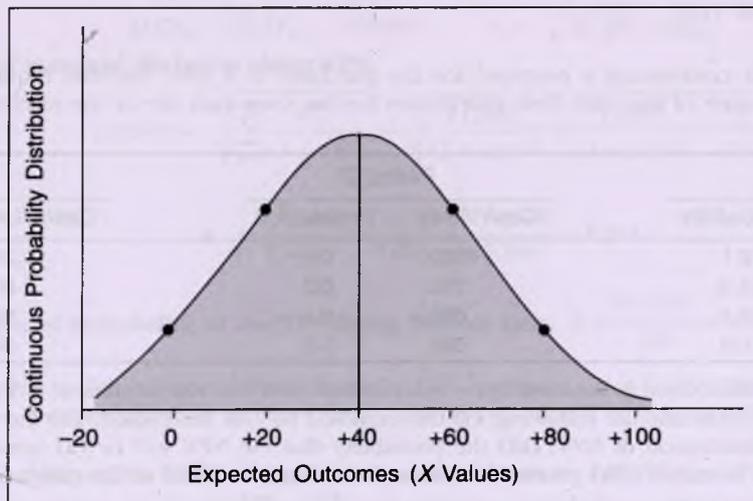

FIGURE 12.3

The figure of -2 indicates that a NPV of 0 lies 2 standard deviation to the left of the expected value of the probability distribution of possible NPV. Table Z indicates that the probability of the value within the range of 0 to 40 is 0.4772. Since the area of the left-hand side of the normal curve is equal to 0.5, the probability of NPV being zero or less would be 0.0228, that is, $0.5 - 0.4772$. It means that there is 2.28 per cent probability that the NPV of the project will be zero or less.

(ii) Greater than zero: The probability for the NPV being greater than zero would be equal to 97.72 per cent, that is, $100 - 2.28$ per cent probability of NPV being zero or less.

(iii) Between the range of ₹25 and ₹45: The first step is to calculate the value of Z for two ranges: (a) between ₹25 and ₹40, and (b) between ₹40 and ₹45. The second and the last step is to sum up the probabilities obtained for these values of Z :

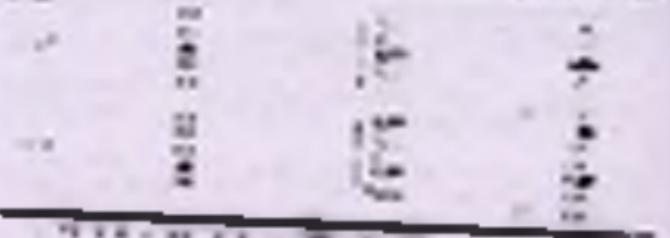

Diagram illustrating the structure of a building or architectural element.

Text describing the structure shown in the diagram above, detailing its components and construction.

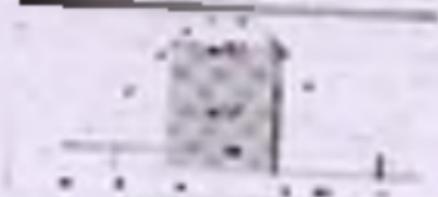

Diagram illustrating the structure of a building or architectural element.

Text describing the structure shown in the diagram above, detailing its components and construction.

Text describing the structure shown in the diagram above, detailing its components and construction.

Text describing the structure shown in the diagram above, detailing its components and construction.

$$Z_1 = \frac{₹25 - ₹40}{₹20} = -0.75$$

$$Z_2 = \frac{₹45 - ₹40}{₹20} = +0.25$$

The area as per Table Z for the respective values of -0.75 and 0.25 is 0.2734 and 0.0987 respectively. Summing up, we have 0.3721 . In other words, there is 37.21 per cent probability of NPV being within the range of ₹25 and ₹45. (It may be noted that the negative signs for the value of Z in any way does not affect the way Table Z is to be consulted. It simply reflects that the value lies to the left of the mean value).

(iv) Between the range of ₹15 and ₹30:

$$Z_1 = \frac{₹15 - ₹40}{₹20} = -1.25$$

$$Z_2 = \frac{₹30 - ₹40}{₹20} = -0.50$$

According to Table Z, the area for respective values -1.25 and -0.5 is 0.3944 and 0.1915 . The probability of having value between ₹15 and 40 is 39.44 per cent, while the probability of having value between ₹30 and 40 = 19.15 per cent. Therefore, the probability of having value between ₹15 and ₹30 would be 20.29 per cent = $(39.44$ per cent $- 19.15$ per cent).

The application of the probability distribution approach in evaluating risky projects is comprehensively illustrated in Example 12.8.

Example 12.8

The Cautious Ltd is considering a proposal for the purchase of a new machine requiring an outlay of ₹1,500 lakh. Its estimate of the cash flow distribution for the three-year life of the machine is given below (amount in ₹lakh):

Period 1		Period 2		Period 3	
Cash flows	Probability	Cash flows	Probability	Cash flows	Probability
₹800	0.1	₹800	0.1	₹1,200	0.2
600	0.2	700	0.3	900	0.5
400	0.4	600	0.4	600	0.2
200	0.3	500	0.2	300	0.1

The probability distribution is assumed to be independent. Risk-free rate of interest is 5 per cent. From the above information, determine the following: **(i)** the expected NPV of the project; **(ii)** the standard deviation of the probability distribution of NPV; **(iii)** the probability that the NPV will be **(a)** zero or less (assuming that the distribution is normal); **(b)** greater than zero; and **(c)** at least equal to the mean; **(iv)** the profitability index of the expected value; and **(v)** the probability that the profitability index will be less than 1.

Solution

TABLE 12.9 (i) Determination of Expected NPV

Period 1			Period 2			Period 3		
CF	P_j	Cash flow (CF × P_j)	CF	P_j	Cash flow (CF × P_j)	CF	P_j	Cash flow (CF × P_j)
800	0.1	80	800	0.1	80	1,200	0.2	240
600	0.2	120	700	0.3	210	900	0.5	450
400	0.4	160	600	0.4	240	600	0.2	120
200	0.3	60	500	0.2	100	300	0.1	30
Mean (CF ₁)		420	Mean (CF ₂)		630	Mean (CF ₃)		840

$$\text{NPV} = ₹420 (0.952) + ₹630 (0.907) + ₹840 (0.864) - ₹1,500 = ₹197 \text{ lakh.}$$

(ii) Standard Deviation of Expected Cash Flow for Period, t

<i>Period 1</i>	$(CF_{1j} - \overline{CF}_1)^2 (\times) P_{1j} = (CF_{1j} - \overline{CF}_1)^2 P_{1j}$	
	₹1,44,400 × 0.1 = ₹14,440	
	32,400 × 0.2 = 6,480	
	400 × 0.4 = 160	
	48,400 × 0.3 = 14,520	
	$\Sigma(CF_{1j} - \overline{CF}_1)^2 P_{1j} = 35,600$	$\sigma_1 = \sqrt{35,600} = 188$
<i>Period 2</i>	$(CF_{2j} - \overline{CF}_2)^2 (\times) P_{2j} = (CF_{2j} - \overline{CF}_2)^2 P_{2j}$	
	₹28,900 × 0.1 = ₹2,890	
	4,900 × 0.3 = 1,470	
	900 × 16,900 × 0.2 = 3,380	
	$\Sigma(CF_{2j} - \overline{CF}_2)^2 P_{2j} = 8,100$	$\sigma_2 = \sqrt{8,100} = 90$
<i>Period 3</i>	$(CF_{3j} - \overline{CF}_3)^2 (\times) P_{3j} = (CF_{3j} - \overline{CF}_3)^2 P_{3j}$	
	₹1,29,600 × 0.2 = ₹25,920	
	3,600 × 0.5 = 1,800	
	57,600 × 0.2 = 11,520	
	2,91,600 × 0.1 = 29,160	
	$\Sigma(CF_{3j} - \overline{CF}_3)^2 P_{3j} = ₹68,400$	$\sigma_3 = \sqrt{68,400} = 262$

Calculation of standard deviation about NPV:

$$\sigma(NPV) = \sqrt{\sum_{t=1}^n \frac{\sigma_t^2}{(1+i)^{2t}}} = \sqrt{\frac{₹(188)^2}{(1+0.05)^2} + \frac{₹(90)^2}{(1+0.05)^4} + \frac{₹(262)^2}{(1+0.05)^6}}$$

$$= \sqrt{\frac{₹35,520}{1.102} + \frac{₹8,100}{1.216} + \frac{₹68,400}{1.340}} = ₹300$$

(iii) (a) Calculation of Probability of the NPV Being Zero or Less: $Z = \frac{0 - 197}{300} = -.6567$

According to Table Z, the probability of the NPV being zero is = 0.2454, that is, 24.54 per cent. Therefore, the probability of the NPV being zero or less would be $0.5 - 0.2454 = 0.2546$ or 25.46 per cent.

(b) The probability of the NPV being greater than zero would be $1 - 0.2546 = 0.7454$ or 74.54 per cent

(c) At least equal to mean: $Z = \frac{197 - 197}{300} = 0$

Reading from the normal distribution table, we get the probability corresponding to 0 as 0.5. Therefore, the probability of having NPV at least equal to mean would be equivalent to the area to the right of the curve, that is, $0.5 = 50$ per cent.

(iv) Profitability Index: $= \frac{PV \text{ of cash inflows}}{PV \text{ of cash outflows}} = \frac{₹197 + ₹1,500}{₹1,500} = 1.13$

(v) The probability of the index being less than 1: For the index to be 1 or less, the NPV would have to be zero or negative. Thus, the probability would be equal to 25.46 per cent as calculated in part (iii) (a) of the answer.

Decision-tree Approach

The Decision-tree Approach (DT) is another useful alternative for evaluating risky investment proposals. The outstanding feature of this method is that it takes into account the impact of all probabilistic estimates of potential outcomes. In other words, every possible outcome is weighed in probabilistic terms and then evaluated. The DT approach is especially useful for situations in which decisions at one point of time also affect the decisions of the firm at some later date. Another useful application of the DT approach is for projects which require decisions to be made in sequential parts.

Decision tree is a pictorial representation in tree form which indicates the magnitude, probability and inter-relationships of all possible outcomes.

A **decision tree** is a pictorial representation in tree form which indicates the magnitude, probability and inter-relationship of all possible outcomes.¹¹ The format of the exercise of the investment decision has an appearance of a tree with branches and, therefore, this method is referred to as the decision-tree method. A decision tree shows the sequential cash flows and the NPV of the proposed project under different circumstances. In Example 12.9 we illustrate the application of this method to a particular investment decision problem.

Example 12.9

Suppose a firm has an investment proposal, requiring an outlay of ₹2,00,000 at present ($t = 0$). The investment proposal is expected to have 2 years' economic life with no salvage value. In year 1, there is a 0.3 probability (30 per cent chance) that CFAT will be ₹80,000; a 0.4 probability (40 per cent chance) that CFAT will be ₹1,10,000 and a 0.3 probability (30 per cent chance) that CFAT will be ₹1,50,000. In year 2, the CFAT possibilities depend on the CFAT that occurs in year 1. That is, the CFAT for the year 2 are conditional on CFAT for the year 1. Accordingly, the probabilities assigned with the CFAT of the year 2 are conditional probabilities. The estimated conditional CFAT and their associated conditional probabilities are as follows:

If $CFAT_1 = ₹80,000$		If $CFAT_1 = ₹1,10,000$		If $CFAT_1 = ₹1,50,000$	
$CFAT_2$	Probability	$CFAT_2$	Probability	$CFAT_2$	Probability
₹40,000	0.2	₹1,30,000	0.3	₹1,60,000	0.1
1,00,000	0.6	1,50,000	0.4	2,00,000	0.8
1,50,000	0.2	1,60,000	0.3	2,40,000	0.1

Solution

The estimated values have been portrayed in Fig. 12.4.

It may be noted that the DT figure covers all the dimensions of the problem: (i) the timing of the CFAT, (ii) the possible CFAT outcomes in each year (including the conditional nature of the CFAT outcomes in year 2), and the probabilities associated with these outcomes. The DT shows 9 distinct possibilities, the project could assume if accepted. For example, one possibility is that the CFAT for the year one may amount to ₹80,000 and for the year 2 ₹40,000. A close perusal of Fig. 12.4 would also indicate that this is the worst event that could happen. Assuming a 8 per cent risk free/discount rate for the project, the NPV would be negative. Likewise, the best outcome that could occur is $CFAT_1 = ₹1,50,000$ and $CFAT_2 = ₹2,40,000$. The NPV would be the highest among all the 9 possible combinations. Figure 12.4 shows the NPV at 8 per cent discount rate of each of the estimated CFATs.

The expected NPV (\overline{NPV}) of the project is given by the following mathematical formulation:

$$\overline{NPV} = \sum_{j=1}^m P_j NPV_j \quad (12.9)$$

Time: 0	Year 1		Year 2		Path	Expected NPV at 8% rate of discount*	Joint Probability (P_j)**	Expected NPV NPV (\times) P_j
	Probabilities	CFAT	Probabilities	CFAT				
Cash Outlays ₹2,00,000	0.3	₹80,000	0.2	₹40,000	1	₹(- 91,640)	0.06	₹(- 5,498.4)
			0.6	1,00,000	2	(-40,220)	0.18	(-7,239.6)
			0.2	1,50,000	3	(-2,630)	0.06	(-157.8)
	0.4	1,10,000	0.3	1,30,000	4	13,270	0.12	1,592.4
			0.4	1,50,000	5	30,410	0.16	4,865.6
			0.3	1,60,000	6	38,980	0.12	4,677.6
	0.3	1,50,000	0.1	1,60,000	7	76,020	0.03	2,280.6
			0.8	2,00,000	8	1,10,300	0.24	26,472.0
			0.1	2,40,000	9	1,44,580	0.03	4,337.4
						1.00	31,329.8	

* PV factors for years 1 and 2 at 8% discount rate as per Table A-3 are 0.926 and 0.857 respectively. Multiply $CFAT_1$ by 0.926 and $CFAT_2$ by 0.857; summing up, we get total PV for individual possible CFAT; subtracting ₹2,00,000 (CO), we get the NPV.

** Product of probabilities of CFAT for years 1 and 2.

FIGURE 12.4 Decision Tree

where P_j = The probability of the j th path occurring which is equal to the joint probability along the path;

NPV_j = NPV of the j th path occurring.

In our example, the joint probability, P_j for the worst path is 0.06 (0.3×0.2) and for the best path is 0.03 (0.3×0.1). The sum of all these joint probabilities must be equal to 1. The last column shows the expected NPV (\overline{NPV}), which is obtained by summing up the product of NPV of j th path and the corresponding probability of j th path ($EP_j \times NPV_j$). The sum of these weighted NPVs is positive and, therefore, the project should be accepted.

This approach has the advantage of exhibiting a bird's eye view of all the possibilities associated with the proposed project. It also makes the management aware well in advance of the adverse possibilities (when the NPV is negative). The conditional nature of CFAT associated with the project is clearly shown. The primary limitation of the method is that the decision tree format may itself become very unwieldy, complex and difficult to understand and construct if the number of years of the expected life of the project and the number of possible outcomes for each year are large. For instance, if we have a 3 year project, there will be 27 paths and, 60,000 paths if the project life is 10 years, assuming only 3 possible outcomes.

LO 12.4 RISK AND REAL OPTOINS

As discussed earlier, a capital budgeting project is accepted if it promises positive NPV and is rejected in case the NPV is negative. This traditional capital budgeting procedure has yielded good

Real options are opportunities to respond to changing market conditions and influence the outcomes of a project.

decisions for a considerable period. A more strategic approach for recognising **real options** in investment projects has emerged in recent years.¹²

It may be recalled that the traditional capital budgeting theory, by and large, is silent about actions that can be taken after the project has been accepted and placed in operation which might cause cash flows to change.¹³ However, this may not hold true in practice. Managers can (and often do) make changes that affect future cash flows and/or the life of the project. The traditional DCF methods often ignores these options and the future managerial flexibility that accompanies them. The **flexibility**

relates to changes in the old decisions when conditions change.¹⁴ Professional managers can most often respond to changing market conditions and the actions of competitors. Opportunities to respond to changing circumstances and as a result influence the outcome of a project are called **managerial strategic options**.¹⁵ They are more popularly known as **real options** as they are associated with real assets.

Real options have value. There may be a negative NPV of a project but it may have the potential to provide the opportunity to make follow-on investments that could be extremely profitable. In operational terms, a project having negative NPV may turn out eventually worth accepting, keeping in mind the option such as those a project creates in terms of opportunities to expand in future. The real options have value and enhance the worth of an investment project. The value of an investment project would be the sum of the NPV of the project (determined in the usual way) and the value of the option(s). Symbolically, its value is given by Equation 12.10

$$\text{Project worth} = [\text{NPV (traditional)} + \text{Option value}] \quad (12.10)$$

The option value will depend on the number of options available; the greater is the number of options, the greater is the option value and the greater is the project's worth.

Types of Option

There are four major types of options: **(1)** Growth option **(2)** Abandonment option **(3)** Timing option and **(4)** Flexibility option.

Growth Option It is an option to expand production/markets if the sales demand for a product were to exceed expectations (i.e., the project turns out to be highly successful). Such an option has the

Growth option is an option to expand production/markets if sales exceed expectation.

potential to develop follow-on projects. If an investment project under consideration has the potentials to open new doors, if successful, then recognition of cash flows from such opportunities should be included to judge the worth of an investment project, at its initiation stage itself. Clearly, growth opportunities embedded in a capital budgeting project (not reckoned in the traditional capital budgeting procedure) often contribute in enhancing the project's NPV.¹⁶

Abandonment

option is an option to abandon/shut-down/terminate a project prior to its expected useful life.

Abandonment Option This is an option to abandon/terminate/shut-down an investment project prior to its expected economic useful life. Such an embedded option enables the management to minimise a firm's losses, if the project turns out to be bad/unsuccessful. In other words, the projects having abandonment value, in many cases, can lower the project's risk by limiting downside losses and enhancing its expected profit-

ability (NPV). For instance, if sales demand were significantly lower than expectations, it might be possible for the firm to sell off some capacity or put it to another use. Another possibility is to improve or redesign the product or service.

A variant of abandonment option is an option to suspend or contract operations. The option to suspend operations temporarily is particularly valuable in natural resource extractions (mines).¹⁷ If there is significant fall in the market price of mineral (say, iron ore) and its extraction costs are higher than the selling price, operations might be **temporarily suspended** and can be resumed when the prices increase sufficiently to cover costs and generate surplus. Likewise, the quantity of production can be scaled down when there is excess supply of products in the market. Higher production level can be resumed when excess supply is exhausted.

The difference between the expected NPV with and without the abandonment represents the value of abandonment options.

Timing Option Also known as **investment timing options**, it is an option to begin an investment at an optimal time. In effect, it is an option to postpone an investment project for one or more periods to accelerate or slow the process of implementing a project in response to new information.¹⁸ Put differently, investment timing option emphasises upon the need for comparing the NPV of an investment project if it is undertaken now (time = 0) or later (at time 1 or 2). There is no guarantee that the project undertaken earlier necessarily generates higher NPV. For example, there are projects in which there is an option to wait. For instance, selling real estate in an adjoining metropolitan city in a future period may more often be more profitable than to sell now. The option to wait in such situations can be valuable.

- **Timing option**
- is an option
- to postpone/
- accelerate/slow
- down a project in
- response to new
- information.

There is yet another advantage of timing option. A project having negative NPV today does not mean that it should never be re-considered. The scenario may change in future and the project may turn out to be profitable.

The investment timing option is in sharp contrast to the traditional NPV analysis which provides decision criterion either to accept the project now or never. The timing option can cause decisive impact on the project's projected profitability and risk. In general, the greater is the uncertainty about the future market conditions, the more attractive it becomes to wait. But this advantage of risk reduction should be more to offset the loss of the 'first-move advantage'.¹⁹

Flexibility Option Flexibility option is an option to incorporate flexibility into the firm's operations, particularly production. It includes, among others, the opportunity to design the production process to accept multiple inputs and use versatile plant/technology to produce a variety of products by reconfiguring the same plant and equipment.²⁰ *Prima-facie*, there may be an increase in the capital spendings of an investment project which enables the firm to have the desired valuable flexibility options. More often, such projects may have higher NPV.

- **Flexibility option**
- is an option to
- redesign the
- production process
- by reconfiguring the
- plant/equipment.

The above discussion underlines the importance of incorporating the value of real options in determining true worth of an investment project. Their non-recognition runs the risk for management to reject investment projects which are acceptable. Given their importance and usefulness in capital budgeting decisions, the use of real options is likely to become more common in years to come.

LO 12.5 ASSESSMENT OF PROJECT RISK PRACTICES IN INDIA

The major features relating to the methodology followed by the Indian corporates to assess the project risk and the relative significance assigned to different risk assessment techniques are summarised below.

- The respondent firms use, as can be expected, more than one technique out of the available techniques, namely, sensitivity analysis, scenario analysis, risk adjusted discounted rate, decision-tree analysis and Monte Carlo simulation.
- The sensitivity analysis is used overwhelmingly (91 per cent). It is used more significantly by public sector units and private sector firms having chartered accounts (CAs) as chief financial officers (CFOs).
- The scenario analysis is also used widely (62 per cent) more frequently by large firms than small firms.
- The risk adjusted discount rate is used by around one-third of the corporates.
- The decision tree analysis as well as Monte Carlo simulation to analyse project risk is not popular among corporates to any significant extent.
- Sensitivity analysis is the most popular approach for quantifying risk. It is followed by shorter pay back period and higher cut-off rate.
- Diversification of corporate investment is also used by the sample corporates (53 per cent) for risk reduction.
- The survey (undertaken in 2011–2012) indicates the emergence of new techniques of real options and abandonment options as a part of practice by the sample companies in evaluating capital budgeting proposals.

SUMMARY

Risk refers to the variability in the actual returns *vis-à-vis* the estimated returns, in terms of cash flows.

Risk involved in capital budgeting can be measured in absolute as well as relative terms. The absolute measures of risk include sensitivity analysis, simulation and standard deviation. The coefficient of variation is a relative measure of risk.

Sensitivity analysis provides information as to how sensitive the various estimated project parameters, namely, cash flows, cost of capital and project's economic life are to estimation errors. The estimates are normally made under three assumptions: (i) the most pessimistic, (ii) the most likely and (iii) the most optimistic.

Scenario analysis evaluates the impact of simultaneous changes in more than one variable at a time on the project's profitability. The analysis normally is carried out on three sets of scenarios: (1) most likely (2) worst-case and (3) best-case. The values of NPV can be used to assess project risk. In case the project promises positive NPV even in the worst case scenario, it is considered to have low risk. The project is considered highly risky if it generates moderate NPV even in the best-case.

Simulation technique employs predetermined probability distributions and random numbers to estimate risky outcomes. It shows impact of changes in all the key variables on the distribution of probable values of NPV, in one iteration only.

LO 12.2

Standard deviation measures the variability of cash flows around the expected value. Symbolically, the expected value (\overline{CF}) is $\sum_{t=1}^n CF_t P_t$. The formula to calculate standard deviation (σ) is $\sqrt{\sum_{t=1}^n P_t (CF_t - \overline{CF})^2}$.

The greater is the value of (σ), the higher is the degree of risk associated with the proposed investment project.

Coefficient of variation (V) is an appropriate technique of measuring risk of alternative projects involving different investment outlays. It is σ/\overline{CF} .

There are four important methods of incorporating risk: (1) Risk adjusted discount rate (RAD) approach, (2) Certainty equivalent (CE) approach, (3) Probability distribution (PD) approach and (4) Decision-tree (DT) approach.

According to the RAD approach, the element of risk is incorporated by adjusting the required rate of return, using higher discount rates for more risky projects and lower discount rates for less risky projects. The $NPV = \sum_{t=1}^n \frac{CFAT_t}{(1+k_r)^t} - CO$.

LO 12.3

The CE approach adjusts the risk through the cash flows associated with the projects with the help of certainty-equivalent coefficient. The CE coefficient (a) indicates the relationship between riskless cash flows and risky cash flows. The $NPV = \sum_{t=1}^n \frac{a_t CFAT_t}{(1+i)^t} - CO$.

The PD approach illustrates the analysis of risk through the application of probability distribution, assuming independence of cash flows over time. The steps involved are: (i) Determination of expected NPV, (ii) computation of standard deviation of expected cash flows and (iii) calculation of probability of different value of NPV based on Z value. The value of $Z = (X_t - \bar{X})/\sigma$.

The DT approach takes into account the impact of all probable estimates of potential out-comes. Every possible outcome is weighed in probability terms and then evaluated, assuming dependence of cash flows. The expected NPV (\overline{NPV}) = $\sum_{j=1}^m P_j NPV_j$.

LO 12.4

Real options are associated with real assets. They have value in that they provide opportunities to the management to respond to the changing circumstances likely to have positive impact on the eventual outcome of an investment project. As a result, the project's worth is higher by the value of the option.

There are four major types of options: (1) growth option, (2) abandonment option, (3) timing option and (4) flexibility option.

Growth option is an option to expand production in case the sales demand for a product exceeds expectation. It has also the potential to develop follow-on projects.

Abandonment option is an option to abandon the investment project prior to the completion of its expected economic useful life. A variant to abandonment option is an option to suspend or contract business operations temporarily.

Investment timing option is an option to undertake an investment project at an appropriate time. This option emphasises upon the value to wait; an investment/project started early need not necessarily yield the maximum NPV.

Flexibility option is an option to incorporate flexibility into the firm's operations. In particular, it focuses on the need to design a production process to accept multiple inputs and use a versatile plant to produce a variety of products by reconfiguring the same plant and equipment.

SOLVED PROBLEMS

P.12.1 A textile company is considering two mutually exclusive investment proposals. Their expected cash flow streams (CFAT) are given as follows:

LO 12.3	LOD E
----------------	------------------

Year	Proposal X (₹ thousand)	Proposal Y (₹ thousand)
0	(500)	(700)
1	145	100
2	145	110
3	145	130
4	145	150
5	145	160
6	145	150
7		120
8		120
9		110
10		100

The company employs the risk-adjusted method of evaluating risky projects and selects the appropriate required rate of return as follows:

Project pay back	Required rate of return (percentage)
Less than 1 year	8
1 to 5 years	10
5 to 10 years	12
Over 10 years	15

Which proposal should be acceptable to the company?

Solution

(i) Pay back period (PB) for Proposal X:

$$= \frac{\text{₹}5,00,000}{\text{₹}1,45,000} = 3.448 \text{ years.}$$

The appropriate risk adjusted rate of return for pay back period of 3.448 years is 0.10.

(ii) Pay back period for proposal Y:

Year	Cash flows (₹ thousand)	Cumulative cash flows (₹ thousand)
1	100	100
2	110	210
3	130	340
4	150	490
5	160	650
6	150	800

The pay back period for Proposal Y is 5 years and 4 months and the appropriate risk adjusted rate of return is 0.12.

(iii) Net present value of proposal X:

Years	CFAT	PV factor (at 0.10)	Total PV
1-6	₹1,45,000	4.355	₹6,31,475
Less: Cash outflows			5,00,000
NPV			1,31,475

(iv) Net present value of proposal Y:

Year	CFAT (₹ thousand)	PV factor (at 0.12)	Total PV
1	100	0.893	₹89,300
2	110	0.797	87,670
3	130	0.712	92,560
4	150	0.636	95,400
5	160	0.567	90,720
6	150	0.507	76,050
7	120	0.452	54,240
8	120	0.404	48,480
9	110	0.361	39,710
10	100	0.322	32,200
Total PV			7,06,330
Less: Cash outflows			7,00,000
NPV			6,330

Proposal X should be acceptable to the company as its NPV is higher than that of Proposal Y.

P.12.2 A company employs certainty-equivalent approach in the evaluation of risky investments. The capital budgeting department of the company has developed the following information regarding a new project:

LO 12.3 **LOD E**

Year	Expected CFAT (₹ thousand)	Certainty-equivalent quotient
0	(200)	1.0
1	160	0.8
2	140	0.7
3	130	0.6
4	120	0.4
5	80	0.3

The firm's cost of equity capital is 18 per cent; its cost of debt is 9 per cent and the riskless rate of interest in the market on the government securities is 6 per cent. Should the project be accepted?

Solution

Determination of NPV

Year	Expected CFAT (₹ thousand)	Certainty-equivalent (CE)	Adjusted CFAT (CFAT × CE) (₹ thousand)	PV factor (at 0.06)	Total PV
0	(200)	1.0	(200)	1.000	₹(2,00,000)
1	160	0.8	128	0.943	1,20,704
2	140	0.7	98	0.890	87,220
3	130	0.6	78	0.840	65,520
4	120	0.4	48	0.792	38,016
5	80	0.3	24	0.747	17,928
NPV					1,29,388

The project should be accepted.

P.12.3 The Delta Corporation is considering an investment in one of the two mutually exclusive proposals: Project A which involves an initial outlay of ₹1,70,000 and Project B which has an outlay of ₹1,50,000. The Certainty-Equivalent Approach is employed in evaluating risky investments. The current yield on treasury bills is 0.05 and the company uses this as the riskless rate. The expected values of net cash flows with their respective certainty-equivalents are:

LO 12.3 **LOD M**

Year	Project A		Project B	
	Cash flow (₹ thousand)	Certainty-equivalent	Cash flows (₹ thousand)	Certainty-equivalent
1	90	0.8	90	0.9
2	100	0.7	90	0.8
3	110	0.5	100	0.6

- (i) Which project should be acceptable to the company?
- (ii) Which project is riskier? How do you know?
- (iii) If the company was to use the risk-adjusted discount rate method, which project would be analysed with higher rate?

Solution**(i) Determination of NPV of project A**

Year	CFAT (₹ thousand)	CE	Adjusted CFAT (CFAT × CE) (₹ thousand)	PV factor (at 0.05)	Total PV
1	90	0.8	72	0.952	₹68,544
2	100	0.7	70	0.907	63,490
3	110	0.5	55	0.864	47,520
Total PV					1,79,554
Less: Initial outlay					1,70,000
NPV					9,554

(ii) Determination of NPV of project B:

Year	CFAT (₹ thousand)	CE	Adjusted CFAT (CFAT × CE) (₹ thousand)	PV factor (at 0.05)	Total PV
1	90	0.9	81	0.952	₹77,112
2	90	0.8	72	0.907	65,304
3	100	0.6	60	0.864	51,840
Total PV					1,94,256
Less: Initial outlay					1,50,000
NPV					44,256

The NPV being greater, Project B should be acceptable to the company.

(ii) Project A is riskier. It is because certainty-equivalent associated with expected CFAT of Project A is lower.

(iii) Project A being more risky would be analysed using a higher discount rate, if the company was to use risk-adjusted discount rate method.

P.12.4 A company is considering two mutually exclusive projects. The company uses the risk adjusted discount rate method. Certain CFAT and certainty equivalents for projects (X and Y) are as follows:

LO 12.3

Year	Project X		Project Y	
	Certain CFAT	Certainty equivalents	Certain CFAT	Certainty equivalents
0	(₹40,00,000)	1.00	(₹45,00,000)	1.00
1	14,25,000	0.95	22,50,000	0.90
2	15,30,000	0.85	16,00,000	0.80
3	14,00,000	0.70	17,50,000	0.70
4	13,00,000	0.65	10,80,000	0.60

Which project should be accepted, if risk free rate of return of the firm is 9%, cost of capital is 13%, and the risk-adjusted discount rate (for projects X and Y) is 16%?

Solution

Determination of NPV of Projects X and Y

Year	Certain CFAT	Certainty equivalent (CE)	Estimated CFAT (Certain CFAT/CE)	PV factor at 16%	Total PV
Project X:					
1	₹14,25,000	0.95	₹15,00,000	0.862	₹12,93,000
2	15,30,000	0.85	18,00,000	0.743	13,37,400
3	14,00,000	0.70	20,00,000	0.641	12,82,000
4	13,00,000	0.65	20,00,000	0.552	11,04,000
Total present value					50,16,400
Less cost of machine					(40,00,000)
NPV					10,16,400
Project Y:					
1	₹22,50,000	0.90	₹25,00,000	0.862	₹21,55,000
2	16,00,000	0.80	20,00,000	0.743	14,86,000
3	17,50,000	0.70	25,00,000	0.641	16,02,500
4	10,80,000	0.60	18,00,000	0.552	9,93,600
Total present value					62,37,100
Less cost of machine					(45,00,000)
NPV					17,37,100

Recommendation Since NPV of Project Y is higher than Project X, project Y should be accepted.

P.12.5 A company has under consideration two mutually exclusive projects for increasing its plant capacity. The management has developed pessimistic, most likely and optimistic estimates of the annual cash flows associated with each project. The estimates are as follows:

LO 12.1 ^{LOD} E

	Project A	Project B
Net investment	₹30,000	₹30,000
CFAT estimates:		
Pessimistic	1,200	3,700
Most likely	4,000	4,000
Optimistic	7,000	4,500

- (a) Determine the NPV associated with each estimate given for both the projects. The projects have 20 year life each and the firm's cost of capital, 10 per cent.
- (b) Which project do you consider should be selected by the company and why?

Solution

- (a) Determination of NPV of project A

Expected cash flow	CFAT ($t = 1 - 20$)	PV factor at 0.10	Total PV	NPV (PV - ₹30,000)
Pessimistic	₹1,200	8.514	₹10,217	(₹19,783)
Most likely	4,000	8.514	34,056	4,056
Optimistic	7,000	8.514	59,598	29,598
Determination of NPV of project B				
Pessimistic	3,700	8.514	31,501	1,501
Most likely	4,000	8.514	34,056	4,056
Optimistic	4,500	8.514	38,313	8,313

- (b) The calculations suggest that the projects are equally desirable on the basis of the most likely estimates of their cash flows. However, Project A is riskier than Project B because the NPV can be negative by an amount as high as ₹19,783. On the other hand, in the case of Project B, there is no possibility of the firm incurring losses as the values of NPV are positive under all expected cash flow situations. Since the projects are mutually exclusive, the actual selection will depend on the decision maker's attitude towards risk. If he is willing to take risk, he will select Project A, because it has also the possibility of yielding a much higher amount of NPV as compared to Project B; if he is risk-averse, he will obviously select Project B.

P.12.6 The initial investment outlay for a capital investment project consists of ₹100 lakh for plant and machinery and ₹40 lakh for working capital. Other details are summarised below:

LO 12.1 **LOD D**

Sales (lakh units per annum for years 1 to 5)	1
Selling price (per unit)	120
Variable cost (per unit)	60
Fixed overheads (excluding depreciation) (lakh per annum for years 1 to 5)	15
Rate of depreciation on plant and machinery (per cent on WDV)	25
Salvage value of plant and machinery (Equal to the WDV at the end of year 5)	
Applicable tax rate (per cent)	40
Time horizon (years)	5
Post-tax cut off rate (per cent)	12

Required:

- (i) Indicate the financial viability of the project by calculating the net present value.
- (ii) Determine the sensitivity of the project's NPV under each of the following conditions:
 - (a) Decrease in selling price by 10 per cent.
 - (b) Increase in variable cost by 10 per cent.
 - (c) Increase in variable cost by 5 per cent and increase in selling price by 5 per cent.

Solution

(i) Financial viability of capital investment decision (₹ lakh)

Cash outflows	
Cost of plant and machinery	100
Add working capital	40
Total cash outflows	140

Determination of CFAT and NPV

(Amount in lakh of rupees)

Particulars	Years				
	1	2	3	4	5
Sales	120	120	120	120	120
Less: Variable cost	60	60	60	60	60
Less: Fixed cost	15	15	15	15	15
EBDT	45	45	45	45	45
Less: Depreciation*	25	18.75	14.06	10.55	7.91
EBT	20	26.25	30.94	34.45	37.09
Less: Taxes @ 40%	8	10.5	12.38	13.78	14.84

EAT	13.8	17.55	20.36	22.47	24.05
CFAT	38.8	36.3	34.42	33.02	31.96
Salvage value					23.73
Recovery of working capital					40.00
(x) PV Factor (0.12)	0.893	0.797	0.712	0.636	0.567
PV of cash flows	34.64	28.93	24.50	21	54.26
Total present value of cash inflows					163.33
Less: Cash outflows					140
NPV					23.33

Determination of financial viability of the project under various scenarios

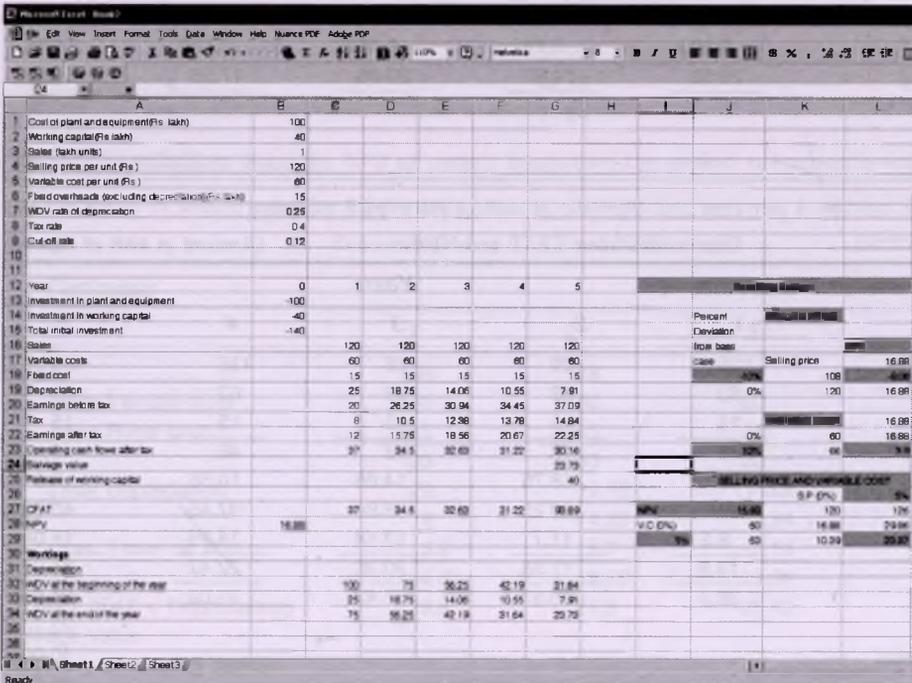

(₹ lakh)

Particulars	NPV	Change in NPV	
Base case	₹16.851		
Sensitivity			
(i) Decrease in selling price by 10 per cent	(-9.12)	₹(-25.971)	(-154.1%)
(ii) Increase in variable cost by 10 per cent	3.88	12.971	(-76.9%)
(iii) Increase in variable cost by 5 per cent and increase in selling price by 5 per cent	23.33	6.48	(38.5%)

It can be observed from the above

1. The project becomes profitably unviable (as the NPV becomes negative) if the selling price declines by 10 per cent.
2. The project remains viable (though the NPV decreases) if the variable cost increases by 10 per cent.
3. The project viability improves (as NPV increases) if the selling price and variable cost increases by 5 per cent.

SPREADSHEET SOLUTION

Financial Viability of Capital Investment Decision

Enter the inputs in cells B1 to B9

Enter =- B1 in cell B13, =- B2 in cell B14 for investment in equipment and working capital respectively.

Enter =SUM(B13:B14) in cell B15 to calculate the total initial investment.

Enter the formula =(\$B3*\$B4) in cell C16 and copy the formula in cells D16 to G16 to determine sales for all the years. Enter the formula =\$B3*\$B5 in cell C17 and copy the formula to cells D17 to G17 to show the variable cost.

Enter =\$B6 in cell C18 and copy it to cells D18 to G18 to show the fixed cost.

Depreciation is worked out in cells C32 to G34. For calculating depreciation enter =b\$1 in cell C32. Enter the formula =C32*\$B7 in cell C33. Enter =C32-C33 in cell c34 and copy it to cells D34 to G34. Also copy the formula in cell C33 to cells D33 to G33. Enter =C34 in cell D32 and copy it to cells E32 to G32. The Depreciation figures are carried to Cells C19 to G19. This is done by entering =C33 in cell C19 and it is copied in cells D19 to G19.

To calculate earnings before taxes, enter =C16-(SUM(C17:C19)) in cell C20 and copy the formula to cells D20 to G20.

To calculate taxes, enter =C20*\$B.8 in cell C21 and copy to cells D21 to G21.

To calculate earnings after taxes, enter =C20-C21 in cell C22 and copy to cells D22 to G22.

To calculate operating CFAT, enter =C22+C19 in cell C23 and copy to cells D23 to G23.

Salvage value is entered in cell G24 by entering =G34.

Working capital released is entered in cell G25 by providing reference to cell B2 by entering =B2 in cell G25.

Year wise CFATs are calculated by entering =SUM(C23:C25) in cell C27 and copying it to cells D27 to G27.

NPV is calculated in cell B28 by entering =NPV(B9, C27:G27)+B15.

Sensitivity Analysis for Change in Selling Price

First of all, enter =B28 in cell L17. Enter -10% in cell J18 and 0% in cell J19. Enter 120 in cell K19 and formula = K19*(1+J18) in cell K18.

Select cells K17 to L19. Choose Data/What if Analysis/ Data Table from the main menu. A table dialogue box pops up. Enter the address B4 in column input cell and click on OK. The new NPV will be displayed in cell L18.

Sensitivity Analysis for Change in Variable Cost

Enter 0% in cell J22 and 10% in cell J23. Enter 60 in cell K22 and formula = K22*(1+J23) in cell K23.

Select cells K21 to L23. Choose Data/What if Analysis/ Data Table from the main menu. A table dialogue box pops up. Enter the address B5 in column input cell and click on OK. The new NPV will be displayed in cell L23.

Sensitivity Analysis for Changes in Selling Price and Variable Cost

Enter =B28 in cell J27. Enter SP(0%) in cell I28 and VC(0%) in cell K26. Enter 5% in cell I29 and in cell L26. Enter 120 in cell K27 and the formula =K27*(1+L26) in cell L27. Enter 60 in cell J28 and formula =J28*(1+I29) in cell J29.

Select cells J27 to L29. Choose Data/What if Analysis/ Data Table from the main menu. A table dialogue box pops up. Enter the address B4 in the row input cell and B5 in the column input cell and click on OK. The new NPV will be displayed in cell L29.

P.12.7 A company is considering an investment in a project that requires an initial net investment of ₹3,000 with an expected cash flow (CFAT) generated over three years as follows:

LO 12.3	LOD	M
----------------	------------	----------

CFAT	Probability	CFAT	Probability	CFAT	Probability
₹800	0.1	₹800	0.1	₹800	0.2
1,000	0.2	1,000	0.3	1,000	0.5
1,500	0.4	1,500	0.4	1,500	0.2
2,000	0.3	2,000	0.2	2,000	0.1

- What is the expected NPV of this project? (Assume that the probability distributions are independent and the risk-free rate of interest in the market is 0.05).
- Calculate the standard deviation about the expected value.

Table 1. Summary of data for the first 100 cases.

Case No.	Age	Sex	Occupation	Duration of Illness (days)	Outcome
1	25	M	Teacher	10	Recovered
2	30	F	Homemaker	12	Recovered
3	18	M	Student	8	Recovered
4	45	F	Nurse	15	Recovered
5	22	M	Engineer	9	Recovered
6	35	F	Writer	11	Recovered
7	15	M	Student	7	Recovered
8	40	F	Teacher	13	Recovered
9	28	M	Engineer	10	Recovered
10	32	F	Homemaker	14	Recovered

The following table shows the distribution of cases by age group and sex. The data are based on the first 100 cases.

Age Group	Sex	Number of Cases
0-10	Male	15
0-10	Female	10
11-20	Male	20
11-20	Female	15
21-30	Male	18
21-30	Female	12
31-40	Male	12
31-40	Female	10
41-50	Male	8
41-50	Female	10
51-60	Male	5
51-60	Female	8
61-70	Male	3
61-70	Female	5
71-80	Male	2
71-80	Female	3
81-90	Male	1
81-90	Female	2
91-100	Male	1
91-100	Female	1

The following table shows the distribution of cases by occupation. The data are based on the first 100 cases.

The following table shows the distribution of cases by duration of illness. The data are based on the first 100 cases.

Duration (days)	Number of Cases
0-5	10
6-10	20
11-15	15
16-20	12
21-25	8
26-30	5
31-35	3
36-40	2
41-45	1
46-50	1

The following table shows the distribution of cases by outcome. The data are based on the first 100 cases.

Outcome	Number of Cases
Recovered	85
Deceased	10
Discharged	5

The following table shows the distribution of cases by sex. The data are based on the first 100 cases.

Sex	Number of Cases
Male	55
Female	45

The following table shows the distribution of cases by age group. The data are based on the first 100 cases.

- (c) Find the probability that the NPV will be less than zero (Assume that the distribution is normal and continuous).
- (d) What is the probability that the NPV will be greater than zero?
- (e) What is the probability that NPV will be (i) between the range of ₹500 and ₹750, (ii) between the range of ₹400 and ₹600, (iii) at least ₹300 and (iv) at least ₹1,000.

Solution

(a) Determination of expected NPV

Period 1			Period 2			Period 3		
CF	P_j	Cash flow ($CF \times P_j$)	CF	P_j	Cash flow ($CF \times P_j$)	CF	P_j	Cash flow ($CF \times P_j$)
₹800	0.1	₹80	₹800	0.1	₹80	₹800	0.2	₹160
1,000	0.2	200	1,000	0.3	300	1,000	0.5	500
1,500	0.4	600	1,500	0.4	600	1,500	0.2	300
2,000	0.3	600	2,000	0.2	400	2,000	0.1	200
Mean (CF_1)		1,480	(CF_2)		1,380	(CF_3)		1,160

Determination of NPV

CF	PV factor (0.05)	Total PV
₹1,480	0.952	₹1,409
1,380	0.907	1,252
1,160	0.864	1,002
Total PV		3,663
Less: Cash outflows		3,000
NPV		663

(b) Determination of standard deviation for each period

Period 1

$(CF_{j1} - \overline{CF}_1)^2$	(x)	P_{j1}	$(CF_{j1} - \overline{CF}_1)^2 P_{j1}$
₹4,62,400	x	0.1	₹46,240
2,30,400	x	0.2	46,080
400	x	0.4	160
2,70,400	x	0.3	81,120
			1,73,600
			$\sigma_1 = \sqrt{1,73,600} = 417$

Period 2

$(CF_{j2} - \overline{CF}_2)^2$	(x)	P_{j2}	$(CF_{j2} - \overline{CF}_2)^2 P_{j2}$
₹3,36,400	x	0.1	₹33,640
1,44,400	x	0.3	43,320
14,400	x	0.4	5,760
3,84,400	x	0.2	76,880
			1,59,600
			$\sigma_2 = \sqrt{1,59,600} = 400$

(Contd.)

(Contd.)

Period 3 $(CF_{\beta} - \overline{CF}_3)^2$	(x)	P_{β}	$(CF_{\beta} - \overline{CF}_3)^2 P_{\beta}$
₹1,29,600	×	0.2	₹25,920
25,600	×	0.5	12,800
1,15,600	×	0.2	23,120
7,05,600	×	0.1	70,560
			1,32,400
			$\sigma_3 = \sqrt{1,32,400} = 364$

Standard deviation about the expected value:

$$\sigma = \sqrt{\frac{417^2}{(1+0.05)^2} + \frac{400^2}{(1+0.05)^4} + \frac{364^2}{(1+0.05)^6}}$$

$$= \sqrt{3,87,588} = 622$$

(c) The probability that the NPV will be zero or less:

$$Z = \frac{0 - NPV}{\sigma} = \frac{0 - 663}{622} = -1.0659 = -1.07$$

According to Table Z, the probability of the NPV being zero is 0.3577; therefore, the probability of the NPV being less than zero would be $0.5 - 0.3577 = 0.1423 = 14.23$ per cent.

(d) The probability of the NPV being greater than zero would be:

$$1 - 0.1423 = 0.8577 = 85.77 \text{ per cent}$$

(e) (i) The probability of the NPV being within the range of ₹500 and ₹750:

$$Z_1 = \frac{₹500 - ₹663}{₹622} = (0.262) \quad Z_2 = \frac{₹750 - ₹663}{₹622} = (0.141)$$

According to Table Z, the probability corresponding to the respective values of Z_1 and Z_2 is 0.1026 and 0.0557. Summing up the values, we have, 0.1583, that is 15.83 per cent.

(ii) Between the range of ₹400 and ₹600

$$Z_1 = \frac{₹400 - ₹663}{₹622} = (0.42) \quad Z_2 = \frac{₹600 - ₹663}{₹622} = (0.10)$$

According to Table Z, the probability corresponding to the respective values of Z are 0.1628 and 0.0398 respectively.

To put it explicitly: The probability of NPV having a value between ₹400 and ₹663 = 0.1628. The probability of it having a value between ₹600 and ₹663 = 0.0398. Therefore, the probability of having its value between ₹400 and ₹600 would be $0.1628 - 0.0398 = 0.1230 = 12.3$ per cent.

(iii) At least ₹300

$$Z = \frac{₹300 - ₹663}{₹622} = (0.5836)$$

According to Table Z, probability of the NPV being 300 = 0.2190. The probability of having NPV at least equal to ₹300 would be more by 0.50 (area to the right side of mean), that is, 0.7190 or 71.9 per cent.

(iv) At least ₹1,000

$$Z = \frac{₹1,000 - ₹663}{₹622} = 0.5418$$

According to Table Z the probability of having the NPV value ₹1,000 is 0.254. The probability of having NPV ₹1,000 or more would be $0.5 - 0.2054 = 0.2946 = 29.46$.

The first part of the paper is devoted to a discussion of the general theory of the problem. It is shown that the problem is equivalent to a problem of the theory of the motion of a particle in a potential field.

In the second part of the paper the explicit solutions are obtained for the case of a constant potential. It is shown that the solutions are given by the hypergeometric functions.

In the third part of the paper the asymptotic behavior of the solutions is investigated. It is shown that the solutions have a logarithmic divergence for large values of the parameter.

The fourth part of the paper is devoted to a discussion of the physical interpretation of the results. It is shown that the results are in agreement with the experimental data.

The fifth part of the paper is devoted to a discussion of the mathematical properties of the solutions. It is shown that the solutions are analytic functions of the parameter.

The sixth part of the paper is devoted to a discussion of the numerical properties of the solutions. It is shown that the solutions are stable under numerical errors.

The first part of the paper is devoted to a discussion of the general theory of the problem. It is shown that the problem is equivalent to a problem of the theory of the motion of a particle in a potential field.

In the second part of the paper the explicit solutions are obtained for the case of a constant potential. It is shown that the solutions are given by the hypergeometric functions.

In the third part of the paper the asymptotic behavior of the solutions is investigated. It is shown that the solutions have a logarithmic divergence for large values of the parameter.

The fourth part of the paper is devoted to a discussion of the physical interpretation of the results. It is shown that the results are in agreement with the experimental data.

The fifth part of the paper is devoted to a discussion of the mathematical properties of the solutions. It is shown that the solutions are analytic functions of the parameter.

The sixth part of the paper is devoted to a discussion of the numerical properties of the solutions. It is shown that the solutions are stable under numerical errors.

P.12.8 Tiny limited is considering a proposal to purchase a new machine. The machine has an initial cost of ₹50,000. The company has developed the following data based on probability distribution approach for cashflows generated by the machine during its economic useful life of 3 years.

LO 12.3 **LOD D**

Gross present value for ($t = 1 - 3$)	₹73,206
Standard deviation for ($t = 1 - 3$):	
Year 1	4,500
2	3,208
3	9,000

- (I) Assuming that the probability distribution of cash flows for future periods are independent, determine the expected NPV.
 (II) Determine the standard deviation about the expected value; the firm's risk free rate of return is 5 per cent.
 (III) Assuming normal distribution, (a) what is the probability of the NPV being less than zero, (b) greater than zero, (c) at least equal to mean and (d) 10 per cent below mean?

Solution

(i) Determination of expected NPV

Gross present value	₹73,206
Less cost of new machine	50,000
Net present value	23,206

(ii) Standard deviation about the expected value

$$\sqrt{\frac{4,500^2}{(1+0.05)^2} + \frac{3,208^2}{(1+0.05)^4} + \frac{9,000^2}{(1+0.05)^6}}$$

$$\sqrt{\frac{2,02,50,000}{1.102} + \frac{1,02,91,264}{1.216} + \frac{8,10,00,000}{1.340}}$$

$$\sigma = \sqrt{1,83,75,681 + 84,63,211 + 6,04,47,761} = \sqrt{8,72,86,653} = 9,343$$

(iii) (a) Probability of NPV less than zero

$$Z = \frac{0 - \text{NPV}}{\sigma} = \frac{0 - 23,206}{9,343} = -2.484$$

According to Table Z, probability of NPV being zero is 0.4934. Therefore, the probability of less than zero would be $0.5 - 0.4934 = 0.0066$ or 0.66 per cent.

(b) Probability of NPV greater than zero

$$1 - 0.0066 = 0.9934 \text{ or } 99.34 \text{ per cent.}$$

(c) Probability of NPV atleast equal to mean

$$Z = (23,206 - 23,206) / 9,343 = 0$$

According to table Z, probability corresponding to 0.0 is 0. Therefore, the probability of having NPV at least equal to mean would be equivalent to the area to the right of curve, that is, $0.5 = 50$ per cent.

(d) Probability of NPV 10 per cent below mean

$$Z = (0.9 \times 23,206 - 23,206) / 9,343 = 0.2483$$

The area as per Table Z, corresponding to 0.2483 (= 0.25) is 0.0987. In other words, there is 9.87 per cent probability of NPV being less than 10 per cent of the value of mean.

P.12.9 Toy Enterprises Ltd designs and manufactures toys. Past experience indicates that the product life of a toy is 3 years. Promotional advertising produces an increase in sales in the early years, but there is a substantial sales decline in the final year of a toy's life. LO 12.3 LOD D

Consumer demand for new toys placed on the market tends to fall into three classes. About 30 per cent of the new toys sell well above expectations, 60 per cent sell as anticipated, and 10 per cent have poor consumer acceptance.

A new toy has been developed. The following sales projections were made by carefully evaluating the consumer demand.

Consumer demand for a new toy	Probability of occurrence	Estimated sales in year (₹ in lakh)		
		1	2	3
Above average	0.30	12	25	6
Average	0.60	7	17	4
Below average	0.10	2	9	1.5

Variable costs are estimated at 30 per cent of the selling price. Special machinery must be purchased at a cost of ₹8,60,000 which will be installed in an unused portion of the factory. The company has been trying unsuccessfully for several years to rent out the vacant portion at ₹50,000 per year. Fixed expenses (excluding depreciation) are estimated at ₹50,000 per year. The new machinery will be depreciated by the written down value method @ 20 per cent with an estimated value of ₹1,10,000 at the year-end 3. Assume this is the only asset in the block. Advertising and promotional expenses will be incurred uniformly, and will total ₹1,00,000 in the first year, ₹1,50,000 in the second year, and ₹50,000 in the third year.

The company is subject to a corporate tax rate of 35 per cent. Its cost of capital is 10 per cent.

- (i) Prepare a schedule computing the probable sales of this new toy in each of the three years. Also, determine the NPV of the proposal.
- (ii) Assuming that cash flows occur uniformly throughout each year, determine the NPV of the proposal. The present value of ₹1 earned uniformly throughout the year discounted at 10 per cent is as follows:

Year	Discount factor
1	0.95
2	0.86
3	0.78

- (iii) Assume that the firm would have sufficient short-term capital gains in year 3.
- (iv) Give your recommendations in both the situations.

Solution

(i) Schedule showing probable sales of the new toy, years 1-3 (₹ in lakh)

Consumer demand for new toy	Probability of occurrence (P _i)	Years (estimated sales)			Probable sales per year		
		1	2	3	1	2	3
Above average	0.30	12	25	6	3.6	7.5	1.80
Average	0.60	7	17	4	4.2	10.2	2.40
Below average	0.10	2	9	1.5	0.2	0.9	0.15
					8.0	18.6	4.35

Determination of CFAT

Particulars	Years		
	1	2	3
Probable sales revenue	₹8,00,000	₹18,60,000	₹4,35,000
Less: Variable costs (0.30)	2,40,000	5,58,000	1,30,500
Less: Depreciation	1,72,000	1,37,600	Nil*

(Contd.)

(Contd.)

Cash fixed costs	50,000	50,000	50,000
Advertising expenses	1,00,000	1,50,000	50,000
EBT	2,38,000	9,64,400	2,04,500
Less: Taxes (0.35)	83,300	3,37,540	71,575
EAT	1,54,700	6,26,860	1,32,925
CFAT (EAT + Depreciation)	3,26,700	7,64,460	1,32,925
Add: Salvage value	—	—	1,10,000
Add: Tax savings on short-term capital loss**	—	—	1,54,140
	3,26,700	7,64,460	3,97,065

* No depreciation in terminal year.

** (₹4,40,400 x 0.35)

Determination of NPV

Year	CFAT	PV factor (0.10)	Total PV
1	₹3,26,700	0.909	₹2,96,970
2	7,64,460	0.826	6,31,444
3	3,97,065	0.751	2,98,196
Total present value			12,26,610
Less: Cash outflows			8,60,000
NPV			3,66,610

(ii) Determination of NPV assuming CFAT occurs uniformly throughout the year

Year	CFAT	PV factor (0.10)	Total PV
1	₹3,26,700	0.95	₹3,10,365
2	7,64,460	0.86	6,57,436
3	3,97,065	0.78	3,09,711
3	1,10,000 (salvage value)	0.751	82,610
3	1,54,140 (tax savings on short-term capital loss)	0.751	1,15,759
Total present value			14,75,880
Less: Cash outflows			8,60,000
NPV			6,15,880

(iii) **Recommendation** The project should be accepted in both the situations.

P.12.10 A company has spent ₹75,000 on research in developing a new product. The product will be marketed if it promises a risk-adjusted rate of return (applicable to such projects) of at least 25 per cent after taxes. For the purposes of financial analysis, the following information has been collected.

LO 12.3 LOD D

- The estimated life of the product is 3 years
- Projected sales are as follows:

Year	Sales revenue
1	₹15,00,000
2	25,00,000
3	6,00,000

- Variable costs to manufacture and sell the product are estimated at 60 per cent of the selling price.
- The present cash fixed costs will be increased by ₹10,000 to cover insurance, and maintenance of new equipment.
- Advertising of the new product will be incurred uniformly, and will total ₹1,25,000 in the first year, and ₹75,000 and ₹60,000 in years 2 and 3, respectively.

6. New machinery will have to be purchased at an estimated cost of ₹9,60,000. The machinery will be depreciated at the rate of 33.33 per cent on the basis of written down value method of depreciation. The salvage value at the expiry of 3 years is estimated at ₹1,00,000. There are several other machines in this block of assets.
7. The new machinery will be installed in a factory area now occupied by equipment that can be no longer be used, that is, scrap equipment. The company has already arranged for removal of the old equipment at a cost of ₹10,000.
8. The new product will be stored in a company owned warehouse in a portion that is vacant now. The company has been trying unsuccessfully to rent this space at ₹25,000 per year. Several offers have been rejected, the highest rent offer being ₹15,000 per year, payable uniformly over the year under a 3-year lease.
9. The firm pays 35 per cent tax on its income. It is assumed that these taxes will be paid uniformly as income is earned.
10. PV of ₹1 at a 25 per cent discount rate are as follows:

Year	₹1 received at the end of year	₹1 received uniformly over the year
1	0.80	0.88
2	0.64	0.69
3	0.51	0.54

Evaluate the financial implications of the proposal, assuming that the operating cash flows occur uniformly throughout the period of the project's life.

Solution

Determination of CFAT

Particulars	Year 1	Year 2	Year 3
Sales revenue	₹15,00,000	₹25,00,000	₹6,00,000
Less: Costs:			
Variable costs (0.60)	9,00,000	15,00,000	3,60,000
Incremental fixed costs	10,000	10,000	10,000
Advertising costs	1,25,000	75,000	60,000
Depreciation (0.333)	3,20,000	2,13,333	1,42,222
Rent (opportunity cost of the space used)	15,000	15,000	15,000
Total costs	13,70,000	18,13,333	5,87,222
EBT	1,30,000	6,86,667	12,778
Less: Taxes paid (0.35)	45,500	2,40,333	4,472
EAT	84,500	4,46,334	8,306
CFAT (EAT + Depreciation)	4,04,500	6,59,667	1,50,528

Determination of NPV assuming CFAT are received uniformly throughout the year

Year	CFAT	PV factor (0.25)	Total PV
1	₹4,04,500	0.88	₹3,55,960
2	6,59,667	0.69	4,55,170
3	1,50,528	0.54	81,285
4	1,00,000 (salvage value)*	0.51	51,000
Total present value			9,43,415
Less: Cash outflows			9,60,000
NPV			(16,585)

*At the beginning of year 4.

Recommendation The proposal is not financially viable.

P.12.11 A company is trying to decide whether to invest in a new project. Two mutually exclusive projects are available, each requiring an investment of ₹3,00,000. Project A is expected to generate cash inflows of ₹2,00,000 per year in the next 2 years. It is estimated that the cash inflows associated with project B would either be ₹1,80,000, or ₹2,20,000 (each with 0.5 probability of occurrence) next year. If ₹1,80,000 is received in the first year, the cash inflow for the second year is likely to be ₹1,50,000 (probability of 0.3), ₹1,80,000 (probability of 0.4) and ₹2,00,000 (probability of 0.3). In case the first year's cash inflow is ₹2,20,000, the second year's likely cash inflow would be ₹1,80,000 and ₹2,70,000 (each with 0.3 probability), and ₹2,20,000 (probability 0.4).

LO 12.3 **LOD M**

The firm uses a 14 per cent minimum required rate of return for deciding whether to invest in projects comparable in risk to the ones under consideration.

- (i) Calculate the risk adjusted expected NPV for projects A and B.
- (ii) Identify the best and the worst possible outcomes for B.
- (iii) Which of the projects, if any, would you recommend? Why?

Solution

(i) Determination of expected NPV of project A

Year	CFAT	PV factor (0.14)	Total PV
1	₹2,00,000	0.877	₹1,75,400
2	2,00,000	0.769	1,53,800
Total present value			3,29,200
Less: PV of cash outflows			3,00,000
NPV			29,200

Decision Tree

Determination of expected NPV of project B

Time 0	1	CFAT ₂	NPV at 14%	Joint probability	Expected NPV		
Cost of the project (₹3,00,000)	0.5	CFAT ₹1,80,000	0.3	₹1,50,000	(₹26,790)	0.15	(₹4,019)
			0.4	1,80,000	(3,720)	0.20	(744)
			0.3	2,00,000	11,660	0.16	1,749
	0.5	CFAT ₹2,20,000	0.3	1,80,000	31,360	0.15	4,704
			0.4	2,20,000	62,120	0.20	12,424
			0.3	2,70,000	1,00,570	0.15	15,085
					29,199		

- (ii) The worst possible outcome is a CFAT of ₹1,80,000 (year 1) and ₹1,50,000 (year 2) with the maximum negative NPV as ₹26,790.
The best possible outcome is when NPV is maximum, ₹1,00,570. It results when CFAT in year 1 is ₹2,20,000, followed by ₹2,70,000 in year 2.
- (iii) The expected NPVs are the same for both projects. However, from the point of view of risk, project A should be chosen as there is no variability of possible events.

P.12.12 A company has the following estimates of the present values of the future cash flows after taxes associated with the investment proposal, concerned with expanding the plant capacity. It intends to use a decision-tree approach to get a clear picture of the possible outcomes of this investment. The plant expansion is expected to cost ₹3,00,000. The respective PVs of future CFAT and probabilities are as follows:

LO 12.3 **LOD M**

PV of future CFAT		
With expansion	Without expansion	Probabilities
₹3,00,000	₹2,00,000	0.2
5,00,000	2,00,000	0.4
9,00,000	3,50,000	0.4

Advise the company regarding the financial feasibility of the project.

Solution

The relevant computations are depicted below.

Decision Tree

Time:0	Year 1	Probabilities (Pi)	PV of CFAT	Expected PV (CFAT) × (Pi)
Decision tree	Expand plant	0.2	₹3,00,000	₹60,000
	Cash outlays ₹3,00,000	0.4	5,00,000	2,00,000
		0.4	9,00,000	3,60,000
				6,20,000
			Less: Cash Outflows – 3,00,000	NPV 3,20,000
	Do not expand plant	0.2	2,00,000	40,000
	Cash outlays Nil	0.4	2,00,000	80,000
		0.4	3,50,000	1,40,000
				2,60,000
			Less: Cash outflows Nil	NPV 2,60,000

The expected NPV with plant expansion and without expansion is ₹3,20,000 and ₹2,60,000 respectively. Therefore, the company is advised to expand the plant capacity.

REVIEW QUESTIONS

LOD: Easy

RQ.12.1 Indicate whether the following statements are true or false.

LO 12.1,2,3

- (i) Coefficient of variation is an absolute measure of risk.
- (ii) Sensitivity analysis is an absolute measure of risk.
- (iii) The estimates under sensitivity analysis are normally made under two categories.
- (iv) The higher the value of the coefficient of variation, the lower is the degree of the risk associated with the proposed investment project.
- (v) Simulation technique shows the impact of changes in all the variables on the distribution of probable values of NPV, in one iteration only.
- (vi) The higher is the risk, the higher is the certainty equivalent coefficient.

- (vii) Conceptually the terms risk and uncertainty can be used interchangeably.
- (viii) Projects involving expansions programmes of existing products employ the same risk adjusted discount rate as those required to be used for new products meant for the new types of customers.
- (ix) Risk-adjusted discount rate approach is conceptually superior to certainty-equivalent approach to incorporate risk factor in evaluating investment projects.
- (x) Risk-free rate of return is employed as a discount rate to evaluate investment projects using certainty equivalent approach.
- (xi) The probability distribution approach determines probability of different values of NPV based on Z value.
- (xii) The decision-tree approach shows the select/important probable outcomes along with their probabilities.

[Answers: (i) False (ii) True (iii) False (iv) False (v) False (vi) False (vii) False (viii) False (ix) False (x) True (xi) True (xii) False]

RQ.12.2 Why are cash flow estimates for distant years usually less reliable than for more immediate years? How can this time factor be accommodated when evaluating the riskiness of a project?

[LO 12.1,2,3]

RQ.12.3 (a) What similarities are there between the risk-adjusted discount rate method and the certainty-equivalent Method?

[LO 12.3]

(b) Enumerate the fundamental conceptual differences between the two methods.

(c) Discuss the comparative advantages and disadvantages of each.

RQ 12.4 Describe how **(a)** sensitivity analysis **(b)** scenario analysis and **(c)** simulation approach can be used to assess risk of investment projects.

[LO 12.1]

RQ.12.5 ABC Ltd is considering a proposal to buy a machine for ₹30,000. The expected cash flows after taxes from the machine for a period of 3 consecutive years are ₹20,000 each. After the expiry of the useful life of the machine, the seller has guaranteed its repurchase at ₹2,000. The firm's cost of capital is 10 per cent and the risk adjusted discount rate is 18 per cent. Should the company accept the proposal of purchasing the machine?

[LO 12.3]

RQ.12.6 The Premier Ltd is considering a proposal to buy one of the two machines to manufacture a new product. Each of these machines requires an investment of ₹50,000, and is expected to provide benefits over a period of 12 years. The firm has made pessimistic, most likely, and optimistic estimates of the returns associated with each of these alternatives. These estimates are as follows:

	Machine A	Machine B
Cost	₹50,000	₹50,000
Cash flow estimates:		
Pessimistic	8,000	0
Most likely	12,000	10,000
Optimistic	16,000	20,000

Assuming 14 per cent cost of capital, which project do you consider more risky, and why?

[LO 12.1]

LOD: Medium

RQ.12.7 What is the sensitivity approach for dealing with project risk? What is one of the most common methods used to evaluate projects using sensitivity analysis?

[LO 12.1]

RQ.12.8 Why may the use of standard deviation as a measure of risk lead to a wrong decision? What modifications can be made to obtain an improved measure?

[LO 12.2]

- RQ.12.9** How is risk assessed for a particular investment by using a probability distribution? Take a simple example to illustrate the method. [LO 12.3]
- RQ.12.10** When would the use of tree diagrams be beneficial? When would it be impossible to use them? [LO 12.3]
- RQ.12.11** What are real options? State the major types of real options. [LO 12.4]
- RQ.12.12** What are the options to expand, abandon and suspend operations? [LO 12.4]
- RQ.12.13** The Hypothetical Ltd is examining two mutually exclusive proposals. The management of the company uses certainty equivalents (CE) approach to evaluate new investment proposals. From the following information pertaining to these projects, advise the company as to which project should be taken up by it. [LO 12.3]

Year	Proposal A		Proposal B	
	CFAT	CE	CFAT	CE
0	₹(25,000)	1.0	₹(25,000)	1.0
1	15,000	0.8	9,000	0.9
2	15,000	0.7	18,000	0.8
3	15,000	0.6	12,000	0.7
4	15,000	0.5	16,000	0.4

The firm's cost of capital is 12 per cent, and risk-free borrowing rate is 6 per cent.

- RQ.12.14** ABC Ltd is considering a proposal to purchase a new machine. The machine has an initial cost of ₹50,000. The capital budgeting department has developed the following discrete probability distribution for cash flows generated by the project during its useful life of 3 years. [LO 12.3]

Period 1		Period 2		Period 3	
CFAT	Probability	CFAT	Probability	CFAT	Probability
₹15,000	0.2	₹20,000	0.5	₹25,000	0.1
20,000	0.4	23,000	0.1	30,000	0.3
25,000	0.3	25,000	0.2	35,000	0.3
30,000	0.1	28,000	0.2	50,000	0.3

- (i) Assuming that the probability distribution of cash flows for future periods are independent, the firm's cost of capital is 10 per cent, and the firm can invest in 5 per cent treasury bills, determine the expected NPV.
- (ii) Determine the standard deviation about the expected value.
- (iii) If the total distribution is approximately normal, and assumed continuous, (a) what is the probability of the NPV being zero or less, (b) greater than zero, (c) profitability index being 1 or less, (d) at least equal to mean, (e) 10 per cent below mean, and (f) 10 per cent above mean?

LOD: Difficult

- RQ.12.15** What makes risk important in the selection of projects? Explain briefly the various methods of evaluating risky projects? Can you think of a capital budgeting project that would have perfectly certain returns? [LO 12.1]
- RQ.12.16** A company has made the following estimates of the CFAT associated with an investment proposal. The company intends to use a decision tree to get a clearer picture of the project's cash inflows. The project has an expected life of 2 years. [LO 12.3]

CFAT ($t = 1$)	Probability
₹25,000	0.4
30,000	0.6
CFAT ($t = 2$)	
If $CFAT_1 = ₹25,000 \dots ₹12,000$	0.2
16,000	0.3
22,000	0.5
If $CFAT_2 = ₹30,000 \dots$	
20,000	0.4
25,000	0.5
30,000	0.1

The equipment costs ₹40,000 and the company uses a 10 per cent discount rate for this type of investment.

- (i) Construct a decision tree for the proposed investment project.
- (ii) What NPV will the project yield if the worst outcome is realised? What is the probability of occurrence of this NPV?
- (iii) What will be the NPV if the best outcome occurs? What is its probability?
- (iv) Will the project be accepted?

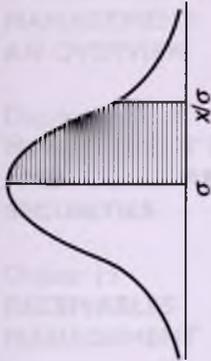

ANSWERS

- 12.5** Yes, the company should accept the proposal with positive NPV ₹14,982
- 12.6** Project B is more risky because the NPV can be negative as high as ₹50,000 while in Project A, the NPV can be negative only by ₹4,720.
- 12.13** NPV Project A ₹9,161
 NPV Project B ₹7,579
 The company should take up Project A.
- 12.14** (i) NPV (expected) ₹23,206
 (ii) Period 1 ₹4,500; Period 2 ₹3,208;
 Period 3 ₹9,000; Standard deviation of expected value ₹9,343.
 (iii) (a) 0.66 per cent
 (b) 99.34 per cent
 (c) 0.66 per cent
 (d) 50 per cent
 (e) 9.87 per cent
 (f) 9.87 per cent
- 12.16** (i) NPV ₹3,111.88
 (ii) If the worst outcome is realized, the NPV (₹7,363)
 (iii) Best outcome NPV ₹12,050 with 6 per cent probability.
 (iv) Yes, the project, should be accepted, because NPV ₹3,111.88

WORKING CAPITAL FINANCING

Our discussion in Part III of this book related to the management of the fixed assets which yield returns over a period of time. In practice, a firm has also to employ short-term assets and short-run resources of financing. The management of such assets, described as working capital management or current assets management, (short-term financial management) is one of the most important aspects of the overall financial management. Technically, working capital management is an integral part of the overall financial management. To that extent, it is similar to the long-term decision making process because both entail an analysis of the effect of risk and profitability.

The problems involved in the management of working capital differ from those in the management of fixed assets. In the first place, fixed assets are acquired to be retained in the business over a period of time and yield returns over the life of the assets. Probably, the most notable feature of such assets, from the view point of financial analysis, is the time dimension. The operational implication is that discounting and compounding techniques to adjust the value of benefits accruing from such assets over time play a fairly significant role in financial management. In contrast, the stock-in-

trade of working capital management, by definition, is short-term assets which loses its identity fairly quickly, usually within an operating cycle not exceeding a year. In the management of working capital, therefore, the time factor is not at all crucial as a decision variable.

Yet another notable feature of short-term assets is the question of profitability versus liquidity and the related aspect of risk. If the size of such assets is large, the liquidity position would improve, but profitability would be adversely affected as funds will remain idle. conversely, if the holdings of such assets are relatively small, the overall profitability will no doubt increase, but it will have an adverse effect on the liquidity position and make the firm more risk-prone. Working capital management should, therefore, aim at striking a balance such that there is an optimum amount of short-term assets. The purpose of this part is to provide an insight into the problems of managing working capital. There are two issues involved: first, the overview of working capital management in terms of the basic concepts, basic relationships between different kinds of short-term assets and liabilities, their financing and so on. Chapter 13 presents an in-depth discussion of the theory of working capital management. The basic concepts/strategies/policies are covered in the Chapter. Chapter also deals with the planning of working capital and its determinants. Secondly, the components of working capital, the individual assets, are covered in the subsequent chapters of this Part. The chapters 14 through 16 respectively analyse the management of cash, receivables and inventory. Finally, some important aspects of the financing of working capital in India are covered in Chapter 17.

Working Capital Management: An Overview

LEARNING OBJECTIVES

LO 13.1	Understand the nature of working capital in terms of basic concepts, strategies, policies and financing strategies
LO 13.2	Analyse the planning of working capital requirements in terms of need, determinants and its computation
LO 13.3	Outline the main elements of management of working capital in India

INTRODUCTION

This chapter presents an overview of working capital management. It explains the nature of working capital and the determination of financing mix. It is also concerned with the planning of working capital requirements. The main points are summarised by way of recapitulation.

LO 13.1 NATURE OF WORKING CAPITAL

We explain below the nature of working capital in terms of the basic concepts, strategies and policies of working capital management. It also illustrates the determination of financing mix.

Working capital management is concerned with the problems that arise in attempting to manage the current assets, the current liabilities and the interrelationship that exists between them. The term *current assets* refer to those assets which in the ordinary course of business can be, or will be, converted into cash within one year without undergoing a diminution in value and without disrupting the operations of the firm. The major current assets are cash, marketable securities, accounts receivable and inventory. Current liabilities are those liabilities which are intended, at their inception, to be paid in the ordinary course of business, within a year, out of the current assets or earnings of the concern. The basic current liabilities are accounts payable, bills payable, bank overdraft, and outstanding expenses. *The goal of working capital management is to manage*

CHAPTER 13
Working Capital Management: An Overview

Working capital management is the management of a firm's short-term assets and liabilities. It involves the management of cash, accounts receivable, inventory, and accounts payable. The goal of working capital management is to ensure that the firm has sufficient liquidity to meet its short-term obligations while maximizing the use of its resources.

CHAPTER 13

Working Capital Management: An Overview

- 13.1 The Working Capital Cycle
- 13.2 Cash Management
- 13.3 Accounts Receivable Management
- 13.4 Inventory Management
- 13.5 Accounts Payable Management

13.1

The working capital cycle is the process of converting raw materials into finished goods and then selling them to customers. It involves the management of cash, accounts receivable, inventory, and accounts payable.

13.2

Cash management is the management of a firm's cash resources. It involves the management of cash flows, cash balances, and cash investments. The goal of cash management is to ensure that the firm has sufficient liquidity to meet its short-term obligations while maximizing the use of its resources.

the firm's current assets and liabilities in such a way that a satisfactory level of working capital is maintained. This is so because if the firm cannot maintain a satisfactory level of working capital, it is likely to become insolvent and may even be forced into bankruptcy. The current assets should be large enough to cover its current liabilities in order to ensure a reasonable margin of safety. Each of the current assets must be managed efficiently in order to maintain the liquidity of the firm while not keeping too high a level of any one of them. Each of the short-term sources of financing must be continuously managed to ensure that they are obtained and used in the best possible way. *The interaction between current assets and current liabilities is, therefore, the main theme of the theory of working management.*

Concepts and Definitions of Working Capital

There are two concepts of working capital: gross and net.

The term **gross working capital**, also referred to as working capital, means the total current assets.

The term **net working capital** can be defined in two ways: (i) the most common definition of net working capital (NWC) is the difference between current assets and current liabilities; and (ii) alternate definition of NWC is that portion of current assets which is financed with long-term funds.¹

Gross working capital means the current assets which represent the proportion of investment that circulates from one form to another in the ordinary conduct of business.

The task of the financial manager in managing working capital efficiently is to ensure sufficient liquidity in the operations of the enterprise. The liquidity of a business firm is measured by its ability to satisfy short-term obligations as they become due. The three basic measures of a firm's overall liquidity are **(i)** the current ratio, **(ii)** the acid-test ratio, and **(iii)** the net working capital. The suitability of the first two measures has already been discussed in detail in Chapter 6. In brief, they are very useful in interfirm comparisons of liquidity. Net working capital (NWC), as a measure of liquidity, is not very useful for comparing the performance of different firms, but it is quite useful for internal control. The NWC helps in comparing the liquidity of the same firm over time. *For purpose of working capital management, therefore, NWC can be said to measure the liquidity of the firm. In other words, the goal of working capital management is to manage the current assets and liabilities in such a way that an acceptable level of NWC is maintained.*

Net working capital is the difference between current assets and current liabilities or alternatively the portion of current assets financed with long-term funds.

The Common Definition of NWC and its Implications *NWC is commonly defined as the difference between current assets and current liabilities.* Efficient working capital management requires that firms should operate with some amount of NWC, the exact amount varying from firm to firm and depending, among other things, on the nature of industry. The theoretical justification for the use of NWC to measure liquidity is

based on the premise that the greater the margin by which the current assets cover the short-term obligations, the more is the ability to pay obligations when they become due for payment. The NWC is necessary because the cash outflows and inflows do not coincide. In other words, it is the *non-synchronous* nature of cash flows that makes NWC necessary. In general, the cash outflows resulting from payment of current liabilities are relatively predictable. The cash inflows are, however, difficult to predict. The more predictable the cash inflows are, the less NWC will be required. A firm, say an electricity generation company, with almost certain and predictable cash inflows can operate with little or no NWC. But where cash inflows are uncertain, it will be necessary to maintain current assets at a level adequate to cover current liabilities, that is, there must be NWC.

Alternative Definition of NWC *NWC can alternatively be defined as that part of the current assets which are financed with long-term funds.* Since current liabilities represent sources of short-term funds, as long as current assets exceed the current liabilities, the excess must be financed with long-term funds.

Concept of Zero Working Capital² The zero working capital (ZWC) concept of net working capital differs from the commonly used concept of working capital (CA – CL). The $ZWC = \text{Inventories (+) Receivables (-) Payables}$. The rationale is that inventories and receivables are the major constituents of current assets which affect sales. Further, suppliers finance inventories through account payable.

- **Zero working Capital**
- is inventory plus receivables minus payables.

There are financial benefits of reducing the working capital. First, it results in a one-time release of cash flow. Second, the release of cash flow enhances the firm's earnings. Put differently, permanent reduction in working capital funds results in less financial costs (saving in capital costs). The zero working capital concept forces the corporates to produce and deliver faster. This, in turn, may help to gain new business. With low inventories, storage cost as well as loss due to obsolete inventories are also minimised, leading to another set of savings in operating costs. Just-in-time method of inventory control (**discussed in Chapter 16**) facilitate carrying relatively low level of raw-material inventories. Efficient production system (production in tune with sales) can further help in reducing work-in-process and finished goods inventories.

In reality, however, it may not be possible for most firms to operate at zero working capital. Yet, the concept is important as it focuses that the firms should strive for carrying minimum safety stock of inventories, pursuing good credit collection policies leading to minimum investment in debtors and bargaining for maximum credit payment period from suppliers. These measures would result in financial and production economies, leading to higher return on investments.

Policies Related to Current Assets Investment

There are three alternative policies related to the total amount of investments made in current assets: (1) Relaxed, (2) Aggressive and (3) Moderate. These policies differ in respect of the total amount of current assets carried to support any given level of sales.³ As a result, these policies have an impact on current assets turnover ratio.

Relaxed Current Assets Investment Policy This refers to the policy where the firms carry relatively large amounts of cash and cash-equivalents, inventories and receivables. They use liberal credit policy implying relatively longer time-span of credit period extended to debtors, as a means of promoting sales (**explained in Chapter 15**). In view of the relatively higher amount of investment in current assets, the current assets turnover ratio of such firms tend to be relatively low.

- **Relaxed policy**
- involves large amounts of cash/cash-equivalents, receivables and inventory.

Aggressive Current Assets Investment Policy This refers to the policy where the firm's holdings of cash and cash-equivalents, inventories and receivables are minimised. Since there is relatively lower amount of current assets to support given level of sales, the current assets turnover ratio tends to be high.

- **Aggressive policy**
- implies minimum cash/cash equivalents, receivables and inventory.

Under such a policy, the firm would hold minimum level of safety stocks of cash and inventories, and would pursue a tight/strict credit policy for credit sales (though at times, it runs the risk of losing sales). An aggressive/restricted/lean-and-mean current

The first step in the process of starting a business is to determine the market for your product or service. This involves identifying your target audience and understanding their needs and preferences. Once you have a clear understanding of the market, you can begin to develop your business plan, which will outline your goals, strategies, and financial projections.

General Business Plan

The general business plan is a document that provides a comprehensive overview of your business. It typically includes sections on the company's mission and vision, the market analysis, the organizational structure, the marketing and sales strategy, and the financial plan. This plan is essential for securing financing and for guiding the overall direction of the business.

Marketing and Sales Strategy
The marketing and sales strategy is a critical component of the business plan. It details the methods you will use to attract and retain customers. This may include advertising, public relations, direct sales, and other promotional activities. A well-defined marketing and sales strategy is essential for the success of any business.

Financial Plan
The financial plan is a detailed projection of the business's financial performance over a period of time. It includes the income statement, the balance sheet, and the cash flow statement. This plan is used to determine the business's profitability and to identify any potential financial risks. It is also a key document for investors and lenders.

Organizational Structure
The organizational structure is a diagram that shows the hierarchy of the business. It identifies the key positions and the reporting relationships between them. This structure is important for ensuring that the business is run efficiently and effectively. It also helps to clarify the roles and responsibilities of each employee.

The second step in the process of starting a business is to develop a business plan. This plan should outline your business's goals, strategies, and financial projections. It is a crucial document for securing financing and for guiding the overall direction of the business.

assets investment policy generally provides the highest expected return on investment. At the same time, it entails the greatest risk⁴. The reverse is true for a relaxed policy.

Moderate Current Assets Investment Policy This falls between the above two extreme policies in terms of current assets carried as well as expected return and risk.

Determining Financing Mix

One of the most important decisions, involved in the management of working capital is how current assets will be financed. There are, broadly speaking, two sources from which funds can be raised for current asset financing; (i) short-term sources (current liabilities), and (ii) long-term sources, such as share capital, long-term borrowings, internally generated resources like retained earnings and so on. What proportion of current assets should be financed by current liabilities and how much by long-term resources? *Decisions on such questions will determine the financing mix.*

There are three basic approaches to determine an appropriate **financing mix**: (a) Hedging approach, also called the Matching approach; (b) Conservative approach, and (c) Trade-off between these two.

Financing mix is the choice of sources of financing of current assets.

Hedging Approach The term 'hedging' is often used in the sense of a risk-reducing investment strategy involving transactions of a simultaneous but opposing nature so that the effect of one is likely to counterbalance the effect of the other. With reference to an appropriate financing-mix, the term hedging can be said to refer to the process of matching maturities of debt with the maturities of financial needs.⁵ This approach to the financing decision to determine an appropriate financing mix is, therefore, also called as **Matching approach**.

Matching approach to financing is the process of matching maturities of debt with the maturities of the financial needs.

According to this approach, the maturity of the source of funds should match the nature of the assets to be financed. For the purpose of analysis, the current assets can be broadly classified into two classes:

1. those which are required in a certain amount for a given level of operation and, hence, do not vary over time.
2. those which fluctuate over time.

The hedging approach suggests that long-term funds should be used to finance the fixed portion of current assets requirements as spelt out in (1) above, in a manner similar to the financing of fixed assets. The purely temporary requirements, that is, the seasonal variations over and above the permanent financing needs should be appropriately financed with short-term funds (current liabilities). This approach, therefore, divides the requirements of total funds into permanent and seasonal components, each being financed by a different source. This has been illustrated in Table 13.1.

TABLE 13.1 Estimated Total Funds Requirements of Hypothetical Ltd

(Amount in ₹ lakh)

Month	Total funds required	Permanent requirements	Seasonal requirements
(1)	(2)	(3)	(4)
January	₹8,500	₹6,900	₹1,600
February	8,000	6,900	1,100
March	7,500	6,900	600
April	7,000	6,900	100

(Contd.)

(Contd.)

May	6,900	6,900	0
June	7,150	6,900	250
July	8,000	6,900	1,100
August	8,350	6,900	1,450
September	8,500	6,900	1,600
October	9,000	6,900	2,100
November	8,000	6,900	1,100
December	7,500	6,900	600
			11,600

According to the hedging approach, the **permanent portion** of funds required (Col.3) should be financed with long-term funds and the **seasonal portion** (Col.4) with short-term funds. With this approach, the short-term financing requirements (current assets) would be just equal to the short-term financing available (current liabilities).

Conservative Approach This approach suggests that the estimated requirement of total funds should be met from long-term sources; the use of short-term funds should be restricted to only emergency situations or when there is an unexpected outflow of funds. In the case of the Hypothetical Ltd in Table 13.1, the total requirements, including the entire ₹9,000 needed in October, will be financed by long-run sources. The short-term funds will be used only to meet contingencies. The amounts given in column 4 of Table 13.1 represent the extent to which short-term financial needs are being financed by long-term funds, that is, the NWC. The NWC reaches the highest level (₹2,100) in October (₹9,000 – ₹6,900). Any long-term financing in excess of ₹6,900 in permanent financing the needs of the company represents NWC.

Comparison of Hedging Approach with Conservative Approach A comparison of the two approaches can be made on the basis of (i) cost considerations, and (ii) risk considerations.

Cost Considerations The cost of these financing plans has a bearing on the profitability of the enterprise. We assume that the cost of short-term funds and long-term funds is 3 per cent and 8 per cent respectively.

Hedging Plan The cost of financing under the hedging plan can be estimated as follows:

(i) Cost of short-term funds: The cost of short-term funds = average annual short-term loan x interest rate.

Average annual short-term loan = total of monthly seasonal requirements (Col.4) divided by the number of months.

Average annual short-term loan = ₹11,600 lakh ÷ 12 = ₹966.67 lakh.

Short-term cost = ₹966.67 lakh × 0.03 = ₹29 lakh.

(ii) Cost of long-term funds = (Average annual long-term fund requirement) × (annual interest rate) = ₹6,900 lakh × 0.08 = ₹552 lakh.

(iii) Total cost under hedging plan = total of (i) + (ii) = ₹29 lakh + ₹552 lakh = ₹581 lakh

Conservative Plan The cost of financing under the conservative plan is equal to the cost of the long-term funds, that is, annual average loan, multiplied by the long-term rate of interest = ₹9,000 lakh × 0.08 = ₹720 lakh.

- **Permanent needs**
- implies financing needs for fixed assets plus the permanent portion of current assets which remain unchanged over the year.

- **Seasonal portion**
- implies the financing requirements for temporary current assets which vary over the year.

- **Conservative financing approach**
- is a strategy by which the firm finances all funds requirement, with long-term funds for emergencies or unexpected outflows.

Thus, the cost of financing under the conservative approach (₹720 lakh) is higher than the cost using the hedging approach (₹581 lakh). The conservative plan for financing is more expensive because the available funds are not fully utilised during certain periods; moreover, interest has to be paid for funds which are not actually needed (i.e. the period when there is NWC).

Risk Considerations The two approaches can also be contrasted on the basis of the risk involved.

Hedging Approach The hedging approach is more risky in comparison to the conservative approach. There are two reasons for this. First, there is, as already observed, no NWC with the hedging approach because no long-term funds are used to finance short-term seasonal needs, that is, current assets are just equal to current liabilities. On the other hand, the conservative approach has a fairly high level of NWC. Secondly, the hedging plan is risky because it involves almost full utilisation of the capacity to use short-term funds and in emergency situations it may be difficult to satisfy the short-term needs.

Conservative Approach With the conservative approach, in contrast, the company does not use any of its short-term borrowings. Therefore, the firm has sufficient short-term borrowing capacity to cover unexpected financial needs and avoid technical insolvency.

To summarise, the hedging approach is a high profit (low cost)-high risk (no NWC) approach to determine an appropriate financing-mix. In contrast, the conservative approach is low profit (high cost)-low risk (high NWC). The contrast between these approaches is indicative of the need for trade-off between profitability and risk.

A Trade-off between the Hedging and Conservative Approaches It has been shown that the hedging approach is associated with high profits as well as high risk, while the conservative approach provides low profits and low risk. Obviously, neither approach by itself would serve the purpose of efficient working capital management. A trade-off between these two extremes would give an **acceptable financing strategy**. The third approach—trade-off between the two approaches—strikes a balance and provides a financing plan that lies between these two extremes.

Acceptable financing strategy is a trade-off between matching and conservative financing strategies.

The exact trade-off between risk and profitability will differ from case to case depending on risk perception of the decision makers. One possible trade-off could be assumed to be equal to the average of the minimum and maximum monthly requirements of funds during a given period of time. This level of requirement of funds may be financed through long-run sources and for any additional financing need, short-term funds may be used. The breakdown of the requirement of funds of the Hypothetical Ltd between long-term and short-term sources under the trade-off plans is shown in Table 13.2.

TABLE 13.2 Trade-off between Hedging and Conservative Approaches

(Amount in ₹ lakh)

Month	Total funds required	Permanent requirements	Seasonal requirements
(1)	(2)	(3)	(4)
January	₹8,500	₹7,950	₹550
February	8,000	7,950	50
March	7,500	7,950	0
April	7,000	7,950	0

(Contd.)

(Contd.)

May	6,900	7,950	0
June	7,150	7,950	0
July	8,000	7,950	50
August	8,350	7,950	400
September	8,500	7,950	550
October	9,000	7,950	1,050
November	8,000	7,950	50
December	7,500	7,950	0
			2,700

The figures in Table 13.2 reveal that the maximum fund required is ₹9,000 lakh (October) and the minimum is ₹6,900 lakh (May). The average $\left(\frac{₹9,000 \text{ lakh} + ₹6,900 \text{ lakh}}{2} \right) = ₹7,950 \text{ lakh}$.

In other words, the company should use ₹7,950 lakh each month (Col.3) in the form of long-term funds and raise additional funds, if needed, through short-term resources (current liabilities). It is clear from the table that no short-term funds are required during 5 months, namely, March, April, May, June and December, because long-term funds available exceed the total requirements for funds. In the remaining 7 months, the company will have to use short-term funds totalling ₹2,700 lakh (Col. 4).

Cost of the Financing Plan under the Trade-off Approach

- (i) Cost of short-term funds: = (Average annual short-term funds required) × (Rate of short-term interest) = ₹2,700 lakh/12 = ₹225 lakh × 0.03 = ₹6.75 lakh
- (ii) Cost of long-term funds = (Average long-term funds required) × (Rate of interest on long-term funds) = ₹7,950 lakh × 0.08 = ₹636 lakh
- (iii) Total cost of the trade-off plan = ₹6.75 lakh + ₹636 lakh = ₹642.75 lakh

Risk Consideration The NWC under this plan would be ₹1,050 lakh (₹7,950 lakh – ₹6,900 lakh).

Comparison of the Trade-off Plan with the Hedging and Conservative Approaches For a comparison of the three approaches to determine an appropriate financing-mix, the summary of the results of these approaches on profitability and risk is given in Table 13.3.

TABLE 13.3 Comparison of Trade-off Plan

(Amount in ₹ lakh)

Financing Plan	Maximum NWC*	Degree of risk	Total cost of financing	Level of profits
(1)	(2)	(3)	(4)	(5)
Hedging	0	Highest	₹581.00	Highest
Trade-off	₹1,050	Intermediate	642.75	Intermediate
Conservative	2,100	Lowest	720.00	Lowest

*The minimum level would be zero in each case.

Interpretation From the summary of results in Table 13.3, it can be seen clearly that the hedging approach is the most risky while the conservative approach is the least risky. The trade-off plan stands midway; less risky than the hedging approach but more risky than the conservative approach. The measure of risk is the level of NWC. From the point of view of profitability (as reflected in the

level of total cost of financing plan) a similar kind of relationship is found to exist, the trade-off plan lying between the other two approaches. The preceding analysis, thus, established the trade-off between profitability and risk. In this connection two generalisations are warranted: (i) the lower the NWC, the higher is the risk present, and (ii) the higher the risk of insolvency, the higher is the expected profits.

LO 13.2 PLANNING OF WORKING CAPITAL

The main aspects covered here are the need for working capital, the determinants of working capital and its computation.

Need for Working Capital

The need for working capital (gross) or current assets cannot be overemphasized. Given the objective of financial decision making to maximise the shareholders' wealth, it is necessary to generate sufficient profits. The extent to which profits can be earned will naturally depend, among other things, upon the magnitude of the sales. A successful sales programme is, in other words, necessary for earning profits by any business enterprise. However, sales do not convert into cash instantly; there is invariably a time-lag between the sale of goods and the receipt of cash. There is, therefore, a need for working capital in the form of current assets to deal with the problem arising out of the lack of immediate realisation of cash against goods sold. Therefore, sufficient working capital is necessary to sustain sales activity. Technically, this is referred to as the **operating or cash cycle**.

Operating cycle implies the continuing flow from cash to suppliers, to inventory to accounts receivable and back into cash.

The operating cycle can be said to be at the heart of the need for working capital.

'The continuing flow from cash to suppliers, to inventory, to accounts receivable and back into cash is what is called the operating cycle'.⁶ In other words, the term cash cycle refers to the length of time necessary to complete the following cycle of events:

1. Conversion of cash into inventory;
2. Conversion of inventory into receivables;
3. Conversion of receivables into cash.

The operating cycle, which is a continuous process, is shown in Fig. 13.1.

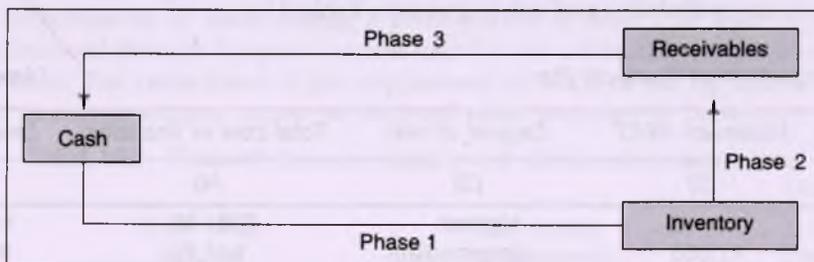

FIGURE 13.1 Operating Cycle

If it were possible to complete the sequences instantaneously, there would be no need for current assets (working capital). But since it is not possible, the firm is forced to have current assets. Since cash inflows and outflows do not match, firms have to necessarily keep cash or invest in short-term liquid securities so that they will be in a position to meet obligations when they become due.

Similarly, firms must have adequate inventory to guard against the possibility of not being able to meet demand for their products. Adequate inventory, therefore, provides a cushion against being out of stock. If firms have to be competitive, they must sell goods to their customers on credit which necessitates the holding of accounts receivable. It is in these ways that an adequate level of working capital is absolutely necessary for smooth sales activity which, in turn, enhances the owner's wealth.

The operating cycle consists of three phases. In phase 1, cash gets converted into inventory. This includes purchase of raw materials, conversion of raw materials into work-in-progress, finished goods and finally the transfer of goods to stock at the end of the manufacturing process. In the case of trading organisations, this phase is shorter as there would be no manufacturing activity and cash is directly converted into inventory. The phase is, of course, totally absent in the case of service organisations.

In phase II of the cycle, the inventory is converted into receivables as credit sales are made to customers. Firms which do not sell on credit obviously not have phase II of the operating cycle.

The last phase, phase III, represents the stage when receivables are collected. This phase completes the operating cycle. Thus, the firm has moved from cash to inventory, to receivables and to cash again.

Permanent and Temporary Working Capital The operating cycle, thus, creates the need for current assets (working capital). However, the need does not come to an end after the cycle is completed. It continues to exist. To explain this continuing need of current assets, a distinction should be drawn between *permanent* and *temporary* working capital.

Business activity does not come to an end after the realisation of cash from customers. For a company, the process is continuous and, hence, the need for a regular supply of working capital. However, the magnitude of working capital required is not constant, but fluctuating. To carry on business, a certain minimum level of working capital is necessary on a continuous and uninterrupted basis. For all practical purposes, this requirement has to be met permanently as with other fixed assets. This requirement is referred to as **permanent or fixed working capital**.

- **Permanent**
- **(fixed) working capital**
- is a certain
- minimum level of
- working capital on
- a continuous and
- uninterrupted basis.

Any amount over and above the permanent level of working capital is **temporary, fluctuating or variable working capital**.⁷ The position of the required working capital is needed to meet fluctuations in demand consequent upon changes in production and sales as a result of seasonal changes. The basic distinction between permanent and temporary working capital is illustrated in Fig. 13.2.

- **Temporary**
- **(fluctuating/variable) working capital**
- is the working
- capital needed to
- meet seasonal as
- well as unforeseen
- requirements.

Figure 13.2 shows that the permanent level is fairly constant, while temporary working capital is fluctuating—increasing and decreasing in accordance with seasonal demands. In the case of an expanding firm, the permanent working capital line may not be horizontal. This is because the demand for permanent current assets might be increasing (or decreasing) to support a rising level of activity. In that case the line would be a rising one as shown in Fig. 13.3.

Both kinds of working capital are necessary to facilitate the sales process through the operating cycle. Temporary working capital is created to meet liquidity requirements that are of a purely transient nature.

Changes in Working Capital The changes in the level of working capital occur for the following three basic reasons: **(i)** changes in the level of sales and/or operating expenses, **(ii)** policy changes, and **(iii)** changes in technology.

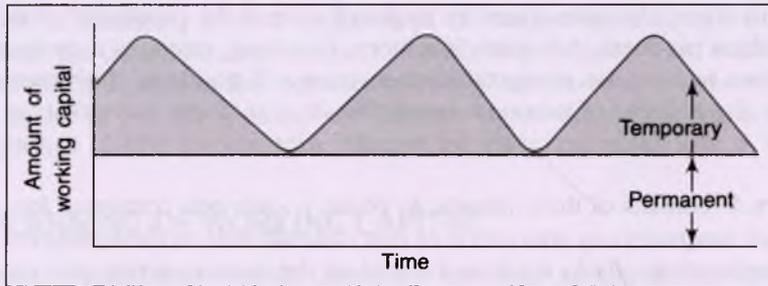

FIGURE 13.2 Permanent and Temporary Working Capital

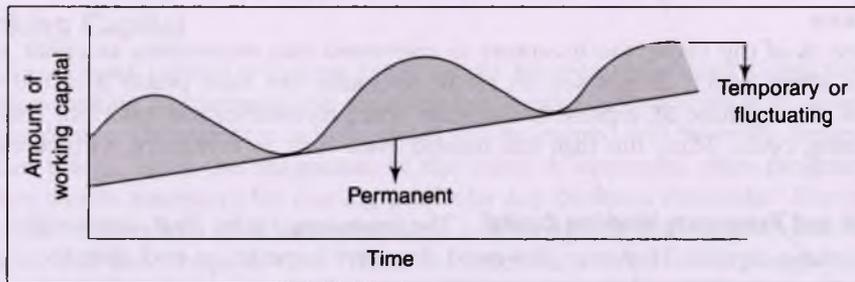

FIGURE 13.3 Permanent and Temporary Working Capital

Changes in Sales and Operating Expenses The first factor causing a change in the working capital requirement is a change in the sales and operating expenses. The changes in this factor may be due to three reasons: First, there may be a *long-run* trend of change. For instance, the price of a raw material, say oil, may constantly rise, necessitating the holding of a large inventory. The *secular* trends would mainly affect the need for permanent current assets. In the second place, *cyclical* changes in the economy leading to ups and downs in business activity influence the level of working capital, both permanent and temporary. The third source of change is seasonality in sales activity. Seasonality—peaks and troughs—can be said to be the main source of variation in the level of temporary working capital.

The change in sales and operating expenses may be either in the form of an increase or decrease. An increase in the volume of sales is bound to be accompanied by higher levels of cash, inventory and receivables. The decline in sales has exactly the opposite effect—a decline in the need for working capital. A change in the operating expenses—rise or fall—has a similar effect on the levels of working capital.

Policy Changes The second major cause of changes in the level of working capital is because of policy changes initiated by the management. There is a wide choice in the matter of **current assets policy**. The term current asset policy may be defined as the relationship between current assets and sales volume. A firm following a conservative policy in this respect having a very high level of current assets in relation to sales may deliberately opt for a less conservative policy and *vice versa*. These conscious managerial decisions certainly have an impact on the level of working capital.

Technological Changes Finally, technological changes can cause significant changes in the level of working capital. If a new process emerges as a result of technological developments, which shortens the operating cycle, it reduces the need for working capital and *vice versa*.

Determinants of Working Capital

A firm should plan its operations in such a way that it should have neither too much nor too little working capital. The total working capital requirement is determined by a wide variety of factors. These factors, however, affect different enterprises differently. They also vary from time to time. In general, the following factors are involved in a proper assessment of the quantum of working capital required.

General Nature of Business The working capital requirements of an enterprise are basically related to the conduct of business. Enterprises fall into some broad categories depending on the nature of their business. For instance, public utilities have certain features which have a bearing on their working capital needs. The two relevant features are: **(i)** the cash nature of business, that is, cash sale, and **(ii)** sale of services rather than commodities. In view of these features, they do not maintain big inventories and have, therefore, probably the least requirement of working capital. At the other extreme are trading and financial enterprises. The nature of their business is such that they have to maintain a sufficient amount of cash, inventories and book debts. They have necessarily to invest proportionately large amounts in working capital. The manufacturing enterprises fall, in a sense, between these two extremes. The industrial concerns require fairly large amounts of working capital though it varies from industry to industry depending on their asset structure. The proportion of current assets to total assets measures the relative requirements of working capital of various industries. Available data in respect of companies in India confirm the wide variations in the use of working capital by different enterprises. The percentage of current assets to total assets was found to be the lowest in hotels, restaurants and eating houses (10-20 per cent range), while in electricity generation and supply it was in the range of 20-30 per cent. The enterprises in the tobacco, construction and trading groups had, as is to be expected, the highest component of working capital (80-90 per cent range). The other industrial groups fall between these limits though there are very wide inter-industry variations.⁸

Production Cycle Another factor which has a bearing on the quantum of working capital is the production cycle. The term 'production or manufacturing cycle' refers to the time involved in the manufacture of goods. It covers the time-span between the procurement of raw materials and the completion of the manufacturing process leading to the production of finished goods. Funds have to be necessarily tied up during the process of manufacture, necessitating *enhanced* working capital. In other words, there is some time gap before raw materials become finished goods. To sustain such activities the need for working capital is obvious. The longer the time-span (i.e. the production cycle), the larger will be the tied-up funds and, therefore, the larger is the working capital needed and *vice versa*. There are enterprises which, due to the nature of business, have a short operating cycle. A distillery, which has an ageing process, has generally to make a relatively heavy investment in inventory. The other extreme is provided by a bakery. The bakeries sell their products at short intervals and have a very high inventory turnover. The investment in inventory and, consequently, working capital is not very large.

Further, even within the same group of industries, the operating cycle may be different due to technological considerations. For economy in working capital, that process should be selected which has a shorter manufacturing process. Having selected a particular process of manufacture, steps should be taken to ensure that the cycle is completed in the expected time. This underlines the need for effective organisation and coordination at all levels of the enterprise. Appropriate policies concerning terms of credit for raw materials and other supplies can help in reducing working capital requirements. Often, companies manufacturing heavy machinery and equipment minimise the investment in inventory or working capital by requiring advance payment from customers as

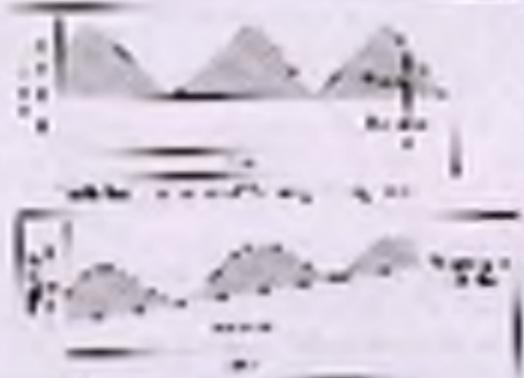

Figure 1: Comparison of two data series over time.

The first graph shows a series of three peaks, each higher than the last, with a clear upward trend. The second graph shows a series of peaks that are more irregular in height and timing, suggesting a more complex or noisy data set. Both graphs use a linear scale on the y-axis, with major ticks every 2 units.

The data points in the first graph are connected by straight lines, emphasizing the discrete nature of the observations. The second graph also uses straight lines, but the peaks are more closely spaced and vary in height, creating a more jagged appearance.

The overall comparison suggests that the two data series represent different underlying processes or conditions. The first series is more regular and shows a clear growth pattern, while the second series is more erratic and lacks a clear long-term trend.

The statistical analysis of these two series would likely involve comparing their means, variances, and possibly their autocorrelation functions to determine if they are significantly different.

Statistical Analysis of the Data

The data presented in the two graphs above are analyzed using standard statistical methods. The first graph shows a clear upward trend, which can be modeled using a linear regression. The second graph shows a more complex pattern, which may require a more sophisticated model, such as a moving average or a time series model.

work proceeds against orders. Thus, a part of the financial burden relating to the manufacturing cycle time is passed on to others.

Business Cycle The working capital requirements are also determined by the nature of the business cycle. Business fluctuations lead to cyclical and seasonal changes which, in turn, cause a shift in the working capital position, particularly for temporary working capital requirements. The variations in business conditions may be in two directions: **(i) upward phase** when boom conditions prevail, and **(ii) downswing phase** when economic activity is marked by a decline. During the upswing of business activity, the need for working capital is likely to grow to cover the lag between increased sales and receipt of cash as well as to finance purchases of additional material to cater to the expansion of the level of activity. Additional funds may be required to invest in plant and machinery to meet the increased demand. The downswing phase of the business cycle has exactly an opposite effect on the level of working capital requirement. The decline in the economy is associated with a fall in the volume of sales which, in turn, leads to a fall in the level of inventories and book debts. The need for working capital in recessionary conditions is bound to decline. In brief, business fluctuations influence the size of working capital mainly through the effect on inventories. The response of inventory to business cycles is mild or violent according to nature of the business cycle.

Production Policy The quantum of working capital is also determined by production policy. In the case of certain lines of business, the demand for products is seasonal, that is, they are purchased during certain months of the year. What kind of production policy should be followed in such cases? There are two options open to such enterprises: either they confine their production only to periods when goods are purchased or they follow a steady production policy throughout the year and produce goods at a level to meet the peak demand. In the former case, there are serious production problems. During the slack season, the firms have to maintain their working force and physical facilities without adequate production and sale. When the peak period arrives, the firms have to operate at full capacity to meet the demand. This kind of arrangement would not only be expensive but also inconvenient. Thus, serious difficulties will be encountered in trying to match production to the ebb and flow of the seasonal demand pattern. A better alternative is a steady production policy independent of shifts in demand for the finished goods. This means a large accumulation of finished goods (inventories) during the off-season and their abrupt sale during the peak season. The progressive accumulation of stock naturally requires an increasing amount of working capital which remains tied up for some months. Working capital planning has to incorporate this pattern of requirement of funds when production and seasonal sales are steady. This strategy (steady production policy) is, however, not necessarily adopted by everyone. It may be possible, for instance, for some to follow a policy of diversification which enables them to engage the working force and the physical facilities in some other activity. If this is possible, there will be no major working capital problem. Moreover, the nature of some products may be such that accumulation of inventories may create special risk and cost problems. For them, a production policy in tune with the changing demands may be preferable. Therefore, production policies have to be formulated on the basis of the individual setting of each enterprise and the magnitude and dimension of the working capital problems will accordingly vary.

Credit Policy The credit policy relating to sales and purchases also affects the working capital. The credit policy influences the requirement of working capital in two ways: **(i)** through credit terms granted by the firm to its customers/buyers of goods; **(ii)** credit terms available to the firm from its creditors.

The credit terms granted to customers have a bearing on the magnitude of working capital by determining the level of book debts. The credit sales result in higher book debts (receivables). Higher book debts mean more working capital. On the other hand, if liberal credit terms are available from

the suppliers of goods (trade creditors), the need for working capital is less. The working capital requirements of a business are, thus, affected by the terms of purchase and sale, and the role given to credit by a company in its dealings with creditors and debtors.

Credit terms fixed by an enterprise are affected by the prevailing trade practices as well as changing economic conditions. If, for example, competition is keen, there would be pressure to grant generous credit terms. Nevertheless, there is wide scope for managerial discretion in working out a suitable credit policy relevant to each customer based on the merits of each case. For instance, liberal credit facilities can be extended on the basis of credit rating. This will avoid the problem of having excess working capital. Similarly, the collection procedure can be so framed that funds, which would otherwise be available for meeting operating needs⁹ are not locked up. Thus, adoption of rationalised credit policies would be a significant factor in determining the working capital needs of an enterprise.

Such discretion may, however, not be available to a company which operates in a highly competitive market. To win and retain customers, it may be forced, among other things, to offer generous credit terms to them. The investment in book debts will consequently be of a higher order, necessitating large working capital in another way. To be able to enjoy consumer patronage on a continuous basis, a firm will have to offer a variety of products quite unlike a firm which has a hold on the market and, hence, does not need special efforts to satisfy customer requirements. The consequence of a higher level of inventories would be an additional need for working capital. The degree of competition is, therefore, an important factor influencing working capital requirements.

Growth and Expansion As a company grows, it is logical to expect that a larger amount of working capital is required. It is, of course, difficult to determine precisely the relationship between the growth in the volume of business of a company and the increase in its working capital. The composition of working capital in a growing company also shifts with economic circumstances and corporate practices. Other things being equal, growth industries require more working capital than those that are static. "The critical fact, however, is that the need for increased working capital funds does not follow the growth in business activities but precedes it."¹⁰ Advance planning of working capital is, therefore, a continuing necessity for a growing concern. Or else, the company may have substantial earnings but little cash.

Vagaries in the Availability of Raw Material The availability or otherwise of certain raw materials on a continuous basis without interruption would sometimes affect the requirement of working capital. There may be some materials which cannot be procured easily either because of their sources are few or they are irregular. To sustain smooth production, therefore, the firm might be compelled to purchase and stock them far in excess of genuine production needs. This will result in an excessive inventory of such materials. The procurement of some essential raw materials is difficult because of their sporadic supply. This happens very often with raw materials which are in short supply and are controlled to ensure equitable distribution. The buyer has in such cases very limited options as to the quantum and timing of procurement. It may so happen that a bulk consignment may be available but the firm may be short of funds, while when surplus funds are available the commodities may be in short supply. This element of uncertainty would lead to a relatively high level of working capital. Finally, some raw materials may be available only during certain seasons. They would have to be necessarily obtained, when available, to provide for a period when supplies are lean. This will cause seasonal fluctuations in working capital requirements.

Profit Level The level of profits earned differ from enterprise to enterprise. In general, the nature of the product, hold on the market, quality of management and monopoly power would by and large determine the profit earned by a firm. *A priori*, it can be generalised that a firm dealing in a high quality product, having a good marketing arrangement and enjoying monopoly power in the market,

THE UNIVERSITY OF CHICAGO
CHICAGO, ILLINOIS

is likely to earn high profits and vice versa. Higher profit margin would improve the prospects of generating more internal funds thereby contributing to the working capital pool. *The net profit is a source of working capital to the extent that it has been earned in cash.* The cash profit can be found by adjusting non-cash items such as depreciation, outstanding expenses and losses written off, in the net profit. But, in practice, the net cash inflows from operations cannot be considered as cash available for use at the end of cash cycle. Even as the company's operations are in progress, cash is used for augmenting stock, book debts and fixed assets.¹¹ It must, therefore, be seen that cash generation has been used for furthering the interest of the enterprise. It is in this context that elaborate planning and projections of expected activities and the resulting cash inflows on a day-to-day, week-to-week and month-to-month basis assume importance because steps can then be taken to deal with surplus and deficit cash.

The availability of internal funds for working capital requirements is determined not merely by the profit margin but also by the manner of appropriating profits. The availability of such funds would depend upon the profit appropriations for taxation, dividend, reserves and depreciations.

Level of Taxes The first appropriation out of profits is payment or provision for tax. The amount of taxes to be paid is determined by the prevailing tax regulations. The management has no discretion in this respect. Very often, taxes have to be paid in advance on the basis of the profit of the preceding year. Tax liability is, in a sense, short-term liability payable in cash. An adequate provision for tax payments is, therefore, an important aspect of working capital planning. If tax liability increases, it leads to an increase in the requirement of working capital and vice versa. Management has no discretion in regard to the payment of taxes; in some cases non-payment may invite penal action. There is, however, wide scope to reduce the tax liability through proper tax planning. The service of tax experts can be availed of to take advantage of the various concessions and incentives through avoidance as opposed to evasion of taxes. Tax planning can, therefore, be said to be an integral part of working capital planning.

Dividend Policy Another appropriation of profits which has a bearing on working capital is dividend payment. The payment of dividend consumes cash resources and, thereby, affects working capital to that extent. Conversely, if the firm does not pay dividend but retains the profits, working capital increases. In planning working capital requirements, therefore, a basic question to be decided is whether profits will be retained or paid out to shareholders. In theory, a firm should retain profits to preserve cash resources and, at the same time, it must pay dividends to satisfy the expectations of investors. When profits are relatively small, the choice is between retention and payment. The choice must be made after taking into account all the relevant factors.

There are wide variations in industry practices as regards the interrelationship between working capital requirements and dividend payment. In some cases, shortage of working capital has been a powerful reason for reducing or even skipping dividends in cash. There are occasions, on the other hand, when dividend payments are continued in spite of inadequate earnings in a particular year because of sound liquidity. Sometimes, the dilemma is resolved by the payment of bonus shares. This enables the payment of dividend without draining away the cash resources and, thus, without reducing working capital. Dividend policy, is thus, a significant element in determining the level of working capital in an organisation.

Depreciation Policy Depreciation policy also exerts an influence on the quantum of working capital. Depreciation charges do not involve any cash outflows. The effect of depreciation policy on working capital is, therefore, indirect. In the first place, depreciation affects the tax liability and retention of profits. Depreciation is allowable expenditure in calculating net profits. Enhanced rates of depreciation lower the profits and, therefore, the tax liability and, thus, more cash profits. Higher depreciation also means lower disposable profits and, therefore, a smaller dividend payment. Thus,

cash is preserved. In the second place, the selection of the method of depreciation has important financial implications. If current capital expenditure falls short of the depreciation provision, the working capital position is strengthened and there may be no need for short-term borrowing. If, on the other hand, the current capital expenditure exceeds the depreciation provision, either outside borrowing will have to be resorted to or a restriction on dividend payment coupled with retention of profits will have to be adopted to prevent the working capital position from being adversely affected. It is in these ways that depreciation policy is relevant to the planning of working capital.

Price Level Changes Changes in the price level also affect the requirements of working capital. Rising prices necessitate the use of more funds for maintaining an existing level of activity. For the same level of current assets, higher cash outlays are required. The effect of rising prices is that a higher amount of working capital is needed. However, in the case of companies which can raise their prices proportionately, there is no serious problem regarding working capital. Moreover, the price rise does not have a uniform effect on all commodities. It is likely that some firms may not be affected at all. In brief, the implications of changing price levels on working capital position vary from company to company depending on the nature of its operations, its standing in the market and other relevant considerations.

Operating Efficiency The operating efficiency of the management is also an important determinant of the level of working capital. The management can contribute to a sound working capital position through operating efficiency. Although the management cannot control the rise in prices, it can ensure the efficient utilisation of resources by eliminating waste, improving coordination, and a fuller utilisation of existing resources, and so on. Efficiency of operations accelerates the pace of cash cycle and improves the working capital turnover. It releases the pressure on working capital by improving profitability and improving the internal generation of funds.

To conclude, the level of working capital is determined by a wide variety of factors which are partly internal to the firm and partly external (environmental) to it. Efficient working capital management requires efficient planning and a constant review of the needs for an appropriate working capital strategy.

Computation of Working Capital

The two components of working capital (WC) are current assets (CA) and current liabilities (CL). They have a bearing on the cash operating cycle. In order to calculate the working capital needs, what is required is the holding period of various types of inventories, the credit collection period and the credit payment period. Working capital also depends on the budgeted level of activity in terms of production/sales. The calculation of WC is based on the assumption that the production/sales is carried on evenly throughout the year and all costs accrue similarly. As the working capital requirements are related to the cost excluding depreciation and not to the sale price, WC is computed with reference to cash cost. The cash cost approach is comprehensive and superior to the operating cycle approach based on holding period of debtors and inventories and payment period of creditors. Some problems have been solved, however, using the operating cycle approach also.

The steps involved in estimating the different items of CA and CL are as follows:

Estimation of Current Assets: Raw Materials Inventory The investment in raw materials inventory is estimated on the basis of Eq. 13.1.

$$\begin{array}{rcccl}
 \text{Budgeted} & & \text{Cost of raw} & & \text{Average inventory} \\
 \text{production} & \times & \text{material(s)} & \times & \text{holding period} \\
 \text{(in units)} & & \text{per unit} & & \text{(months/days)} \\
 \hline
 & & & & 12 \text{ months}/365 \text{ days}
 \end{array} \tag{13.1}$$

Work-in-Process (W/P) Inventory The relevant costs to determine work-in-process inventory are the proportionate share of cost of raw materials and conversion costs (labour and manufacturing overhead costs excluding depreciation).¹² In case, full unit of raw material is required in the beginning, the unit cost of work-in-process would be higher, that is, cost of full unit + 50 per cent of conversion cost, compared to the raw material requirement throughout the production cycle; W/P is normally equivalent to 50 per cent of total cost of production. Symbolically,

$$\frac{\text{Budgeted production (in units)} \times \text{Estimated work-in-process cost per unit} \times \text{Average time span of work-in-progress inventory (months/days)}}{12 \text{ months}/365 \text{ days}} \quad (13.2)$$

Finished Goods Inventory Working capital required to finance the inished goods inventory is given by factors summed up in Eq. 13.3.

$$\frac{\text{Budgeted production (in units)} \times \text{Cost of goods produced per unit (excluding depreciation)} \times \text{Finished goods holding period (months/days)}}{12 \text{ months}/365 \text{ days}} \quad (13.3)$$

Debtors The WC tied up in debtors should be estimated in relation to total cost price (excluding depreciation) Symbolically,

$$\frac{\text{Budgeted credit sales (in units)} \times \text{Cost of sales per unit excluding depreciation} \times \text{Average debt collection period (months/days)}}{12 \text{ months}/365 \text{ days}} \quad (13.4)$$

Cash and Bank Balances Apart from WC needs for financing inventories and debtors, firms also find it useful to have some minimum cash balances with them. It is difficult to lay down the exact procedure of determining such an amount. This would primarily be based on the motives for holding cash balances¹³ of the business firm, attitude of management toward risk, the access to the borrowing sources in times of need and past experience, and so on.

Estimation of Current Liabilities The working capital needs of business firms are lower to the that extent such needs are met through the current liabilities (other than bank credit¹⁴) arising in the ordinary course of business. The important current liabilities (CL), in this context are, trade-creditors, wages and overheads:

Trade Creditors

$$\frac{\text{Budgeted yearly production (in units)} \times \text{Raw material cost per unit} \times \text{Credit period allowed by creditors (months/days)}}{12 \text{ months}/365 \text{ days}} \quad (13.5)$$

Note: Proportional adjustment should be made to cash purchases of raw materials.

Direct Wages

$$\frac{\text{Budgeted yearly production (in units)} \times \text{Direct labour cost per unit} \times \text{Average time-lag in payment of wages (months/days)}}{12 \text{ months}/365 \text{ days}} \quad (13.6)$$

The average credit period for the payment of wages approximates to a half-a-month in the case of monthly wage payment: The first days' monthly wages are paid on the 30th day of the month, extending credit for 29 days, the second day's wages are, again, paid on the 30th, extending credit for 28 days, and so on. Average credit period approximates to half-a-month.

Overheads (Other than Depreciation and Amortisation)

Budgeted yearly production (in units)	×	Overhead cost per unit	×	Average time-lag in payment of overheads (months/days)	(13.7)
12 months/365 days					

Goods and Services Tax (GST)

Budgeted yearly sales (in units)	×	GST per unit	×	Average time-lag in payment of GST (weeks/days)	(13.8)
--	---	-----------------	---	---	--------

The amount of overheads may be separately calculated for different types of overheads. In the case of selling overheads, the relevant item would be sales volume instead of production volume. Since cash cost approach is the basis of determining NWC, the sums due to provision for taxes are excluded as they are payable only when the firm has profits; likewise, it is equally important to note the rationale of excluding short-term bank loan and bank overdraft; the rationale is computation of working capital should indicate the required amount of NWC and not the source of financing it. Obviously, the inclusion of source would distort the NWC required.

The computation of working capital is summarised in format 13.1.

FORMAT 13.1 Determination of Working Capital

	Amount
(I) <i>Estimation of Current Asset:</i>	
(a) Minimum desired cash and bank balances	
(b) Inventories	
Raw material	
Work-in-process	
Finished Goods	
(c) Debtors	
Total Current Assets	
(II) <i>Estimation of Current Liabilities:</i>	
(a) Creditors**	
(b) Wages	
(c) Overheads	
(d) Goods and Services Tax (GST)	
Total Current Liabilities	
(III) <i>Net Working Capital (I – II)</i>	
Add margin for contingency	
(IV) <i>Net Working Capital Required</i>	

*If payment is received in advance, the item would be listed in CL.
**If advance payment is to be made to creditors, the item would appear under CA. The same would be the treatment for advance payment of wages and overheads.

LO 13.3 MANAGEMENT OF WORKING CAPITAL IN INDIA

- Indian corporates seem to have adequate and satisfactory level of working capital as reflected in their liquidity ratios. The foreign controlled companies are placed in a better position relative to the domestic companies.
- There are wide inter-industry variations in the liquidity ratios of the corporate enterprises. With the exception of sugar, all other industry groups have safe and satisfactory liquidity position.
- The majority of Indian companies maintains relatively lower cash/bank balances. Marketable securities have emerged as a popular means of cash management. The excess cash is also deployed to retire short-term debt/in short-term bank deposits. Bank overdraft/cash credit has been cited as the major source of dealing with cash deficit situations by the vast majority of the sample companies. Discounting bill receivables and having special arrangement with some lending agency are less frequently used techniques by them to meet such situations.
- In spite of the notable decline over the years, inventory constitutes a sizeable part of the total current assets of the Indian corporates. The most important objective of inventory management in India is 'avoid loss of production/sales'. The popular control techniques are ABC, FSN and SDE and inventory turnover ratio and comparison with competitors are widely used to assess the performance of inventory management. The low average value of inventory holding periods of raw materials and space parts, work-in-process and finished goods for eleven years (2001-2011) period is indicative of efficient inventory management of the sample companies.
- Debtors/receivables also constitute a significant component of current assets. 'growth in sales' is the most important objective of credit policy and the 'open credit with approval if exceeds a specified limit' is the most favoured policy. It is common practice to prepare 'ageing schedule' of debtors' to assess the financial health of the customers before granting credit and monitoring purposes. To speed up collections, the corporates offer cash discount. The majority of the companies also charge penal interest. The vast majority of sample companies do not reckon 'offering credit terms better than those of competitors' as the primary objective of the credit policy.
- Accounts payable and short-term loans/advances are the major components of current liabilities.
- The 'length of the operating cycle' is the most widely use method to determine working capital need. The working capital financing policy is based on the matching approach. The majority of the companies have occasionally experienced working capital shortage due mainly to excess inventory accumulation and poor debt collection.
- The sample companies have increasingly become more aggressive in managing their working capital with more than one-fourth companies operating at a zero working capital in 2011 compared to 14.8 per cent in 2001.

Source: Jain, P.K. and Yadav, S.S, *op. cit*, pp 81-102. Also Singh, Shveta, P. K. Jain and Surendra S. Yadav, "Working Capital Management: Empirical Evidence From Indian Corporates". *The Management Accountant*, Vol. 48, No. 6, 2013, pp. 691-706.

SUMMARY

Working capital management is concerned with the problems that arise in managing the current assets (CA), current liabilities (CL) and the interrelationships between them. Its operational goal is to manage the CA and CL in such a way that a satisfactory/acceptable level of net working capital (NWC) is maintained.

There are three concepts of working capital (WC): gross, net and zero. The gross WC means the total CA. The NWC is the difference between the CA and CL. Zero WC = inventories plus receivables minus payables.

The NWC is necessary due to non-synchronous nature of expected cash inflows and required cash outflows. The more predictable the cash inflows are, the less NWC will be required and *vice-versa*. The NWC represents the liquidity position of a firm.

The NWC has a bearing on liquidity, profitability and risk of becoming technically insolvent. In general, the greater is the NWC, the higher is the liquidity, the lower is the risk and the profitability, and *vice-versa*. The trade-off between profitability and risk is an important element in the evaluation of the level of NWC of a firm.

Determination of financing mix is another important constituent of WC management. The financing mix refers to the proportion of CA to be financed by short-term sources (CL) and long-term sources (such as share capital and long-term borrowings). It is concerned with determination of relative share of these two broad sources in financing CA.

There are three approaches to determine an appropriate financing mix: (i) hedging/matching approach, (ii) conservative approach and (iii) trade-off between these two.

According to hedging approach, long-term funds should be used to finance the permanent/core part of the CA and the purely temporary and seasonal requirements (over and above the permanent needs) should be met out of short-term funds. This approach is a high profit-high risk financing mix.

According to the conservative approach, the estimated total requirements of the CA should be financed from long-term sources. The short-term sources of finance should be used only in emergency situations. The firm has NWC equal to the excess of long-term financing over the permanent requirement. This approach is a low-profit, low-risk combination.

Neither the hedging approach nor the conservative approach is suitable for determining an appropriate financing mix. A trade-off between these two extreme approaches would give an acceptable financing strategy.

The need for working capital (WC) arises from the cash/operating cycle of a firm. It refers to the length of time required to complete the following sequence of events: conversion of cash into inventory, inventory into receivables and receivables into cash. The operating cycle creates the need for working capital and its length in terms of time-span required to complete the cycle is the major determinant of the firm's working capital needs.

Working capital can be (i) permanent and (ii) temporary. While the permanent component reflects the need for a certain irreducible level of current assets on a continuous and uninterrupted basis, the temporary portion is needed to meet seasonal and other temporary requirements. While permanent working capital requirements should be financed from long-term sources, short-term funds should be used to finance temporary working capital needs of a firm.

Working capital requirements are determined by a variety of factors. These factors, however, affect different enterprises differently. In general, the factors relevant for proper assessment of the quantum of working capital required are: general nature of business, production cycle, business cycle, production policy, credit policy, growth and expansion, availability of raw materials, profit-level, level of taxes, dividend policy, depreciation policy, price level changes and operating efficiency.

Manufacturing and trading enterprises require fairly large amounts of working capital to maintain a sufficient amount of cash, inventories and book debts to support their production (purchases) and sales activity. Service enterprises (like public utilities) and hotels, restaurants and eating houses need to carry less WC.

The longer is the production cycle, the larger is the WC needed or *vice-versa*.

While during boom conditions, reflecting upswing in business activity, the need for WC is likely to grow to cater to the increased level of activity, the need for working capital in the downswing phase/recessionary conditions tend to be low due to fall in the volume of sales and production.

While the liberal credit policy offered to customers would necessitate more working capital, tight credit terms would reduce its requirement. The liberal credit terms available from creditors/suppliers of materials would be an offsetting factor.

LO 13.1

LO 13.2

Growth industries and firms require more working capital.

To meet vagaries in the unavailability, a firm should have excess inventory of raw materials to sustain smooth production. Such a firm would tend to have high level of WC.

Cash profit, *per-se*, should not be viewed as a source of financing WC. The actual availability of such funds would depend upon the firm's requirement for payment of dividend, payment of loan instalment, creation of sinking fund, purchase of fixed assets, and so on. In case these requirements are substantial, cash profit is not likely to be available to meet the needs of a firm. Alternatively, only adjusted cash profits after provisioning for these requirements should be reckoned for WC financing.

The payment of dividend consumes cash resources and, therefore, decreases WC of a firm. Conversely, the non-payment of dividend increases WC.

Higher depreciation (enhanced rates of depreciations) has a positive impact on WC for two reasons: (i) lower tax liability and, hence, more cash profits and (ii) lower disposable profits and, therefore, a smaller dividend payment. They imply more cash with a corporate.

Rising prices in input costs (without corresponding increase or less than a proportionate increase in selling prices of products) necessitates more WC to sustain an existing level of activity.

Efficiency of operations accelerates the pace of cash cycle and improves the WC turnover resulting in reduced requirement of WC.

A firm should have adequate WC to support its budgeted level of activity in terms of production/sales. It should have neither more nor less WC than required. While the excessive WC adversely affects its profits, the inadequate WC interrupts its smooth operations. Therefore, its correct computation is an important constituent of efficient WC management.

There are two components of WC, namely, CA and CL. Each component is to be separately estimated to determine the correct amount of WC. The relevant factors are the holding periods of the various types of inventories, debtors collection period, creditors payment period, budgeted yearly production/sales, cost of goods produced, cost of sales, average time-lag in payment of wages and other overheads, average time-lag in payment of goods and services tax (GST), minimum cash balances and so on.

Working capital requirements are to be computed with reference to cash costs (excluding depreciation) and not the sale price as depreciation is a non-cash cost and, hence, does not need WC. The investment required to finance debtors are at cost price. The 'cash cost approach' is appropriate to determine WC requirement of a firm.

- 13.14 Bank credit is excluded as it is a source of finance of WC.

SOLVED PROBLEMS

P.13.1 X & Y Ltd is desirous to purchase a business and has consulted you, and one point on which you are asked to advise them, is the average amount of working capital which will be required in the first year's working.

LO 13.2 **LOD M**

You are given the following estimates and are instructed to add 10 per cent to your computed figure to allow for contingencies.

<i>Particulars</i>	<i>Amount for the year</i>
(i) Average amount backed up for stocks:	
Stocks of finished product	₹5,000
Stocks of stores and materials	8,000
(ii) Average credit given:	
Inland sales, 6 weeks' credit	3,12,000
Export sales, 1.5 weeks' credit	78,000
(iii) Average time lag in payment of wages and other outgoings:	
Wages, 1.5 weeks	2,60,000
Stocks and materials, 1.5 months	48,000
Rent and royalties, 6 months	10,000
Clerical staff, 0.5 month	62,400
Manager, 0.5 month	4,800
Miscellaneous expenses, 1.5 months	48,000
(iv) Payment in advance:	
Sundry expenses (paid quarterly in advance)	8,000
Undrawn profits on an average throughout the year	11,000

Set up your calculations for the average amount of working capital required.

Solution

Statement to determine net working capital for X & Y Ltd

(a) Current assets:	
(i) Stock of finished product	₹5,000
(ii) Stock of stores and materials	8,000
(iii) Debtors:	
Inland sales ($₹3,12,000 \times 6/52$)	36,000
Export sales, ($₹78,000 \times 3/104$)	2,250
(iv) Advance payment of sundry expenses ($₹8,000 \times 1/4$)	2,000
Total investment in current assets	53,250
(b) Current liabilities:	
(i) Wages ($₹2,60,000 \times 3/104$)	7,500
(ii) Stocks/materials, ($₹48,000 \times 3/24$)	6,000
(iii) Rent, royalties, ($₹10,000 \times 6/12$)	5,000
(iv) Clerical staff ($₹62,400 \times 1/24$)	2,600
(v) Manager ($₹4,800 \times 1/24$)	200
(vi) Miscellaneous expenses ($₹48,000 \times 3/24$)	6,000
Total estimate of current liabilities	27,300
(c) Net working capital:	
(i) Current assets – Current liabilities (A – B)	25,950
(ii) Add 10 per cent contingency allowance	2,595
Average amount of working capital required	28,545

Assumptions:

- (i) A time period of 52 weeks/12 months has been assumed in year.
- (ii) Undrawn profit has been ignored in the working capital computation for the following reasons:
- For the purpose of determining working capital provided by net profit, it is necessary to adjust the net profit for income tax and dividends/drawings, and so on.
 - Profit need not always be a source of financing working capital. It may be used for other purposes like purchase of fixed assets, repayment of long-term loans, and so on. Since the firm does not seem to have such uses, ₹11,000 may be treated as source of working capital. But the NWC will not change.
- (iii) Actual working capital requirement would be more than what is estimated here as the cash component of current assets is not known.

P.13.2 While preparing a project report on behalf of a client you have collected the following facts. Estimate the net working capital required for that project. Add 10 per cent to your computed figure to allow contingencies:

LO 13.2	LOD E
----------------	--------------

Particulars	Amount per unit
Estimated cost per unit of production:	
Raw material	₹80
Direct labour	30
Overheads (exclusive of depreciation, ₹10 per unit)	60
Total cash cost	170

Additional information:

Selling price, ₹200 per unit. The product is subject to GST of 18 per cent.

Level of activity, 1,04,000 units of production per annum

Raw materials in stock, average 4 weeks

Work in progress (assume 50 per cent completion stage in respect of conversion costs and 100 per cent completion in respect of materials), average 2 weeks

Finished goods in stock, average 4 weeks

Credit allowed by suppliers, average 4 weeks

Credit allowed to debtors, average 8 weeks

Lag in payment of wages, average 1.5 weeks

Lag in payment of GST, average 4 weeks

Cash at bank is expected to be, ₹25,000.

You may assume that production is carried on evenly throughout the year (52 weeks) and wages and overheads accrue similarly. All sales are on credit basis only.

Solution

Net working capital estimate of a project

(A) Current assets:

(i) Raw materials in stock, $(1,04,000 \times ₹80 \times 4/52)$	₹6,40,000
(ii) Work-in-progress	
(a) Raw material $(1,04,000 \times ₹80 \times 2/52)$	3,20,000
(b) Direct Labour $(1,04,000 \times ₹15 \times 2/52)$	60,000
(c) Overheads $(1,04,000 \times ₹30 \times 2/52)$	1,20,000
(iii) Finished goods stock: $(1,04,000 \times ₹170 \times 4/52)$	13,60,000
(iv) Debtors: $(1,04,000 \times ₹206 \times 8/52)$	32,96,000
(v) Cash at bank	25,000
Total investment in current assets	58,21,000

(Contd.)

(Contd.)

(B) Current liabilities:	
(i) Creditors, average 4 weeks: $(1,04,000 \times ₹80 \times 4/52)$	6,40,000
(ii) Lag in payment of wages $(1,04,000 \times ₹30 \times 1.5/52)$	90,000
(iii) Lag in payment of GST $(1,04,000 \times ₹36 \times 4/52)$	2,88,000
Total current liabilities	<u>10,18,000</u>
(C) Net working capital: Current assets – Current liabilities	48,03,000
Add: 10 per cent contingencies	4,80,300
Net working capital required	<u>52,83,300</u>

Working Notes:

- A full unit of raw material is required at the beginning of the manufacturing process and, therefore, total cost of the material, that is, ₹80 per unit has been taken into consideration, while in the case of expenses, viz. direct labour and overheads, the unit has been finished only to the extent of 50 per cent. Accordingly, ₹15 and ₹30 have been charged for direct labour and overheads respectively in valuing work-in-process.
- Debtors: $₹170 + (18\% \text{ GST} \times ₹200 = ₹36) = ₹206$

P.13.3 A newly formed company has applied for a loan to a commercial bank for financing its working capital requirements. You are requested by the bank to prepare an estimate of the requirements of the working capital for the company. Add 10 per cent to your estimated figure to cover unforeseen contingencies. The information about the projected profit and loss account of this company is as under:

LO 13.2

Sales		₹21,00,000
Cost of goods sold		15,30,000
Gross profit		<u>5,70,000</u>
Administrative expenses	₹1,40,000	
Selling expenses	<u>1,30,000</u>	
		<u>2,70,000</u>
Profit before tax		<u>3,00,000</u>
Provision for tax		<u>1,00,000</u>

Note: Cost of goods sold has been derived as follows:

Materials used	8,40,000
Wages and manufacturing expenses	6,25,000
Depreciation	2,35,000
	<u>17,00,000</u>
Less: Stock of finished goods (10 per cent not yet sold)	1,70,000
	<u>15,30,000</u>

The figures given above relate only to the goods that have been finished and not to work in progress; goods equal to 15 per cent of the year's production (in terms of physical units) are in progress on an average, requiring full materials but only 40 per cent of other expenses. The company believes in keeping two months consumption of material in stock; Desired cash balance, ₹40,000.

Average time-lag in payment of all expenses is 1 month; suppliers of materials extend 1.5 months credit; sales are 20 per cent cash; rest are at two months credit; 70 per cent of the income tax has to be paid in advance in quarterly instalments.

You can make such other assumptions as you deem necessary for estimating working capital requirements.

Solution

Net working capital estimate of a company

(A) Current assets:		
(i) Raw material in stock = (₹8,40,000 × 2/12)		₹1,40,000
(ii) Work-in-progress:		
(a) Raw material (₹8,40,000 × 15/100)		1,26,000
(b) Wages and manufacturing expenses = (₹6,25,000 × 0.4 × 15/100)		37,500
(iii) Stock of finished goods: [₹1,70,000 – ₹23,500 (0.10 × ₹2,35,000, depreciation)]		1,46,500
(iv) Debtors		
(a) Cost of goods sold	₹15,30,000	
Less: Depreciation (₹2,35,000 × 0.9)	<u>2,11,500</u>	
	13,18,500	
(b) Administrative expenses	1,40,000	
(c) Selling expenses	<u>1,30,000</u>	
Total	<u>15,88,500</u>	
Credit sales (4/5 of ₹15,88,500) = ₹12,70,800 (12,70,800 × 2/12)		2,11,800
(v) Cash required		<u>40,000</u>
Total investment in current assets		<u>7,01,800</u>
(B) Current liabilities:		
(i) Average time-lag in payment of expenses:		
(a) Wages and manufacturing expenses	6,25,000	
(b) Administrative expenses	1,40,000	
(c) Selling expenses	<u>1,30,000</u>	
	<u>8,95,000/12</u>	74,583
(ii) Creditors (₹8,40,000 × 3/24)		<u>1,05,000</u>
Total current liabilities		<u>1,79,583</u>
(C) Net working capital: Current assets – Current liabilities (A – B)		<u>5,22,217</u>
Add: 10 per cent contingencies		<u>52,222</u>
Net working capital required		<u>5,74,439</u>

Assumption and Working Notes

- (i) Depreciation is not a cash expense and, therefore, excluded from cost of goods sold for the purpose of determining work-in-progress, finished goods and investment in debtors.
- (ii) Since profit is not taken into consideration in our calculation as a source of working capital, income tax has been excluded as it is to be paid out of profits.

P.13.4 From the following projections of XYZ & Ltd for the next year, you are required to determine the working capital required by the company.

LO 13.2	100	D
----------------	------------	----------

Annual sales, ₹14,40,000

Cost of production (including depreciation of ₹1,20,000), ₹12,00,000

Raw material purchases, ₹7,05,000

Monthly expenditure, ₹30,000

Estimated opening stock of raw materials, ₹140,000

Estimated closing stock of raw materials, ₹1,25,000

Inventory norms:

Raw materials, 2 months, Work-in-process, 1/2 month, and Finished goods, 1 month

The firm enjoys a credit of half-a-month on its purchases and allows one month credit on its supplies. On sales orders, the company receives an advance of ₹15,000. You may assume that production is carried out evenly throughout the year and minimum cash balance desired to be maintained is ₹35,000.

Solution Statement showing determination of net working capital

(A) Current assets:		
Cash balance		₹35,000
<i>Inventories:</i>		
Raw materials:	Opening stock	₹1,40,000
	Add: Purchases	7,05,000
	Less: Closing stock	1,25,000
	Annual consumption	<u>7,20,000</u>
	Two months requirement: (₹7,20,000 × 2/12)	1,20,000
	Work-in-process: (₹10,80,000 × 1/24)	45,000
	Finished goods: (₹10,80,000 × 1/12)	90,000
Debtors: (₹10,80,000 × 1/12)		<u>90,000</u> [@]
Total current assets		<u>3,80,000</u>
(B) Current liabilities:		
Trade creditors: (₹7,05,000 × 1/24)		29,375
Advance received from debtors		<u>15,000</u>
Total current liabilities		<u>44,375</u>
(C) Net working capital (A – B)		<u>3,35,625</u>

[@]It is assumed that there is neither opening nor closing stock of finished stock and, therefore, cost of sales is ₹10,80,000 excluding depreciation.

Monthly expenditure is excluded as the cost of production includes it (₹7.2 lakh, raw materials + ₹3.6 lakh, other expenses @ ₹30,000 per month).

P.13.5 From the following data, compute the duration of the operating cycle for each of the two years and comment on the increase/decrease:

LO 13.2 **LOD E**

Particulars	Year 1	Year 2
Stocks:		
Raw materials	₹20,000	₹27,000
Work-in-process	14,000	18,000
Finished goods	21,000	24,000
Purchase of raw materials	96,000	1,35,000
Cost of goods sold	1,40,000	1,80,000
Sales	1,60,000	2,00,000
Debtors	32,000	50,000
Creditors	16,000	18,000

Assume 360 days per year for computations purposes.

Solution Determination of operating cycle

Particulars	Year 1 (Days)	Year 2 (Days)
(i) Raw materials holding period:		
$\frac{360 \text{ days} \times \text{Stock of raw materials}}{\text{Cost of raw material consumed}}$	$\left(\frac{360 \times ₹20,000}{₹96,000} \right) = 75$	$\left(\frac{360 \times ₹27,000}{₹1,35,000} \right) = 72$
(assumed to be equivalent to purchases)		
(ii) Less: Creditors payment period:		
$\frac{360 \text{ days} \times \text{Creditors}}{\text{Purchases}}$	$\left(\frac{360 \times ₹16,000}{₹96,000} \right) = (60)$	$\left(\frac{360 \times ₹18,000}{₹1,35,000} \right) = (48)$

January 15, 1936

REPORT OF THE
COMMISSIONERS OF THE DEPARTMENT OF SOCIAL SERVICES

FOR THE YEAR ENDING DECEMBER 31, 1935

ALBANY: J.B. LIPPINCOTT COMPANY, 1936

PRINTED AT THE STATE PRINTING OFFICE, ALBANY, N. Y.

THE STATE OF NEW YORK
OFFICE OF THE COMMISSIONERS OF THE DEPARTMENT OF SOCIAL SERVICES
ALBANY, N. Y.

(Contd.)

(iii) Work-in-process holding period:

$$\frac{360 \text{ days} \times \text{Stock of WIP}}{\text{Cost of goods manufactured}} = \frac{(360 \times ₹14,000)}{₹1,40,000} = 36 \qquad \frac{(360 \times ₹18,000)}{₹1,80,000} = 36$$

(assumed equal to cost of goods sold)

(iv) Finished goods holding period:

$$\frac{360 \text{ days} \times \text{Stock of finished goods}}{\text{Cost of goods sold}} = \frac{(360 \times ₹21,000)}{₹1,40,000} = 54 \qquad \frac{(360 \times ₹24,000)}{₹1,80,000} = 48$$

(v) Debtors collection period:

$$\frac{360 \text{ days} \times \text{Debtors}}{\text{Credit sales}} = \frac{(360 \times ₹32,000)}{₹1,60,000} = 72 \qquad \frac{(360 \times ₹50,000)}{₹2,00,000} = 90$$

(assumed equal to total sales)

Duration of operating cycle [sum of (i) to (v)] = 177 = 198

The duration of the operating cycle has increased by 21 days in year 2 compared to year 1. It will necessitate more working capital in year 2. This increase has been primarily caused by an increase in debtors collection period and decrease in creditors payment period (as shown below):

Increase in debtors collection period	18 days
Decrease in creditors payment period	12
Less: Decrease in raw material holding period	(3)
Less: Decrease in finished goods holding period	(6)
Net increase in operating cycle	21

P.13.6 X Ltd sells goods at a gross profit of 20 per cent. It includes depreciation as a part of cost of production. The following figures for the 12 month-period ending March 31, current year are given to enable you to ascertain the requirements of working capital of the company on a cash cost basis.

LO 13.2	LOD M
---------	----------

In your working, you are required to assume that:

- (i) A safety margin of 15 per cent will be maintained;
- (ii) Cash is to be held to the extent of 50 per cent of current liabilities;
- (iii) There will be no work-in-progress;
- (iv) Tax is to be ignored;
- (v) Finished goods are to be valued at manufacturing costs. Stocks of raw materials and finished goods are kept at one month's requirements.

Sales at 2 month's credit, ₹27,00,000

Materials consumed (suppliers' credit is for 2 months), ₹6,75,000

Wages (paid on the last day of the month), ₹5,40,000

Manufacturing expenses outstanding at the end of the year (cash expenses are paid one month in arrear), ₹60,000

Total administrative expenses (paid as above), ₹180,000

Sales promotion expenses (paid quarterly in advance), ₹90,000

Solution Statement showing determination of working capital

(A) Current assets:

(i) Raw materials (₹6,75,000/12)	₹56,250
(ii) Finished goods (₹19,35,000/12)	1,61,250

(Contd.)

(Contd.)

(iii) Debtors ($₹22,05,000 \times 2/12$)	3,67,500
(iv) Sales promotion expenses ($₹90,000 \times 3/12$)	22,500
(v) Cash in hand ($₹2,10,000 \times 0.50$)	1,05,000
Total current assets	7,12,500
(B) Current liabilities:	
(i) Creditors ($₹6,75,000 \times 2/12$)	1,12,500
(ii) Manufacturing expenses	60,000
(iii) Administrative expenses ($₹1,80,000/12$)	15,000
(iv) Wages ($₹5,40,000 \times 1/24$)	22,500
Total current liabilities	2,10,000
(C) Net working capital (A - B)	5,02,500
Add: Safety margin ($0.15 \times ₹5,02,500$)	75,375
Working capital required on cash cost basis	5,77,875

Working Notes

(i) Determination of manufacturing expenses		
Sales		₹27,00,000
Less: Gross profit margin (₹27 lakh \times 0.20)		5,40,000
Total manufacturing costs		21,60,000
Less: Cost of materials consumed	₹6,75,000	
Less: Wages	5,40,000	12,15,000
Manufacturing expenses (balancing figure)		9,45,000
(ii) Cash manufacturing expenses ($₹60,000 \times 12$)		7,20,000
(iii) Depreciation ($₹9,45,000 - ₹7,20,000$)		2,25,000
(iv) Cash manufacturing costs ($₹21,60,000 - ₹2,25,000$)		19,35,000
(v) Cash cost of sales ($₹19,35,000 + ₹1,80,000 + ₹90,000$)		22,05,000

P.13.7 Marks Limited is launching a new project for the manufacture of a unique component.

LO 13.2	LO D
----------------	-------------

At full capacity of 24,000 units, the cost per unit will be as follows:

Material	₹80
Labour and variable expenses	40
Fixed manufacturing and administrative expenses	20
Depreciation	10
	<u>150</u>

The selling price per unit is expected at ₹200 and the selling expenses per unit will be ₹10, 80 per cent being variable.

In the first two years, production and sales are expected to be as follows:

Year	Production units	Sales units
1	15,000	14,000
2	20,000	18,000

To assess working capital requirement, the following additional information is given:

- Stock of raw material - 3 month's average consumption.
- Work-in-process - Nil
- Debtors - 1 month average cost of sales. Ignore GST.
- Creditors for supply of materials - 2 months average purchases of the year.
- Creditors for expenses - 1 month average of all expenses during the year.
- Minimum desired cash balance - ₹20,000
- Stock of finished goods is taken at average cost.

You are required to prepare a projected statement of working capital requirements for two years.

Solution

Projected statement to determine net working capital of Marks Limited for Year 1 and 2

Particulars	Year 1	Year 2
(A) Current assets:		
(i) Stock of raw materials:		
(15,000 units × ₹80 × 3/12) for year, 1	₹3,00,000	
(20,000 units × ₹80 × 3/12) for year, 2		₹4,00,000
(ii) Finished goods:	1,52,000*	4,33,143**
<i>Cash cost of production</i>	<i>Year 1</i>	<i>Year 2</i>
Materials @ ₹80 per unit	₹12,00,000	₹16,00,000
Labour and variable expenses @ ₹40 per unit	6,00,000	8,00,000
Total fixed and administrative expenses (24,000 units × ₹20)	4,80,000	4,80,000
Current cost (cash)	22,80,000	28,80,000
Add: Opening stock at average cost ((₹22,80,000 × 1000)/15,000) for year 2	—	1,52,000*
Less: Closing stock at average cost ((₹30,32,000 × 3,000)/21,000)	1,52,000	4,33,143**
Cost of goods sold (cash)	21,28,000	25,98,857
(iii) Debtors: (₹22,88,000/12; ₹27,90,857/12)		
Cost of goods sold (cash)	21,28,000	25,98,857
Add: Variable expenses @ ₹8	1,12,000	1,44,000
Add: Total fixed selling expenses (24,000 × ₹2)	48,000	48,000
Cost of sales (cash)	22,88,000	27,90,857
(iv) Minimum desired cash	20,000	20,000
Total investments in current assets	6,62,667	10,85,714
(B) Current liabilities:		
(i) Creditors for supply of materials: (₹15,00,000 × 2/12; ₹17,00,000 × 2/12)		
Materials consumed	12,00,000	16,00,000
Add: Closing stock (equivalent to 3 month's average consumption)	3,00,000	4,00,000
Less: Opening stock	—	(3,00,000)
Purchases	15,00,000	17,00,000
(ii) Creditors for expenses: (₹12,40,000 × 1/12; ₹14,72,000 × 1/12)		
Labour and variable	6,00,000	8,00,000
Fixed manufacturing and administrative	4,80,000	4,80,000
Selling (fixed & variable)	1,60,000	1,92,000
Total expenses	12,40,000	14,72,000
Total current liabilities	3,53,333	4,06,000
Working capital (net)	3,09,334	6,79,714

Note: Working capital is required in respect of the full amount of fixed overheads.

MINI CASES

13.C.1 Strong Cement Company Ltd has an installed capacity of producing 1.25 lakh tonnes of cement per annum; its present capacity utilisation is 80 per cent. The major raw material to manufacture cement is limestone which is obtained from the company's own mechanised mine located near the plant. The company produces cement in 200 kgs bags. From the information given below, determine the net working capital (NWC) requirement of the company for the current year.

Cost structure per bag of cement (estimated)

Gypsum	₹25
Limestone	15
Coal	30
Packing material	10
Direct labour	50
Factory overheads (including depreciation of ₹10)	30
Administrative overheads	20
Selling overheads	25
Total cost	205
Selling price	250
Add: GST (18 per cent of selling price)	45
Invoice price to consumers	295

Additional information:

- (i) Desired holding period of raw materials: Gypsum, 3 months, Limestone, 1 month, Coal, 2.5 months, and Packing material, 1.5 months
 - (ii) The product is in process for a period of 0.5 month (assume full units of materials, namely gypsum limestone and coal are required in the beginning; other conversion costs are to be taken at 50 per cent).
 - (iii) Finished goods are in stock for a period of 1 month before they are sold.
 - (iv) Debtors are extended credit for a period 3 months.
 - (v) Average time lag in payment of wages is approximately 0.5 month and of overheads, 1 month.
 - (vi) Average time lag in payment of GST is 1 month.
 - (vii) The credit period extended by various suppliers are:
Gypsum, 2 months, Coal, 1 month, and Packing material, 0.5 month.
 - (viii) Minimum desired cash balance is ₹25 lakh.
- You may state your assumptions, if any.

Solution

TABLE 13.C.1 Statement showing determination of net working capital of Strong Cement Company Ltd

Current assets:	
Minimum desired cash balance	₹25,00,000
Raw materials:	
Gypsum (5 lakh bags ¹ × ₹25 × 3/12)	31,25,000
Limestone (5 lakh bags × ₹15 × 1/12)	6,25,000
Coal (5 lakh bags × ₹30 × 2.5/12)	31,25,000
Packing material (5 lakh bags × ₹10 × 1.5/12)	6,25,000

(Contd.)

(Contd.)

Work-in-process: (5 lakh bags × ₹115 × 1/24)		23,95,833
— Raw material cost 100 per cent (₹25 + ₹15 + ₹30)	₹70	
— Other conversion costs (₹50 + ₹20 cash factory overheads + ₹20) × 0.5	45	
	115	
Finished goods (5 lakh bags × ₹170** × 1/12)		70,83,333
Debtors (5 lakh bags × ₹240*** × 3/12)		3,00,00,000
Total		4,94,79,166
Current liabilities:		
Creditors:		
Gypsum (5 lakh bags × ₹25 × 2/12)		20,83,333
Coal (5 lakh bags × ₹30 × 1/12)		12,50,000
Packing material (5 lakh bags × ₹10 × 1/24)		2,08,333
Wages (5 lakh bags × ₹50 × 1/24)		10,41,667
Overheads (5 lakh bags × ₹65 × 1/12)		27,08,333
GST (5 lakh bags × ₹45 × 1/12)		18,75,000
Total		91,66,666
NWC		4,03,12,500

*1.25 lakh tons × 0.8 = 1 lakh ton/200 kgs = 5,00,000 bags

** (Total cost, ₹205 – Depreciation, ₹10 – selling overheads, ₹25)

*** (Cash cost, ₹195 + GST, ₹45)

13.C.2 Crimson Industries Ltd is desirous of assessing its working capital requirements for the next year. The finance manager has collected the following information for the purpose.

Estimated cost per unit of finished product

Raw materials	₹90
Direct labour	50
Manufacturing and administrative overhead (excluding depreciation)	40
Depreciation	20
Selling overheads	30
Total cost	230

The product is sold at ₹300 per unit. GST applicable is 18 per cent.

Additional information:

- (i) Budgeted level of activity is 1,20,000 units of output for the next year.
- (ii) Raw material cost consists of the following:
Pig iron ₹65 per unit, Ferro alloys 15 per unit, and Cast iron borings 10 per unit
- (iii) Raw materials are purchased from different suppliers, extending different credit period:
Pig iron, 2 months, Ferro alloys, 1/2 month, and Cast iron borings, 1 month.
- (iv) Product is in process for a period of 1/2 month. Production process requires full unit (100 per cent) of pig iron and ferro alloys in the beginning of production; cast iron boring is required only to the extent of 50 per cent in the beginning and the remaining is needed at a uniform rate during the process. Direct labour and other overheads accrue similarly at a uniform rate throughout production process.
- (v) Past trends indicate that the pig iron is required to be stored for 2 months and other materials for 1 month.
- (vi) Finished goods are in stock for a period of 1 month.
- (vii) It is estimated that one-fourth of total sales are on cash basis and the remaining sales are on credit. The past experience of the firm has been to collect the credit sales in 2 months.

- (viii) Average time-lag in payment of all overheads is 1 month and 0.5 month in the case of direct labour.
 (ix) Average time-lag in payment of GST is 1 month.
 (x) Desired cash balance is to be maintained at ₹10 lakh.

You are required to determine the amount of net working capital of the firm. State your assumptions, if any.

Solution

TABLE 13.C.2 Determination of net working capital of Crimson Industries Ltd

Current assets:	
Minimum desired cash balance	₹10,00,000
Raw materials:	
Pig iron ($1,20,000 \times ₹65 \times 2/12$)	13,00,000
Ferro alloys ($1,20,000 \times ₹15 \times 1/12$)	1,50,000
Cast iron borings ($1,20,000 \times ₹10 \times 1/12$)	1,00,000
Work-in-process ($1,20,000 \times ₹132.5^1 \times 1/24$)	6,62,500
Finished goods ($1,20,000 \times ₹180 \times 1/12$)	18,00,000
Debtors ($1,20,000 \times 0.75 \times ₹264^2 \times 2/12$)	39,60,000
Total	89,72,500
Current liabilities:	
Creditors:	
Pig iron ($1,20,000 \times ₹65 \times 2/12$)	13,00,000
Ferro alloys ($1,20,000 \times ₹15 \times 1/24$)	75,000
Cast iron borings ($1,20,000 \times ₹10 \times 1/12$)	1,00,000
Wages ($1,20,000 \times ₹50 \times 1/24$)	2,50,000
Total overheads ($1,20,000 \times ₹70 \times 1/12$)	7,00,000
GST ($1,20,000 \times ₹54 \times 1/12$)	5,40,000
Total	29,65,000
NWC	60,07,500

Working Notes

(1) Determination of work-in-process

Pig iron		₹65
Ferro alloys		15
Cast iron boring ($0.50 \times ₹10$)		5
Other costs:		
Cast iron borings ($0.50 \times ₹5$)	₹2.5	
Direct labour ($0.5 \times ₹50$)	25	
Manufacturing and administrative overhead ($0.50 \times ₹40$)	20	
		<u>47.5</u>
		132.5

(2) Debtors

Raw material	90
Direct labour	50
Manufacturing and administrative overheads	40
Selling overheads	30
GST ($0.18 \times ₹300$)	54
	<u>264</u>

1. The first part of the document
 discusses the general principles
 of the system and its objectives.
 It outlines the scope of the
 project and the roles of the
 various participants involved.
 The second part of the document
 provides a detailed description
 of the system's architecture
 and the components that make
 up the system. This includes
 a discussion of the hardware
 and software requirements, as
 well as the data flow and
 the control logic of the system.
 The third part of the document
 describes the implementation
 of the system, including the
 development of the software
 and the installation of the
 hardware. It also discusses the
 testing and validation of the
 system, and the results of the
 tests. Finally, the document
 concludes with a summary of the
 findings and a list of references.
 The document is organized into
 several sections, each of which
 is numbered and titled. The
 sections are: Introduction, System
 Architecture, Implementation,
 Testing and Validation, and
 Conclusion. Each section is
 further divided into sub-sections,
 which are also numbered and
 titled. The document is written
 in a clear and concise style,
 and is intended for a technical
 audience. It provides a comprehensive
 overview of the system and its
 development, and is a valuable
 resource for anyone interested
 in the system.

The system is designed to be
 flexible and scalable, and can
 be adapted to a wide range of
 applications. It is also easy
 to use and maintain, and
 provides a high level of
 performance and reliability.
 The system is currently being
 used in a number of different
 environments, and has been
 found to be a very effective
 tool for a variety of tasks.
 The system is also being
 used in a number of different
 countries, and has been found
 to be a very effective tool for
 a variety of tasks.

13.C.3 (Working Capital) Powerful CD Ltd manufactures high-tech CDs. After two years of operation, it is planning to expand its operations to meet the increased demand for CDs. The current level of production is 5,00,000 packs of 50 CDs. The budgeted level of production after expansion is 7,00,000 packs annually. The CEO of Powerful CD Ltd, Priti Chopra, wants the CFO, Bhavna Upadhyay, to submit a report relating to the projected working capital requirement after expansion. The cost and price data for the budgeted level of production are summarized in Exhibit 1.

EXHIBIT 1 Post-expansion Cost and Price Data of one CD Pack of 50 CDs

Raw materials:			
Optical storage media (₹2 × 50)		₹100	
Packing material		5	₹105
Direct labour			55
Overheads:			
Manufacturing (excluding depreciation)			
Fixed	₹40		
Variable	70	110	
Selling and Distribution			
Fixed	30		
Variable	50	80	
Depreciation		60	250
Total cost per CD pack			410
Selling price			500
GST (18% of selling price)			90
Invoice price to customers			590

Additional information:

- Budgeted level of production, 7,00,000 packs annually
- Raw materials for optical storage media are purchased on 2 months credit from suppliers.
- Packing materials are purchased on 1 month credit
- Average time-lag in payment of overheads, 1 month
- Average time-lag in payment of wages, half a month
- Average time-lag in payment of GST is 1 month
- Production process on an average, half a month. Full unit of raw materials is required in the beginning of manufacturing process.
- Sales on 3 months credit
- Stock of raw materials and finished goods equal half a month requirements
- Safety margin, 10 per cent
- Minimum desired cash balance, ₹50,00,000

Solution

Assessment of Working Capital Requirement (Post-expansion)

(a) Current Assets:

Raw materials (7,00,000 units × ₹105 × 1/24)		₹30,62,500
Work-in-process:		
Raw materials* (7,00,000 × ₹100 × 1/24)	₹29,16,667	
Direct labour (7,00,000 × ₹55 × 1/24) × 0.5	8,02,083	
Overheads (7,00,000 × ₹110 × 1/24) × 0.5	16,04,167	53,22,917
Stock of finished goods (7,00,000 × ₹270 × 1/24)		78,75,000
Debtors:		
Cost of goods sold (7,00,000 × ₹330 × 3/12)	5,77,50,000	
Less: depreciation (7,00,000 × ₹60 × 3/12)	(1,05,00,000)	
Selling and distribution expenses (7,00,000 × ₹80 × 3/12)	1,40,00,000	
GST (7,00,000 × ₹90 × 3/12)	1,57,50,000	7,70,00,000

Cash balance		50,00,000
Total		<u>9,82,60,417</u>
(b) Current Liabilities:		
Creditors for materials ($7,00,000 \times ₹100 \times 2/12$)		1,16,66,667
Creditors for packing material ($7,00,000 \times ₹5 \times 1/12$)		2,91,667
Expenses:		
Wages ($7,00,000 \times ₹55 \times 1/24$)	16,04,167	
Overheads ($7,00,000 \times ₹190 \times 1/12$)	1,10,83,333	
GST ($7,00,000 \times ₹90 \times 1/12$)	<u>52,50,000</u>	1,79,37,500
Total		2,98,95,834
Networking capital (a - b)		6,83,64,583
Working capital required (NWC $\times 1.10$)		<u>7,52,01,041</u>

*Excluding packing material

Working capital required after expansion is ₹7,52,01,041.

REVIEW QUESTIONS

LOD: Easy

RQ.13.1 Indicate whether the following statements are true or false.

[LO 13.1.2]

- (i) Working capital is primarily required due to non-synchronous nature of the expected cash inflows and required cash outflows.
- (ii) Higher net working capital leads to higher liquidity and higher profitability.
- (iii) Conservative approach warrants that long-term funds should be used to finance the permanent part of the current assets and the temporary/seasonal requirements should be financed by short-term funds.
- (iv) According to hedging approach, current assets should be financed from long-term sources.
- (v) Trade-off plan, in general, is considered an appropriate financing strategy for working capital.
- (vi) There is an inverse relationship between the length of operating cycle of a firm and its working capital requirements.
- (vii) In general, manufacturing enterprises require higher working capital than trading firms.
- (viii) The longer the production cycle, the higher is the working capital needed or *vice-versa*.
- (ix) There is a positive correlation between level of business activity and working capital needs of a business firm.
- (x) Efficiency of operation accelerates the pace of cash cycle of a firm but it does not affect its working capital requirements.
- (xi) A firm should carry higher working capital than required to execute smoothly its planned level of business activity.
- (xii) The entire sum of net profit earned by a corporate can, *per-se*, be considered a source of financing working capital.
- (xiii) Cash cost approach is an appropriate basis of computing working capital requirements of a business firm.

... ..

... ..

... ..

... ..

... ..

...

...

... ..

- (xiv) Working capital tied up with debtors should be estimated in relation to the selling price.
 (xv) From the perspective of determining net working capital, all current liabilities including short-term sources of finance are considered.

[Answers: (i) True (ii) False (iii) False (iv) False (v) True (vi) False (vii) True (viii) True (ix) True (x) False (xi) False (xii) False (xiii) True (xiv) False (xv) False]

RQ.13.2 How are net working capital, liquidity, technical insolvency, and risk related? [LO 13.1]

RQ.13.3 Hypothetical Ltd has forecast its total fund requirements for the coming year as follows:

Month	Amount (₹ in lakh)	Month	Amount (₹ in lakh)
January	30	July	200
February	30	August	180
March	40	September	110
April	60	October	70
May	100	November	40
June	150	December	20

The firm's cost of short-term and long-term financing is expected to be 4 per cent and 10 per cent respectively. [LO 13.1]

- (i) Calculate the cost of financing, using the hedging approach.
 (ii) Calculate the cost of financing, using the conservative approach.
 (iii) Discuss the basic profitability risk trade-off associated with each of these plans.

LOD: Medium

RQ.13.4 What is the basic premise of the hedging approach for meeting funds requirements? What are the effects of this approach on the profitability and risk? [LO 13.1]

RQ.13.5 What is the conservative approach to financing funds requirements? What kind of profitability-risk trade-off is involved? [LO 13.1]

RQ.13.6 Length of operating cycle is a major determinant of working capital needs of a business firm. Explain. [LO 13.2]

RQ.13.7 Distinguish between: (a) Gross working capital and Net working capital, (b) Permanent and Temporary working capital (c) Production and operating cycle. [LO 13.1,2]

RQ.13.8 The board of directors of Nanak Engineering Company Private Ltd requests you to prepare a statement showing the working capital requirements for a level of activity at 1,56,000 units of production. The following information is available for your calculation: [LO 13.2]

	Per unit
(A) Raw materials	₹90
Direct labour	40
Overheads (excluding depreciation of ₹10)	75
Total	205
Selling price	250
GST (18 per cent)	45
Invoice price to debtors	295

- (B) (i) Raw materials are in stock, on average, for 1 month.
 (ii) Materials are in process, (50 per cent complete) on average for 4 weeks.
 (iii) Finished goods are in stock on average for 1 month
 (iv) Credit allowed by suppliers is 1 month.

- (v) Time lag in payment from debtors is 2 months.
- (vi) Average lag in payment of wages is 1.5 weeks.
- (vii) Average lag in payment of overheads is 1 month.
- (viii) Average time-lag in payment of GST is 1 month.
- (ix) 20 per cent of the output is sold against cash. Desired minimum cash in hand and in bank, ₹60,000. It is to be assumed that production is carried on evenly throughout the year; wages and overheads accrue similarly, and a time period of 4 weeks is equivalent to a month.

RQ.13.9 POR Ltd sells goods in domestic market on a gross profit of 25 per cent, not counting depreciation as a part of the 'cost of goods sold'. Its estimates for next year are as follows: [LO 13.2]

Particulars	Amount (₹ in lakh)
Sales – Home at 1 month's credit	1,200
Exports at 3 months' credit, selling price 10 per cent below home price	540
Materials used (suppliers extend 2 months' credit)	450
Wages paid, 1/2 month in arrears	360
Manufacturing expenses (cash) paid, 1 month in arrears	540
Depreciation on fixed assets	60
Administrative expenses, paid 1 month in arrears	120
Sales promotion expenses (payable quarterly—in advance)	60
Income-tax payable in 4 instalments of which one falls in the next financial year	150

The company keeps 1 month's stock of each of raw materials and finished goods and believes in keeping ₹20 lakh as cash. Assuming a 15 per cent safety margin, ascertain the estimated working capital requirement of the company (ignore work-in-process as well as GST).

LOD: Difficult

RQ.13.10 If a firm has constant funds requirement throughout the year, which, if any, of the three financing plans is preferable? Why? [LO 13.1]

RQ.13.11 Hypothetical Ltd estimates its requirements of funds for the coming year to be constant at a level of ₹1,00,000. If the cost of both current liabilities and long-term financing are 8 per cent, calculate the cost, using the hedging and conservative approaches, and discuss your preference with respect to applying either of them to finance the firm. [LO 13.1]

RQ.13.12 MA Ltd is commencing a new project to manufacture a plastic component. The following cost information has been ascertained for annual production of 12,000 units which is the full capacity.

Materials	₹40	per unit
Direct labour and variable expenses	20	
Fixed manufacturing expenses	6	
Depreciation	10	
Fixed administration expenses	4	
	80	

The selling price per unit is expected to be ₹96 and the selling expenses ₹5 per unit, 80 per cent of which is variable. In the first 2 years of operations, production and sales are expected to be as follows: [LO 13.2]

Year	Production	Sales
1	6,000 units	5,000 units
2	9,000 units	8,500 units

To assess the working capital requirements, the following additional information is available:

- (a) Stock of materials, 2.25 months average consumption.
- (b) Work-in-process, Nil.
- (c) Debtors, 1 month's average cost of sales.
- (d) Cash balance, ₹10,000.
- (e) Creditors for materials, 1 month's average purchases during the year.
- (f) Creditors for expenses, 1 month's average of all expenses during the year.

You are required to prepare a projected statement of working capital requirements for 2 years. Assume that there is no GST applicable on the product.

ANSWERS

13.3 (i) ₹4.63 lakh

(ii) ₹20 lakh

(iii) ₹11.67 lakh

13.8 Current assets ₹1,04,27,500

Current liabilities ₹29,25,000

NWC ₹75,02,500

13.9 NWC ₹237.50 lakh

13.11 The cost would be the same under both the plans. Preference should be given to a plan involving long-term financing. The cost is ₹8,000

13.12 NWC ₹1,24,583 (Year 1)

₹1,84,042 (Year 2)

CHAPTER

14

Management of Cash and Marketable Securities

LEARNING OBJECTIVES

LO 14.1	Discuss the motives for holding cash and marketable securities
LO 14.2	Understand the objectives of cash management
LO 14.3	Describe the factors that determine the required cash balances
LO 14.4	Illustrate the two approaches to derive optimal cash balance, namely, analytical models of cash management as a normative framework and cash budget as a cash management tool
LO 14.5	Demonstrate, using the operating and cash conversion cycles, the three basic strategies for the efficient management of cash to minimise financing/cash balance needs
LO 14.6	Explain popular techniques for speeding up collections (concentration banking and lock-box system) and slowing disbursements (centralised disbursements, float, etc.)
LO 14.7	Understand the basic characteristics of marketable securities and the key features of the popular types of Government and non-Government issues
LO 14.8	Outline cash management practices in India

INTRODUCTION

Cash management is one of the key areas of working capital management. Apart from the fact that it is the most liquid current asset, cash is the common denominator to which all current assets can be reduced because the other major liquid assets, that is, receivables and inventory get eventually converted into cash. This underlines the significance of cash management.

The present Chapter gives a detailed account of the problems involved in managing cash. It outlines the motives for holding cash followed by the objectives of cash management. A discussion of the factors determining cash needs follows. The approaches to derive optimal cash balances, namely, cash management models and cash budgets are also examined in-depth. The basic strategies for efficient management of cash are the subject-matter of the subsequent discussions. We have explained specific techniques to manage cash subsequently. The remainder of the chapter is devoted to the discussion of marketable securities and Indian practices. It concludes with a summary of the major points by way of recapitulation.

1. The first step in the management of cash is to determine the amount of cash required for the business. This is done by comparing the cash receipts and disbursements for a given period.

2. The second step is to determine the source of the cash. This is done by comparing the cash receipts and disbursements for a given period.

3. The third step is to determine the timing of the cash. This is done by comparing the cash receipts and disbursements for a given period.

4. The fourth step is to determine the security of the cash. This is done by comparing the cash receipts and disbursements for a given period.

17. To determine the amount of cash required for the business.
18. To determine the source of the cash.
19. To determine the timing of the cash.
20. To determine the security of the cash.

DEFINITIONS

The first step in the management of cash is to determine the amount of cash required for the business. This is done by comparing the cash receipts and disbursements for a given period.

The second step is to determine the source of the cash. This is done by comparing the cash receipts and disbursements for a given period.

The third step is to determine the timing of the cash. This is done by comparing the cash receipts and disbursements for a given period.

The fourth step is to determine the security of the cash. This is done by comparing the cash receipts and disbursements for a given period.

LO 14.1 MOTIVES FOR HOLDING CASH

Cash is the ready currency to which all liquid assets can be reduced.

Near cash implies marketable securities viewed the same way as cash because of their high liquidity.

Marketable securities are short-term interest earning money market instruments used by firms to obtain a return on temporarily idle funds.

Transaction motive is a motive for holding cash/near cash to meet routine cash requirements to finance transaction in the normal course of business.

Precautionary motive is a motive for holding cash/near cash as a cushion to meet unexpected contingencies/demand for cash.

The term '**cash**' with reference to cash management is used in two senses. In a narrow sense, it is used broadly to cover currency and generally accepted equivalents of cash, such as cheques, drafts and demand deposits in banks. The broad view of cash also includes **near-cash** assets, such as **marketable securities** and time deposits in banks. The main characteristics of these is that they can be readily sold and converted into cash. They serve as a reserve pool of liquidity that provides cash quickly when needed. They also provide a short-term investment outlet for excess cash and are also useful for meeting planned outflow of funds. Here, the term *cash management* is employed in the broader sense. Irrespective of the form in which it is held, a distinguishing feature of cash, as an asset, is that it has no earning power. If cash does not earn any return, why is it held? There are four primary motives for maintaining cash balances: **(i)** Transaction motive; **(ii)** Precautionary motive; **(iii)** Speculative motive; and **(iv)** Compensating motive.

Transaction Motive

An important reason for maintaining cash balances is the **transaction motive**. This refers to the holding of cash to meet routine cash requirements to finance the transactions which a firm carries on in the ordinary course of business. A firm enters into a variety of transactions to accomplish its objectives which have to be paid for in the form of cash. For example, cash payments have to be made for purchases, wages, operating expenses, financial charges like interest, taxes, dividends, and so on. Similarly, there is a regular inflow of cash to the firm from sales operations, returns on outside investments, and so on. These receipts and payments constitute a continuous two-way flow of cash. But the inflows (receipts), and outflows (disbursements) do not perfectly coincide or synchronise. At times, receipts exceed outflows while, at other times, payments exceed inflows. To ensure that the firm can meet its obligations when payments become due in a situation in which disbursements are in excess of the current receipts, it must have an adequate cash balance. The requirement of cash balances to meet routine cash needs is known as the **transaction motive** and such motive refers to the holding of cash to meet anticipated obligations whose

timing is not perfectly synchronised with cash receipts. If the receipts of cash and its disbursements could exactly coincide in the normal course of operations, a firm would not need cash for transaction purposes. Although a major part of transaction balances are held in cash, a part may also be in such marketable securities whose maturity conforms to the timing of the anticipated payments, such as payment of taxes, dividends, and so on.

Precautionary Motive

In addition to the non-synchronisation of anticipated cash inflows and outflows in the ordinary course of business, a firm may have to pay cash for purposes which cannot be predicted or anticipated. The unexpected cash needs at short notice may be the result of:

- Floods, strikes and failure of important customers;
- Bills may be presented for settlement earlier than expected;

- Unexpected slow down in collection of accounts receivable;
- Cancellation of some order for goods as the customer is not satisfied; and
- Sharp increase in cost of raw materials.

The cash balances held in reserve for such random and unforeseen fluctuations in cash flows are called as **precautionary balances**. In other words, precautionary motive of holding cash implies the need to hold cash to meet unpredictable obligations. Thus, precautionary cash balance serves to provide **a cushion to meet unexpected contingencies**. The more unpredictable are the cash flows, the larger is the need for such balances.

Another factor which has a bearing on the level of such cash balances is the availability of short-term credit. If a firm can borrow at short notice to pay for unforeseen obligations, it will need to maintain a relatively small balance and *vice versa*.

Such cash balances are usually held in the form of marketable securities so that they earn a return.

Speculative Motive

It refers to the desire of a firm to take advantage of opportunities which present themselves at unexpected moments and which are typically outside the normal course of business. While the precautionary motive is defensive in nature in that firms must make provisions to tide over un-expected contingencies, the **speculative motive** represents a positive and aggressive approach. Firms aim to exploit profitable opportunities and keep cash in reserve to do so. The speculative motive helps to take advantage of:

- An opportunity to purchase raw materials at a reduced price on payment of immediate cash;
- A chance to speculate on interest rate movements by buying securities when interest rates are expected to decline;
- Delay purchases of raw materials on the anticipation of decline in prices; and
- Make purchase at favourable prices.

- **Speculative motive**
- is a motive for holding cash/near-cash to quickly take advantage of opportunities typically outside the normal course of business.

Compensating Motive

Yet another motive to hold cash balances is to compensate banks for providing certain services and loans.

Banks provide a variety of services to business firms, such as clearance of cheque, supply of credit information, transfer of funds, and so on. While for some of these services banks charge a commission or fee, for others they seek indirect compensation. Usually clients are required to maintain a minimum balance of cash at the bank. Since this balance cannot be utilised by the firms for transaction purposes, the banks themselves can use the amount to earn a return. Such balances are **compensating balances**.

- **Compensating motive**
- is a motive for holding cash/near-cash to compensate banks for providing certain services or loans.

Compensating balances are also required by some loan agreements between a bank and its customers. During periods when the supply of credit is restricted and interest rates are rising, banks require a borrower to maintain a minimum balance in his account as a condition precedent to the grant of loan. This is presumably to 'compensate' the bank for a rise in the interest rate during the period when the loan will be pending.

The compensating cash balances can take either of two forms: **(i)** an absolute minimum, say, ₹5 lakh, below which the actual bank balance will never fall; **(ii)** a minimum average balance,

say, ₹5 lakh over the month. The first alternative is more restrictive as the average amount of cash held during the month must be above ₹5 lakh by the amount of the transaction balance. From the firm's viewpoint, this is obviously dead money. Under the second alternative, the balance could fall to zero one day provided it was ₹10 lakh some other day with the average working to ₹5 lakh.

Of the four primary motives of holding cash balances, the two most important are the transactions motive and the compensation motive. Business firms normally do not speculate and need not have speculative balances. The requirement of precautionary balances can be met out of short-term borrowings.

LO 14.2 OBJECTIVES OF CASH MANAGEMENT

The basic objectives of cash management are two-fold: **(a)** to meet the cash disbursement needs (payment schedule); and **(b)** to minimise funds committed to cash balances. These are conflicting and mutually contradictory and the task of cash management is to reconcile them.

Meeting Payments Schedule

In the normal course of business, firms have to make payments of cash on a continuous and regular basis to suppliers of goods, employees and so on. At the same time, there is a constant inflow of cash through collections from debtors. Cash is, therefore, aptly described as the 'oil to lubricate the ever-turning wheels of business: without it the process grinds to a stop'.¹ A basic objective of cash management is to meet the payment schedule, that is, to have sufficient cash to meet the cash disbursement needs of a firm.

The importance of sufficient cash to meet the payment schedule can hardly be overemphasised. The advantages of adequate cash are: **(i)** it prevents insolvency or bankruptcy arising out of the inability of a firm to meet its obligations; **(ii)** the relationship with the bank is not strained; **(iii)** it helps in fostering good relations with trade creditors and suppliers of raw materials, as prompt payment may help their own cash management; **(iv)** a cash discount can be availed of if payment is made within the due date. For example, a firm is entitled to a 2 per cent discount for a payment made within 10 days when the entire payment is to be made within 30 days. Since the net amount is due in 30 days, failure to take the discount means paying an extra 2 per cent for using the money for an additional 20 days. If a firm were to pay 2 per cent for every 20-day period over a year, there would be 18 such periods ($360 \text{ days} \div 20 \text{ days}$). This represents an annual interest rate of 36 per cent;² **(v)** it leads to a strong credit rating which enables the firm to purchase goods on favourable terms and to maintain its line of credit with banks and other sources of credit; **(vi)** to take advantage of favourable business opportunities that may be available periodically; and finally, **(vii)** the firm can meet unanticipated cash expenditure with a minimum of strain during emergencies, such as strikes, fires or a new marketing campaign by competitors. Keeping large cash balances, however, implies a high cost. The advantage of prompt payment of cash can well be realised by **sufficient** and not **excessive** cash.

Minimising Funds Committed to Cash Balances

The second objective of cash management is to minimise cash balances. In minimising the cash balances, two conflicting aspects have to be reconciled. A high level of cash balances will, as shown above, ensure prompt payment together with all the advantages. But it also implies that large funds will remain idle, as cash is a non-earning asset and the firm will have to forego profits. A low level

of cash balances, on the other hand, may mean failure to meet the payment schedule. The aim of cash management, therefore, should be to have an optimal amount of cash balances.

Keeping in view these conflicting aspects of cash management, we propose to discuss the planning/determination of the need for cash balances. There are two aspects involved in cash planning: first, an examination of those factors which have a bearing on the firm's required cash balances; second, a review of the approaches to achieve optimum cash balances.

LO 14.3 FACTORS DETERMINING CASH BALANCES

The factors that determine the required cash balances are: **(i)** synchronisation of cash flows, **(ii)** short costs, **(iii)** excess cash balance, **(iv)** procurement and management, and **(v)** uncertainty.

Synchronisation of Cash Flows

The need for maintaining cash balances arises from the non-synchronisation of the inflows and outflows of cash: if the receipts and payments of cash perfectly coincide or balance each other, there would be no need for cash balances. The first consideration in determining the cash need is, therefore, the extent of non-synchronisation of cash receipts and disbursements. For this purpose, the inflows and outflows have to be forecast over a period of time, depending upon the planning horizon which is typically a one-year period with each of the 12 months being a subperiod. The technique adopted is a cash budget. The preparation of a cash budget is discussed in the next section of this chapter. A properly prepared budget will pinpoint the months/periods when the firm will have an excess or a shortage of cash.

Short Costs

Another general factor to be considered in determining cash needs is the cost associated with a shortfall in the cash needs. The cash forecast presented in the cash budget would reveal periods of cash shortages. In addition, there may be some unexpected shortfall. Every shortage of cash—whether expected or unexpected—involves a cost 'depending upon the severity, duration and frequency of the shortfall and how the shortage is covered. Expenses incurred as a result of shortfall are called **short costs**'.³ Included in the short costs are the following:

- (i) Transaction costs** associated with raising cash to tide over the shortage. This is usually the *brokerage* incurred in relation to the sale of some short-term near-cash assets such as marketable securities.
- (ii) Borrowing costs** associated with borrowing to cover the shortage. These include items such as interest on loan, commitment charges and other expenses relating to the loan.
- (iii) Loss of cash-discount**, that is, a substantial loss because of a temporary shortage of cash.
- (iv) Cost associated with deterioration of the credit rating** which is reflected in higher bank charges on loans, stoppage of supplies, demands for cash payment, refusal to sell, loss of image and the attendant decline in sales and profits.
- (v) Penalty rates** by banks to meet a shortfall in compensating balances.

Excess Cash Balance Costs

The cost of having excessively large cash balances is known as the *excess cash balance cost*. If large funds are idle, the implication is that the firm has missed opportunities to invest those funds and has thereby lost interest which it would otherwise have earned. This loss of interest is primarily the excess cost.

Procurement and Management

These are the costs associated with establishing and operating cash management staff and activities. They are generally fixed and are mainly accounted for by salary, storage, handling of securities, and so on.

Uncertainty and Cash Management

Finally, the impact of uncertainty on cash management strategy is also relevant as cash flows cannot be predicted with complete accuracy. The first requirement is a precautionary cushion to cope with irregularities in cash flows, unexpected delays in collections and disbursements, defaults and unexpected cash needs.

The impact of uncertainty on cash management can, however, be mitigated through **(i)** improved forecasting of tax payments, capital expenditure, dividends, and so on; and **(ii)** increased ability to borrow through overdraft facility.

LO 14.4 DETERMINING CASH NEED

After the examination of the pertinent considerations and cost that determine cash needs, the next aspect relates to the determination of cash needs.

There are two approaches to derive an optimal cash balance, namely, **(a)** minimising cost cash models and **(b)** cash budget.

Cash Management/Conversion Models

While it is true that financial managers need not necessarily follow cash management models exactly but a familiarity with them provides an insight into the normative framework as to how cash management should be conducted. This section, therefore, attempts to outline the following analytical models for cash management: **(i)** Baumol Model, **(ii)** Miller-Orr Model and **(iii)** Orgler's Model. The Control Theory Model Approach is highly mathematical and outside the scope of this book.⁴

Baumol Model⁵ The purpose of this model is to determine the minimum cost amount of cash that a financial manager can obtain by converting securities to cash, considering the cost of conversion

Baumol Model is a model that provides for cost-efficient transactional balances and assumes that the demand for cash can be predicted with certainty and determines the optimal conversion size/lot.

and the counter-balancing cost of keeping idle cash balances which otherwise could have been invested in marketable securities. The total cost associated with cash management, according to this model, has two elements: **(i)** cost of converting marketable securities into cash and **(ii)** the lost opportunity cost.

The *conversion costs* are incurred each time marketable securities are converted into cash. Symbolically,

$$\text{Total conversion cost per period} = \frac{Tb}{C} \quad (14.1)$$

Where b = cost per conversion assumed to be independent of the size of the transaction,

T = total transaction cash needs for the period,

C = value of marketable securities sold at each conversion.

The *opportunity cost* is derived from the lost/forfeited interest rate (i) that could have been earned on the investment of cash balances. The total opportunity cost is the interest rate times the average cash balance kept by the firm. The model assumes a constant and a certain pattern of cash

outflows. At the beginning of each period, the firm starts with a cash balance which it gradually spends until at the end of the period it has a zero cash balance and must replenish its cash supply to the level of cash balance in the beginning. Symbolically, the average lost opportunity cost.

$$i \left(\frac{C}{2} \right) \tag{14.2}$$

Where i = interest rate that could have been earned.

$C/2$ = the average cash balance that is, the beginning cash (C) plus the ending cash balance of the period (zero) divided by 2.

The total cost associated with cash management comprising total conversion cost plus opportunity cost of not investing cash until needed in interest-bearing instruments can be symbolically expressed as:

$$i \left(\frac{C}{2} \right) + \left(\frac{Tb}{C} \right) \tag{14.3}$$

To minimise the cost, therefore, the model attempts to determine the **optimal conversion amount**, that is, the cash withdrawal which costs the least. The reason is that a firm should not keep the total beginning cash balance during the entire period as it is not needed at the beginning of the period. For example, if the period were one thirty day month, only one-thirtieth of the opening cash balance each day will be required. This means if only one-thirtieth of the entire amount is withdrawn, the rest could be left invested in interest-earning marketable securities. As a result, on the one-thirtieth of the cash not needed to the last day of the month, twenty-nine day's interest could be earned by the firm and so on. Symbolically, the optimal conversion amount (C),

- **Optimal conversion size/ amount**
- is the cost of minimising quantity in which to convert marketable securities to cash or cash to marketable securities.

$$C = \sqrt{\frac{2bt}{i}} \tag{14.4}$$

The model in terms of Eq. 14.4 has important implications. First, as the total cash needs for transaction rises because of expansion/diversification, the optimal withdrawal increases less than proportionately. This is the result of economy of scale in cash management. Each project does not need its own additional cash balances. It only needs enough additions to the general cash balance of the firm to facilitate expanded operations. Secondly, as the opportunity interest rate (i) increases, the optimal cash withdrawal decreases. This is so because as (i) increases it is more costly to forfeit the investment opportunity and financial managers want to keep as much cash invested in securities for as long as possible. They can afford to do this at the higher interest rates because at those higher rates any shortfall costs caused by a lower withdrawal are offset.

In sum, the Baumol Model of cash management is very simplistic. Further, its assumptions of certainty and regularity of withdrawal of cash do not realistically reflect the actual situation in any firm. Also, the model is concerned only with transaction balances and not with precautionary balances. In addition, the assumed fixed nature of the cash withdrawals is also not realistic.

Nevertheless, the model does clearly and concisely demonstrate the economies of scale and the counteracting nature of the conversion and opportunity costs which are undoubtedly major considerations in any financial manager's cash management strategy.

Example 14.1

The ABC Ltd requires ₹30 lakh in cash to meet its transaction needs during the next three-month cash planning period. It holds marketable securities of an equal amount. The annual yield on these marketable securities is 20 per cent. The conversion of these securities into cash entails a fixed cost of ₹3,000 per transaction. Using

... the ... of ...

Baumol model, compute the amount of marketable securities converted into cash per order. Assuming ABC Ltd can sell its marketable securities in any of the five lot sizes: ₹1,50,000, 3,00,000, 6,00,000, 7,50,000 and 15,00,000, prepare a table indicating the economic lot size using numerical analysis.

Solution

$C = \sqrt{\frac{2bT}{i}}$, where C = optimal conversion amount/amount of marketable securities converted into cash per order; b = cost of conversion into cash per lot/transaction; T = projected cash requirement during the planning period; i = interest rate earned per planning period on investment in marketable securities.

$$= \sqrt{\frac{2 \times ₹3,000 \times ₹30,00,000}{0.05^{④}}} = ₹6,00,000 \quad \text{④ Annual yield 20 per cent/4} = 5 \text{ per cent.}$$

TABLE 14.1 Optimal Cash Conversion Size/Lot

1. Total cash requirement (₹ lakh)	30	30	30	30	30
2. Lot size (₹ lakh)	1.5	3	6	7.5	15
3. Number of lots (1 ÷ 2)	20	10	5	4	2
4. Conversion cost per lot (₹ thousand)	3	3	3	3	3
5. Total conversion cost (3 × 4) (₹ thousand)	60	30	15	12	6
6. Average lot size (₹ lakh)	0.75	1.5	3	3.75	7.5
7. Interest cost (6 × 0.05) (₹)	3,750	7,500	15,000	18,750	37,500
8. Total cost (5 + 7) (₹)	63,750	37,500	30,000	30,750	42,500

The optimal cash conversion size is ₹6 lakh.

Working Notes

- Number of conversion during the planning period = $\frac{\text{Total cash requirement (₹30 lakh)}}{\text{Cash conversion lot/size}}$
- Average cash balance = Cash conversion size/2.
- Interest income foregone = Average cash balance × interest rate for the cash planning period; interest rate = annual yield/4.
- Cost of cash conversion = Number of conversions × cost per conversion.
- Total cost of converting and holding cash = Interest income foregone + Cost of cash conversion.

Example 14.2

The management of Popular Traders anticipates ₹15 lakh in cash outlays (demand) during the next year. The recent experience has been that it costs ₹30 to convert marketable securities to cash and *vice versa*. The marketable securities currently earns 8 per cent annual return. Find the total cost of managing cash according to Baumol model.

Miller-Orr Solution

Miller-Orr model is a model that provides for cost-efficient transactional balances and assumes uncertain cash flows and determines an upper limit and return point for cash balances.

$$\text{Economic/optimal conversion size/lot} = \frac{\sqrt{2 \times ₹30 \times ₹15,00,000}}{0.08} = ₹33,541$$

$$\text{Number of conversions} = ₹15,00,000 \div ₹33,541 = 45$$

$$\text{Average cash balance} = ₹16,770.50 \text{ (₹33,541} \div 2)$$

$$\text{Total cost} = (₹30 \times 45) + (0.08 \times ₹16,770.50) = ₹2,692$$

Miller-Orr Model⁶ The objective of cash management, according to Miller-Orr (MO), is to determine the optimum cash balance level which minimises the cost of cash management. Symbolically,

$$C = \frac{bE(N)}{t} + iE(M) \quad (14.5)$$

where b = the fixed cost per conversion, $E(M)$ = the expected average daily cash balance, $E(N)$ = the expected number of conversions, t = the number of days in the period, i = the lost opportunity costs, and C = total cash management costs

The MO Model is, in fact, an attempt to make the Baumol Model more realistic as regards the pattern of cash flows. As against the assumption of uniform and certain levels of cash balances in the Baumol Model, the MO Model assumes that *cash balances randomly* fluctuate between an upper bound (b) and a lower bound (O). When the cash balances hit the upper bound, the firm has too much cash and should buy enough marketable securities to bring the cash balances back to the optimal bound (z). When the cash balances hit zero, the financial manager must return them to the optimum bound (z) by selling/converting securities into cash. According to the MO Model, as in Baumol model, the optimal cash balance (z) can be expressed symbolically as

$$z = \sqrt{\frac{3br^2}{4i}} \quad (14.6)$$

where r^2 = the variance of the daily changes in cash balances.

Thus, as in Baumol Model, there are economies of scale in cash management and the two basic costs of conversion and lost interest that have to be minimised.

MO Model also specifies the optimum upper boundary (b) as three times the optimal cash balance level such that

$$b = 3z \quad (14.7)$$

Further, the financial manager could consider the use of less liquid, potentially more profitable securities as investments for the cash balances in excess of b .

Example 14.3

Assuming for Popular Traders in Example 14.2 that variance of daily net cash flows is estimated to be ₹27,000, show the cash balances as per Miller-Orr model.

Solution

$$\text{Return point} = \frac{\sqrt{3 \times ₹30 \times ₹27,000}}{4 \times 0.000222^{\text{a}}} = ₹1,399$$

^adaily portfolio return = (8% ÷ 360 days)

$$\text{upper limit} = 3 \times ₹1,399 = ₹4,197$$

The cash balance of Popular Traders would be allowed to vary between ₹0 (zero) and ₹4,197. When the upper limit is reached, ₹2,798 (₹4,197 – ₹1,399) is converted from cash to marketable securities that will earn interest. When the cash balance falls to zero, ₹1,399 (₹1,399 – ₹0) is converted from marketable securities into cash.

Orgler's Model⁷ According to this model, an optimal cash management strategy can be determined through the use of a multiple linear programming model. The construction of the model comprises three sections: (1) selection of the appropriate planning horizon, (2) selection of the appropriate decision variables and (3) formulation of the cash management strategy itself. The advantage of linear programming model is that it enables coordination of the optimal cash management strategy with the other operations of the firm such as production and with less restrictions on working capital balances.

- **Orgler's model**
- is a model that
- provides for
- integration of cash
- management with
- production and
- other aspects of the
- firm.

The model basically uses one year *planning horizon* with twelve monthly periods because of its simplicity. It has four basic sets of *decisions variables* which influence cash management of a firm and which must be incorporated into the linear programming model of the firm. These are: **(i)** payment schedule, **(ii)** short-term financing, **(iii)** purchase and sale of marketable securities and **(iv)** cash balance itself.

The formulation of the model requires that the financial managers first specify an objective function and then specify a set of constraints.

Orgler's objective function is to 'minimise the horizon value of the net revenues from the cash budget over the entire planning period'. Using the assumption that all revenues generated are immediately re-invested and that any cost is immediately financed, the objective function represents the value of the net income from the cash budget at the horizon 'by adding the net returns over the planning period'. Thus, the objective function recognises each operation of the firm that generates cash inflows or cash outflows as adding or subtracting profit opportunities for the firm from its cash management operations. In the objective function, decision variables which cause inflows, such as payments on receivables, have positive co-efficient, while decision variables which generate cash outflows, such as interest on short-term borrowings have negative co-efficients. The purchase of marketable securities would, for example, produce revenue and thus have a positive co-efficient while the sale of those securities would incur conversion costs and have a negative co-efficient.

The constraints of the model could be **(i)** institutional or **(ii)** policy-constraints. The institutional constraints are those imposed by external factors, that is, bank-required compensating balance. Policy constraints are imposed on cash management by the firm itself. For instance, the financial manager may be prohibited from selling securities before maturity. Either constraint can occur in the model during one monthly period or over several or all the months in the one year planning horizon.

An example of the linear programming model is as follows:

Objective function:

$$\text{Maximise profit} = a_1x_1 + a_2x_2 \quad (14.8)$$

Subject to:

$$b_1x_1 \leq \text{production}$$

$$b_2x_2 \leq \text{constraints} \quad (14.9)$$

$$C_1x_1 + C_2x_2 \leq \text{Cash available constraint} \quad (14.10)$$

$$a_1x_1 + a_2x_2 > \text{Current assets requirement constraint} \quad (14.11)$$

$$x_i \geq 0, \quad n \text{ non-negativity constraint} \quad (14.12)$$

A very important feature of the model is that it allows the financial managers to integrate cash management with production and other aspects of the firm.

Cash Budget: Management Tool

Cash budget is a statement of the inflows and outflows of cash that is used to estimate its short-term requirements.

A firm is well advised to hold adequate cash balances but should avoid *excessive* balances. The firm has, therefore, to assess its need for cash properly. The cash budget is probably the most important tool in cash management. It is a device to help a firm to plan and control the use of cash. It is a statement showing the estimated cash inflows and cash outflows over the planning horizon. In other words, the net cash position (surplus or deficiency) of a firm as it moves from one budgeting subperiod to another is highlighted by the cash budget.

The various purposes of cash budgets are: **(i)** to coordinate the timings of cash needs. It identifies the period(s) when there might either be a shortage of cash or an abnormally large cash requirement; **(ii)** it pinpoints the period(s) when there is likely to be excess cash; **(iii)** it enables a firm which has sufficient cash to take advantage of cash discounts on its accounts payable, to pay obligations when due, to formulate dividend policy, to plan financing of capital expansion and to help unify the production schedule during the year so that the firm can smooth out costly seasonal fluctuations;⁸ finally, **(iv)** it helps to arrange needed funds on the most favourable terms and prevents the accumulation of excess funds. With adequate time to study his needs, the finance manager can select the best alternative. In contrast, a firm which does not budget its cash requirements, may suddenly find itself short of funds. With pressing needs and little time to explore alternative avenues of financing, the management would be forced to accept the best terms offered in a difficult situation. 'These terms will not be as favourable, since the lack of planning indicates to the lender, that there is an organisational deficiency. The firm, therefore, represents a higher risk.'⁹

Elements/Preparation of Cash Budget Thus, the principal aim of the cash budget, as a tool to predict cash flows over a given period of time, is to ascertain whether at any point of time there is likely to be an excess or shortage of cash. The preparation of a cash budget involves various steps. These may be described as the elements of the cash budgeting system.

The *first* element of a cash budget is the selection of the period of time to be covered by the budget. It is referred to as the **planning horizon**. The planning horizon means the *time span* and the sub-periods within that time span over which the cash flows are to be projected. There is no fixed rule. The coverage of a cash budget will differ from firm to firm depending upon its nature and the degree of accuracy with which the estimates can be made. As a general rule, the period selected should be neither too long nor too short. If it is too long, it is likely that the estimates will be inaccurate. If, on the other hand, the time span is too small, many important events which lie just beyond the period cannot be accounted for and the work associated with the preparation of the budget becomes excessive.

The planning horizon of a cash budget should be determined in the light of the circumstances and requirements of a particular case. For instance, if the flows are expected to be stable and dependable, such a firm may prepare a cash budget covering a long period, say, a year and divide it into quarterly intervals. In the case of a firm whose flows are uncertain, a quarterly budget, divided into monthly intervals, may be appropriate. Where flows are affected by seasonal variations, monthly budgets, sub-divided on a weekly or even a daily basis, may be necessary. If the flows are subject to extreme fluctuations, even a daily budget may be called for. The idea behind subdividing the budgeting period into smaller intervals is to highlight the movement of cash from one subperiod to another. The sub-division will provide information on the fluctuations in the cash reservoir level during the time span covered by the budget.

The *second* element of the cash budget is the selection of the factors that have a bearing on cash flows. The items included in the cash budget are only cash items; non-cash items such as depreciation and amortisation are excluded.¹⁰ The factors that generate cash flows are generally divided, for purposes of the construction of cash budget, into two broad categories: **(a)** operating, and **(b)** financial. This two-fold classification of cash budget items is based on their *nature*. While the former category includes cash flows generated by the operations of the firms and are known as **operating cash flows**, the latter consists of **financial cash flows**.

- **Operating cashflows**
- are cashflows generated by the operations of the firm.

- **Financial cashflows**
- are cashflows generated by the financial activities of the firm.

Operating Cash Flows The main operating factors/items which generate cash outflows and inflows over the time span of a cash budget are tabulated in Exhibit 14.1.

EXHIBIT 14.1 Operating Cash Flow Items

<i>Inflows/Cash Receipts</i>	<i>Outflows/Disbursements</i>
1. Cash sales	1. Accounts payable/Payable payments
2. Collection of accounts receivable	2. Purchase of raw materials
3. Disposal of fixed assets	3. Wages and salary (payroll)
	4. Factory expenses
	5. Administrative and selling expenses
	6. Maintenance expenses
	7. Purchase of fixed assets

Cash receipts • Among the operating factors affecting cash flows, are the collection of accounts receivable (inflow) and accounts payable (outflows). The terms of credit and the speed with which the customers pay would determine the lag between the creation of the accounts receivable and their collection. Also, discounts and allowances for early payments, returns from customers and bad debts affect cash inflows. Similarly, in the case of accounts payable relating to credit purchase, cash outflows are affected by the purchase terms.

Cash disbursements • The calculation of the collection on credit sales and payments on credit purchases, is generally done in the form of a statement known as the *worksheet*.¹¹ The results are subsequently incorporated in the cash budget. We illustrate in Example 14.4 how the credit policy of a firm and the purchase terms affect cash flows.

Example 14.4

A firm sells goods on credit and allows a cash discount for payments made within 20 days. If the discount is not availed of, the buyer must pay the full amount in 40 days. However, the firm finds that some of its customers delay payments up to 90 days. The experience has been that on 20 per cent of sales, payment is made during the month in which the sale is made, on 70 per cent of the sales payment is made during the second month after sale and on 10 per cent of sales payment is made during the third month.

The raw materials and other supplies required for production amount to 70 per cent of sales and are bought in the month before the firm expects to sell its finished products. Its purchase terms allow the firm to delay payment on its purchases for one month.

The credit sales of the firm are:

				(₹ lakh)	
May	10	August	30	November	20
June	10	September	40	December	10
July	20	October	20	January	10

Prepare a worksheet, showing the anticipated cash inflows on account of collection of receivables and disbursement of payables.

Solution

The expected cash inflows through collection of receivables and the anticipated outflows on account of accounts payable are presented in Table 14.2 in the form of a worksheet.

TABLE 14.2 Worksheet

(₹ lakh)

	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.
1. Credit sales	10	10	20	30	40	20	20	10	10
2. Collections:									
During month of sale (20%)	2	2	4	6	8	4	4	2	2
During the first month after sale (70%)	—	7	7	14	21	28	14	14	7
During second month after sale (10%)	—	—	1	1	2	3	4	2	2
Total collections	2	9	12	21	31	35	22	18	11
3. Credit purchases (70% of next month's sale)	7	14	21	28	14	14	7	7	7
Payment (one month lag)	—	7	14	21	28	14	14	7	7
Total payments	—	7	14	21	28	14	14	7	7

Financial Cash Flows The major financial factors/items affecting the generation of cash flows are depicted in Exhibit 14.2.

EXHIBIT 14.2 Financial Cash Flow Items

Cash Inflows/Receipts	Cash Outflows/Payments
1. Loans/Borrowings	1. Income-tax/Tax payments
2. Sales of securities	2. Redemption of loan
3. Interest received	3. Repurchase of shares
4. Dividend received	4. Interest paid
5. Rent received	5. Dividends paid
6. Refund of tax	
7. Issue of new shares and securities	

Preparation of Cash Budget After the time span of the cash budget has been decided and pertinent operating and financial factors have been identified, the final step is the construction of the cash budget. The preparation of a cash budget is illustrated in Examples 14.5 and 14.6.

Example 14.5

A firm adopts a six-monthly time span, subdivided into monthly intervals for its cash budget.

(A) The following information is available in respect of its operations:

(₹ lakh)

Particulars	Months					
	1	2	3	4	5	6
1. Sales	40	50	60	60	60	60
2. Purchases	1	1.50	2	2	2	1
3. Direct labour	6	7	8	8	8	6
4. Manufacturing overheads	13	13.50	14	14	14	13
5. Administrative expenses	2	2	2	2	2	2
6. Distribution expenses	2	3	4	4	4	2
7. Raw materials (30 days credit)	14	15	16	16	16	15

(B) Assume the following financial flows during the period:

- (a) *Inflows*:
1. Interest received in month 1 and month 6, ₹1 lakh each;
 2. Dividend received during months 3 and 6, ₹2 lakh each;
 3. Sales of shares in month 6, ₹160 lakh.
- (b) *Outflows*:
1. Interest paid during month 1, ₹0.4 lakh;
 2. Dividends paid during months 1 and 4, ₹2 lakh each;
 3. Instalment payment on machine in month 6, ₹20 lakh;
 4. Repayment of loan in month 6, ₹80 lakhs.
- (c) Assume that 10 per cent of each month's sales are for cash; the balance 90 per cent are on credit. The terms and credit experience of the firm are:
1. No cash discount;
 2. 1 per cent of credit sales is returned by the customers;
 3. 1 per cent of total accounts receivable is bad debt;
 4. 50 per cent of all accounts that are going to pay, do so within 30 days;
 5. 100 per cent of all accounts that are going to pay, do so within 60 days.

Using the above information prepare a cash budget.

Solution The cash budget is constructed in Table 14.3.

TABLE 14.3 Cash Budget for Six Months

Particulars	Months					
	1	2	3	4	5	6
(₹ lakh)						
(A) Cash inflows:						
1. Cash sales (10% of total)	4.00	5.00	6.00	6.00	6.00	6.00
2. Receivables collection	—	17.64	39.68	48.50	52.92	52.92
3. Interest received	1.00	—	—	—	—	1.00
4. Dividends received	—	—	2.00	—	—	2.00
5. Sale of shares	—	—	—	—	—	160.00
Total (A)	5.00	22.64	47.68	54.50	58.92	221.92
(B) Cash outflows:						
1. Purchases	1.00	1.50	2.00	2.00	2.00	1.00
2. Labour	6.00	7.00	8.00	8.00	8.00	6.00
3. Manufacturing overheads	13.00	13.50	14.00	14.00	14.00	13.00
4. Administrative expenses	2.00	2.00	2.00	2.00	2.00	2.00
5. Distribution charges	2.00	3.00	4.00	4.00	4.00	2.00
6. Raw materials (30 days credit)	—	14.00	15.00	16.00	16.00	16.00
7. Interest paid	0.40	—	—	—	—	—
8. Dividend paid	2.00	—	—	2.00	—	—
9. Instalment of machine	—	—	—	—	—	20.00
10. Repayment of loan	—	—	—	—	—	80.00
Total (B)	26.40	41.00	45.00	48.00	46.00	140.00
(C) Net Receipt or (Payment) (A – B)	(21.40)	(18.36)	2.68	6.50	12.92	81.92

It can be seen from Table 14.3 that the cash budget helps to reconcile the need for cash with the financing arrangement. For instance, in the first two months, the cash receipts fall below the disbursements and the firm obviously needs temporary financing which it will be able to pay in the subsequent months. In month 6, it has, in fact, excess cash for which temporary investment will have to be made until the funds can be employed in business.

Example 14.6

The following information is available in respect of a firm:

(A) Balance Sheet as on March 31					
<i>Liabilities</i>	<i>Amount</i>	<i>Assets</i>	<i>Amount</i>		
Accrued salaries	₹500	Cash	₹3,000		
Other liabilities	2,500	Inventory*	8,000		
Capital	65,000	Other assets	₹70,000		
		Less: Depreciation	13,000	57,000	
	68,000			68,000	

*Consists of ₹2,000 minimum inventory plus ₹6,000 of inventory scheduled to be sold next month.

(B) Sales Forecast					
April	₹10,000	July	₹50,000		
May	20,000	August	40,000		
June	30,000	September	20,000		
		October	5,000		

(C) Salary Expenses Budget					
April	₹1,500	July	₹4,000		
May	2,000	August	3,000		
June	2,500	September	2,000		

(D) The firm is expected to operate on the following lines:

- Other expenses approximate 12 per cent of sales (paid in the same month).
- Sales will be 80 per cent cash and 20 per cent credit. The all credit sales will be collected in the following month and no bad debts are expected.
- All inventory purchases will be paid for during the month in which they are made.
- A basic inventory of ₹2,000 (at cost) will be maintained. The firm will follow a policy of purchasing additional inventory each month to cover the following month's sale.
- A minimum cash balance of ₹3,000 will be maintained.
- New orders for equipment amounting to ₹20,000 scheduled for May 1 delivery and ₹10,000 for June 1 delivery have been made. Payment will be made at the time of delivery.
- Accrued salaries and other liabilities will remain unchanged.
- Gross profit margin is 40 per cent of sales.

Prepare a cash budget for 6 months (April to September). Borrowings are made in thousands of rupees. Ignore interest.

Solution

TABLE 14.4 Cash Budget (Amount in '000 rupees)

<i>Particulars</i>	<i>April</i>	<i>May</i>	<i>June</i>	<i>July</i>	<i>Aug.</i>	<i>Sept.</i>
(A) Cash inflows:						
1. Cash sales (0.80)	8	16	24	40	32	16
2. Accounts receivable collections (0.2)	—	2	4	6	10	8
Total	8	18	28	46	42	24

LO 14.5 CASH MANAGEMENT: BASIC STRATEGIES

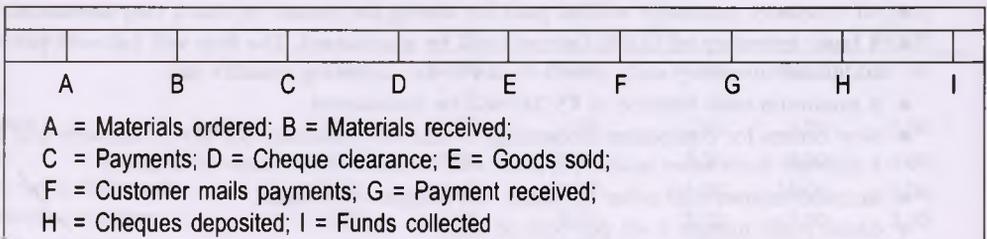

Cash cycle is the amount of time cash is tied up between payment for production inputs and receipt of payment from the sale of the resulting finished product; calculated as average age of inventory plus average collection period minus average accounts payable period.

The cash budget, as a cash management tool, would throw light on the net cash position of a firm. After knowing the cash position, the management should work out the basic strategies to be employed to manage its cash. The discussion that follows attempts to outline the basic strategies of cash management.

The broad cash management strategies are essentially related to the cash turnover process, that is, the cash cycle together with the cash turnover. The **cash cycle** refers¹² to the process by which cash is used to purchase materials from which are produced goods, which are then sold to customers, who later pay the bills. The firm receives cash from customers and the cycle repeats itself. The **cash turnover** means the number of times cash is used during each year.¹³ The cash cycle involves several steps along the way as funds flow from the firm's accounts, as shown in Exhibit 14.3.

EXHIBIT 14.3 Details of Cash Cycle

Cash turnover is the number of times cash is used during the year; calculated by dividing number of days in a year by the cash cycle.

In addressing the issue of cash management strategies, we are concerned with the time periods involved in stages B, C, D, and F, G, H, I. A firm has no control over the time involved between stages A and B. The lag between D and E is determined by the production process and inventory policy. The time period between stages E and F is determined by credit terms and the payments policy of customers.

The cash cycle and cash turnover are illustrated in Example 14.7.

Example 14.7

A firm which purchases raw materials on credit is required by the credit terms to make payments within 30 days. On its side, the firm allows its credit buyers to pay within 60 days. Its experience has been that it takes, on an average, 35 days to pay its accounts payable and 70 days to collect its accounts receivable. Moreover, 85 days elapse between the purchase of raw materials and the sale of finished

goods, that is to say, the average age of inventory is 85 days. What is the firm's cash cycle? Also, estimate the cash turnover.

Solution

The cash cycle of the firm can be calculated by finding the average number of days that elapse between the cash outflows associated with paying accounts payable and the cash inflows associated with collecting accounts receivable:

(i) Cash cycle = 85 days + 70 days – 35 days = 120 days

(ii) Cash turnover = the assumed number of days in a year divided by the cash cycle = $365/120 = 3$

Minimum Operating Cash

The higher the cash turnover, the less is the cash a firm requires. A firm should, therefore, try to maximise the cash turnover. But it must maintain a **minimum amount of operating cash balance** so that it does not run out of cash. The minimum level of operating cash is determined by dividing the total operating annual outlays by the cash turnover rate. If, for example, the total operating annual outlay of a firm is ₹240 lakh, its minimum cash requirement is ₹80 lakh (i.e. $₹240 \text{ lakh} \div 3$). The operational implication of the minimum operating cash requirement is that if the firm has opening cash balance of ₹80 lakh, it would be able to meet its obligations when they become due. In other words, it would not have to borrow anything. But the minimum operating cash involves a cost in terms of the earnings foregone from investing it temporarily, that is to say, there is an opportunity cost. Assuming 10 per cent return on a riskless investment (or retirement of a debt carrying 10 per cent interest), the cost of the minimum cash balance of ₹80 lakh works out to ₹8 lakh.

- **Minimum operating cash**
- is the level of
- opening cash
- balance at which
- a firm would meet
- all obligations
- and is computed
- by dividing total
- annual outlays by
- the cash turnover.

Cash management strategies are intended to minimise the operating cash balance requirement. The basic strategies that can be employed to do the needful are as follows:¹⁴

- (a) Stretching Accounts Payable,
- (b) Efficient Inventory-Production Management,
- (c) Speedy Collection of Accounts Receivable, and
- (d) Combined Cash Management Strategies.

We spell out the implications of these strategies to the minimum cash balance and the associated cost with the underlying assumption that a firm should adopt such cash management strategies as will lead to the minimising of the operating cash requirement. In other words, efficient cash management implies minimum cash balances consistent with the need to pay bills when they become due.

Stretching Accounts Payable

One basic strategy of efficient cash management is to stretch the accounts payable. In other words, a firm should pay its accounts payable as late as possible without damaging its credit standing. It should, however, take advantage of the cash discount available on prompt payment.

If the firm, in our Example 14.7, can stretch its accounts payable from the current level of 35 days to 45 days, its cash cycle will be 110 days (i.e. reduced by 10 days from the original 120 days). The reduction in the cash cycle by 10 days as a result of the stretching of the accounts payable by 10 days will increase the cash turnover from 3 (initially) to 3.27 ($360 \div 110$). This will lead to a

decrease in the minimum cash requirement from ₹80 lakh to ₹73.40 lakh ($₹240 \text{ lakh} \div 3.27$). That is, the requirement has been reduced by ₹6.60 lakh. Assuming a 10 per cent rate of interest, there will be a saving in cost to the firm to the extent of ₹0.66 lakh.

Efficient Inventory-Production Management

Another strategy is to increase the inventory turnover, avoiding stock-outs, that is, shortage of stock. This can be done in the following ways:

1. *Increasing the raw materials turnover* by using more efficient inventory control techniques.
2. *Decreasing the production cycle* through better production planning, scheduling and control techniques; it will lead to an increase in the work-in-progress inventory turnover.
3. *Increasing the finished goods turnover* through better forecasting of demand and a better planning of production.

Assume that the firm in Example 14.7 is able to reduce the average age of its inventory from 85 to 70, that is, by 15 days. As a result, the cash cycle will decline by 15 days from 120 days to 105 days. The cash turnover will increase to 3.43 ($360 \div 105$) from the original level of 3. The effect of an increase in the cash turnover will be to reduce the minimum cash requirement from ₹80 lakh to ₹70 lakh ($₹240 \text{ lakh} \div 3.43$). The saving in cost on ₹10 lakh will ₹1 lakh ($₹10 \text{ lakh} \times 0.10$). Thus, efficient inventory and production management causes a decline in the operating cash requirement and, hence, a saving in cash operating cost.

Speeding Collection of Accounts Receivable

Yet another strategy for efficient cash management is to collect accounts receivable as quickly as possible without losing future sales because of high-pressure collection techniques. The average collection period of receivables can be reduced by changes in **(i)** credit terms, **(ii)** credit standards, and **(iii)** collection policies. These are elaborated in the next chapter. In brief, **credit standards** represent the criteria for determining to whom credit should be extended. The collection policies determine the effort put forth to collect accounts receivable promptly.

If the firm in our Example 14.7 manages to reduce the average age of its accounts receivable from the current level of 70 days to 50 days, the cash cycle will be reduced to 100 days from 120 days (decline by 20 days). The cash turnover will increase in consequence to 3.60 ($360 \div 100$) from the original level of 3. The operating cash requirement will fall from ₹80 lakh to approximately ₹66.67 lakh ($₹240 \div 3.60$). The reduction in cash balance of about ₹13.33 lakh will lead to a saving in cost amounting to ₹1.33 lakh ($0.10 \times ₹13.33 \text{ lakh}$). Thus, a reduction in the average collection period by 20 days, releases funds equivalent to ₹13.33 lakh and leads to a saving in cash operating cost of ₹1.33 lakh.

Combined Cash Management Strategies

We have shown the effect of individual strategies on the efficiency of cash management. Each one of them has a favourable effect on the operating cash requirement. We now illustrate their combined effect, as firms will be well advised to use a combination of these strategies.

Assume the firm in Example 14.7 simultaneously **(i)** increases the average accounts payable by 10 days; **(ii)** reduces the average age of inventory by 15 days; **(iii)** speeds up the collection of accounts receivable by 20 days. Now, the cash cycle will be 75 days ($120 \text{ days} - 10 \text{ days} - 15 \text{ days} - 20 \text{ days}$); the cash turnover will increase to 4.8 ($360 \div 75$); the minimum operating cash requirement will go down to ₹50 lakh, that is, a reduction of ₹30 lakh; assuming a 10 per cent rate of interest, the saving in cash operating cost will be ₹3 lakh.

The foregoing discussion clearly shows that the three basic strategies of cash management, related to (1) accounts payable, (2) inventory, and (3) accounts receivable, lead to a reduction in the cash balance. But, they imply certain problems for the management. *First*, if the accounts payable are postponed too long, the credit standing of the firm may be adversely affected. *Secondly*, a low level of inventory may lead to a stoppage of production as sufficient raw materials may not be available for uninterrupted production, or the firm may be short of enough stock to meet the demand for its product, that is, **stock-out**. *Finally*, restrictive credit standards, credit terms and collection policies may jeopardise sales. These implications should be constantly kept in view while working out cash management strategies.

- **Stock-out**
- implies shortage of enough stock to meet the demand for the product.

LO 14.6 CASH MANAGEMENT TECHNIQUES/PROCESSES

The basic strategies of cash management have been outlined in the preceding section. It has been shown that the strategic aspects of efficient cash management are: **(i)** efficient inventory management, **(ii)** speedy collection of accounts receivable, and **(iii)** delaying payments on accounts payable. The main elements of an efficient management of inventory are discussed in some detail in Chapter 31. There are some specific techniques and processes for speedy collection of receivables from customers and slowing disbursements. We discuss them below.

Speedy Cash Collections

In managing cash efficiently, the cash inflow process can be accelerated through systematic planning and refined techniques. There are two broad approaches to do this. In the first place, the customers should be encouraged to pay as quickly as possible. Secondly, the payment from customers should be converted into cash without any delay.

Prompt Payment by Customers One way to ensure prompt payment by customers is *prompt billing*. What the customer has to pay and the period of payment should be notified accurately and in advance. The use of mechanical devices for billing along with the enclosure of a self-addressed return envelope will speed up payment by customers. Another, and more important, technique to encourage prompt payment by customers, is the practice of offering cash discounts. The availability of discount implies considerable saving to the customers. To avail of the facility, the customers would be eager to make payment early.

Early Conversion of Payments into Cash Once the customer makes the payment by writing a cheque in favour of the firm, the collection can be expedited by prompt encashment of the cheque. There is a lag between the time a cheque is prepared and mailed by the customer and the time the funds are included in the cash reservoir of the firm. This is represented by stages F to I in Exhibit 14.3. Within this time interval three steps are involved: **(a)** transit or mailing time, that is, the time taken by the post offices to transfer the cheque from the customers to the firm. This delay or lag is referred to as **postal float**; **(b)** time taken in processing the cheques within the firm before they are deposited in the banks, termed as **lethargy**; and **(c)** collection time within the bank, that is, the time taken by the bank in collecting the payment from the customer's bank. This is called **bank float**. The early conversion of payment into cash, as a technique to speed up collection of accounts receivable, is done to reduce the time lag between posting of the cheque by the customer and the realisation

- **Postal float**
- is delay between the time when a payer mails a payment and the time when the payee receives it.
- **Lethargy/processing float**
- is the delay between the receipt of a cheque by the payee and its deposit in the account.

of money by the firm. The postal float, lethargy and bank float are collectively referred to as **deposit float**. The term deposit float is defined as *the sum of cheques written by customers that are not yet usable by the firm*.¹⁵

Bank/clearing float is the delay between the deposit of a cheque by the payee and the actual availability of funds.

The collection of accounts receivable can be considerably accelerated, by reducing transit, processing and collection time. An important cash management technique is reduction in deposit float. This is possible if a firm adopts a policy of **decentralised collections**. We discuss below some of the important processes that ensure decentralised collection so as to reduce **(i)** the amount of time that elapses between the mailing of a payment by a customer, and **(ii)** the point the funds become available to the firm for use. The principal methods of establishing a decentralised collection network are **(a)** Concentration Banking, and **(b)** Lock-box System.

Deposit float is the funds despatched by a payer that are not yet in a form that can be spent/used by the payee.

Concentration Banking In this system of decentralised collection of accounts receivable, large firms which have a large number of branches at different places, select some of the strategically located branches as collection centres for receiving payment from customers. Instead of all the payments being collected at the head office of the firm, the cheques for a certain geographical area are collected at a specified local collection centre. Under this arrangement, the customers are required to send their payments (cheques) to the collection centre covering the area in which they live and these are deposited in the local account of the concerned collection centre, after meeting local expenses, if any. Funds beyond a predetermined minimum are transferred daily to a *central or disbursing or concentration* bank or account. A concentration bank is one with which the firm has a major account—usually a disbursement account.¹⁶ Hence, this arrangement is referred to as concentration banking.

Concentration banking is a collection procedure in which payments are made to regionally dispersed collection centres, then deposited in local banks for quick clearing; reduces float by shortening the postal and bank float.

Concentration banking, as a system of decentralised billing and multiple collection points, is a useful technique to expedite the collection of accounts receivable. It reduces the time needed in the collection process by reducing the *mailing* time. Since the collection centres are near the customers, the time involved in sending the bill to the customer is reduced. Moreover, the time-lag between the despatch of the cheque by the customer and its receipt by the firm is also reduced. Mailing time is saved both in respect of sending the bill to the customers as well as in the receipt of payment.

The second reason why deposit float is reduced by concentration banking is that the banks of the firm as well as the customers may be in close proximity. Thus, the arrangement of multiple collection centres with concentration banking results in a saving of time in both mailing and clearance of customer payments and leads to a reduction in the operating cash requirements. Another advantage is that *concentration* permits the firm to 'store' its cash more efficiently.¹⁷ This is so mainly because by pooling funds for disbursement in a single account, the aggregate requirement for cash balance is lower than it would be if balances are maintained at each branch office.

Lock-Box System The concentration banking arrangement is instrumental in reducing the time involved in mailing and collection. But with this system of collection of accounts receivable, *processing* for purpose of internal accounting is involved, that is, some time elapses before a cheque is deposited by the local collection centre in its account. The lock-box system takes care of this kind of problem, apart from effecting economy in mailing and clearance times. Under this arrangement, firms hire a post office lock-box at important collection centres. The customers are required to remit payments to the post office lock-box. The local banks of the firm, at the respective

places, are authorised to open the box and pick up the remittances (cheques) received from the customers. Usually, the authorised banks pick up the cheques several times a day and deposit them in the firm's accounts. After crediting the account of the firm, the banks send a deposit slip along with the list of payments and other enclosures, if any, to the firm by way of proof and record of the collection.

Thus, the **lock-box system** is like concentration banking in that the collection is decentralised and is done at the branch level. But they differ in one very important respect. While the customer sends the cheques, under the concentration banking arrangement, to the collection centres, he sends them to a post office box under the lock-box system. The cheques are directly received by the bank which empties the box and not from the firm or its local branch.

In a way, the lock-box arrangement is an improvement over the concentration banking system. Its superiority arises from the fact that one step in the collection process is eliminated with the use of lock-box: the receipt and deposit of cheques by the firm. In other words, the processing time within the firm before depositing a cheque in the bank is eliminated. Also, some extra saving in mailing timing is provided by the lock-box system as the cheques received in the post office box are not delivered either by the post office or the firm itself to the bank; rather, the bank itself picks them up at the post office.

Thus, the lock-box system, as a method of collection of receivables, has a two-fold advantage: (i) the bank performs the clerical task of handling the remittances prior to deposits, services which the bank may be able to perform at lower cost; (ii) the process of collection through the banking system begins immediately upon the receipt of the cheque/remittance and does not have to wait until the firm completes its processing for internal accounting purposes. In terms of the steps involved in the cash cycle, as shown in Exhibit 14.3, GH and HI would take place simultaneously. As a result, the time-lag between payment by a customer and the availability of funds to the firm for use would be reduced and, thereby, the collection of receivables would be accelerated.

Although the use of concentration banking and lock-box systems accelerate the collection of receivables, they involve a cost. While in the case of the former, the cost is in terms of the maintenance of multiple collection centres, compensation to the bank for services represents the cost associated with the latter. The justification for the use or otherwise of these special cash management techniques would be based on a comparison of the cost with the return generated on the released funds.¹⁸ If the income exceeds the cost, the system is profitable and should be used; otherwise, not. For this reason, these techniques can be pressed into service only by large firms which receive a large number of cheques from a wide geographical area.

Example 14.8

A firm uses a continuous billing system that results in an average daily receipt of ₹40,00,000. It is contemplating the institution of concentration banking, instead of the current system of centralised billing and collection. It is estimated that such a system would reduce the collection period of accounts receivable by 2 days.

Concentration banking would cost ₹75,000 annually and 8 per cent can be earned by the firm on its investments. It is also found that a lock-box system could reduce its overall collection time by four days and could cost annually ₹1,20,000.

- (i) How much cash would be released with the concentration banking system?
- (ii) How much money can be saved due to reduction in the collection period by 2 days? Should the firm institute the concentration banking system?
- (iii) How much cash would be freed by lock-box system?
- (iv) Between concentration banking and lock-box system, which is better?

- **Lock-box system**
- is a collection procedure in which
- payers send their payments/cheques
- to a nearby post box that is emptied
- by the firm's bank several times and
- the bank deposits the cheque in the firm's account;
- reduces float by shortening the
- lethargy as well as postal and bank floats.

Solution

(i) Cash released by the concentration banking system = ₹40,00,000 × 2 days = ₹80,00,000

(ii) Saving = $0.08 \times ₹80,00,000 = ₹6,40,000$.

The firm should institute the concentration banking system. It costs only ₹75,000 while the savings expected are ₹6,40,000.

(iii) Cash released by the lock-box system = ₹40,00,000 × 4 days = ₹1,60,00,000

(iv) Saving in lock-box system: $0.08 \times ₹1,60,00,000 = ₹12,80,000$

Lock-box system is better. Its net savings ₹11,60,000 (₹12,80,000 – ₹1,20,000) are higher than that of concentration banking.

Slowing Disbursements

Apart from speedy collection of accounts receivable, the operating cash requirement can be reduced by slow disbursements of accounts payable. In fact, slow disbursements represent a source of funds requiring no interest payments. There are several techniques to delay payment of accounts payable, namely, (i) avoidance of early payments; (ii) centralised disbursements; (iii) floats; and (iv) accruals.

Avoidance of Early Payments One way to delay payments is to avoid early payments. According to the terms of credit, a firm is required to make a payment within a stipulated period. It entitles a firm to cash discounts. If, however, payments are delayed beyond the due date, the credit standing may be adversely affected so that the firms would find it difficult to secure trade credit later. But if the firm pays its accounts payable before the due date it has no special advantage. Thus, a firm would be well advised not to make payments early, that is, before the due date.

Centralised Disbursements Another method to slow down disbursements is to have centralised disbursements. All the payments should be made by the head office from a centralised disbursement account. Such an arrangement would enable a firm to delay payments and conserve cash for several reasons. Firstly, it involves increase in the *transit* time. The remittance from the head office to the customers in distant places would involve more mailing time than a decentralised payment by the local branch. The second reason for reduction in operating cash requirement is that since the firm has a centralised bank account, a relatively smaller total cash balance will be needed. In the case of a decentralised arrangement, a minimum cash balance will have to be maintained at each branch which will add to a large operating cash balance. Finally, schedules can be tightly controlled and disbursements made exactly on the right day.

Float A very important technique of slow disbursements is float. The term float refers to the amount of money tied up in cheques that have been written, but have yet to be collected and encashed.

Cheque-kiting is a method of consciously anticipating the resulting float or delay associated with the payment process using it to keep funds in an interest-earning form for as long as possible.

Alternatively, float represents the difference between the bank balance and book balance of cash of a firm. The difference between the balance as shown by the firm's record and the actual bank balance is due to *transit* and processing delays. There is a time-lag between the issue of a cheque by the firm and its presentation to its bank by the customer's bank for payment. The implication is that although the cheque has been issued, cash would be required later when the cheque is presented for encashment. Therefore, a firm can send remittances although it does not have cash in its bank at the time of issuance of the cheque. Meanwhile, funds can be arranged to make payment when the cheque is presented for collection after a few days. Float used in this sense is called as **cheque kiting**.¹⁹ There are two ways of doing it: (a) paying from a distant bank, (b) scientific cheque-cashing analysis.

Paying From a Distant Bank The firm may issue a cheque on banks away from the creditor's bank. This would involve relatively longer transit time for the creditor's bank to get payment and, thus, enable the firm to use its funds longer.

Cheque-encashment Analysis Another way to make use of float is to analyse, on the basis of past experience, the time-lag in the issue of cheques and their encashment. For instance, cheques issued to pay wages and salary may not be encashed immediately; it may be spread over a few days, say, 25 per cent on one day, 50 per cent on the second day and the balance on the third day. It would mean that the firm should keep in the bank not the entire amount of a payroll but only a fraction represented by the actual withdrawal each day. This strategy would enable the firm to save operating cash.

Accruals Finally, a potential tool for stretching accounts payable is accruals which are defined as current liabilities that represent a service or goods received by a firm but not yet paid for. For instance, payroll, that is, remuneration to employees who render service in advance and receive payment later. In a way, they extend credit to the firm for a period at the end of which they are paid, say, a week or a month. The longer the period after which payment is made, the greater is the amount of free financing consequently and the smaller is the amount of cash balances required. Thus, less frequent payrolls, that is, weekly as compared to monthly, are an important source of accrual. They can be manipulated to slow down disbursements. Other examples of accrual are rent to lessors and taxes to government. But these can be utilised only to a limited extent as there are legal constraints beyond which such payments cannot be extended.

LO 14.7 MARKETABLE SECURITIES

We present below a brief description of the marketable securities. Attention is focussed on the meaning and characteristics of marketable securities, the general selection criterion and the basic types of such securities.

Meaning and Characteristics

Once the optimum level of cash balance of a firm has been determined, the residual of its liquid assets is invested in marketable securities. Such securities are short-term investment instruments to obtain a return on temporarily idle funds. In other words, they are securities which can be converted into cash in a short period of time, typically a few days. The basic characteristics of marketable securities affect the degree of their marketability/liquidity. To be liquid, a security must have two basic characteristics: a ready market and safety of principal. Ready marketability minimises the amount of time required to convert a security into cash. A ready market should have both **breadth** in the sense of a large number of participants scattered over a wide geographical area as well as **depth** as determined by its ability to absorb the purchase/sale of large amounts of securities.

The second determinant of liquidity is that there should be little or no loss in the value of a marketable security over time. Only those securities that can be easily converted into cash without any reduction in the principal amount qualify for short-term investments. A firm would be better off leaving the balances in cash if the alternative were to risk a significant reduction in principal.

- **Cheque encashment analysis**
- is a way to play the float by depositing a certain proportion of a payroll
- payment in the firm's account on several successive days following the actual issue of cheques.

- **Breadth of market**
- is a characteristic of a ready market determined by the number of participants (buyers) in the market.

- **Depth of market**
- is a characteristic of a ready market, determined by its ability to absorb the purchase/sale of a large amount of a particular securities.

Selection Criterion

A major decision confronting the financial managers involves the determination of the mix of cash and marketable securities. Some of the quantitative models for determining the optimum amounts of marketable securities to hold in certain circumstances have been outlined in an earlier section. In general, the choice of the mix is based on a trade-off between the opportunity to earn a return on idle funds (cash) during the holding period, and the brokerage costs associated with the purchase and sale of marketable securities. For example, take the case of a firm paying ₹350 as brokerage costs to purchase and sell ₹45,000 worth of marketable securities, yielding an annual return of 8 per cent and held for one month. The interest earned on the securities works out at ₹300 ($1/12 \times .08 \times ₹45,000$). Since this amount is less than the cost of the transaction (₹350), it is not advisable for the firm to make the investments. This trade-off between interest returns and brokerage costs is a key factor in determining what proportion of liquid assets should be held in the form of marketable securities.

There are three motives for maintaining liquidity (cash as well as marketable securities) and, therefore, for holding marketable securities: transaction motive, safety/precautionary motive and speculative motive. Each motive is based on the premise that a firm should attempt to earn a return on temporarily idle funds. The type of marketable security purchased will depend on the motive for the purchase. An assessment of certain criteria can provide the financial manager with a useful framework for selecting a proper marketable securities mix. These considerations include evaluation of (i) financial risk, (ii) interest rate risk, (iii) taxability, (iv) liquidity, and (v) yield among different financial assets.

Financial/Default Risk It refers to the uncertainty of expected returns from a security attributable to

Default risk is the uncertainty of expected return attributable to possible change in financial capacity of issuer of security to make future payments.

possible changes in the financial capacity of the *security-issuer* to make future payments to the *security-owner*. If the chance of default on the terms of the investment is high (low), then the financial risk is said to be high (low). As the marketable securities portfolio is designed to provide a return on funds that would be otherwise tied up in idle cash held for transaction or precautionary purposes, the financial manager will not usually be willing to assume such financial/default risk in the hope of greater return within the makeup of the portfolio.

Interest Rate Risk The uncertainty that is associated with the expected returns from a financial instrument attributable to changes in interest rate is known as **interest rate risk**. Of particular concern to the corporate financial manager is the price volatility associated with instruments that have long, as opposed to short, terms to maturity.

If prevailing interest rates rise compared with the date of purchase, the market price of the securities will fall to bring their yield to maturity in line with what financial managers could obtain by buying a new issue of a given instrument, for instance, treasury bills. The longer the maturity of the instrument, the larger will be the fall in prices. To hedge against the price volatility caused by interest rate risk, the market securities portfolio will tend to be composed of instruments that mature over short periods.

Taxability Another factor affecting observed difference in market yields is the differential impact of taxes. Securities, income on which is tax-exempt, sell in the market at lower yields to maturity than other securities of the same maturity. A differential impact on yields arises also because interest income is taxed at the ordinary tax rate while capital gains are taxed at a lower rate. As a result, fixed-interest securities that sell at a discount because of low coupon rate in relation to the prevailing yields are attractive to taxable investors. The reason is that part of the yield to maturity is a capital

gain. Owing to the desirability of discount on low-interest fixed-income securities, their yield to maturity tends to be lower than the yield on comparable securities with higher coupon rates. The greater the discount, the greater is the capital gains attraction and the lower is its yield relative to what it would be if the coupon rate were such that the security was sold at par.

Liquidity With reference to marketable securities portfolio, **liquidity** refers to the ability to transform a security into cash. Should an unforeseen event require that a significant amount of cash be immediately available, a sizeable portion of the portfolio might have to be sold. The financial manager will want the cash *quickly* and will not want to accept a large price reduction in order to convert the securities. Thus, in the formulation of preferences for the inclusion of particular instruments in the portfolio, consideration will be given to **(i)** the time period needed to sell the security and **(ii)** the likelihood that the security can be sold at or near its prevailing market price. The latter element, here, means that 'thin' markets, where relatively few transactions take place or where trades are accomplished only with large price changes between transaction, should be avoided.

- **Liquidity**
- is the ability
- to transform a
- security into cash.

Yield The final selection criterion is the yields that are available on the different financial assets suitable for inclusion in the marketable/near-cash portfolio. All the four factors listed above, *financial risk*, *interest rate risk*, *liquidity* and *taxability*, influence the available yields on financial instruments. Therefore, the yield criterion involves a weighing of the risks and benefits inherent in these factors. If a given risk is assumed, such as lack of liquidity, then a higher yield may be expected on the instrument lacking the liquidity characteristics.

In brief, the finance manager must focus on the risk-return trade-offs associated with the four factors on yield through his analysis. Coming to grips with these trade-offs will enable the finance manager to determine the proper marketable securities mix for his firm.

Marketable Security Alternatives

We describe below briefly the more prominent marketable/near-cash securities available for investment. Our concern is with money market instruments.

Treasury Bills These are obligations of the government. They are sold on a discount basis. The investor does not receive an actual interest payment. The return is the difference between the purchase price and the face (par) value of the bill.

The **treasury bills** are issued only in *bearer* form. They are purchased, therefore, without the investors' name upon them. This attribute makes them easily transferable from one investor to another. A very active secondary market exists for these bills. The secondary market for bills not only makes them highly liquid but also allows purchase of bills with very short maturities. As the bills have the full financial backing of the government, they are, for all practical purposes, risk-free. The negligible financial risk and the high degree of liquidity makes their yield lower than those on the other marketable securities. Due to their virtually risk-free nature and because of active secondary market for them, treasury bills are one of the most popular marketable securities even though the yield on them is lower.

- **Treasury bills**
- are Indian
- government
- obligations issued
- on auction basis
- having maturities of
- 91-days and 364-
- days and virtually
- no risk.

Negotiable Certificates of Deposit (CDs) These are marketable receipts for funds that have been deposited in a bank for a fixed period of time. The deposited funds earn a fixed rate of interest. The denomination and maturities are tailored to the investors' need. The **CDs** are offered by banks on a basis different from treasury bills, that is,

- **Negotiable**
- **certificates of**
- **deposits**
- are negotiable
- instruments
- representing
- specific cash
- deposits in banks
- having varying
- maturities and
- yields based on
- size, maturity and
- prevailing money
- market conditions.

they are not sold at a discount. Rather, when the certificates mature, the owner receives the full amount deposited plus the earned interest. A secondary market exists for the CDs. While CDs may be issued in either registered or bearer form, the latter facilitates transactions in the secondary market and, thus, is the most common. The default risk is that of the bank failure, a possibility that is low in most cases.

Commercial Paper It refers to short-term unsecured promissory note sold by large business firms to raise cash. As they are unsecured, the issuing side of the market is dominated by large companies

Commercial papers is a short-term, unsecured promissory note issued by a firm that has high credit rating/standing.

which typically maintain sound credit ratings. **Commercial papers** (CPs) can be sold either directly or through dealers. Companies with high credit rating can sell directly to investors. The denominations in which they can be bought vary over a wide range. They can be purchased similarly with varying maturities. These papers are *generally* sold on discount basis in bearer form although at times commercial papers can be issued carrying interest and made payable to the order of the investor. For all practical purposes, there is no active trading in secondary market for commercial paper although direct sellers of CPs often repurchase it on request. This feature distinguishes CPs from all of the previously discussed short-term investment vehicles. When, therefore,

a financial manager evaluates these for possible inclusion in marketable securities portfolio, he should plan to hold it to maturity. Owing to its lack of marketability, CPs provide a yield advantage over other near-cash assets of comparable maturity.

Bankers' Acceptances These are drafts (order to pay) drawn on a specific bank by an exporter in order to obtain payment for goods he has shipped to a customer who maintains an account with that specific bank. They can also be used in financing domestic trade. The draft

Banker's acceptances are short-term, low-risk marketable securities arising from bank guarantees of business transactions.

guarantees payment by the accepting bank at a specific point of time. The seller who holds such acceptance may sell it at a discount to get immediate funds. Thus, the acceptance becomes a marketable security. Since acceptances are used to finance the acquisition of goods by one party, the document is not 'issued' in specialised denominations; its size/denomination is determined by the cost of goods being purchased. They serve a wide range of maturities and are sold on a discount basis, payable to the bearer. A secondary market for the acceptances of large banks does exist. Owing to their greater financial risk and lesser liquidity, acceptances provide investors a yield advantage over treasury bills of like maturity. In fact, the acceptances of major banks

are a very safe investment, making the yield advantage over treasury bills worth looking for marketable securities portfolio.

Repurchase (Repo) Agreements These are legal contracts that involve the actual sale of securities by a borrower to the lender with a commitment on the part of the former to repurchase the securities at the current price plus a stated interest charge. The securities involved are government

Repurchase agreement is an agreement whereby a bank sells securities and agrees to buy them back at a specific price and time.

securities and other money market instruments. The borrower is either a financial institution or a security dealer.

There are two major reasons why a firm with excess cash prefers to buy **repurchase agreements** rather than a marketable security. First, the original maturities of the instrument being sold can, in effect, be adjusted to suit the particular needs of the investing firm. Therefore, funds available for a very short period, that is, one/two days can be employed to earn a return. Closely related to the first is the second reason, namely, since the contract price of the securities that make up the

arrangement is fixed for the duration of the transaction, the firm buying the repurchase agreement is protected against market fluctuations throughout the contract period. This makes it a sound alternative investment for funds that are surplus for only short periods.

Units The units of mutual funds offer a reasonably convenient alternative avenue for investing surplus liquidity as **(i)** there is a very active secondary market for them, **(ii)** the income from units is tax-exempt up to a specified amount and, **(iii)** the units appreciate in a fairly predictable manner.

Intercorporate Deposits Intercorporate deposits, that is, short-term deposits with other companies is a fairly attractive form of investment of short-term funds in terms of rate of return which currently ranges between 12 and 15 per cent. However, apart from the fact that one month's time is required to convert them into cash, intercorporate deposits suffer from high degree of risk.

Bills Discounting Surplus funds may be deployed to purchase/discount bills. Bills of exchange are drawn by seller (drawer) on the buyer (drawee) for the value of goods delivered to him. During the pendency of the bill, if the seller is in need of funds, he may get it discounted. On maturity, the bill should be presented to the drawee for payment. A bill of exchange is a self-liquidating instrument. Bill discounting is superior to intercorporate deposits for investing surplus funds. While parking surplus funds in bills discounting, it should be ensured that the bills are trade bills arising out of genuine commercial transaction and, as far as possible, they should be backed by letter of credit/acceptance by banks to ensure absolute safety of funds.

Money Market Mutual Funds/Liquid Funds are professionally managed portfolios of marketable securities. They provide instant liquidity. Due to high liquidity, competitive yields and low transactions, these funds have achieved significant growth in size and popularity in recent years.

- Money market
- mutual funds
- are professionally
- managed portfolios

- competitive yield
- and low transaction
- costs.

LO 14.8

CASH MANAGEMENT PRACTICES IN INDIA

Cash management in India presents a daunting task in light of the huge number of clearing houses (1,056) and bank branches (more than 75,000). The main features of cash management practices in India are: (i) collection methods, (ii) payment mechanisms, and (iii) electronic banking.

Collection Methods

Collection services provided by banks use their own branches and their correspondent bank's network as well as country-wide arrangements with couriers and coordinators. There are two broad categories of collection products offered by banks in India: local collection and upcountry collection/outstation clearing.

Local collection is used for cheques deposited with the bank/its correspondent bank in the location on which it is drawn. Compared with outstation cheque collections, local collection funds are realised faster.

Outstation clearing is used when the location where the cheque is deposited with the bank is different from the location on which it is drawn. Banks offer two types of outstation cheque collection products: one for cheques drawn on a correspondent bank location and the other for cheques drawn on locations that are not covered by the correspondent bank. In the case of the former, the typical clearing period of the cheque is relatively faster, and the risk involved (loss of cheques in transit) is also much lower.

1940

The collection proceeds can be made available to the customer on either a cleared funds or guaranteed basis (i.e. cheque-discounting) depending on the corporate's cashflow requirements. Value-added services such as cheque pick-ups, customised management information reporting, data-entry of deposit-slip information and so on are also provided.

Bulk Collection is offered by banks for processing high-volume collections such as cheque collection for initial public offerings (IPOs), utility bill collections for telephone, electricity, cellular service providers and so on through timely clearing of instruments together with strong reconciliation and reporting.

Post-dated Cheque (PDC) Management solutions are critical for non-banking finance companies that collect PDCs from their retail and auto-loan disbursement customers.

Electronic Clearing Service—Debit Scheme of the RBI enables corporates typically utility or insurance companies to collect the proceeds of small value large-volume payments from their customers.

Cheque Truncation removes the need for much of the physical handling and movement of paper-based payment instruments as only the electronic image of the instrument is transmitted through the clearing system.

Payment Mechanism

Currently payments are significantly paper-based through cash/cheques/demand drafts. The key mechanism available to customers in India are illustrated below:

<i>Payment mechanism</i>	<i>Features</i>
Cheque	Currently the most prevalent mode of payment. The customer's account is debited only when a cheque is presented in clearing by the beneficiary.
Cheque payable at par	A cheque that can be redeemed at par at any of the locations where the bank has a branch. The customer's account is debited only on clearing.
Customer's or pay order	A pre-funded payment instrument issued by a bank, i.e. the customer's account is debited up front, and is typically payable at all locations where the bank has branches.
Demand draft	A pre-funded out-station pay order, which is drawn on a location where the bank does not have its own branch, but has a tie-up with a correspondent bank. The customer's account is debited upfront.
Real-time gross settlement (RTGS)	A domestic electronic payment mechanism for funds transfer (credit-push). The beneficiary's bank is required to credit the proceeds of an inward RTGS transaction to the beneficiary's account, or return the funds, within two hours of receipt of the payment notification. Participation by banks in RTGS customer payments is currently voluntary.

(Contd.)

*(Contd.)***Electronic Funds Transfer (EFT)**

An electronic payment mode for same-day inter- and intra-city funds transfer (credit-push). It is mandatory for all bank branches, in 16 large metros in India, directly involved in clearing, to participate in RBI's EFT System for inward EFT.

Special Electronic Funds Transfer (SEFT)

An electronic payment mode for same-day inter- and intra-city funds transfer (credit-push). This is an extension of RBI's EFT system, but participation in SEFT is voluntary for banks, and only networked branches are allowed to participate. Thus, location coverage is wider than EFT, but not all banks participate in SEFT.

Electronic Clearing Service (ECS) – Credit

ECS (credit) is an electronic mode of payment which is designed for large-volume payments. The ECS scheme is operational in some 46 cities and all banks directly participating in clearing have to process inward ECS. The ECS settlement cycle is four days; much longer than for RTGS, EFT or SEFT.

Interest/Dividend warrants

These are paper-based payment instruments that are required to be pre-funded (based on applicable regulations) and are used for large-volume interest and dividend payments.

The migration from paper-based to electronic modes of payment has been relatively slow and gradual. Corporates are realising the potential of cost-savings in processing electronic payments as these are conducive to system-integration with the client's internal systems.

Payment Outsourcing Corporates and financial institutions are increasingly outsourcing payment-processing to banks. Payment outsourcing products eliminate manual processing and the overhead costs associated with preparing, verifying and signing/despatching individual cheques. Banks facilitate the interfacing of corporate's back-office payment system with the bank's electronic banking platforms.

Electronic Banking

Banks offer sophisticated electronic banking delivery channels. They not only allow customers to access account-balance information in real-time but also enable them to initiate transactions for payments, inter-account transfers, deposit placements and so on. Corporates have access to extensive management information reports. The internet banking offerings also allow corporates to access their accounts with the banks from different countries.

SUMMARY**LO 14.1**

Cash management is one of the key areas of working capital management. There are four motives for holding cash: (i) transaction motive, (ii) precautionary motive, (iii) speculative motive, and (iv) compensating motive. The transaction motive refers to the holding of cash to meet anticipated obligations whose time is not perfectly synchronised with cash receipts

CONCLUSION

... ..

... ..

... ..

... ..

... ..

LO 14.1	<p>The cash balances held in reserve for random and unforeseen fluctuations in cash flows are called precautionary balances. The speculative motive indicates the desire of a firm to take advantage of opportunities which present themselves at unexpected moments and which are typically outside the normal course of business. The compensating motive means keeping the bank balance sufficient to earn a return equal to the cost of free services provided by the banks.</p>
LO 14.2	<p>The basic objectives of cash management are to reconcile two mutually contradictory and conflicting tasks: to meet the payment schedule and to minimise funds committed to cash balances.</p>
LO 14.3	<p>The factors that determine the required cash balances are: (i) synchronisation of cash flows, (ii) the cost associated with a shortfall in the firm's cash needs, (iii) excess cash balance cost, (iv) cost associated with establishing an operating cash management staff and activities, and (v) the impact of uncertainties on cash management strategy.</p>
LO 14.4	<p>There are two approaches to derive an optimal cash balance: (i) minimising cash cost models and (ii) cash budget. The important models are: (1) Baumol Model, (2) Miller-Orr Model and (3) Orgler's Model.</p> <p>The focus of Baumol model is to minimise the total cost associated with cash management comprising total conversion costs (that is, costs incurred each time marketable securities are converted into cash) and the opportunity cost of keeping idle cash balances which otherwise could have been invested in marketable securities.</p> <p>The objective of Miller-Orr Model is to determine the optimum cash balance level which minimises the cost of cash management.</p> <p>Orgler's model requires the use of multiple linear programming to determine an optimal cash management strategy. An important feature of this model is that it allows the financial managers to integrate cash management with production, current assets requirement and other aspects of the corporate.</p> <p>Cash budget is probably the most important tool in cash management. It is a device to help a firm to plan and control the use of cash. The cash position of a firm as it moves from one period to another period is highlighted by the cash budget. A cash budget has normally three parts, namely, cash collections, cash payments and cash balances. The major sources of cash receipts and payments are operating and financial. The operating sources are repetitive in nature, while the financial sources are non-recurring.</p>
LO 14.5	<p>The cash management strategies are intended to minimise the operating cash balance requirement. The basic strategies that can be employed are (i) stretching accounts payable without affecting the credit of the firm, (ii) efficient inventory management and (iii) speedy collections of accounts receivable. Some of the specific techniques and processes for speedy collection of receivables from customers are ensuring prompt payment for customers and early payment/conversion into cash. Concentration banking and lock-box system deserve specific mention as principal methods of establishing a decentralised collection network. The techniques to delay payments of accounts payable include avoidance of early payment, centralised disbursements and float.</p>
14.6	<p>Concentration banking, as a system of decentralised billing and multiple collection points, is a useful technique to expedite the collection of accounts receivable by reducing the mailing time. The mailing time is saved both in respect of sending the bill to the customers as well as in the receipt of payment.</p> <p>Under the lock-box system, firms hire a post office lock-box at important collection centers where the customers remit payments. The local banks are authorized to open the box and pick up the remittances (cheques) received from the customers. As a result, there is some extra saving in mailing time compared to concentration banking.</p> <p>The financial evaluation of concentration banking and lock-box system would be based on the incremental analysis by comparing the cost of operations and benefits in terms of interest earnings on the early release of funds.</p>

Marketable securities are an outlet for surplus cash as liquid security/assets. To be liquid a security must have two basic characteristics, that is, a ready market and safety of principal.

The selection criteria for marketable securities include the evaluation of financial risk, interest-rate risk, liquidity, taxability and yield among different financial assets. The prominent marketable securities available for investment are: treasury bills, negotiable certificates of deposits, commercial paper, bankers' acceptance, units of mutual funds, intercorporate deposits, interbank call money, commercial bills under the bill market scheme and short-term deposits.

SOLVED PROBLEMS

P.14.1 The following information is available in respect of a trading firm:

- (i) On an average, debtors are collected after 45 days; inventories have an average holding period of 75 days and creditors payment period on an average is 30 days.
- (ii) The firm spends a total of ₹120 lakh annually at a constant rate.
- (iii) It can earn 10 per cent on investments.

LO 14.5 LOD
M

From the above information, compute: (a) the cash cycle and cash turnover, (b) minimum amounts of cash to be maintained to meet payments as they become due, (c) savings by reducing the average inventory holding period by 30 days.

The first part of the book is devoted to a general history of the world, from the beginning of time to the present day. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

The second part of the book is devoted to a history of the British Empire, from its origin to its present state. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

The third part of the book is devoted to a history of the United States, from its origin to its present state. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

The fourth part of the book is devoted to a history of the French Republic, from its origin to its present state. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

The eleventh part of the book is devoted to a history of the British Colonies, from their origin to their present state. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

The twelfth part of the book is devoted to a history of the British Empire, from its origin to its present state. It is written in a clear and concise style, and is well illustrated with maps and diagrams.

APPENDIX

The first part of the appendix is devoted to a list of the names of the British monarchs, from the first to the last.

The second part of the appendix is devoted to a list of the names of the British Prime Ministers, from the first to the last.

The third part of the appendix is devoted to a list of the names of the British Secretaries of State, from the first to the last.

The fourth part of the appendix is devoted to a list of the names of the British Admirals, from the first to the last.

The fifth part of the appendix is devoted to a list of the names of the British Generals, from the first to the last.

The sixth part of the appendix is devoted to a list of the names of the British Bishops, from the first to the last.

The seventh part of the appendix is devoted to a list of the names of the British Judges, from the first to the last.

The eighth part of the appendix is devoted to a list of the names of the British Members of Parliament, from the first to the last.

The ninth part of the appendix is devoted to a list of the names of the British Knights, from the first to the last.

The tenth part of the appendix is devoted to a list of the names of the British Barons, from the first to the last.

INDEX

The first part of the index is devoted to a list of the names of the British monarchs, from the first to the last.

The second part of the index is devoted to a list of the names of the British Prime Ministers, from the first to the last.

The third part of the index is devoted to a list of the names of the British Secretaries of State, from the first to the last.

The fourth part of the index is devoted to a list of the names of the British Admirals, from the first to the last.

Solution

- (a) Cash cycle = 45 days + 75 days – 30 days = 90 days (3 months)
Cash turnover = 12 months (360 days)/3 months (90 days) = 4.
- (b) Minimum operating cash = Total operating annual outlay/cash turnover, that is, ₹120 lakh/4 = ₹30 lakh.
- (c) Cash cycle = 45 days + 45 days – 30 days = 60 days (2 months)
Cash turnover = 12 months (360 days)/2 months (60 days) = 6.
Minimum operating cash = ₹120 lakh/6 = ₹20 lakh
Reduction in investments = ₹30 lakh – ₹20 lakh = ₹10 lakh
Savings = $0.10 \times ₹10 \text{ lakh} = ₹1 \text{ lakh}$.

P.14.2 A firm has been offered a cash management service by a bank for ₹1,00,000 per year. It is estimated that such a service would not only eliminate 'excess' cash on deposits (₹8,00,000) but also reduce its administration and other costs to the tune of ₹5,000 per month. Assuming the cost of capital of 15 per cent, is it worthwhile for the firm to engage the cash management service?

LO 14.5 LOD E

Solution

Benefits (annual):

Savings in interest (₹8,00,000 × 0.15)	₹1,20,000
Reduction in administration and other costs (₹5,000 × 12)	60,000

Total	1,80,000
-------	----------

Less: Cost (annual):

Bank service charges	1,00,000
----------------------	----------

Net annual benefits	80,000
---------------------	--------

Recommendation It is worthwhile to engage the bank services.

P.14.3 Royal Industries feels a lock-box system can shorten its accounts receivable collection period by 3 days. Credit sales are estimated at ₹365 lakh per year, billed on a continuous basis. The firm's opportunity cost of funds is 15 per cent. The cost of lock box system is ₹50,000.

LO 14.6 LOD M

- (a) Will you advise 'Royal' to go for lock-box system?
(b) Will your answer be different if accounts receivable collection period is reduced by 5 days?

Solution

(a) Cash released by lock-box system (₹365 lakh/365 days = ₹1 lakh × 3 days)	₹3,00,000
Savings (₹3 lakh × 0.15)	45,000
Less: Cost of lock-box system	50,000
Net loss	(5,000)

The firm is advised not to go for the lock-box system.

(b) Cash released: ₹1 lakh × 5 days	₹5,00,000
Savings (₹5 lakh × 0.15)	75,000
Less: Cost of lock-box system	50,000
Net savings	25,000

Recommendation The firm should go for the lock box system.

P.14.4 Sagar Industries sells its products through widely dispersed distributors in Northern India. It currently takes on an average 8 days for cash receipt cheques to become available to the firm from the day they are mailed. The firm is contemplating the institution of concentration banking to reduce this period. It is estimated that such a system would reduce the collection period of accounts receivable by 3 days. The daily cheque receipts currently average ₹10,00,000.

LO 14.6 LOD M

The concentration banking would cost ₹1,50,000 annually and the cost of funds is 15 per cent.

- (a) Advise Sagar whether it should introduce concentration banking system.

- (b) Will your answer be different, if it is estimated that a lock-box system can reduce the collection time by 4 days and its annual cost would be ₹2,00,000?

Solution

- (a) Cash released by concentration banking system (₹10 lakh × 3 = ₹30 lakh)

Savings (₹30 lakh × 0.15)	₹4,50,000
Less: Costs	1,50,000
Net savings	3,00,000

The firm should introduce concentration banking system.

- (b) Cash released by lock-box system (₹10 lakh × 4 = ₹40 lakh)

Savings (₹40 lakh × 0.15)	6,00,000
Less: Costs	2,00,000
Net savings	4,00,000

The lock box system is better.

P.14.5 The following results are expected by XYZ Ltd by quarters next year, in thousands of rupees.

Particulars	Quarter			
	1	2	3	4
Sales	7,500	10,500	18,000	10,500
Cash payments:				
Production costs	7,000	10,000	8,000	8,500
Selling, administrative and other costs	1,000	2,000	2,900	1,600
Purchases of plant and other fixed assets	100	1,100	2,100	2,100

The debtors at the end of a quarter are one-third of sales for the quarter. The opening balance of debtors is ₹30,00,000. Cash on hand at the beginning of the year is ₹6,50,000 and the desired minimum balance is ₹5,00,000. Borrowings are made at the beginning of quarters in which the need will occur in multiples of ₹10,000 and are repaid at the end of quarters. Interest charges may be ignored. You are required to prepare:

LO 14.4 LOD M

- (a) a cash budget by quarters for the year; and
 (b) state the amount of loan outstanding at the end of the year.

Solution

(a) Cash budget next year (quarter-wise)

(thousands of rupees)

Particulars	Quarter				Total
	1	2	3	4	
(A) Cash inflows:					
Collection from debtors					
(i) From prior quarter (1/3 of sales)	3,000	2,500	3,500	6,000	15,000
(ii) From current quarter (2/3 of sales)	5,000	7,000	12,000	7,000	31,000
Total	8,000	9,500	15,500	13,000	46,000
(B) Cash outflows:					
Production costs	7,000	10,000	8,000	8,500	33,500
Selling, administrative and other costs	1,000	2,000	2,900	1,600	7,500

(C) Surplus/(deficiency)	(100)	(3,600)	2,500	800	(400)
Beginning balance	650	550	500	500	650
Ending balance (indicated)	550	(3,050)	3,000	1,300	250
Borrowings required (deficiency + minimum cash required)		3,550			3,550
(Repayments) made (balance – minimum cash required)			(2,500)	(800)	(3,300)
Ending balance (actually now estimated)	550	500	500	500	500

(b) Loan outstanding = ₹35,50,000 – ₹33,00,000 = ₹2,50,000.

P.14.6 The following data pertain to a shop. The owner has made the following sales forecasts for the first 5 months of the coming year:

LO 14.4	LO 14.5
---------	---------

January	₹40,000	April	60,000
February	45,000	May	50,000
March	55,000		

Other data are as follows:

(a) Debtors and creditors' balances at the beginning of the year are ₹30,000 and ₹14,000, respectively. The balances of other relevant assets and liabilities are:

Cash balance	₹7,500
Stock	51,000
Accrued sales commission	3,500

(b) 40 per cent sales are on cash basis. Credit sales are collected in the month following sale.

(c) Cost of goods sold is 60 per cent of sales.

(d) The only other variable cost is a 5 per cent commission to sales agents. The sales commission is paid in month after it is earned.

(e) Inventory (stock) is kept equal to sales requirements for the next two months' budgeted sales.

(f) Trade creditors are paid in the following month after purchases.

(g) Fixed costs are ₹5,000 per month, including ₹2,000 depreciation.

You are required to prepare a cash budget for each of the first three months of coming year.

Solution

Cash budget for 3 months (January-March)

Particulars	Month		
	January	February	March
(A) Cash inflows:			
Cash sales (40% of total sales)	₹16,000	₹18,000	₹22,000
Collection from debtors (one month after sales)	30,000	24,000	27,000
Total	46,000	42,000	49,000
(B) Cash outflows:			
Paid to trade creditors for purchases (see working note on purchase budget)	14,000	33,000	36,000
Sales commission (5 per cent of prior month's sales)	3,500	2,000	2,250
Fixed costs (₹5,000 – ₹2,000 depreciation)	3,000	3,000	3,000
Total	20,500	38,000	41,250
(C) Surplus/(deficiency) (A) – (B)	25,500	4,000	7,750
Beginning balance	7,500	33,000	37,000
Ending balance (indicated)	33,000	37,000	44,750

Working Notes

Purchase budget	January	February	March
Desired ending inventory (at cost price)	₹60,000	₹69,000	₹66,000
Plus cost of goods sold (current month)	24,000	27,000	33,000
Total requirements	84,000	96,000	99,000
Less: Beginning inventory	51,000	60,000	69,000
Purchases	33,000	36,000	30,000

LO 14.4 LOD M
P.14.7 Prepare the cash budget for July-December from the following information:

 (i) The estimated sales, expenses, etc. are as follows: (₹ lakh)

	June	July	August	September	October	November	December
Sales	35	40	40	50	50	60	65
Purchases	14	16	17	20	20	25	28
Wages and salaries	12	14	14	18	18	20	22
Miscellaneous expenses	5	6	6	6	7	7	7
Interest received	2	—	—	2	—	—	2
Sale of shares	—	—	20	—	—	—	—

(ii) 20 per cent of the sales are on cash and the balance on credit.

(iii) 1 per cent of the credit sales are returned by the customers; 2 per cent debts are uncollectible; 50 per cent of the good accounts receivable are collected in the month of the sales and the rest during next month.

(iv) The time-lag in payment of miscellaneous expenses and purchase is one month. Wages and salaries are paid fortnightly with a time-lag of 15 days.

(v) The company keeps a minimum cash balance of ₹5 lakhs. Cash in excess of ₹7 lakh is invested in government securities in multiples of ₹1 lakh. Shortfalls in the minimum cash balance are made good by borrowings from the banks. Ignore interest received and paid.

Solution

Cash budget for the months of July-December

(Amount in lakh of rupees)

Particulars	July	August	September	October	November	December
(a) Cash inflows						
Cash sales	8.00	8.00	10.00	10.00	12.00	13.00
Collection from debtors (see working notes)	14.10	31.05	34.93	38.81	42.69	48.51
Interest received	—	—	2.00	—	—	2.00
Sale of shares	—	20.00	—	—	—	—
Total	37.10	59.05	46.93	48.81	54.69	63.51
(b) Cash outflows						
Payment to suppliers (1 month time-lag)	14.00	16.00	17.00	20.00	20.00	25.00
Miscellaneous expenses (1 month time-lag)	5.00	6.00	6.00	6.00	7.00	7.00
Wages and salaries: (time-lag of 15 days)						
Δ Paid for the previous month (50%)	6.00	7.00	7.00	9.00	9.00	10.00
Δ Paid for the current month (50%)	7.00	7.00	9.00	9.00	10.00	11.00
Total	32.00	36.00	39.00	44.00	46.00	53.00
(c) Surplus/(deficiency) [(a) – (b)]	5.10	23.05	7.93	4.81	8.69	10.51
Beginning balance	5.00	7.10	7.15	7.08	7.89	7.58
Closing balance (indicated)	10.10	30.14	15.08	11.89	16.58	18.09
Investment in Government securities	3.00	23.00	8.00	4.00	9.00	11.00
Closing balance (now actually estimated)	7.10	7.15	7.08	7.89	7.58	7.09

Working Notes

Particulars	Collection from debtors						
	(amount in lakh of rupees)						
	June	July	August	September	October	November	December
Sales	35	40	40	50	50	60	65
Less: Cash sales (20%)	7	8	8	10	10	12	13

50% in the next month	—	13.58	15.53	15.53	19.41	19.41	23.29
	13.59	29.10	31.05	34.93	38.81	42.69	48.51

P.14.8 JPL has two dates when it receives its cash inflows, that is, February 15, and August 15. On each of these dates, it expects to receive ₹15 crore. Cash expenditures are expected to be steady throughout the subsequent 6 month period. Presently, the ROI in marketable securities is 8 per cent per annum, and the cost of transfer from securities to cash is ₹125 each time a transfer occurs.

LO 14.4 LOD M

- What is the optimal transfer size using the EOQ model? What is the average cash balance?
- What would be your answer to part (i), if the ROI were 12 per cent per annum and the transfer costs were ₹75? Why do they differ from those in part (i)?

Solution

- Optimal transfer size using the EOQ model

$$C = \sqrt{\frac{2bT}{i}}$$

Where, C = Optimal conversion amount of marketable securities converted into cash per order
 T = Projected cash requirement during the planning period
 b = Cost of conversion into cash per lost/transaction
 i = Rate of interest earned on securities

$$\text{Therefore, } C = \sqrt{\frac{2 \times ₹30 \text{ Crore} \times ₹125}{0.08}} = ₹9,68,245$$

$$\text{Average cash balance} = C/2 = ₹9,68,245/2 = ₹4,84,123$$

- Optimal transfer size using EOQ model

Given, $i = 0.12$
 $b = ₹75$

$$C = \sqrt{\frac{2 \times ₹30 \text{ crore} \times ₹75}{0.12}} = ₹6,12,372$$

$$\text{Average cash balance} = C/2 = ₹6,12,372/2 = ₹3,06,186$$

- The major reasons for holding lower balances in the latter situations are: (i) higher opportunity cost for holding cash (the ROI is 12 per cent *vis-à-vis* 8 per cent in the former situation) and (ii) lower transaction costs favour frequent conversion of marketable securities into cash.

P.14.9 The annual cash requirement of A Ltd is ₹10 lakh. The company has marketable securities in lot sizes of ₹50,000, ₹1,00,000, ₹2,00,000, ₹2,50,000 and ₹5,00,000. Cost of conversion of marketable securities per lot is ₹1,000. The company can earn 5 per cent yield on its securities.

LO 14.4 LOD D

You are required to prepare a table indicating which lot size will have to be sold by the company. Also, show that economic lot size can be obtained by the Baumol Model.

Solution

(a) Table showing lot size of marketable securities

1. Total annual cash requirement	₹10,00,000	₹10,00,000	₹10,00,000	₹10,00,000	₹10,00,000
2. Lot size	50,000	1,00,000	2,00,000	2,50,000	5,00,000
3. Number of lots (1 ÷ 2)	20	10	5	4	2
4. Conversion cost per lot	1,000	1,000	1,000	1,000	1,000
5. Total conversion cost (3 × 4)	20,000	10,000	5,000	4,000	2,000
6. Average lot size	25,000	50,000	1,00,000	1,25,000	2,50,000
7. Interest cost (Average lot size × 0.05)	1,250	2,500	5,000	6,250	12,500
8. Total cost (5 + 7)	21,250	12,500	10,000	10,250	14,500

Economic lot size = ₹2,00,000 as at this size the total costs are minimum.

(b) Baumol Model = $\sqrt{\frac{2bt}{i}}$

where b = Cost per conversion
 t = Total cash transaction needs for the period (year)
 i = Interest rate that could be earned.

$$= \sqrt{\frac{2 \times ₹1,000 \times ₹10,00,000}{0.05}} = ₹2,00,000.$$

MINI CASES

14.C.1 Alcobex Metal Company (AMC) does business in three products P₁, P₂ and P₃. Products P₁ and P₂ are manufactured in the company, while product P₃ is procured from outside and resold as a combination with either product P₁ or P₂. The sales volume budgeted for the three products for the current year (April – March) are as under:

Product	₹ in lakh		
P ₁	1,200		
P ₂	500		
P ₃	400	[Dec. to March previous year]	₹20.00 lakh per month
		[April to July current year]	25.00 lakh per month
		[August to November]	30.00 lakh per month
		[December to March]	45.00 lakh per month

Based on the budgeted sales value, the cash flow forecast for the company is prepared based on the following assumptions:

- (1) Sales realisation is considered at:
 - 50 per cent current month
 - 25 per cent second month
 - 25 per cent third month
- (2) Production programme for each month is based on the sales value of the next month.
- (3) Raw material consumption of the company is kept at 59 per cent of the month's production.
- (4) 81 per cent of the raw materials consumed are components.

Summary

	1949	1950	1951	1952	1953	1954	1955	1956	1957	1958	1959	1960
...

The following table shows the results of the survey conducted in 1950. The data indicates a steady increase in the number of respondents over the period shown. The average age of the respondents was found to be 35 years.

Notes

1. The data for 1950 is preliminary and subject to change.

2. The survey was conducted in the following areas: ...

3. The results of the survey are as follows: ...

4. The survey was conducted by the following persons: ...

Summary

	1949	1950	1951	1952	1953	1954	1955	1956	1957	1958	1959	1960
...

The following table shows the results of the survey conducted in 1950. The data indicates a steady increase in the number of respondents over the period shown. The average age of the respondents was found to be 35 years.

Notes

1. The data for 1950 is preliminary and subject to change.

2. The survey was conducted in the following areas: ...

3. The results of the survey are as follows: ...

4. The survey was conducted by the following persons: ...

- (5) Raw material and components to the extent, at 25 per cent are procured through import.
- (6) The purchases budget is as follows:
- Indigenous raw materials are purchased two months before the actual.
 - Components are procured in the month of consumption.
 - Imported raw materials and components are bought three months prior to the month of consumption.
- (7) The company avails of the following credit terms from suppliers:
- Raw materials are paid for in the month of purchases;
 - Company gets one month's credit for its components;
 - For imported raw material and components payments are made one month prior to the dates of purchases.
- (8) Currently, the company has a cash credit facility of ₹140.88 lakh.
- (9) Expenses are given below and are expected to be constant throughout the year (₹ lakh).

Wages and salaries	₹312
Administrative expenses	322
Selling and distribution expenses	53

- (10) Dividend of ₹58.03 lakh is to be paid in October.
- (11) Tax of ₹23.92 lakh will be paid in equal instalments in four-quarters: i.e., January, April, July and October.
- (12) The term-loan of ₹237.32 lakh is repayable in two equal instalments half-yearly, i.e., June/December.
- (13) Capital expenditure of ₹292.44 lakh for the year is expected to be spread equally during the 12 month period.

You are required to prepare a cash flow statement (Cash budget) for the current year period of June to November.

Solution

Cash budget for the period June-November

(Amount in ₹ lakh)

Particulars	June	July	August	September	October	November	Total cash flow
(A) Cash inflows							
Collection from customers ²	166.67	166.67	169.17	170.42	171.67	171.67	1016.27
Total	<u>166.67</u>	<u>166.67</u>	<u>169.17</u>	<u>170.42</u>	<u>171.67</u>	<u>171.67</u>	<u>1016.27</u>
(B) Cash outflows							
Payment to suppliers	99.49	101.70	103.5	104.76	104.76	104.76	618.97

14.C.2 The following is the balance sheet of Amar Industries Limited as on March 31 of the current year (amount in lakh of rupees)

Liabilities	Amount	Assets	Amount
Capital and reserves	1,650	Fixed assets at cost	1300
12% Debentures	900	Less: Depreciation	(400)
Creditors for purchases	600	Sundry debtors	700
Creditors for expenses	70	Stocks and stores	1,200
Provision for bonus	30	Loans and advances	500
Provision for tax	100	Cash and bank balances	100
Proposed dividends	50		
	3,400		3,400

Projected P & L A/c for the first 4 months (April-July) of the next year shows the following

Particulars	April	May	June	July
Sales	800	800	900	900
Excise duty recoveries	80	80	90	90
	880	880	990	990
Materials:				
Opening stock	1,200	1,200	1,260	1,320
Add: Purchases	600	660	720	720
Less: Closing stock	(1,200)	(1,260)	(1,320)	(1,320)
Cost of materials used	600	600	660	720
Expenses	180	180	200	200
Excise duty	80	84	88	92
	860	864	948	1,012
Profit (loss)	20	16	42	(22)

The following are the other relevant additional information:

- (i) 10 per cent of sales are for cash and the balance on 30 days' credit.
- (ii) Creditors for purchases are paid in 30 days.
- (iii) Expenses include:
 - (a) Interest payable at the end of each quarter;
 - (b) Depreciation of ₹10 lakh per month.
 - (c) Provision for bonus to workmen, ₹5 lakh per month, payable only in October.
 - (d) One-half of rest of the expenses payable in the following month.
- (iv) ₹200 lakh of debentures are redeemable on June 30.

- (v) Provision for taxation includes ₹20 lakh of surplus provision carried forward from earlier year besides the balance for the current year payable before June 30.
- (vi) Annual general meeting is to be held on May 31.
- (vii) Overdraft is permissible; however, interest on overdraft may be ignored.

You are required to prepare cash budget for the months of April to July (on a monthly basis) for the next year.

Solution

Cash budget of Amar Industries Ltd from April to July

(Amount in lakh of rupees)

Particulars	April	May	June	July
Gross sales (including excise duty)	880	880	990	990
Credit sales (90 per cent)	792	792	891	891
Credit purchases	600	660	720	720
Cash inflows:				
Cash sales	88	88	99	99
Collection from debtors: in the month following sales	700	792	792	891
Total	788	880	891	990
Cash outflows:				
Payment to creditors (in the month following purchases)	600	600	660	720
Interest ($0.12 \times ₹900 \text{ lakh} \times 1/4$)	—	—	27	—
Excise duty (assumed to be paid in the same month)	80	84	88	92
Expenses (working note 1)	148	156	166	177
Redemption of debentures	—	—	200	—
Tax (assumed to be paid in June)	—	—	80	—
Dividends (assumed to be paid in July)	—	—	—	50
Total	828	840	1,221	1,039
Surplus (deficiency)	(40)	40	(330)	(49)
Beginning balance	100	60	100	(230)
Closing balance (overdraft)	60	100	(230)	(279)

Working Notes

Payment for expenses

(Amount in lakh of rupees)

	April	May	June	July
Total expenses	180	180	200	200
Less: Interest on debentures	9	9	9	7
Less: Depreciation	10	10	10	10
Less: Provision for bonus	5	5	5	5
Net expenses (for a month)	156	156	176	178
50 per cent payable in the same month	78	78	88	89
50 per cent of the previous month	70	78	78	88
	148	156	166	177

5. The fifth part of the document is a list of names and addresses, similar to the first four parts. The names are written in a cursive hand, and the addresses are in a more formal, printed style. The list is organized into columns, with names in the first column and addresses in the second.

6. The sixth part of the document is a list of names and addresses, similar to the first five parts. The names are written in a cursive hand, and the addresses are in a more formal, printed style. The list is organized into columns, with names in the first column and addresses in the second.

7. The seventh part of the document is a list of names and addresses, similar to the first six parts. The names are written in a cursive hand, and the addresses are in a more formal, printed style. The list is organized into columns, with names in the first column and addresses in the second.

8. The eighth part of the document is a list of names and addresses, similar to the first seven parts. The names are written in a cursive hand, and the addresses are in a more formal, printed style. The list is organized into columns, with names in the first column and addresses in the second.

REVIEW QUESTIONS

LOD: Easy

- RQ.14.1** Indicate whether the following statements are true or false. [LO 14.1-7]
- (i) Cash, in a narrow sense, implies currency and bank balances only.
 - (ii) Cash, in broad sense, includes marketable securities and time deposits in banks.
 - (iii) Transaction, precautionary and speculative are three motives for holding cash.
 - (iv) Speculative motive cash balance serves to provide a cushion to meet unexpected contingencies.
 - (v) To meet the payment schedule and to minimize funds committed to cash balance are two basic objectives of cash management.
 - (vi) Costs caused due to inadequate cash are referred to as short costs.
 - (vii) Baumol model takes into account all motives of holding cash.
 - (viii) Miller-Orr model assumes that cash balances randomly fluctuate between an upper bound and lower bound.
 - (ix) Orgler's model is based on the use of a simple linear programming model.
 - (x) Cash budget is based on operating cash flows.
 - (xi) The higher the period of cash cycle, the higher is cash turnover.
 - (xii) Time taken by the bank in collecting payment from the customer's bank is referred to as deposit float.
 - (xiii) Investment in marketable securities is intended to obtain a return on temporarily idle cash.

[Answers: (i) False (ii) True (iii) False (iv) False (v) True (vi) True (vii) False (viii) True (ix) False (x) False (xi) False (xii) False (xiii) True]

- RQ.14.9** Explain and contrast deposit float and payment float. [LO 14.6]
- RQ.14.10** The following information is available relating to the PQR Ltd.: [LO 14.4]

1 Sales forecast

May	₹75,000	September	₹3,00,000
June	75,000	October	1,50,000
July	1,50,000	November	1,50,000
August	2,25,000	December	1,37,500
		January	75,000

2 Raw materials

May	₹37,500	September	₹1,27,500
June	37,500	October	97,500
July	52,500	November	67,500
August	3,67,500	December	37,500

3 Collection estimates:

- (1) Within the month of sale, 5 per cent
- (2) During the month following sale, 80 per cent
- (3) During the second month the following sale, 15 per cent.

4 Payment for raw materials:

During the month following the month in which purchase take place.

5 Miscellaneous:

- (1) General and administrative salary, ₹11,250 per month.
- (2) Monthly lease payment, ₹3,750.
- (3) Monthly depreciation charges, ₹15,000.
- (4) Monthly miscellaneous expenses, ₹1,150.
- (5) Income tax, ₹26,250 each in September and December.
- (6) Payment for research in October, ₹75,000.
- (7) Opening balance of cash on July 1, ₹55,000.
- (8) Minimum cash balance of ₹37,500 throughout the cash budget period.

Prepare:

- (1) a monthly cash budget for 6 months — July to December
- (2) an estimate of excess cash or shortage of cash for each month.

LOD: Difficult

RQ.14.11 What purpose do the following models serve? • Banmol model, • Miller-orr model, and • Orgler's model. [LO 14.4]

RQ.14.12 Briefly describe similarities and differences among cash management models. [LO 14.4]

RQ.14.13 Prepare a cash budget of XYZ Ltd for the 6 months, commencing April, on the basis of the following information: [LO 14.4]

- (i) Costs and prices remain unchanged.
- (ii) Cash sales are 25 per cent of the total sales and balance 75 per cent are credit sales.
- (iii) 60 per cent of credit sales are collected in the month following the sales, balance 30 per cent and 10 per cent in the two following months, respectively. No bad debts are anticipated.
- (iv) Sales forecast is as follows:

January	₹12,00,000	June	₹8,00,000
February	14,00,000	July	12,00,000
March	16,00,000	August	10,00,000
April	6,00,000	September	8,00,000
May	8,00,000	October	12,00,000

(v) Gross profit margin, 20 per cent.

(vi) Anticipated purchases:

April	₹6,40,000
May	6,40,000
June	9,60,000
July	8,00,000
August	6,40,000
September	9,60,000

(vii) Wages and salaries to be paid:

April	₹1,20,000
May	1,60,000
June	2,00,000
July	2,00,000
August	1,60,000
September	1,40,000

- (viii) Interest @ 6 per cent on debentures of ₹20,00,000 is paid quarterly and is payable in June and September.
- (ix) Excise duty due in July, ₹2,00,000.
- (x) Capital expenditure for plant and machinery planned for September, ₹1,20,000.
- (xi) Company has a cash balance of ₹4,00,000 as on March 31. This is the minimum desired cash balance per month.
- (xii) The company can borrow on monthly basis. Ignore interest on borrowings.
- (xiii) Rent is ₹8,000 per month.

RQ.14.14 The following information is available about a firm:

[LO 14.5]

- (a) On an average, accounts receivable are collected after 80 days; inventories have an average of 100 days and accounts payable are paid approximately 60 days after they arise.
- (b) The firm spends a total of ₹1,81,20,000 annually at a constant rate.
- (c) It can earn 8 per cent on investments.

Calculate: (i) the firm's cash cycle and cash turnover assuming a 360-days year; (ii) minimum amount of cash to be maintained to meet payments as they become due; (iii) savings by reducing the average age of inventories to 70 days.

RQ.14.15 Hypothetical Ltd uses a continuous billing system that results in an average daily receipt of ₹40,00,000. It is contemplating the institution of concentration banking, instead of the current system of centralised billing and collection. It is estimated that such a system would reduce the collection period of accounts receivable by 2 days.

[LO 14.6]

Concentration banking would cost ₹75,000 annually, and 8 per cent can be earned by the firm on its investments. It is also found that a lock-box system could reduce its overall collection time by 4 days and would cost annually ₹1,20,000.

- (i) How much would cash be released with the concentration banking system?
- (ii) How much money can be saved due to reduction in the collection period by 2 days? Should the firm institute the concentration banking system?
- (iii) How much would cash be freed by lock-box system?
- (iv) How much can be saved with lock-box?
- (v) Between concentration banking and lock-box system, which is better?

ANSWERS

- 14.10** (i) July ₹80,100; August ₹1,53,950; September ₹37,500
 October ₹37,500; November ₹45,500; December ₹84,975
- (ii) September ₹75,950; Shortage
 October ₹62,600; Repayments
 November ₹13,350; Repayments
- 14.13** (i) April ₹907; May 1,034; June ₹651
 July ₹400; August 550; September ₹400

Receivables Management

LEARNING OBJECTIVES

LO 15.1	Explain the objectives of receivables management with reference to the specific relevant costs and benefits
LO 15.2	Describe the key aspects of credit policies, namely, credit selection: obtaining credit information and analysing credit information
LO 15.3	Examine the three basic components of a firm's credit terms, the effects of changes in each of them on key variables and profits and the procedure for evaluating the quantitative effects of the proposed changes
LO 15.4	Explain the key features of collection policy, the basic tradeoffs and the popular collection techniques

INTRODUCTION

In the preceding Chapter, which was devoted to an in-depth examination of one of the most important components of current assets, that is, cash, it was observed that a basic strategy to reduce the operating cash requirement of a firm is to accelerate the collection of receivables so as to reduce the average collection period. The receivables represent an important component of the current assets of a firm. The purpose of the present Chapter is to analyse the important dimensions of the efficient management of receivables within the framework of a firm's objectives of value maximisation. This chapter discusses the objectives of receivables management. This is followed by an in-depth analysis of the three crucial aspects of management of receivables. The first aspect, that is, credit policies, have two dimensions: **(i)** credit standard defined as the criteria to determine to whom credit should be extended and **(ii)** credit analysis. The policies regarding both these aspects have been evaluated. The second major part of receivables management is 'credit terms' comprising **(i)** cash discount, **(ii)** cash discount period, and **(iii)** credit period. This is extensively spelt out later in the Chapter. The next discussion is concerned with the third major component of receivables management, collection policies, that is, the types and degree of effort made to collect receivables from customers. The main points are summarised by way of recapitulation.

1. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas.

2. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas.

3. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas.

4. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas.

5. The company's sales are divided into two categories: (a) sales to customers in the same geographical area as the company's headquarters, and (b) sales to customers in other geographical areas.

Receivables Management

CHAPTER OBJECTIVES

1. Explain the importance of receivables management.
2. Explain the importance of credit policy.
3. Explain the importance of credit analysis.
4. Explain the importance of credit control.
5. Explain the importance of credit collection.

INTRODUCTION

The primary objective of receivables management is to ensure that the company's receivables are collected in a timely and efficient manner. This involves the implementation of a credit policy, the analysis of credit risk, and the control of credit collection. Receivables management is a critical component of a company's working capital management strategy. It involves the implementation of a credit policy, the analysis of credit risk, and the control of credit collection. Receivables management is a critical component of a company's working capital management strategy.

LO 15.1 OBJECTIVES

The term receivables is defined as 'debt owed to the firm by customers arising from sale of goods or services in the ordinary course of business'.¹ When a firm makes an ordinary sale of goods or services and does not receive payment, the firm grants trade credit and creates accounts receivable which could be collected in the future. Receivables management is also called *trade credit management*. Thus, accounts receivable represent an extension of credit to customers, allowing them a reasonable period of time in which to pay for the goods received.

The sale of goods on credit is an essential part of the modern competitive economic systems. In fact, credit sales and, therefore, receivables, are treated as a marketing tool to aid the sale of goods. The credit sales are generally made on open account in the sense that there are no formal acknowledgements of debt obligations through a financial instrument. As a marketing tool, they are intended to promote sales and thereby profits. However, extension of credit involves risk and cost. Management should weigh the benefits as well as cost to determine the goal of receivables management. The objective of receivables management is 'to promote sales and profits *until* that point is reached where the return on investment in further funding receivables is less than the cost of funds raised to finance that additional credit (i.e. cost of capital)'.² The specific costs and benefits which are relevant to the determination of the objectives of receivables management are examined below.

Costs

The major categories of costs associated with the extension of credit and accounts receivable are: (i) collection cost, (ii) capital cost, (iii) delinquency cost, and (iv) default cost.

Collection Cost **Collection costs** are administrative costs incurred in collecting the receivables from the customers to whom credit sales have been made. Included in this category of costs are: **(a)** additional expenses on the creation and maintenance of a credit department with staff, accounting records, stationery, postage and other related items; **(b)** expenses involved in acquiring credit information either through outside specialist agencies or by the staff of the firm itself. These expenses would not be incurred if the firm does not sell on credit.

Collection cost is the administrative cost incurred in collecting receivables.

Capital Cost The increased level of accounts receivable is an investment in assets. They have to be financed thereby involving a cost. There is a time-lag between the sale of goods to, and payment by, the customers. Meanwhile, the firm has to pay employees and suppliers of raw materials, thereby implying that the firm should arrange for additional funds to meet its own obligations while waiting for payment from its customers. The **cost on the use of additional capital** to support credit sales, which alternatively could be profitably employed elsewhere, is, therefore, a part of the cost of extending credit or receivables.

Capital cost is the cost on the use of additional capital to support credit sales which alternatively could have been employed elsewhere.

Delinquency Cost This cost arises out of the failure of the customers to meet their obligations when payment on credit sales become due after the expiry of the credit period. Such costs are called **delinquency costs**. The important components of this cost are: **(i)** blocking-up of funds for an extended period, **(ii)** cost associated with steps that have to be initiated to collect the overdues, such as, reminders and other collection efforts, legal charges, where necessary, and so on.

Delinquency cost is cost arising out of failure of customers to pay on due date.

Default Cost Finally, the firm may not be able to recover the overdues because of the inability of the customers. Such debts are treated as bad debts and have to be written off as they cannot be realised. Such costs are known as **default costs** associated with credit sales and accounts receivable.

- **Default costs**
- are the over dues
- that cannot be
- recovered.

Benefits

Apart from the costs, another factor that has a bearing on accounts receivable management is the *benefit* emanating from credit sales. The *benefits* are *the increased sales* and *anticipated profits* because of a more liberal policy. When firms extend trade credit, that is, invest in receivables, they intend to increase the sales. The impact of a liberal trade credit policy is likely to take two forms. First, it is oriented to sales expansion. In other words, a firm may grant trade credit either to increase sales to existing customers or attract new customers. This motive for investment in receivables is growth-oriented. Secondly, the firm may extend credit to protect its current sales against emerging competition. Here, the motive is sales-retention. As a result of increased sales, the profits of the firm will increase.

From the above discussion, it is clear that investments in receivables involve both benefits and costs. The extension of trade credit has a major impact on sales, costs and profitability. Other things being equal, a relatively liberal policy and, therefore, higher investments in receivables, will produce larger sales. However, costs will be higher with liberal policies than with more stringent measures. Therefore, accounts receivable management should aim at a trade-off between profit (benefit) and risk (cost). That is to say, *the decision to commit funds to receivables (or the decision to grant credit) will be based on a comparison of the benefits and costs involved, while determining the optimum level of receivables. The costs and benefits to be compared are marginal costs and benefits.* The firm should only consider the incremental (additional) benefits and costs that result from a change in the receivables or trade credit policy.³

While it is true that general economic conditions and industry practices have a strong impact on the level of receivables, a firm's investments in this type of current assets is also greatly affected by its internal policy. A firm has little or no control over environmental factors, such as economic conditions and industry practices. But it can improve its profitability through a properly conceived trade credit policy or receivables management.

LO 15.2 CREDIT POLICIES

In the preceding discussions it has been clearly shown that the firm's objective with respect to receivables management is not merely to collect receivables quickly, but attention should also be given to the benefit-cost trade-off involved in the various areas of accounts receivable management. The first decision area is credit policies.

The **credit policy** of a firm provides the framework to determine **(a)** whether or not to extend credit to a customer and **(b)** how much credit to extend. The credit policy decision of a firm has two broad dimensions: **(i)** Credit standards and **(ii)** Credit analysis. A firm has to establish and use *standards* in making credit decisions, develop appropriate sources of credit information and methods of credit analysis. We illustrate below how these two aspects are relevant to the accounts receivable management of a firm.

- **Credit policy**
- is the determination
- of credit standards
- and credit analysis.

Credit Standards

The term '**credit standards**' represents the basic criteria for the extension of credit to customers. The quantitative basis of establishing credit standards are factors such as credit ratings, credit references, average payments period and certain financial ratios.⁴ Since we are interested in illustrating the trade-off between benefit and cost to the firm as a whole, we do not consider here these individual components of credit standards. To illustrate the effect, we have divided the overall standards into (a) tight or restrictive, and (b) liberal or non-restrictive. That is to say, *our aim is to show what happens to the trade-off when standards are relaxed or, alternatively, tightened*. The trade-off with reference to credit standards covers **(i)** the collection cost, **(ii)** the average collection period/cost of investment in accounts receivable, **(iii)** level of bad debt losses, and **(iv)** level of sales. These factors should be considered while deciding whether to relax credit standards or not. If standards are relaxed, it means more credit will be extended while if standards are tightened, less credit will be extended. The implications of the four factors are elaborated below.

Credit standards are basic criteria/minimum requirement for extending credit to a customer.

Collection Costs The implications of relaxed credit standards are **(i)** more credit, **(ii)** a large credit department to service accounts receivable and related matters, **(iii)** increase in collection costs. The effect of tightening of credit standards will be exactly the opposite. These costs are likely to be semi-variable. This is because up-to a certain point the existing staff will be able to carry on the increased workload, but beyond that, additional staff would be required. These are assumed to be included in the variable cost per unit and need not be separately identified.

Investments in Receivables or the Average Collection Period The investment in accounts receivable involves a capital cost as funds have to be arranged by the firm to finance them till customers make payments. Moreover, the higher the average accounts receivable, the higher is the capital or carrying cost. A change in the credit standards—relaxation or tightening—leads to a change in the level of accounts receivable either through a change in **(a)** sales, or **(b)** collections.

A relaxation in credit standards, as already stated, implies an increase in sales which, in turn, would lead to higher average accounts receivable. Further, relaxed standards would mean that credit is extended liberally so that it is available to even less *creditworthy* customers who will take a longer period to pay overdues. The extension of trade credit to slow-paying customers would result in a higher level of accounts receivable.

In contrast, a tightening of credit standards would signify **(i)** a decrease in sales and lower average accounts receivable, and **(ii)** an extension of credit limited to more creditworthy customers who can promptly pay their bills and, thus, a lower average level of accounts receivable.

Thus, a change in sales and change in collection period together with a relaxation in standards would produce a higher carrying costs, while changes in sales and collection period result in lower costs when credit standards are tightened. These basic reactions also occur when changes in credit terms or collection procedures are made. We have discussed these in the subsequent sections of this chapter.

Bad Debt Expenses Another factor which is expected to be affected by changes in the credit standards is bad debt (default) expenses. They can be expected to increase with relaxation in credit standards and decrease if credit standards become more restrictive.

Sales Volume Changing credit standards can also be expected to change the volume of sales. As standards are relaxed, sales are expected to increase; conversely, a tightening is expected to cause a decline in sales.

The basic changes and effects on profits arising from a relaxation of credit standards are summarised in Exhibit 15.1. If the credit standards are tightened, the opposite effects, as shown in the brackets, would follow.

EXHIBIT 15.1 Effect of Relaxation of Standards

Item	Direction of Change (Increase = I Decrease = D)	Effect on Profits (Positive + Negative -)
1. Sales Volume	I(D)	+(-)
2. Average Collection Period	I(D)	-(+)
3. Bad Debt	I(D)	-(+)

The effect of alternative credit standards is illustrated in Example 15.1.

Example 15.1

A firm is currently selling a product @ ₹10 per unit. The most recent annual sales (all credit) were 30,000 units. The variable cost per unit is ₹.6 and the average cost per unit, given a sales volume of 30,000 units, is ₹8. The total fixed cost is ₹60,000. The average collection period may be assumed to be 30 days.

The firm is contemplating a relaxation of credit standards that is expected to result in a 15 per cent increase in units sales; the average collection period would increase to 45 days with no change in bad debt expenses. It is also expected that increased sales will result in additional net working capital to the extent of ₹10,000. The increase in collection expenses may be assumed to be negligible. The required return on investment is 15 per cent.

Should the firm relax the credit standard?

Solution

The decision to put the proposed relaxation in the credit standards into effect should be based on a comparison of (i) additional profits on sales and (ii) cost of the incremental investments in receivables. If the former exceeds the latter, the proposal should be implemented, otherwise not.

Profit on Incremental Sales This can be computed in two ways: (i) long approach, and (ii) short-cut-method.

Long Approach According to this approach, the costs and profits on both the present and the proposed sales level are calculated and the difference in profit at the two levels will be the incremental profit. This is shown in Table 15.1.

TABLE 15.1 Long Method to Calculate Marginal Profits

(A) Proposed Plan:		
1. Sales revenue (34,500 × units ₹10)		₹3,45,000
2. Less: Costs:		
(a) Variable (34,500 × ₹6)	₹2,07,000	
(b) Fixed	60,000	2,67,000
3. Profits from sales (I)		78,000
(B) Current Plan:		
1. Sales revenue (30,000 × units ₹10)		3,00,000
2. Less: Costs:		
(a) Variable (30,000 × ₹6)	1,80,000	
(b) Fixed	60,000	2,40,000
3. Profits from sales (II)		60,000
(C) Marginal profits with new plan (I - II):		18,000

Short-Cut Method The profits on sales will increase by an amount equal to the product of the additional units sold and additional profit per unit. Since the 30,000 units representing the current level of sales absorb all the fixed costs, any additional units sold will cost only the variable cost per unit. The marginal profit per unit will be equal to the difference between the sales price per unit (₹10) and the variable cost per unit (₹6). The marginal profit/contribution margin per unit would, therefore, be ₹4. The total additional (marginal) profits from incremental sales will be ₹18,000 (₹4,500 × ₹4).

Cost of Marginal/Incremental Investment in Receivables The second variable relevant to the decision to relax credit standards is the cost of marginal investment in accounts receivable. This cost can be computed by finding the difference between the cost of carrying receivables before and after the proposed relaxation in credit standards. It can be calculated as follows:

(i) Turnover of accounts receivable:

$$\text{Proposed plan} = \frac{\text{Number of days in the year}}{\text{Average collection period}} = \frac{360}{45} = 8$$

$$\text{Present plan} = \frac{360}{30} = 12$$

(ii) Total cost of sales:

$$\text{Present plan} = \text{Number of units} \times \text{cost per unit} = 30,000 \times ₹8 = ₹2,40,000$$

$$\text{Proposed plan} = (30,000 \times ₹8) + (4,500 \times ₹6) = ₹2,67,000$$

(iii) Average investment in accounts receivable:

$$\text{Present plan} = ₹2,40,000/12 = ₹20,000$$

$$\text{Proposed plan} = ₹2,67,000/8 = ₹33,375$$

(iv) The cost of marginal investments in accounts receivable: This is the difference between the average investments in accounts receivable under (i) the proposed plan and (ii) under the present plan. It is calculated as follows:

Average investments with proposed plan	₹33,375
Less average investment with present plan	20,000
Marginal investments	13,375

Marginal investments represent the amount of additional funds required to finance incremental accounts receivable if the proposal to relax the credit standards is implemented. The additional cost of ₹13,375 is the cost of marginal investment in accounts receivable.

$$\text{Given 15 per cent as required return on the investments, the cost} = \frac{₹13,375 \times 15}{100} = ₹2,006.25$$

This is an opportunity cost in that the firm would earn this amount from alternative uses if the funds are not tied up in additional accounts receivable.

(v) Cost of working capital: ₹10,000 × 0.15 = ₹1,500.

In the above illustration, since the additional profits on increased sales as a result of relaxed credit standards (₹18,000) is considerably more than the cost of incremental investments in accounts receivable (₹2,006.25) and working capital (₹1,500), the firm should relax its credit standards. Such an action would lead to an overall increase in the profits of the firm by ₹14,493.75 (₹18,000 – ₹2,006.25 – ₹1,500).

The effect of tightening credit standards would be just the opposite and can be illustrated on the above lines.

Credit Analysis

Besides establishing credit standards, a firm should develop procedures for evaluating credit applicants. The second aspect of credit policies of a firm is **credit analysis** and investigation. Two basic steps are involved in the credit investigation process: **(a)** obtaining credit information, and **(b)** analysis of credit information. It is on the basis of credit analysis that the decisions to grant credit to a customer as well as the quantum of credit would be taken.

- Credit analysis
- involves obtaining
- credit information
- and evaluation of
- credit applicants.

Obtaining Credit Information The first step in credit analysis is obtaining credit information on which to base the evaluation of a customer. The sources of information, broadly speaking, are (i) internal, and (ii) external.

Internal Usually, firms require their customers to fill various forms and documents giving details about financial operations. They are also required to furnish trade references with whom the firms can have contacts to judge the suitability of the customer for credit. This type of information is obtained from internal sources of credit information. Another internal source of credit information is derived from the records of the firms contemplating an extension of credit. It is likely that a particular customer/applicant may have enjoyed credit facility in the past. In that case, the firm would have information on the behaviour of the applicant(s) in terms of the historical payment pattern. This type of information may not be adequate and may, therefore, have to be supplemented by information from other sources.

External The availability of information from external sources to assess the credit-worthiness of customers depends upon the development of institutional facilities and industry practices. In India, the external sources of credit information are not as developed as in the industrially advanced countries of the world. Depending upon the availability, the following external sources may be employed to collect information.

Financial Statements One external source of credit information is the published financial statements, that is, the balance sheet and the profit and loss account. The financial statements contain very useful information. They throw light on an applicant's financial viability, liquidity, profitability and debt capacity. Although the financial statements do not directly reveal the past payment record of the applicant, they are very helpful in assessing the overall financial position of a firm, which significantly determines its credit standing.

Bank References Another useful source of credit information is the bank of the firm which is contemplating the extension of credit. The *modus operandi* here is that the firm's banker collects the necessary information from the applicant's banks. Alternatively, the applicant may be required to ask his banker to provide the necessary information either directly to the firm or to its bank.

Trade References These refer to the collection of information from firms with whom the applicant has dealings and who on the basis of their experience would vouch for the applicant.

Credit Bureau Reports Finally, specialist *credit bureau* reports from organisations specialising in supplying credit information can also be utilised.

Analysis of Credit Information Once the credit information has been collected from different sources, it should be analysed to determine the credit worthiness of the applicant. Although there are no established procedures to analyse the information, the firm should devise one to suit its needs. The analysis should cover two aspects: **(i)** quantitative, and **(ii)** qualitative.

... ..

... ..

... ..

... ..

... ..

... ..

Quantitative The assessment of the quantitative aspects is based on the factual information available from the financial statements, the past records of the firm, and so on. The first step involved in this type of assessment is to prepare an *Aging Schedule* of the accounts payable of the applicant as well as calculate the average age of the accounts payable. This exercise will give an insight into the past payment pattern of the customer. Another step in analysing the credit information is through a ratio analysis of the liquidity, profitability and debt capacity of the applicant. These ratios should be compared with the industry average. Moreover, trend analysis over a period of time would reveal the financial strength of the customer.

Qualitative The quantitative assessment should be supplemented by a qualitative/subjective interpretation of the applicant's creditworthiness. The subjective judgement would cover aspects relating to the quality of management. Here, the references from other suppliers, bank references and specialist bureau reports would form the basis for the conclusions to be drawn. In the ultimate analysis, therefore, the decision whether to extend credit to the applicant and what amount to extend will depend upon the subjective interpretation of his credit standing.

LO 15.3 CREDIT TERMS

The second decision area in accounts receivable management is the credit terms. After the credit standards have been established and the creditworthiness of the customers has been assessed, the

Credit terms specify the repayment terms required of credit customers/receivables.

management of a firm must determine the terms and conditions on which trade credit will be made available. The stipulations under which goods are sold on credit are referred to as **credit terms**. These relate to the repayment of the amount under the credit sale. Thus, credit terms specify the repayment terms of receivables.

Credit terms have three components: **(a) credit period**, in terms of the duration of time for which trade credit is extended—during this period the overdue amount must be paid by the customer; **(b) cash discount**, if any, which the customer can take advantage of, that is, the overdue amount will be reduced by this amount; and **(c) cash discount period**, which refers to the duration during which the discount can be availed of. These terms are usually written in abbreviations, for instance, '2/10 net 30'. The three numerals are explained below:

Credit period is the time for which trade credit is extended to customer in the case of credit sales.

- 2 signifies the rate of cash discount (2 per cent), which will be available to the customers if they pay the overdue within the stipulated time;
- 10 represents the time duration (10 days) within which a customer must pay to be entitled to the discount;
- 30 means the maximum period for which credit is available and the amount must be paid in any case before the expiry of 30 days.

Cash discount is the incentive to customer to make early payment of sum due.

In other words, the abbreviation 2/10 net 30 means that the customer is entitled to 2 per cent cash discount (discount rate) if he pays within 10 days (discount period) after the beginning of the credit period (30 days). If, however, he does not want to take advantage of the discount, he may pay within 30 days. If the payment is not made within a maximum period of 30 days, the customer would be deemed to have defaulted.

Cash discount period is the duration of the period during which discount can be availed of.

The credit terms, like the credit standards, affect the profitability as well as the cost of a firm. A firm should determine the credit terms on the basis of cost-benefit trade-off. We illustrate below how the three components of credit terms, namely, rate

of discount, period of discount and the credit period, affect the trade-off. It should be noted that *our focus in analysing the credit terms is from the view point of suppliers of trade credit and not the recipients for whom it is a source of financing.*⁵

Cash Discount

The cash discount has implications for the sales volume, average collection period/average investment in receivables, bad debt expenses and profit per unit. In taking a decision regarding the grant of cash discount, the management has to see what happens to these factors if it initiates increase, or decrease in the discount rate. The changes in the discount rate would have both positive and negative effects. The implications of increasing or initiating cash discount are as follows:

1. The sales volume will increase. The grant of discount implies reduced prices. If the demand for the products is elastic, reduction in prices will result in higher sales volume.
2. Since the customers, to take advantage of the discount, would like to pay within the discount period, the average collection period would be reduced. The reduction in the collection period would lead to a reduction in the investment in receivables as also the cost. The decrease in the average collection period would also cause a fall in bad debt expenses. As a result, profits would increase.
3. The discount would have a negative effect on the profits. This is because the decrease in prices would affect the profit margin per unit of sale.

The effects of increase in the cash discount are summarised in Table 15.2. The effect of decrease in cash discount will be exactly opposite.

TABLE 15.2 Effects of Increase in Cash Discounts

Item	Direction of Change (I = Increase D = Decrease)	Effect on Profits (Positive+ or Negative-)
Sales Volume	I	+
Average Collection Period	D	+
Bad Debt Expenses	D	+
Profit Per Unit	D	-

The cash discount decision is illustrated in Example 15.2.

Example 15.2

Assume that the firm in our Example 15.1 is contemplating to allow 2 per cent discount for payment within 10 days after a credit purchase. It is expected that if discounts are offered, sales will increase by 15 per cent and the average collection period will drop to 15 days. Assume bad debt expenses will not be affected; return on investment expected by the firm is 15 per cent; 60 per cent of the total sales will be on discount. Should the firm implement the proposal?

Solution

- (i) Profit on sales: The profit on sale = sale of additional units multiplied by the difference between the sales price and the variable cost per unit = $4,500 (\text{₹}10 - \text{₹}6) = 4,500 \times \text{₹}4 = \text{₹}18,000$
- (ii) Saving on average collection period: This saving is what would have been earned on the reduced investments in accounts receivable as a result of the cash discount.

$$\text{Average investment in accounts receivable} = \frac{\text{Cost of sales}}{\text{Receivables turnover}}$$

$$(a) \text{ Present plan (without discount)} = \frac{(30,000 \times ₹8)}{12 \text{ (i.e. } 360/30)} = ₹20,000$$

$$(b) \text{ Proposed plan (with discount)} = \frac{(30,000 \times ₹8) + (4,500 \times ₹6)}{24 \text{ (i.e. } 360/15)} = \frac{₹2,67,000}{24} = ₹11,125$$

Thus, if cash discount is allowed, the average investments in receivables will decline by ₹8,875 (i.e. ₹20,000 – ₹11,125). Given a 15 per cent rate of return, the firm could earn ₹1,331.25 on ₹8,875. Thus, the saving resulting from a drop in the average collection period is ₹1,331.25.

(iii) The total benefits associated with the cash discount

Profit on additional sale	₹18,000.00
Saving in cost	1,331.25
Total	19,331.25

(iv) Cash discount: The cost involved in the cash discount on credit sales, that is, 2 per cent of credit sales = $0.02 \times ₹2,07,000$ (i.e. $0.60 \times ₹3,45,000$) = ₹4,140

Thus, against a cost of ₹4,140, the benefit from initiating cash discount is ₹19,331.25; that is, there is a net gain of ₹15,191.25 (₹19,331.25 – ₹4,140). The firm should, therefore, implement the proposal to allow 2 per cent cash discount for payment within 10 days of the credit purchase by the customers.

A similar type of analysis can be made to illustrate the effect of either reduction or elimination of cash discount.

Credit Period

The second component of credit terms is the credit period. The expected effect of an increase in the credit period is summarised in Table 15.3.

TABLE 15.3 Effect of Increase in Credit Period

Item	Direction of Change (I = Increase D = Decrease)	Effect on Profits (Positive or Negative)
Sales Volume	I	+
Average Collection Period	I	-
Bad Debt Expenses	I	-

A reduction in the credit period is likely to have an opposite effect. The credit period decision is illustrated in Example 15.3.

Example 15.3

Suppose, a firm is contemplating an increase in the credit period from 30 to 60 days. The average collection period which is at present 45 days is expected to increase to 75 days. It is also likely that the bad debt expenses will increase from the current level of 1 per cent to 3 per cent of sales. Total credit sales are expected to increase from the level of 30,000 units to 34,500 units. The present average cost per unit is ₹8, the variable cost and sales per unit is ₹6 and ₹10 per unit respectively. Assume the firm expects a rate of return of 15 per cent.

Should the firm extend the credit period?

Solution

(i) Profit on additional sales: = $(₹4 \times 4,500) = ₹18,000$

(ii) Cost of additional investments in receivables: = Average investments with the proposed credit period less average investments in receivables with the present credit period:

$$\text{Proposed plan} = \frac{\text{Cost of sales}}{\text{Turnover of receivables}} = \frac{(\text{₹}8 \times 30,000) + (\text{₹}6 \times 4,500)}{360 + 75} = \text{₹}55,625$$

$$\text{Present plan} = \frac{(\text{₹}8 \times 30,000)}{360 + 45} = \text{₹}30,000$$

Additional investment in accounts receivable = ₹55,625 – ₹30,000 = ₹25,625

Cost of additional investment at 15 per cent = 0.15 × ₹25,625 = ₹3,843.75.

(iii) Additional bad debt expenses: This is the difference between the bad debt expenses with the proposed and present credit periods.

Bad debt with proposed credit period = 0.03 × ₹3,45,000 = ₹10,350

Bad debt with present credit period = 0.01 × ₹3,00,000 = ₹3,000

Additional bad debt expense = (₹10,350 – ₹3,000) = ₹7,350

Thus, the incremental cost associated with the extension of the credit period is ₹11,193.75 (₹3,843.75 + ₹7,350). As against this, the benefits are ₹18,000. There is, therefore, a net gain of ₹6,806.25, that is, (₹18,000 – ₹11,193.75). The firm would be well-advised to extend the credit period from 30 to 60 days.

TABLE 15.4 Effect of Relaxation of Credit Period to Two Months

Particulars	Amount
Incremental sales revenue (4,500 × ₹10)	₹45,000
Less: incremental variable costs (4,500 × ₹6)	27,000
Incremental contribution	18,000
Less: incremental cost of additional investment in debtors	3,843.75
Less: increase in bad debts	7,350.00
Incremental profit	6,806.25

The effect of a decrease in the credit period can be similarly analysed.

Cost of Additional Investment in Debtors

There are two approaches to determine the cost of additional investment in debtors: (1) Total cost (FC + VC) and (2) Variable costs only. The rationale for the total cost is that the firm needs to finance total cost, whether it is fixed or variable as far as credit sales/investment in debtors is concerned. Its investments are not limited to VC only. The variable cost approach contends that the existing fixed costs are sunk costs and they are to be incurred by the corporate irrespective of the production/sales volume. Therefore, they are irrelevant costs as they are not additional out-of-pocket costs, as far as, additional investment in debtors is concerned. Therefore, the average investment in debtors in present as well as proposed plans should be computed dividing the total variable costs of sales by debtors turnover.⁶

The concept of additional investment in debtors, based on variable cost approach, is explained, based on the data contained in Example 15.3, below.

Average investment in debtors = Total VC/Debtors turnover
Present plan: (₹6 × 30,000 units = ₹1,80,000) ÷ 8 = ₹22,500
Proposed plan: (₹6 × 34,500 units = ₹2,07,000) ÷ 4.8 = ₹43,125
Additional investment: (₹43,125 – ₹22,500) = ₹20,625
Cost of additional investment (₹20,625 × 0.15) = ₹3,093.75
Incremental profit (₹3,843.75 – ₹3,093.75) = ₹750 (Total = ₹7,556.25)

The marginal/additional investment in debtors based on VC approach would obviously be lower than the total cost (TC) approach, leading to less financial cost. This, in turn, would result in higher incremental profits (or lower loss) in the VC approach compared to the total cost approach.

Cost of Additional Investment in Cash and Inventories (Net of Additional Creditors)

Liberal credit terms, in general, lead to additional sales which, in turn, would require higher level of production. To support this higher level of operations, the corporates would evidently require additional working capital in terms of higher level of safety stocks of cash and inventories of all types, besides increased investments in debtors (**explained earlier**). Assuming the requirement net of additional accounts payable is positive, this also needs to be financed. In operational terms, there is need to take into account financial cost of such additional investments to evaluate true profitability of the proposed relaxation in credit terms.

Continuing with Examples 15.3, assume additional net working capital (duly adjusted for increased creditors), besides debtors, is ₹4,000; the cost of ₹4,000 at 15 per cent is ₹600. As a result of this additional cost, profits would decrease by ₹600 to ₹6,206.26 (total cost approach) and to ₹6,956.25 (variable cost approach.)

LO 15.4 COLLECTION POLICIES

The third area involved in the accounts receivable management is collection policies. They refer to the procedures followed to collect accounts receivable when, after the expiry of the credit period, they become due. These policies cover two aspects:

Collection policy involves

procedures for collecting accounts receivables when they are due.

(i) degree of effort to collect the overdues, and (ii) type of collection efforts.

Degree of Collection Effort

To illustrate the effect of the collection effort, the credit policies of a firm may be categorised into (i) strict/light, and (ii) lenient. The collection policy would be tight if very rigorous procedures are followed. A tight collection policy has implications which involve benefits as well costs. The management has to consider a trade-off between them. Likewise, a lenient collection effort also affects the cost-benefit trade-off. The effect of tightening the collection is discussed below.

In the first place, the bad debt expenses (default cost) would decline. Moreover, the average collection period will be reduced. As a result of these two effects, the firm will benefit and its profits will increase. But, there would be a negative effects also. A very rigorous collection strategy would involve increased collection costs. Yet another negative effect may be in the form of a decline in the volume of sales. This may be because some customers may not like the pressure and intense efforts initiated by the firm, and may switch to other firms. These effects are tabulated in Table 15.5.

TABLE 15.5 Basic Trade-off from Tight Collection Effort

Item	Direction of Change (I = Increase D = Decrease)	Effect on Profits [Positive (+) or Negative (-)]
Bad Debt Expenses	D	+
Average Collection Period	D	+
Sales Volume	D	-
Collection Expenditure	I	-

The effect of the lenient policy will be just the opposite. We illustrate the basic trade-off in Example 15.4.

Example 15.4

A firm is contemplating stricter collection policies. The following details are available:

- At present, the firm is selling 36,000 units on credit at a price of ₹32 each; the variable cost per unit is ₹25 while the average cost per unit is ₹29; average collection period is 58 days; and collection expenses amount to ₹10,000; bad debts are 3 per cent.
- If the collection procedures are tightened, additional collection charges amounting to ₹20,000 would be required, bad debts will be 1 per cent; the collection period will be 40 days; sales volume is likely to decline by 500 units.

Assuming a 20 per cent rate of return on investments, what would be your recommendation? Should the firm implement the decision?

Solution

(i) Bad debt expenses:

Present plan: $(0.03 \times ₹11,52,000)$	₹34,560
Proposed plan: $(0.01 \times ₹11,36,000)$	11,360
Savings in bad debt expenses	23,200

(ii) Average collection period/average investment in receivables:

Present plan = $\frac{36,000 \times ₹29}{360 \div 58}$	1,68,200 (a)
Proposed plan = $\frac{(36,000 \times ₹29) - (500 \times ₹25)}{360 \div 40}$	1,14,611 (b)

Savings in average investments (a - b) 53,589

Assuming a 20 per cent return, the firm will be able to earn ₹10,718 on this saving.

(iii) Sales volume: Since the sales volume will decline by 500 units, there would be a loss of ₹3,500 $(500 \times ₹7)$.

(iv) Additional collection charges = ₹20,000.

Thus, the total benefits from a tightening of the collection policy will be ₹33,918 $(₹23,200 + ₹10,718)$ and the total cost will be ₹23,500 $(₹3,500 + ₹20,000)$. Therefore, there would be a net gain of ₹10,418 $(₹33,918 - ₹23,500)$. The firm should, therefore, implement the proposed strategy.

Example 15.5

Super Sports, dealing in sports goods, has an annual sale of ₹50 lakh and currently extending 30 days' credit to the dealers. It is felt that sales can pick up considerably if the dealers are willing to carry increased stocks, but the dealers have difficulty in financing their inventory. The firm is, therefore, considering shifts in credit policy. The following information is available:

The average collection period now is 30 days.
Variable costs, 80 per cent of sales.
Fixed costs, ₹6 lakh per annum
Required (pre-tax) return on investment: 20 per cent

THE JOURNAL OF THE

Credit policy	Average collection period (days)	Annual sales (₹ lakh)
A	45	56
B	60	60
C	75	62
D	90	63

Determine which policy the company should adopt.

Solution

Evaluation of Proposed Credit Policies

(Amount in ₹ lakh)

Particulars	Present (30)	Proposed (number of days)			
		A(45)	B(60)	C(75)	D(90)
(a) Sales revenue	50	56	60	62	63
Less: Variable costs (80% of sales)	40	44.8	48	49.6	50.4
Total contribution	10	11.2	12	12.4	12.6
Less: Fixed costs	6	6	6	6	6
Profit	4	5.2	6	6.4	6.6
Increase in profits due to increase in total contribution (20% of sales) compared to present profits	—	1.2	2	2.4	2.6
(b) Investment in debtors:					
Total cost (VC + FC)	46	50.8	54	55.6	56.4
Debtors turnover (DT) (360 days collection period)	12	8	6	4.8	4
Average investment (total cost + DT)	3.83	6.35	9	11.58	14.10
Additional investment compared to present level	—	2.52	5.17	7.75	10.27
Cost of additional investment	—	0.50	1.03	1.55	2.05
(c) Incremental profit (a – b)	—	0.70	0.97	0.85	0.55

Policy B (average collection period 60 days) should be adopted as it yields maximum profit.

Example 15.6

XYZ Corporation is considering relaxing its present credit policy and is in the process of evaluating two alternative policies. Currently, the firm has annual credit sales of ₹50 lakh and accounts receivable turnover ratio of 4 times a year. The current level of loss due to bad debts is ₹1,50,000. The firm is required to give a return of 25 per cent on the investment in new accounts receivable. The company's variable costs are 70 per cent of the selling price. Given the following information, which is a better option?

Particulars	Present policy	Policy option I	Policy option II
Annual credit sales	₹50,00,000	₹60,00,000	₹67,50,000
Accounts receivable turnover ratio	4	3	2.4
Bad debt losses	1,50,000	3,00,000	4,50,000

Solution

Relative Suitability of Policy Options

Particulars	Present policy	Policy option I	Policy option II
Sales revenue	₹50,00,000	₹60,00,000	₹67,50,000
Less: Variable cost (70%)	35,00,000	42,00,000	47,25,000
Contribution margin (manufacturing)	15,00,000	18,00,000	20,25,000
Less: Other relevant costs:			
Bad debt losses	1,50,000	3,00,000	4,50,000
Investment cost (see working notes)	2,18,750	3,50,000	4,92,187.50
Contribution margin (final)	11,31,250	11,50,000	10,82,812.50

Recommendation The firm is advised to adopt policy option I (extend credit terms to 4 months).

Working Notes

Strictly speaking, investment in accounts receivable should be determined with reference to total cost of goods sold on credit. However, fixed costs are not given. It is assumed that there are no fixed costs and investment in debtors/receivables is determined with reference to variable costs only.

$$\text{Present policy: } \frac{\text{₹ } 35,00,000}{4} = \text{₹ } 8,75,000 \times 0.25 = \text{₹ } 2,18,750$$

$$\text{Policy option I: } \frac{\text{₹ } 42,00,000}{3} = \text{₹ } 14,00,000 \times 0.25 = \text{₹ } 3,50,000$$

$$\text{Policy option II: } \frac{\text{₹ } 47,25,000}{2.4} = \text{₹ } 19,68,750 \times 0.25 = \text{₹ } 4,92,187.5$$

Type of Collection Efforts

The second aspect of collection policies relates to the steps that should be taken to collect overdue from the customers. A well-established collection policy should have clear-cut guidelines as to the sequence of collection efforts. After the credit period is over and payment remains due, the firm should initiate measures to collect them. The effort should in the beginning be polite, but, with the passage of time, it should gradually become strict. The steps usually taken are **(i)** letters, including reminders, to expedite payment; **(ii)** telephone calls for personal contact; **(iii)** personal visits; **(iv)** help of collection agencies; and finally, **(v)** legal action. The firm should take recourse to very stringent measures, like legal action, only after all other avenues have been fully exhausted. They not only involve a cost but also affect the relationship with the customers. The aim should be to collect as early as possible; genuine difficulties of the customers should be given due consideration.

SUMMARY

When a firm sells goods and services on credit, it creates accounts receivable/debtors which would be collected in future. Accounts receivable, represent an extension of credit to customers, allowing them a reasonable period of time, in which to pay for the goods/services purchased by them. In fact, credit sales and, therefore, receivables are considered as a marketing tool to promote sales and thereby profits.

The extension of credit involves risk and cost. The objective of receivables management, therefore, is to have a trade-off between the benefits and costs associated with the extension of credit. The benefits are increased sales and anticipated increased profits/incremental contribution. The major costs are collection costs, capital costs, delinquency costs and default costs. The firm should consider only the incremental benefits and costs that result from a change in the receivables or trade credit policy.

The management of receivables involves crucial decision in three areas: (i) credit policies, (ii) credit terms and (iii) collection policies.

The credit policy of a firm provides the framework to determine whether or not to extend credit to a customer and how much credit to extend. The two broad dimensions of credit policy decision of a firm are credit standards and credit analysis.

Credit standards represent the basic criterion for the extension of credit to customers. These can be either tight/restrictive or liberal/non-restrictive. The trade-off with reference to credit standards cover: (i) collection cost, (ii) cost of investment in debtors, (iii) bad debts and (iv) level of sales profit/contribution. The credit analysis component of credit policies includes obtaining credit information from different sources and its analysis.

LO 15.2

In case, the standards are relaxed, it implies credit for a longer period will be extended. More credit results in increase in sales. The benefits of incremental sales are to be weighed against incremental collection costs, interest costs due to additional investment in debtors, delinquency cost and bad debts.

When standards are tightened, it implies less period of credit extended to customers. It would result in decrease in sales. The contribution foregone due to decrease in sales is to be compared with savings due to the lower collection costs, interest costs and bad debt losses.

LO 15.3

Credit terms specify the repayment terms. The credit terms have three components: (i) credit period, (ii) cash discount and (iii) cash discount period. The credit terms should be determined on the basis of cost-benefit trade-off in these three components.

LO 15.4

Collection policies refer to the procedure followed to collect the receipts when they become due. The collection policies may be classified into (i) strict and (ii) liberal. The effects of tightening the collection policy would be: (i) decline in debts, (ii) decline in collection period resulting lower interest costs, (iii) increase in collection costs and (iv) decline in sales. The effects of a lenient policy would be exactly the opposite.

The framework of analysis of all the three decision areas in receivables management is to secure a trade-off between the costs and benefits of the measurable effects on the sales volume, capital cost due to change in investment in debtors, collection costs, bad debts and so on. The firm should select an alternative which has potentials of more benefits than the cost.

SOLVED PROBLEMS

P.15.1 H Ltd has at present annual sales level of ₹10,000 units at ₹300 per unit. The variable cost is ₹200 per unit and fixed cost amount to ₹3,00,000 per annum. The present credit period allowed by the company is 1 month. The company is considering a proposal to increase the credit period to 2 months and 3 months and has made the following estimates:

LO 15.2,4 LOD E

	Existing		Proposed	
Credit period (month)	1	2	3	3
Increase in sales (per cent)	—	15	30	30
Bad debts (per cent)	1	3	5	5

There will be increase in fixed cost by ₹50,000 on account of increase in sales beyond 25 per cent of present level. The company plans a pre-tax return of 20 per cent on investment in receivables.

You are required to calculate the most paying credit policy for the company.

Solution

Decision-making (liberalisation of credit period to 2 months or 3 months)

Particulars	1 month	2 months	3 months
Sales (units)	10,000	11,500	13,000
Sale revenue	₹30,00,000	₹34,50,000	₹39,00,000
Less: Variable costs	20,00,000	23,00,000	26,00,000
Total contribution	10,00,000	11,50,000	13,00,000
Less: Other costs:			
Fixed costs	3,00,000	3,00,000	3,50,000
Bad debts	30,000	1,03,500	1,95,000
Investment cost (see working notes)	38,333	86,667	1,47,500
Profit	6,31,667	6,59,833	6,07,500

Recommendation The firm is advised to adopt policy of extending credit of 2 months as it yields maximum profit.

Working Note

	Existing	2 months	3 months
Investment in debtors (VC + FC)/Debtors turnover	(₹ 23,00,000) 12 = ₹1,91,667	(₹ 26,00,000) 6 = ₹4,33,333	(₹ 29,50,000) 4 = ₹7,37,500
Cost of investment (Investment in debtors × 0.20)	38,333	86,667	1,47,500

P.15.2 Golden Syntex has annual sales of ₹24,00,000. The selling price per unit is ₹10 and the variable cost is 70 per cent of the selling price. The required rate of return on investment is 20 per cent, average cost, ₹9 per unit; annual collection expenditure, ₹50,000 and percentage of default, 3 per cent; credit terms, 2 months. Golden Syntex is considering the change in credit policy by following Programme A or Programme B.

LO 15.2,4

M

	Programme	
	A	B
Average collection period (months)	1.5	1
Annual collection expenditure (₹)	75,000	1,50,000
Percentage of default (%)	2	1

Determine which collection programme should Golden Syntex follow?

Solution

Financial evaluation of proposed programmes (A or B) relating to credit policy

Particulars	Existing	Programme A	Programme B
Cost of operation:			
Annual collection expenditure	₹50,000	₹75,000	₹1,50,000
Losses due to default/bad debts (on sales of ₹24,00,000)	72,000	48,000	24,000
Cost of investment in debtors (see working note 1)	72,000	54,000	36,000
Total	1,94,000	1,77,000	2,10,000

Recommendation Golden Syntex is advised to adopt Programme A as its entails minimum cost of operation.

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

... ..

Working Note

Cost of investment in debtors

Particulars	Existing	Programme A	Programme B
(a) Investment in debtors			
[(2,40,000 units × ₹7) + (2,40,000 × ₹2)]	(₹ 21.6 lakh) 6 = ₹3,60,000	(₹ 21.6 lakh) 8 = ₹2,70,000	(₹ 21.6 lakh) 12 = ₹1,80,000
(b) Required rate of return (%)	20	20	20
(c) Cost of investment in debtors (a × b)	72,000	54,000	36,000

P.15.3 Sagar company currently makes all sales on credit and offers no cash discount. It is considering a 2 per cent cash discount for payment within 10 days. The firm's current average collection period is 60 days, sales are 2,00,000 units, selling price is ₹30 per unit, variable cost per unit is ₹20 and average cost per unit is ₹25 at the current sales volume. **LO 15.3,4**

It is expected that the change in credit terms will result in increase in sales to 2,25,000 units and the average collection period will fall to 45 days. However, due to increased sales, increased working capital required will be ₹1,00,000 (it does not take into account the effect on debtors). Assuming that 50 per cent of the total sales will be on cash discount and 20 per cent is the required return on investment, should the proposed discount be offered?

Solution

Effect of extending cash discount to customers

Particulars	Amount
Increased sales revenue (25,000 × ₹30)	₹7,50,000
Less: Variable costs (25,000 × ₹20)	5,00,000
Incremental contribution	2,50,000
Add: Savings in cost due to decrease in investment in debtors (see working note 1)	29,167
Less: Cost of additional working capital required (₹1,00,000 × 0.20)	(20,000)
Less: Cost involved in cash discount (0.02 × 2,25,000 units × ₹30 × 0.5)	(67,500)
Profit	1,91,667

It is advised that the firm should offer cash discount to its customers.

Working Note

1. Savings due to decrease in average collection period:

$$\text{Present investment in debtors (without cash discount)} = \frac{2,00,000 \times ₹25}{6 (360 \text{ days}/60)} = ₹8,33,333$$

$$\text{Expected investment in debtors (with cash discount)} = \frac{2,00,000 \times ₹25 + 25,000 \times ₹20}{8 (360 \text{ days}/45)} = ₹6,87,500$$

$$\text{Decrease in investment in debtors} = ₹8,33,333 - ₹6,87,500 = ₹1,45,833$$

$$\text{Savings in cost} = ₹1,45,833 \times 0.20 = ₹29,167$$

P.15.4 Easy Limited specialises in the manufacture of a computer component. The component is currently sold for ₹1,000 and its variable cost is ₹800. For the current year ended December 31, the company sold on an average 400 components per month. **LO 15.3,4**

At present, the company grants one month's credit to its customers. It is thinking of extending the same to two months on account of which the following are expected:

- Increase in sales, 25 per cent
- Increase in stock, ₹2,00,000
- Increase in creditors, ₹1,00,000

You are required to advise the company on whether or not to extend credit terms if (a) all customers avail of the extended credit period of two months and (b) existing customers do not avail of the credit terms but only the new customers avail of the same. Assume the entire increase in sales is attributable to the new customers.

The company expects a minimum return of 40 per cent on the investments.

Solution**(a)** Effect of relaxation of credit period to two months

Particulars	Amount
Incremental sales revenue (100 components \times 12 \times ₹1,000)	₹12,00,000
Less: Increased variable costs (₹12,00,000 \times 0.80)	9,60,000
Incremental contribution	2,40,000
Less: Cost of additional working capital required (see working note 1)	2,32,000
Incremental profit	8,000

Working Note 1

(i) Present investment in debtors: $\frac{400 \times 12 \times ₹800}{12 \text{ (Debtors turnover ratio)}}$	₹3,20,000
(ii) Proposed investment in debtors: $\frac{500 \times 12 \times ₹800}{6 \text{ (Debtors turnover ratio)}}$	8,00,000
(iii) Additional investment in debtors	4,80,000
Add: Increase in stock	2,00,000
Less: Increase in creditors	1,00,000
Additional working capital required	5,80,000
(iv) Minimum return expected on additional working capital (₹5,80,000 \times 0.40)	2,32,000

(b) Effect of relaxation of credit period to two months

Particulars	Amount
Incremental contribution (as per (a) above)	₹2,40,000
Less: Cost of additional working capital (see working note 2)	1,04,000
Incremental profit	1,36,000

Working Note 2

(i) Additional investment in debtors (100 \times 12 \times ₹800/6)	₹1,60,000
Add: Increase in stock	2,00,000
Less: Increase in creditors	1,00,000
Additional working capital required	2,60,000
(ii) Minimum return expected on additional working capital (₹2,60,000 \times 0.40)	1,04,000

P.15.5 Star Limited, manufacturers of colour TV sets, are considering the liberalisation of existing credit terms to three of their large customers. The credit period and likely quantity of TV sets that will be lifted by the customers are as follows:

1818

1818

NAME	AGE	SEX	RELATION
John A. Smith	25	M	Head
Mary A. Smith	22	F	Wife
William A. Smith	10	M	Son
Elizabeth A. Smith	8	F	Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

NAME	AGE	SEX	RELATION
John A. Smith	25	M	Head
Mary A. Smith	22	F	Wife
William A. Smith	10	M	Son
Elizabeth A. Smith	8	F	Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

NAME	AGE	SEX	RELATION
John A. Smith	25	M	Head
Mary A. Smith	22	F	Wife
William A. Smith	10	M	Son
Elizabeth A. Smith	8	F	Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

NAME	AGE	SEX	RELATION
John A. Smith	25	M	Head
Mary A. Smith	22	F	Wife
William A. Smith	10	M	Son
Elizabeth A. Smith	8	F	Daughter

John A. Smith, 25, M, Head
 Mary A. Smith, 22, F, Wife
 William A. Smith, 10, M, Son
 Elizabeth A. Smith, 8, F, Daughter

Credit period (days)	Quantity lifted		
	A	B	C
0	1,000	1,000	—
30	1,000	1,500	—
60	1,000	2,000	1,000
90	1,000	2,500	1,500

The selling price per TV set is ₹9,000. The expected contribution is 20 per cent of the selling price. The cost of carrying debtors averages 20 per cent per annum.

You are required:

- To determine the credit period to be allowed to each customer (assume 360 days in a year for calculation purposes).
- What other problems the company might face in allowing the credit period as determined in (a) above?

Solution

(a) In case of customer A, liberalisation of credit period does not affect sales. No credit should be allowed to him.

Effect of extending credit period to customer B and C (Amount in lakhs of rupees)

Particulars	Customer B (days)				Customer C (days)	
	0	30	60	90	60	90
Sales	90	135	180	225	90	135
Less: Variable costs (0.80)	72	108	144	180	72	108
Contribution (0.20)	18	27	36	45	18	27
Less: Cost of investments in debtors (at VC)	—	1.8	4.8	9.0	2.4	5.4
$\left(\frac{\text{Total VC}}{\text{Debtors turnover}} \right) \times 0.20$	—	$\left(\frac{108}{360/30} \right)$	$\left(\frac{144}{360/60} \right)$	$\left(\frac{180}{360/90} \right)$	$\left(\frac{72}{360/60} \right)$	$\left(\frac{108}{360/90} \right)$
Profit	18	25.2	31.2	36	15.6	21.6

Profits are maximum when credit period is 90 days to both customers.

(b) When customer A comes to know of 90 days credit extended to customer B and C, he will either seek similar credit period or press for cash discount.

Customer B will seek either higher credit period or trade discount for buying more than Customer C.

P.15.6 Radiance garments Ltd. manufactures readymade garments and sells them on credit basis through a network of dealers. Its present sale is ₹60 lakh per annum with 20 days credit period. The company is contemplating an increase in the credit period with a view to increasing sales. **LO 15.2,4** Present variable costs are 70 per cent of sales and the total fixed costs ₹8 lakh per annum. The company expects pre-tax return on investment @ 25 per cent. Some other details are given as under:

Proposed credit policy	Average collection period (days)	Expected annual sales (₹ lakh)
I	30	65
II	40	70
III	50	74
IV	60	75

Required: Which credit policy should the company adopt? Present your answer in a tabular form. Assume 360-day a year. Calculations should be made upto two digits after decimal.

Solution

Evaluation of proposed credit policies

(Amount in ₹ lakh)

Particulars	Present	Proposed (number of days)			
	(20)	I (30)	II (40)	III (50)	IV (60)
(a) Sales revenue	60	65	70	74	75
Less: Variable costs (VC)	42	45.5	49	51.8	52.5
Total contribution	18	19.5	21	22.2	22.5
Less: Fixed costs (FC)	8	8	8	8	8
Profit	10	11.5	13	14.2	14.5
Increase in profit due to increase in total contribution compared to present profit	—	1.5	3	4.2	4.5
(b) Investment in debtors/receivables:					
Total costs (VC + FC)	50	53.5	57	59.8	60.5
Debtors turnover ratio (DT) (360 + Average collection period)	18	12	9	7.2	6
Average investment in debtors (Total cost + DT)	2.78	4.46	6.33	8.3	10.08
Additional investment compared to present level	—	1.68	3.55	5.52	7.30
Cost of additional investment @ 25%	—	0.42	0.89	1.38	1.83
(c) Incremental profit [(a) – (b)]	—	1.08	2.11	2.82	2.67

Recommendation Policy III (average collection period 60 days) is recommended as it yields maximum profit.

P.15.7 A company is currently engaged in the business of manufacturing computer component. The computer component is currently sold for ₹1,000 and its variable cost is ₹800. For the current year ended March 31, the company sold on an average 500 components per month.

LO 15.2,4 LOD D

Presently the company grants one month credit to its customers. The company is thinking of extending the credit to two months on account of which the following is expected

Increase in sales	25 per cent
Increase in stock	₹2,00,000
Increase in creditors	₹1,00,000

You are required to advise the company on whether or not to extend the credit terms if:

(a) All customers avail the credit period of two months and (b) the new credit policy is given to only new customers. Assume that the entire increase in sales is attributable to the new customers. The company expects a minimum return of 40 per cent on investment.

Solution

Incremental analysis whether to extend credit period of two months to all customers or the new customers only

Particulars	All customers	New customers only
Incremental sales:		
Sales at proposed 2 months credit period (500 units × 12 months × ₹1,000 per unit) × 1.25	₹75,00,000	₹75,00,000
Less sales at existing 1 month credit period (500 units × 12 months × ₹1,000 per unit)	60,00,000	60,00,000
Increase in sales	15,00,000	15,00,000

Less increased variable costs (@80% of sales)	12,00,000	12,00,000
Incremental contribution	3,00,000	3,00,000
Less cost of additional working capital required (see working note 1)	2,80,000	1,20,000
Incremental profit	20,000	1,80,000

Recommendation The company is advised to extend the credit terms only for new customers as it yields higher incremental profit.

Working Note 1

- (i) Existing investment in debtors at variable cost with credit period of 1 month ($₹60,00,000 \times 0.8$)/Debtors turnover ratio 12 = ₹4,00,000
